1 History of changes.....	39
1.1 History of improvements/fixes.....	50
2 Introduction and Important Notes.....	57
2.1 About this Documentation.....	57
2.1.1 Documentation and Target Groups.....	58
2.1.2 Structure of the Administrator Documentation.....	59
2.1.3 Types of Topics.....	61
2.1.4 Display Conventions.....	62
2.2 Safety Information and Warnings.....	62
2.2.1 Warnings: Danger.....	63
2.2.2 Warnings: Warning.....	64
2.2.3 Warnings: Caution.....	65
2.2.4 Warnings: Note.....	65
2.2.5 Country-specific Safety Information.....	66
2.2.5.1 Safety Information for Australia.....	66
2.2.5.2 Safety Information for Brazil.....	67
2.2.5.3 Safety Information for the U.S.....	67
2.2.5.4 Safety Information for Canada.....	69
2.3 Important Notes.....	70
2.3.1 Emergencies.....	71
2.3.2 Proper Use.....	71
2.3.3 Correct Disposal and Recycling.....	72
2.3.4 Installation Standards and Guidelines.....	73
2.3.4.1 Connecting OpenScape Office X to the Power Supply Circuit.....	73
2.3.4.2 Connecting OpenScape Business S and OpenScape Business UC Booster Server to the Power Supply Circuit.....	73
2.3.4.3 Shielded Cabling for LAN and WAN Connections of OpenScape Business X.....	73
2.3.4.4 Fire Safety Requirements.....	74
2.3.4.5 Lightning Protection Requirements.....	75
2.3.4.6 Markings for OpenScape Business X.....	75
2.3.5 Notes on Electromagnetic and Radio Frequency Interference of OpenScape Business X.....	76
2.3.6 Data Protection and Data Security.....	76
2.3.7 Technical Regulations and Conformity of OpenScape Business X.....	77
2.3.7.1 CE Conformity.....	77
2.3.7.2 Conformity with US and Canadian Standards.....	77
2.3.7.3 Conformity with International Standards.....	78
2.3.8 Operating Conditions.....	78
2.3.8.1 Operating Conditions for OpenScape Business X.....	78
2.3.8.2 Operating Conditions for OpenScape Business S and OpenScape Business UC Booster Server.....	79
3 System Overview.....	80
3.1 Highlights.....	80
3.2 Unified Communications.....	81
3.2.1 UC Features (Overview).....	81
3.2.2 User Access to UC Features (UC Clients).....	88
3.2.3 Integration in Business Applications.....	91
3.3 OpenScape Business Models.....	92
3.3.1 Expansion Levels Available through Sales.....	92

3.3.2 UC Hardware Models.....	96
3.3.3 UC Booster Hardware.....	97
3.3.4 UC Software Models (Softswitch).....	98
3.3.5 Structure and Environmental Conditions.....	98
3.3.6 Supported Phones.....	99
3.4 Further information.....	100
3.4.1 Languages Supported.....	100
3.4.2 Internet Links.....	102
4 Administration Concept.....	103
4.1 OpenScape Business Assistant (WBM).....	103
4.1.1 Requirements for the WBM.....	103
4.1.2 Home Page of the WBM.....	103
4.1.3 Introduction to the WBM.....	105
4.1.3.1 How to Log into the WBM.....	107
4.1.3.2 How to Log out from the WBM.....	108
4.1.4 WBM User Management.....	108
4.1.4.1 How to Add an Administrator.....	111
4.1.4.2 How to Edit an Administrator.....	111
4.1.4.3 How to Change your Own Administrator Password.....	111
4.1.4.4 How to Delete an Administrator.....	112
4.1.4.5 How to change a Manager E Administrator password.....	112
4.1.5 Wizards.....	112
4.1.5.1 Wizards – Basic Installation.....	113
4.1.5.2 Wizards – Network / Internet.....	113
4.1.5.3 Wizards – Telephones / Subscribers.....	114
4.1.5.4 Wizards – Central Telephony.....	114
4.1.5.5 Wizards – User Telephony.....	115
4.1.5.6 Wizards – Security.....	116
4.1.5.7 Wizards - UC Smart (only with UC Smart).....	116
4.1.5.8 Wizards - UC Suite (only with UC Suite).....	116
4.1.5.9 Wizards – Circuit.....	117
4.1.5.10 Wizards – Unified Directory.....	117
4.1.6 Service Center.....	117
4.1.6.1 Service Center – Documents	118
4.1.6.2 Service Center – Software	118
4.1.6.3 Service Center – Inventory > System	118
4.1.6.4 Service Center – Inventory > Call Numbers	118
4.1.6.5 Service Center – Inventory > Network Overview	119
4.1.6.6 Service Center – Software Update	119
4.1.6.7 Service Center – E-mail Forwarding	119
4.1.6.8 Service Center – Remote Access	119
4.1.6.9 Service Center – Restart / Reload	119
4.1.6.10 Service Center – Diagnostics > Status	119
4.1.6.11 Service Center – Diagnostics > Event Viewer	119
4.1.6.12 Service Center – Diagnostics > Trace	119
4.1.6.13 Service Center – Diagnostics > Service log	120
4.1.7 Expert Mode.....	120
4.1.8 Online Help.....	120
4.1.8.1 How to Invoke the Context-Sensitive Online Help.....	120
4.2 Manager E.....	121
4.2.1 How to Load the CDB into Manager E.....	122
4.2.2 How to Load the CDB Back into the System.....	122
5 Initial Setup for OpenScape Business X.....	123
5.1 Prerequisites for the Initial installation.....	123

5.2 Components.....	124
5.3 Dial Plan.....	126
5.4 IP Address Scheme.....	127
5.5 Initial Startup.....	129
5.5.1 How to Restart the Communication System.....	129
5.5.2 How to Connect the Admin PC to the Communication System.....	130
5.5.3 How to Start the WBM.....	131
5.6 Integration into the Customer LAN.....	133
5.6.1 How to Start the Initial Installation Wizard.....	133
5.6.2 System Settings.....	133
5.6.2.1 How to Set the Display Logo and the Product Name.....	134
5.6.2.2 How to Specify the IP Addresses (Optional).....	134
5.6.2.3 How to Specify the Device Name.....	135
5.6.3 DHCP Settings.....	136
5.6.3.1 How to Disable the Internal DHCP Server.....	137
5.6.3.2 How to Enable and Configure the Internal DHCP Server.....	137
5.6.4 Country and Time Settings.....	138
5.6.4.1 How to Select the Country Code and the Language for Event Logs.....	139
5.6.4.2 How to Enter the DECT System ID.....	140
5.6.4.3 How to Set the Date and Time Manually.....	140
5.6.4.4 How to Obtain the Date and Time from an SNTP Server.....	141
5.6.5 UC Solution.....	142
5.6.5.1 How to Define the UC Solution.....	142
5.6.6 Connecting the Communication System to the Customer LAN.....	143
5.6.6.1 How to Connect the Communication System to the Customer LAN.....	143
5.7 Basic Configuration.....	143
5.7.1 How to Start the Basic Installation Wizard.....	144
5.7.2 System Phone Numbers and Networking.....	144
5.7.2.1 How to Enter the System Phone Numbers for a Point-to-Point connection.....	145
5.7.2.2 How to Enter the System Phone Numbers for a Point-to-Multipoint Connection.....	146
5.7.2.3 How to Activate or Deactivate Networking.....	147
5.7.3 Station Data.....	147
5.7.3.1 How to Display the Station Data.....	149
5.7.3.2 How to Delete all Call Numbers.....	149
5.7.3.3 How to Adapt Preconfigured Station Numbers for the Individual Dial Plan.....	150
5.7.3.4 How to Import the Station Data from an XML File.....	150
5.7.3.5 How to display Mass data.....	151
5.7.4 ISDN Configuration.....	152
5.7.4.1 How to Configure the Connection of ISDN Stations.....	153
5.7.4.2 How to Configure the ISDN Point-to-Point Connection.....	153
5.7.4.3 How to Configure the ISDN Point-to-Multipoint Connection.....	154
5.7.4.4 How to Deactivate the ISDN Configuration.....	154
5.7.5 Internet Access.....	155
5.7.5.1 How to Configure Internet Access via an External Internet Router over the LAN Port.....	156
5.7.5.2 How to Configure Internet Access via an External Internet Router over the WAN Port.....	157
5.7.5.3 How to Configure Internet Access via a Preconfigured ISP.....	158
5.7.5.4 How to Configure Internet Access via the Standard ISP PPPoE.....	160
5.7.5.5 How to Configure Internet Access via a Standard ISP PPTP.....	162
5.7.5.6 How to Disable Internet Access.....	165
5.7.6 Internet Telephony.....	165
5.7.6.1 How to Configure a Predefined ITSP.....	166
5.7.6.2 How to Deactivate Internet Telephony.....	171
5.7.7 Stations.....	171
5.7.7.1 How to Configure ISDN Stations.....	172

5.7.7.2 How to Configure Analog Stations.....	174
5.7.7.3 How to Configure UP0 Stations.....	177
5.7.7.4 How to Configure DECT Stations.....	179
5.7.7.5 How to Configure IP and SIP Stations.....	182
5.7.8 Configuring UC Suite.....	185
5.7.8.1 How to Configure the UC Suite.....	185
5.7.9 Configuring UC Smart Mailboxes.....	186
5.7.9.1 How to Configure UC Smart Voicemail Boxes.....	186
5.7.10 Conference Server Settings.....	187
5.7.10.1 How to Edit the Conference Server Settings.....	187
5.7.11 E-mail Delivery (Optional).....	187
5.7.11.1 How to Configure the Sending of E-mails.....	188
5.8 Closing Activities.....	191
5.8.1 How to Activate and Assign the Licenses.....	191
5.8.2 How to Provision the UC Smart Client for Installation.....	193
5.8.3 How to Provision the UC Suite Clients for Installation.....	194
5.8.4 How to Perform a Data Backup.....	195
5.9 Commissioning of IP Phones.....	196
5.9.1 How to Configure an IP Phone.....	197
5.9.2 How to Configure a SIP Phone.....	198
5.10 How to collect diagnostic traces for error incident.....	200
5.11 Reflashing.....	201
6 Initial Setup for OpenScape Business S.....	204
6.1 Prerequisites for the Initial Setup.....	204
6.2 Components.....	207
6.3 IP Address Scheme.....	208
6.4 Dial Plan.....	209
6.5 Installing the Communication Software.....	210
6.5.1 How to Install the Communication Software.....	211
6.6 Starting Up.....	213
6.6.1 How to Start the Initial Installation Wizard.....	213
6.6.2 System Settings.....	214
6.6.2.1 How to Set the Display Logo and the Product Name.....	214
6.6.2.2 How to Select the Country Code and the Language for Event Logs.....	215
6.6.2.3 How to Activate an Additional LAN Port as a WAN Interface.....	215
6.6.3 UC Solution.....	216
6.6.3.1 How to Define the UC Solution.....	216
6.7 Basic Configuration.....	217
6.7.1 How to Start the Basic Installation Wizard.....	217
6.7.2 System Phone Numbers and Networking.....	218
6.7.2.1 How to Enter the System Phone Numbers for a Point-to-Point connection.....	218
6.7.2.2 How to Enter the System Phone Numbers for a Point-to-Multipoint Connection.....	219
6.7.2.3 How to Activate or Deactivate Networking.....	220
6.7.2.4 How to Configure the Upstream of your Internet connection.....	221
6.7.3 Station Data.....	221
6.7.3.1 How to Display the Station Data.....	223
6.7.3.2 How to Delete all Call Numbers.....	223
6.7.3.3 How to Adapt Preconfigured Station Numbers for the Individual Dial Plan.....	224
6.7.3.4 How to Import the Station Data from an XML File.....	224
6.7.4 Internet Telephony.....	225
6.7.4.1 How to Configure a Predefined ITSP.....	226
6.7.4.2 How to Deactivate Internet Telephony.....	231
6.7.5 Stations.....	231
6.7.5.1 How to Configure IP and SIP Stations.....	231
6.7.6 Configuring UC Suite.....	234

6.7.6.1 How to Configure the UC Suite.....	234
6.7.7 Configuring UC Smart Mailboxes.....	235
6.7.7.1 How to Configure UC Smart Voicemail Boxes.....	235
6.7.8 Conference Server Settings.....	236
6.7.8.1 How to Edit the Conference Server Settings.....	236
6.7.9 E-mail Delivery (Optional).....	237
6.7.9.1 How to Configure the Sending of E-mails.....	237
6.8 Closing Activities.....	240
6.8.1 How to Activate and Assign the Licenses.....	240
6.8.2 How to Provision the UC Smart Client for Installation.....	242
6.8.3 How to Provision the UC Suite Clients for Installation.....	243
6.8.4 How to Perform a Data Backup.....	244
6.9 Commissioning of IP Phones.....	245
6.9.1 How to Configure an IP Phone.....	246
6.9.2 How to Configure a SIP Phone.....	247
6.10 Uninstalling the Communication Software.....	249
6.10.1 How to Uninstall the Communication Software.....	249
6.11 Used Ports.....	249
6.12 How to collect diagnostic traces for error incident.....	252
6.13 Reflashing.....	252
7 Initial Setup of OpenScape Business UC Booster.....	255
7.1 Prerequisites for the Initial Setup.....	258
7.2 Backing up the Configuration Data of the Communication System.....	260
7.2.1 How to Perform a Data Backup.....	260
7.3 Commissioning the UC Booster Card.....	261
7.3.1 Installing the UC Booster Card.....	261
7.3.2 Configuring the UC Booster Card.....	262
7.3.3 Updating the Software for the UC Booster Card.....	262
7.3.3.1 How to Perform a Software Update.....	262
7.4 Commissioning the UC Booster Server.....	263
7.4.1 Installing the Communication Software.....	263
7.4.1.1 How to Install the Communication Software.....	264
7.4.2 Configuring the UC Booster Server.....	266
7.4.2.1 Announcing the IP Address of the Communication System.....	267
7.4.3 Updating the Software for the UC Booster Server.....	269
7.5 Basic Configuration.....	269
7.6 Closing Activities.....	270
7.7 Uninstalling the Communication Software.....	270
7.7.1 How to Uninstall the Communication Software.....	271
7.8 Upgrading from the UC Booster Card to the UC Booster Server.....	271
7.9 Used Ports.....	272
8 Licensing.....	275
8.1 Licensing Procedure.....	276
8.2 Licenses.....	278
8.2.1 Basic License.....	279
8.2.2 User Licenses.....	280
8.2.3 User-oriented Licenses.....	281
8.2.4 System Licenses.....	283
8.2.5 Evaluation Licenses.....	286
8.2.6 Upgrade Licenses.....	287
8.2.7 Possible License Combinations.....	288
8.3 Licensing a Communication System (Standalone).....	290
8.3.1 CLS Connect.....	291
8.3.1.1 How to Activate CLS Connect.....	291

8.3.1.2 Switching from CLS connect.....	292
8.3.2 Activating Licenses (Standalone).....	292
8.3.2.1 How to Activate Licenses Online (Standalone).....	293
8.3.2.2 How to Activate Licenses Offline (Standalone).....	294
8.3.3 Assigning Licenses (Standalone).....	295
8.3.3.1 How to License Subscribers (Standalone).....	297
8.3.3.2 How to License Trunks (Standalone).....	300
8.4 Licensing Multiple Communication Systems (Internetwork).....	300
8.4.1 License Activation (Internetwork).....	302
8.4.1.1 How to Activate Licenses Offline (Internetwork).....	303
8.4.1.2 How to Combine License Files into a Network License File.....	304
8.4.2 Assigning Licenses (Internetwork).....	306
8.4.2.1 How to License Subscribers (Internetwork).....	308
8.4.2.2 How to License Trunks (Internetwork).....	310
8.4.2.3 How to Assign System Licenses to a Node.....	311
8.4.2.4 How to Assign the "Networking" System License to a Node.....	312
8.5 License information.....	312
8.5.1 License Information without a Network (Standalone).....	313
8.5.1.1 How to Display License Information.....	313
8.5.2 License Information in an Internetwork.....	313
8.5.2.1 How to Display all Licenses in the Internetwork.....	314
8.5.2.2 How to Display the Licenses Bound to a Node.....	314
8.5.2.3 How to Display all Shared Licenses in an Internetwork.....	315
8.5.2.4 How to Display a Node-Dependent View of Station Licenses and User-Oriented Licenses.....	315
8.6 Assigning License Profiles.....	316
8.6.1 How to Add a License Profile.....	316
8.6.2 How to Edit a License Profile.....	317
8.6.3 How to Assign a License Profile to Stations.....	318
8.6.4 How to Delete a License Profile.....	319
8.7 Rehosting after Replacement of Hardware.....	319
8.7.1 How to Perform a Rehost after Replacing Hardware.....	320
8.8 License Server (Central License Server, CLS).....	320
8.8.1 How to Check or Change the IP Address of the License Server.....	321
8.8.2 How to check Central License Server (CLS) Connection.....	321
8.9 Customer License Agent (CLA).....	321
8.9.1 How to Configure the Connection to the Local License Agent.....	322
8.9.2 How to Change the Connection to the Central License Agent.....	322
8.10 Locking ID and Advanced ID Locking.....	323
8.10.1 How to Check the Locking ID of the Communication System.....	324
8.10.2 How to Check the Locking ID of the Softswitch.....	324
8.10.3 How to Check the Advanced Locking ID of Softswitches.....	324
8.11 How to migrate from V2 mainboard to V3 mainboard (standalone system).....	325
8.12 How to migrate from V2 mainboard to V3 mainboard the master node of a networked system.....	327
8.13 How to migrate from V2 mainboard to V3 mainboard the slave node of a networked system.....	327
8.14 Migration of HiPath 3000 systems to OSBiz V3 software with V3 mainboard.....	328
8.15 Upgrade from V2 to V3 with CLS Connect	328
8.16 Upgrade from V2 to V3 without CLS Connect	328
9 Integration into the Internal Data Network (LAN).....	330
9.1 LAN Interface.....	330
9.1.1 IP Address and Subnet Mask of the LAN Interface.....	330
9.1.1.1 How to Change the IP Address and Subnet Mask of the Hardware Platform.....	331
9.1.1.2 How to Change the IP Address of the UC Booster Card.....	332

9.1.1.3 How to Check or Change the IP Address and Subnet Mask of the Softswitch.....	332
9.1.2 Internal IP Address Range of the LAN Interface.....	333
9.1.2.1 How to Change the Internal IP Address Range of the Hardware Platform.....	333
9.1.2.2 How to Reset the Internal IP Address Range of the Hardware Platform.....	334
9.2 DHCP.....	334
9.2.1 DHCP Relay Agent.....	334
9.2.1.1 How to Configure the Hardware Platform as a DHCP Relay Agent.....	335
9.2.2 DHCP Server.....	335
9.2.2.1 How to Enable and Configure the DHCP Server of the Hardware Platform.....	337
9.2.2.2 How to Disable the DHCP Server of the Hardware Platform.....	338
9.2.2.3 How to Enable and Configure the DHCP Server of the Softswitch.....	339
9.2.2.4 How to Disable the DHCP Server of the Softswitch.....	339
9.3 DNS - Name Resolution.....	340
9.3.1 How to Define an External DNS Server.....	342
9.4 IP Routing.....	342
9.4.1 How to Activate or Deactivate the Default Router.....	343
9.4.2 How to Add a Static Route.....	343
9.4.3 How to Delete Static Routes.....	344
9.5 Deployment Service (DLS and DLI).....	344
9.5.1 How to Configure the External DLS Server in the Internal DHCP Server.....	347
9.5.2 How to Enable the Internal DLI.....	347
9.5.3 How to Configure the Communication System as a Deployment and Licensing Client...	348
10 Connection to Service Provider.....	349
10.1 Internet Access.....	349
10.1.1 Internet Access via an External Internet Router.....	351
10.1.1.1 How to Configure Internet Access via an External Internet Router over the LAN Port.....	352
10.1.1.2 How to Configure Internet Access via an External Internet Router over the WAN Port.....	352
10.1.2 Internet Access via an Internet Modem.....	354
10.1.2.1 How to Configure Internet Access via a Preconfigured ISP.....	355
10.1.2.2 How to Configure Internet Access via a Standard ISP PPPoE.....	357
10.1.2.3 How to Configure Internet Access via a Standard ISP PPTP.....	359
10.1.3 WAN port.....	362
10.1.4 DynDNS.....	362
10.1.4.1 How to Configure the DynDNS Service.....	363
10.1.4.2 How to Define the Mail Exchanger.....	365
10.2 CO Access via ITSP.....	365
10.2.1 Configuring an ITSP.....	367
10.2.1.1 How to Configure a Predefined ITSP.....	369
10.2.1.2 How to Add a New ITSP.....	374
10.2.1.3 How to Configure Multi-Sites over ITSPs.....	380
10.2.1.4 How to Save a Preconfigured ITSP Template as a New Template.....	382
10.2.1.5 How to Customize a Preconfigured ITSP Template.....	382
10.2.1.6 How to Manually Update a Preconfigured ITSP Template.....	383
10.2.2 STUN (Simple Traversal of UDP through NAT).....	383
10.2.2.1 How to Set the STUN Mode.....	384
10.3 CO Access over Digital and Analog Lines.....	384
10.3.1 Trunks.....	385
10.3.1.1 How to Configure an ISDN Outside Line.....	386
10.3.1.2 How to Configure an Analog Outside Line.....	387
10.3.1.3 How to Display All Trunks.....	388
10.3.1.4 How to Display Individual Trunks.....	388
10.3.1.5 How to Change the Trunk Code.....	389
10.3.1.6 How to Assign an MSN to a Trunk.....	389

10.3.1.7 ISDN protocol, modify.....	389
10.3.1.8 How to Change the B Channel Seizure Mode.....	390
10.3.1.9 How to Change the Dialing Method.....	390
10.3.2 Routes.....	390
10.3.2.1 How to Change a Route Assignment.....	394
10.3.2.2 How to Change the Route Name.....	394
10.3.2.3 How to Change the Seizure Code.....	394
10.3.2.4 How to Configure an Overflow Route with LCR Disabled.....	395
10.3.2.5 How to Configure an Overflow Route with LCR Enabled.....	395
10.3.2.6 How to Configure the Type of Seizure.....	395
10.3.2.7 How to Enter the PABX Number Incoming and Outgoing.....	396
10.3.2.8 How to Configure the Format of the Transmitted Call Number.....	396
10.3.2.9 How to Configure the Type of the Transmitted Call Number.....	396
10.3.2.10 How to Configure the Direction Prefix.....	397
10.3.2.11 How to Define a Route for Networking and Enter a Second CO Code.....	397
10.3.3 Dial Tone Monitoring.....	398
10.3.3.1 How to Configure a Delay Period for Dial Tone Monitoring.....	399
10.3.3.2 How to Configure the Dial Tone Monitoring Time.....	399
10.3.3.3 How to Configure the Digit Dial Time.....	400
10.3.3.4 How to Enable or Disable the Analysis of the Second Dial Tone.....	401
10.4 Prioritizing the Exchange Line Seizure with LCR Enabled.....	401
10.4.1 How to Prioritize the Seizure of Exchange Lines.....	401

1 History of changes

Changes mentioned in this chapter are cumulative.

Changes in V3R3

Impacted chapters	Change description
Migration on page 1348	Added note regarding deleting Unify phone users.
Updates on page 1222 Licensing on page 275 Networking OpenScape Business on page 1020	Added info regarding network - licensing when updating systems.
Reflashing on page 201 Reflashing on page 252	Added two new chapters about reflashing feature.
Licensing Procedure on page 276 Used Ports on page 249 How to Activate CLS Connect on page 291	Removed mentions of obsolete port 7780
Traces on page 1282 Traces on page 1469	Deleted section for RtpProxy Trace, as this trace is no longer available in WBM
Traces Media Server Trace on page 1481 How to Start Media Server Trace on page 1304 How to Stop Media Server Trace on page 1304	New chapters for Media Server
OpenScape Business, UC SuiteUser Directory on page 1708 OpenScape Business UC SuiteServer on page 1727	Updates on date and time format
How to Delete Unify Phone Users on page 1175 myPortal for Teams overview on page 1170	Updates about SDHC card replacement myPortal for Teams: call control support
Basic SettingsPhone Parameter Deployment on page 1533	Updates for Canonical dial settings
Migration on page 1348	Added two notes regarding migration good practices and failure points.
How to License Subscribers (Standalone) on page 297 User-oriented Licenses on page 281	Added two notes regarding assigning voicemail licenses.
Software ImageSystem Software Update via File Upload on page 1462 How to Update the System via File Upload on page 1230	Added information regarding the new flag for updating via file upload.

History of changes

Changes in V3R2 FR1

Impacted chapters	Change description
How to Configure the Recording of Conferences on page 572 How to Activate or Deactivate the Recording of Calls on page 564	New checkbox in order to enable or disable the recording of conferences
Traces Kernel Crash Data on page 1481 How to Start the Kernel Crash Data Service on page 1303 How to Stop the Kernel Crash Data Service on page 1303	New Kernel Crash Data Service
Possible License Combinations on page 288	Added information about the active licenses needed to use the Contact Center and Company AutoAttendant functions
StationStationStation Parameters on page 1630	Mention that the Trusted external station call number field is mandatory
OpenScape Business UC SuiteServer on page 1727	New option to delete after a specified period of time callback messages, live recorded calls, fax calls and emails associated with calls
How to Download a Rule (CCV) as a Backup File on page 897 How to Upload a Downloaded Rule (CCV) in a Backup File Format on page 898	New chapters for downloading and uploading of a rule (CCV)
UC Suite on page 511 Multimedia Contact Center on page 843 Maintenance on page 1198 Expert mode on page 1454	User Interface updates in whole impacted chapters

Impacted chapters	Change description
How to Configure the Sending of E-mails on page 188 OpenScape Business UC SuiteExternal Providers Config on page 1714 OpenScape Business UC Suite Contact Center on page 1716 How to Add Queues for the Sample Contact Center on page 886 How to Add a Queue on page 899 How to Edit a Queue on page 902 How to connect OpenScape Business system to Microsoft Office 365 using Basic Authentication on page 601 How to connect OpenScape Business system to Microsoft Office 365 using Modern Authentication on page 606	Support for OAuth 2.0 authentication
myReports on page 847	myReports administrators can no longer configure the e-mail account to be used for sending reports via e-mail
myPortal for Teams overview on page 1170	myPortal for Teams: support for dial pad and favorites
Prerequisites for myPortal to go on page 923	Updated prerequisites for the myPortal to go iOS client
Subscriber Management on page 835	On myAttendant, the default number of user buttons was increased and can be changed
Users of UC Suite on page 523 OpenScape Business, UC SuiteUser Directory on page 1708	Updated list of supported file formats for uploading a picture

History of changes

Impacted chapters	Change description
User Access to UC Features (UC Clients) on page 88 Supported Phones on page 99 Deployment Service (DLS and DLI) on page 344 UC Smart Clients on page 465 Prerequisites for myPortal @work on page 467 How to Configure Directories for System Telephones on page 486 Features on page 489 Prerequisites for UC Suite PC Clients on page 516 Team Configuration / Team Group on page 682 OpenScape Business Attendant on page 818 myAttendant on page 833 Prerequisites for myAgent on page 845 How to Load a Phone Logo into the System on page 1201 How to Configure Automatic Re-flashing on page 1234 Software Upgrade for OpenScape Business X Systems on page 1349 How to Upgrade UC Business Booster Server V2 to V3 on page 1352 Hardware/Software Migration of OpenScape Business X Systems to V3 on page 1354 Software Upgrade of OpenScape Business S on page 1363 UC Smart Expansion Levels on page 1423 UC Suite Expansion Levels on page 1429 Application Connectivity on page 1450	New supported phones: <ul style="list-style-type: none"> • OpenScape Desk Phone CP 210 • OpenScape Desk Phone CP 710
Supported Phones on page 99	New supported key modules: <ul style="list-style-type: none"> • OpenScape Key Module 410 • OpenScape Key Module 710
Basic SettingsSystem LDAP on page 1517	Added note about the display of LDAP sources.
DISA on page 650	Added note regarding calling DISA numbers in OSBiz S and OSBiz X.
OpenScape Business UC SuiteServer on page 1727	Removed DB table entry.

Impacted chapters	Change description
Open Directory Service on page 1151	Modified external data sources and added info regarding the 'Description' field.
How to migrate from V2 mainboard to V3 mainboard (standalone system) on page 325	Added text regarding issues with the UC Fax functionality.
Migration from OpenScape Business X1 V2 to OpenScape Business X1W V3 on page 1409	Added chapters regarding Migration from X1 V2 to X1W V3.
Switching from CLS connect on page 292	Introduced Switching from CLS connect chapter.
How to migrate from V2 mainboard to V3 mainboard (standalone system) on page 325	Migration OCCLA standalone
Remote Access on page 1339 Overview of functions and codes on page 656 IP Address Scheme on page 127 How to Enable Remote Access via ISDN on page 1340 How to Configure PCs with Microsoft Windows Vista for Remote Access via ISDN on page 1341 How to Configure PCs with Microsoft Windows 7 for Remote Access via ISDN on page 1342	Changed obsolete remote access methods and removed last three chapters.
Migration from OpenScape Business X1 V2 to OpenScape Business X1W V3 on page 1409	Added chapters regarding Migration from X1 V2 to X1W V3.
Voice GatewayNative SIP Server Trunk on page 1613	Added table entries for transport and media security.
OpenScape Business UC SuiteServer on page 1727	Added text regarding the restart of the UC application.
Switching from CLS connect on page 292	Added chapter regarding switching from CLS Connect.
OpenScape Business UC SuiteServer on page 1727	Added text regarding the restart of the UC application.
Voice GatewayNative SIP Server Trunk on page 1613	Added table entries for transport and media security.
Remote Access on page 1339	Removed obsolete remote access methods.
Switching from CLS connect on page 292	Added chapter regarding switching from CLS Connect.

Changes in V3R2

Impacted chapters	Change description
Supported Phones on page 99 Prerequisites for myPortal @work on page 467 Features on page 489 Prerequisites for UC Suite PC Clients on page 516 OpenScape Business Attendant on page 818 myAttendant on page 833 Prerequisites for myAgent on page 845 How to Configure Automatic Re-flashing on page 1234 Significance of Results Obtained from Testing the Radio Area on page 941	New supported phones: <ul style="list-style-type: none"> • OpenScape Desk Phone CP 110 • OpenScape DECT Phone S6/SL6/R6
myPortal for Teams overview on page 1170	myPortal for Teams: journal support
Expansion Levels Available through Sales on page 92 Maximum values for stations on page 1413 UC Smart Expansion Levels on page 1423 UC Suite Expansion Levels on page 1429 Mobility Expansion Limits on page 1447 Application Connectivity on page 1450	myPortal for Teams: Configuration limits and capacities

1.1 History of improvements/fixes

Changes mentioned in this chapter are cumulative.

Changes in V3R3

Service case ID	Date of change	Description of change	Impacted chapters
PRB000068453	27 June 2023	Added information regarding Authenticated SMTP and OAuth 2.0.	How to Configure the Sending of E-mails on page 188
PRB000066465	17 Jul 2023	Added information regarding the new port in the firewall for CLS Connect.	Activating Licenses (Standalone) on page 292, Licensing Procedure on page 276, Used Ports on page 249, How to Activate CLS Connect on page 291
PRB000068453	17 Jul 2023	Updated supported image formats.	OpenScape Business, UC SuiteUser Directory on page 1708, Users of UC Suite on page 523
PRB000071258	18 Oct 2023	Added length limits for CSV data.	How to Import a CSV File from the Local File System into the External Directory on page 544
PRB000061414	20 Oct 2023	Added new flag - Use Dedicated Static Route.	Software ImageSystem Software Update via Internet on page 1461
PRB000064083	26 Oct 2023	Added missing values for the Enforce authentication for HFA devices field.	Basic SettingsSystem > HFA Registration Password on page 1521

Service case ID	Date of change	Description of change	Impacted chapters
PRB000071163	24 Nov 2023	Added new chapters and information regarding certificates handling.	Introduction on page 1006 (new) How to Import Server Certificates (PEM) on page 1011 (new) Certificate Handling for Booster Server on page 1013 (new) How to Generate Certificate Signing Requests (CSR) on page 1009 How to Generate CA Certificates on page 1007 How to Import Server Certificates (PKCS#12) on page 1010 Certificate Handling on page 1005

Changes in V3R2 FR1

Service case ID	Date of change	Description of change	Impacted chapters
PRB000066080	11 May 2023	Added note regarding camp on behaviour.	How to Enable or Disable Immediate Call Waiting (Camp On) by the Attendant Console on page 645
PRB000067262	12 May 2023	Corrected MOH delay timer range values.	Basic SettingsSystem Time Parameters on page 1504
PRB000065660	29 Jun 2023	Added note regarding adding and removing UC contacts.	Directories on page 485, Directories on page 538
PRB000067012	01 Aug 2023	Added note about system speed dialing and toll restriction rules.	System Speed Dialing on page 612
PRB000056655	05 Sep 2023	Added note regarding the display information update after transferring a call.	Transfer on page 627

Changes in V3R2

Service case ID	Date of change	Description of change	Impacted chapters
PRB000052166	20 Jun 2022	Deleted section for Auto DSP Trace, as this trace is no longer available in WBM	Traces on page 1469
PRB000058845	01 Jul 2022	Updated info about the SPE support in networks	Deployment Service (DLS and DLI) on page 344

History of changes

Service case ID	Date of change	Description of change	Impacted chapters
PRB000058415	22 Aug 2022	Deleted section for Non-Supported Boards and Devices, as this section is moved to the Service Documentation.	Appendix on page 1743
PRB000058021	22 Aug 2022	Updated info about the components to be replaced	Hardware/Software Migration of OpenScape Business X Systems to V3 on page 1354
PRB000061111	27 Oct 2022	Added note regarding the VoIP behavior of myPortal@work	UC Smart Clients on page 465
PRB000062363	25 Nov 2022	Added chapter and subchapters regarding migration of HW boards	Migration of HW boards on page 1407
PRB000063445	30 Nov 2022	Added note regarding backup UCD group under basic fallback solution	Fallback solution on page 870
RB000055773, PRB000055775	12 Jan 2023	Added note regarding adding new datasource in ODS.	How to Add an External Data Source for the Open Directory Service on page 1158
PRB000061481	12 Jan 2023	Added note and subchapter regarding deleting Unify Phone users	Unify Phone on page 1172

2 Introduction and Important Notes

This introduction provides you with an overview of the documentation structure. The introduction should assist you in finding information on selected topics faster. Before you begin with the installation and startup of the communication system, make sure that you have carefully read the safety information and warnings as well as the important notes.

INFO: The safety information and requirements inform you about the safety and other requirements to be observed. The important notes contain information on the emergency behavior, the standards and guidelines for the installation, and the radio frequency interference of the communication system. In addition, you will also find details on and the proper disposal and recycling of the communication system here.

2.1 About this Documentation

This documentation describes the administration of OpenScape Business.™.

It includes the hardware models OpenScape Business X1, OpenScape Business X3, OpenScape Business X5 and OpenScape Business X8 as well as the software model OpenScape Business S (softswitch). The UC solution UC Smart is integrated in all OpenScape Business models. The UC solution UC Suite is offered for the hardware models with the optional UC Booster Card or UC Booster Server; in the case of the softswitch, a choice between UC Smart or UC Suite can be made.

NOTICE: The hardware models OpenScape Business X1/X3/X5/X8 (or OpenScape Business X for short) and the Softswitch OpenScape Business S are referred to in this documentation as communication systems.

UC Suite designates the advanced unified communications functions, including the Multimedia Contact Center.

The information in this document contains general descriptions of the technical possibilities, which may not always be available in individual cases. The desired features must be contractually specified for each case.

If a function is not available as described here, this may be due to the following reasons:

- The communication system does not have this feature.
- The required license is not available or activated.

2.1.1 Documentation and Target Groups

The documentation for OpenScape Business is intended for various target groups.

Sales and Project Planning

The following documentation is intended for sales and project planning.

- Feature Description

This documentation describes all the features. This document is an extract from the Administrator Documentation.

Installation and Service

The following documentation is intended for service technicians.

- OpenScape Business X1/X1W, Installation Guide

This document describes the installation of the hardware and the initial installation of OpenScape Business X1.

- OpenScape Business X3/X5/X8, Installation Guide

This document describes the installation of the hardware and the initial installation of OpenScape Business X3/X5/X8.

- OpenScape Business S, Installation Guide

This documentation describes the initial installation of the OpenScape Business S softswitch.

- OpenScape Business X1/X1W, Service Documentation

This documentation describes the hardware of OpenScape Business X1.

- OpenScape Business X3/X5/X8, Service Documentation

This documentation describes the hardware of OpenScape Business X3/X5/X8.

Administration

The following documentation is intended for administrators.

- Administrator Documentation

This documentation describes the configuration of features that are set up using the OpenScape Business Assistant (WBM). The Administrator documentation is available in the system as online help.

- Configuration for Customer Administrators, Administrator Documentation

This documentation describes the configuration of features that can be set up using the OpenScape Business Assistant (WBM) with the **Basic** administrator profile.

- Manager E, Administrator Documentation

This documentation describes the configuration of features that are set up using Manager E.

UC Clients / Telephone User Interfaces (TUI)

The following documentation is intended for UC users.

- myPortal for Desktop, User Guide
This documentation describes the installation, configuration and operation of the UC client myPortal for Desktop.
- myPortal for Outlook, User Guide
This documentation describes the installation, configuration and operation of the UC client myPortal for Outlook.
- myPortal @work, User Guide
This documentation describes the installation, configuration and operation of the UC client myPortal @work.
- Fax Printer, User Guide
This documentation describes the installation, configuration and operation of Fax Printer.
- myPortal to go User Guide
This documentation describes the configuration and operation of the mobile UC client myPortal to go for smartphones and tablet PCs.
- myAgent, User Guide
This documentation describes the installation, configuration and operation of the Contact Center client myAgent.
- myReports, User Guide
This documentation describes the installation, configuration and operation of the Contact Center client myReports.
- myAttendant, User Guide
This documentation describes the installation, configuration and operation of the attendant console myAttendant.
- OpenScape Business Attendant, User Guide
This documentation describes the installation, configuration and operation of the attendant console OpenScape Business Attendant.
- UC Smart Telephone User Interface (TUI), Quick Reference Guide
This documentation describes the voicemail phone menu of the UC solution UC Smart.
- UC Suite Telephone User Interface (TUI), Quick Reference Guide
This documentation describes the voicemail phone menu of the UC solution UC Suite.

2.1.2 Structure of the Administrator Documentation

This section shows you how the content of the Administrator Documentation is structured. The hardware is described in the Service Documentation.

Introduction and Important Notes

Section	Contents
Introduction and Important Notes	Overview of the structure of this documentation and important information/safety information to be observed during installation and operation
System overview	Overview of the communication system for a quick start
Administration concept	Overview of administration programs and user roles in the WBM
Initial Installation of OpenScape Business X	Integration of OpenScape Business X3/X5/X8 in the customer LAN and basic configuration using wizards
Initial Installation of OpenScape Business S	Integration of OpenScape Business S in the customer LAN and basic configuration using wizards
Initial Installation of the OpenScape Business UC Booster	Integration of OpenScape UC Business Booster in the customer LAN and basic configuration using wizards
Licensing	Licensing procedures and licenses
Integration into the Internal Data Network (LAN)	LAN/WAN interface, name resolution, data routing, DLI and DLS
Connection to service provider	Internet access, IP telephony, trunk access
Station	Dial plan, IP stations, UP0 stations; DECT stations, ISDN and analog stations, virtual stations, users of UC clients, user profiles
UC Smart	Clients and functions of the unified communications solution UC Smart, including Smart Voicemail. Presence status, directories and journal, conferences, team functions, voicemails
UC Suite	Clients and functions of the UC Suite unified communications solution: Presence status and CallMe, directories and journal, conferences and web collaboration, voice and fax messages, instant messaging
Functions at the Telephone	Make calls, call signaling, calling line ID, functions during the call, optimizing communication
Working in a team (groups)	Call pickup group, group call, hunt group, team/top, MULAP, UCD
Call routing	Classes of service, toll restriction, tenant system, LCR, emergency calls

Section	Contents
Attendants	AutoAttendants, OpenStage Attendant, PC-based attendants, intercept position
Multimedia Contact Center	Clients and functions of the Contact Center: agents, queues and schedules, VIP service, fallback, reports
Mobility	myPortal to go, Mobility Entry, One Number Service, dual-mode telephony, IP mobility, Cordless/DECT
Security	Firewall, SPE, VPN, certificates
Networking OpenScape Business	Network plan, networking scenarios, central intercept position, survivability
Auxiliary Equipment	Announcement devices, entrance telephone and door opener, actuators and sensors
Application Connectivity	CSTA, TAPI, Application Launcher
Accounting	Call detail recording, call charges and call duration, cost control
Maintenance	Backup and restore, update, restart, reload, shutdown, factory reset, inventory, actions, remote services
Migration	Upgrading HiPath 3000 to OpenScape Business
Configuration Limits and Capacities	Maximum values for the configuration limits and capacities of the different communication systems
Expert mode	Reference description of the windows/masks in Expert mode
Appendix	List of supported standards, the Euro-ISDN features and the IP protocols and port numbers used
Glossary	Brief descriptions of commonly used terms

2.1.3 Types of Topics

The types of topics include concepts and tasks:

Type of topic	Description
Concept	Explains the "What" and provides an overview of context and background information for specific features, etc.

Introduction and Important Notes

Safety Information and Warnings

Type of topic	Description
Task (operating instructions)	<p>Describes task-oriented application cases (i.e., the "How") step-by-step and assumes familiarity with the associated concepts.</p> <p>Tasks can be identified by the title How to</p>

2.1.4 Display Conventions

This documentation uses a variety of methods to present different types of information.

Type of information	Presentation	Example
User Interface Elements	Bold	Click OK .
Menu sequence	>	File > Exit
Special emphasis	Bold	Do not delete Name.
Cross-reference text	Italics	You will find more information in the topic <i>Network</i> .
Output	Monospace font, e.g., Courier	Command not found.
Input	Monospace font, e.g., Courier	Enter LOCAL as the file name.
Key combination	Monospace font, e.g., Courier	<Ctrl>+<Alt>+<Esc>

2.2 Safety Information and Warnings

Safety information and warnings indicate situations that can result in death, injury, property damage, and/or data loss.

Work on the communication systems and devices should **only** be performed by personnel with proper qualifications.

Within the context of this safety information and these warnings, qualified personnel are people who are authorized to ground and label systems, devices, and trunks and put them into operation in compliance with the applicable safety regulations and standards.

Make sure you have read and noted the following safety information and warnings before installing and starting up the communication system:

Make sure you also read carefully and follow all safety information and warnings printed on the communication system and devices.

Familiarize yourself with emergency numbers.

Types of Safety Information and Warnings

This documentation uses the following levels for the different types of safety information and warning:

DANGER: Indicates an immediately dangerous situation that will cause death or serious injuries.

WARNING: Indicates a universally dangerous situation that can cause death or serious injuries.

CAUTION: Indicates a dangerous situation that can cause injuries.

NOTICE: Indicates situations that can cause property damage and/or data loss.

Additional symbols for specifying the source of danger more exactly

The following symbol is generally not used in this documentation, but may appear on the devices or packaging.

ESD - electrostatically sensitive devices

Related concepts

[Important Notes](#) on page 70

2.2.1 Warnings: Danger

"Danger" warnings indicate immediately dangerous situations that will cause death or serious injury.

DANGER: Risk of electric shock through contact with live wires

- Note: Voltages over 30 VAC (alternating current) or 60 VDC (direct current) are dangerous.
- Only personnel with proper qualifications or qualified electricians should perform work on the low-voltage network (<1000 VAC), and all work must comply with the national/local requirements for electrical connections.

2.2.2 Warnings: Warning

"Warnings" indicate universal dangerous situations that can cause death or serious injury.

WARNING: Risk of electric shock through contact with live wires

- Use separate ground wires to provide protective grounding for the OpenScape Business X3R, X3W, X5R and X5W communication systems. Before you start up the system and connect the phones and phone lines, connect the communication system with a permanent earthing conductor.
- Provide protective grounding for each system box of the OpenScape Business X8 communication system with a separate ground wire. Before you start up the system and connect the phones and phone lines, connect the communication system with a permanent earthing conductor.
- Only use systems, tools and equipment which are in perfect condition. Do not use equipment with visible damage.
- Replace any damaged safety equipment (covers, labels and ground wires) immediately.
- Replace the power cable immediately if it appears to be damaged.
- The communication systems and servers should only be operated with outlets that have connected ground contacts.
- During a thunderstorm, do not connect or disconnect lines and do not install or remove boards.
- Disconnect all power supply circuits if you do not require power for certain activities (for example, when changing cables). Disconnect all the communication system's power plugs and make sure that the communication system is not supplied by another power source (uninterrupted power supply unit, for instance).

Before starting any work, make sure that the communication system is de-energized. Never take it for granted that all circuits have reliably been disconnected from the power supply when a fuse or a main switch has been switched off.

- Expect leakage current from the telecommunications network. Disconnect all telecommunication lines from the communication system before disconnecting the prescribed ground wire from the system.
- As long as the power supply is switched on, always observe the greatest caution when performing measurements on powered components and maintenance work on PC boards and covers.

Metallic surfaces such as mirrors are conductive. If you touch them, there is a risk of electric shocks or short circuits.

2.2.3 Warnings: Caution

"Caution" warnings indicate a dangerous situation that can result in injury.

CAUTION: Risk of explosion caused by the incorrect replacement of batteries

- Use only the approved battery packs.
 - The lithium battery should only be replaced with an identical battery or one recommended by the manufacturer.
-

CAUTION: Fire hazard

- Only use communication lines with a conductor diameter of 0.4 mm (AWG 26) or more.
 - Do not store any documents or similar flammable items in a communication system.
-

CAUTION: General risk of injury or accidents in the workplace

- After completing test and maintenance work, make sure that all safety equipment is re-installed in the right place and that all covers and the housing are closed.
 - Install cables in such a way that they do not pose a risk of an accident (tripping), and cannot be damaged.
 - When working on an open communication system or server, make sure that it is never left unattended.
 - Use appropriate tools to lift heavy objects or loads.
 - Check your tools regularly. Only use intact tools.
 - When working on the systems, never wear loose clothing and always tie back long hair.
 - Do not wear jewelry, metal watchbands or clothes with metal ornaments or rivets.
 - Always wear the necessary eye protection whenever appropriate.
 - Always wear a hard hat where there is a risk of injury from falling objects.
 - Make sure that the work area is well lit and tidy.
-

2.2.4 Warnings: Note

"Note" warnings are used to indicate situations that could result in property damage and/or data loss.

The following contains important information on how to avoid property damage and/or data loss:

- Before placing the system into operation, check whether the nominal voltage of the mains power supply corresponds to the

nominal voltage of the communication system or server (type plate).

- Follow these ESD measures to protect the electrostatically sensitive devices:
 - Always wear the antistatic wristband in the prescribed manner before performing any work on PC boards and modules.
 - Always place PC boards and modules on a grounded conductive base.
 - Make sure that the components of the communication system (e.g., the boards) are transported and shipped only in the appropriate packaging.
- Use only original accessories. Failure to comply with this safety information may damage the system equipment or violate safety and EMC regulations.
- Sudden changes in temperature can result in condensing humidity. If a communication system or server is transported from a cold environment to warmer areas, for example, this could result in the condensation of humidity. Wait until the communication system or server has adjusted to the ambient temperature and is completely dry before starting it up.
- Connect all cables only to the specified connection points.
- If no emergency backup power supply is available or if no switchover to emergency analog phones is possible in the event of a power failure, then no emergency calls can be made via the communication system following a power failure.
- Before starting wall mounting, check that the wall has sufficient load bearing capacity. Always use suitable installation and mounting materials to mount the communication systems and devices securely.
- Do not allow easily flammable materials to be stored in or near the room where the communication system is installed.

2.2.5 Country-specific Safety Information

Here, you will find information on the specific safety precautions to be observed when installing, starting up and operating the communication systems in certain countries.

2.2.5.1 Safety Information for Australia

The following safety precautions must always be observed when installing, starting up and operating the OpenScape Business X and OpenScape Business S communication systems and the OpenScape Business UC Booster Server (Application Server) in Australia:

- The OpenScape Business X and OpenScape Business S communication systems and the OpenScape Business UC Booster Server (Application Server) must be installed and serviced only by authorized personnel.
- OpenScape Business wall systems must be installed near the mains socket outlet that supplies power to the respective

communication system. The wall socket shall be readily accessible. The integrity of the wall socket must be assured.

- The OpenScape Business X and OpenScape Business S communication systems and the OpenScape Business UC Booster Server (Application Server) must be configured to allow emergency calls (for example, 000) to be made at all times.
- If no emergency backup power supply is available or if no switchover to emergency analog phones (trunk failure transfer) is possible in the event of a power failure, then no emergency calls can be made via the communication system following a power failure).
- Music on Hold and paging devices must be connected to the communication system via a Line Isolation Unit approved by the Australian Communications Authority (ACA).

2.2.5.2 Safety Information for Brazil

The following safety precautions must always be observed when installing, starting up and operating the OpenScape Business X and OpenScape Business S communication systems and the OpenScape Business UC Booster Server (Application Server) in Brazil:

- The use of the outlet strip with overvoltage protection with part number C39334-Z7052-C33 is absolutely mandatory. The power supply of the OpenScape Business X and OpenScape Business S communication systems and the OpenScape Business UC Booster Server (Application Server) must be passed through an outlet strip with overvoltage protection.
- The use of shielded Ethernet cables for the LAN/WAN interfaces/ ports of the OCCL, OCCM and OCCMR mainboards and the UC Booster Card OCAB (Application Board) is absolutely mandatory.

2.2.5.3 Safety Information for the U.S.

The following safety precautions must always be observed when installing, starting up and operating the OpenScape Business X and OpenScape Business S communication systems and the OpenScape Business UC Booster Server (Application Server) in the United States:

- Disruption of the Network and T1

When communication systems are networked using T1 (1.544 Mbit/s), the telecommunications company (Federal Communications Commission (FCC)) must be notified whenever a communication system is removed from the grid.

If any of the communication systems of Unify Software and Solutions GmbH & Co. KG described in this documentation disrupts the operation of the public telecommunications network, the telecommunications company is entitled to temporarily block access to the outside line. In general, the telecommunications company will inform you about this in advance. If this is not possible, you will receive notification at the earliest possible time.

Introduction and Important Notes

In this context, you will also be informed that you can lodge a complaint with the telecommunications company.

- Telephone Company Facility Changes

The telecommunication company is entitled to adapt its own equipment, devices, operating procedures, and processes as necessary; Such modifications may impair the operation of your communication systems. Under normal circumstances, you should be notified in advance so you can maintain uninterrupted telephone service.

- Nonlive Voice Equipment

Nonlive voice equipment, such as music-on-hold devices and voice recorders must be approved and released by Unify Software and Solutions GmbH & Co. KG and registered in accordance with the rules and regulations of Subpart C of the FCC Rules, Part 68.

Unreleased devices for voice playback may only be connected through protective circuitry that is approved and released by Unify Software and Solutions GmbH & Co. KG and registered in accordance with the rules and regulations in Subpart C of the FCC Rules, Part 68.

- Ringer Equivalence Number REN

The Ringer Equivalence Number (REN) is used to determine the number of devices that can be connected to a telephone line so that all the devices ring when that telephone number is called. In most areas, but not all, the sum of the RENs of all devices connected to a line should not exceed five. Contact the local telecommunication company to determine the maximum REN for your calling area.

- New Local Area and CO Access Codes

Least Cost routing (LCR) must be configured to automatically recognize and take changes in local area codes and CO access codes into account. Otherwise, these codes will not be usable for calls when changes occur.

- Hearing Aid Compatibility

Emergency phones and public phones (installed in common areas such as lobbies, hospital rooms, elevators, and hotel rooms, for example) must have handsets that are compatible with magnetically coupled hearing aids. Hearing-impaired individuals who are not in common areas must be provided with hearing-aid compatible handsets, if needed.

All digital phones from Unify Software and Solutions GmbH & Co. KG manufactured after August 16, 1989, are hearing aid compatible and comply with FCC Rules, Part 68, Section 68.316 and 68.317.

- Programmed Dialer features

When you program emergency numbers or make test calls to emergency numbers with programmed dialer features using products by Unify Software and Solutions GmbH & Co. KG, stay on the line and briefly explain to the dispatcher the reason for the call before hanging up. These activities should be performed during off-peak hours, such early morning or late evening.

- Connecting Off-Premises Station Facilities

Customers who intend to connect off-premises station (OPS) facilities must inform the telecommunications company of the OPS class for which the equipment is registered and the connection desired.

- Direct Inward Dialing Answer Supervision

Customers who operate any of the communication systems from Unify Software and Solutions GmbH & Co. KG described in this documentation without providing proper answer supervision are in violation of Part 68 of the FCC rules.

Every communication system of Unify Software and Solutions GmbH & Co. KG described in this documentation returns proper answer supervision to the public switched telephone network (PSTN) when DID calls are:

- answered by the called station.
- answered by an attendant.
- routed to an announcement administered by the customer.

In addition, every communication system of Unify Software and Solutions GmbH & Co. KG described in this documentation also returns proper answer supervision on all DID calls forwarded to the PSTN. Permissible exceptions are when:

- A call is not answered.
- A busy tone is received.
- A congestion tone (reorder tone) is received.

- Equal Access Requirements

Call aggregators with an increased volume of traffic (such as hotels, hospitals, airports, schools, and so on) must provide end users equal access to the providers of their choice. The current equal access codes (also known as Carrier Access Codes, CACs) are 10xxx and 101xxxx, and 800/888 and 950, where xxx or xxxx represents the provider code.

To select the provider of choice for a call, the user dials a provider-specific access code before dialing the called party number. Equal access is also obtained by dialing the 800/888 or 950 code of the provider of choice.

Every communication system of Unify Software and Solutions GmbH & Co. KG described in this documentation is capable of providing user access to interstate providers through the use of equal access codes.

Modifications by aggregators to alter these capabilities are a violation of the Telephone Operator Consumer Services Improvement Act of 1990 and Part 68 of the FCC Rules.

2.2.5.4 Safety Information for Canada

DANGER: Risk of electric shock through contact with live wires

Only personnel with proper qualifications or qualified electricians should perform work on the low-voltage network

(<1000 VAC) and all work must comply with the national/local requirements for electrical connections.

The following safety precautions must always be observed when installing, starting up and operating the OpenScape Business X and OpenScape Business S communication systems and the OpenScape Business UC Booster Server (Application Server) in Canada:

- Ringer Equivalence Number REN

The Ringer Equivalence Number (REN) defines how many devices can be connected to a telephone line at the same time. The termination of an interface may consist of any combination of devices subject only to the requirement that the sum of the RENs of all the devices does not exceed five.

- Restrictions for connecting devices

The Innovation, Science and Economic Development Canada (ISED) label identifies certified equipment. This certification means that the equipment meets certain requirements with regard to the protection, operation and security of telecommunication networks. The requirements are documented in the Terminal Equipment Technical Requirements. Innovation, Science and Economic Development Canada (ISED) provides no assurances that certified devices will always operate to the satisfaction of the customer.

Before installing the equipment and components described in this documentation, it must be ensured that connections to the facilities of the local telecommunications company are permitted. The communication systems and servers must also be installed using an acceptable method of connection. The customer should be aware that compliance with these conditions may not prevent degradation of performance in some situations.

Repairs to certified equipment should be coordinated by a service technician designated by the manufacturer or supplier. Any repairs or alterations made by the user to any of the equipment or components described in this documentation, or any equipment malfunctions, may give the telecommunications company cause to request the user to disconnect the equipment.

To ensure their own safety, users must verify that the electrical ground connections of the power supply, telephone lines and the metallic water pipe system, if present, are interconnected. This precaution may be particularly important in rural areas.

2.3 Important Notes

The important notes inform you about emergency procedures and the proper disposal, recycling, intended use and operating conditions of the communication systems and servers. In addition, they also include details concerning the standards and guidelines for the installation, the radio interference characteristics of the communication systems, and data protection and data security.

[Safety Information and Warnings](#) on page 62

2.3.1 Emergencies

This section provides information on how to proceed in an emergency.

What To Do In An Emergency

First Aid

Calling for Help

Reporting Accidents

- In the event of an accident, remain calm and controlled.
- Always switch off the power supply before you touch an accident victim.
- If you are not able to immediately switch off the power supply, only touch the victim with non-conductive materials (such as a wooden broom handle), and first of all try to isolate the victim from the power supply.
- Be familiar with basic first aid procedures for electrical shock. A fundamental knowledge of the various resuscitation methods if the victim has stopped breathing or if the victim's heart is no longer beating, as well as first aid for treating burns, is absolutely necessary in such emergencies.
- If the victim is not breathing, immediately perform mouth-to-mouth or mouth-to-nose resuscitation.
- If you have appropriate training, immediately perform heart massage if the victim's heart is not beating.

Immediately call an ambulance or an emergency physician. Provide the following information in the following sequence:

- Where did the accident happen?
- What happened?
- How many people were injured?
- What type of injuries?
- Wait for questions.
- Immediately report all accidents, near accidents and potential sources of danger to your manager.
- Report all electrical shocks, no matter how small.

2.3.2 Proper Use

The communication systems and servers may only be used as described in this documentation and only in conjunction with add-on devices and components recommended and approved by Unify Software and Solutions GmbH & Co. KG.

Introduction and Important Notes

The prerequisites for the proper use of the communication systems and servers include proper transportation, storage, installation, startup, operation and maintenance of the system.

NOTICE: Clean the housing of the communication system and server only with a soft, slightly damp cloth. Do not use any abrasive cleaners or scouring pads.

2.3.3 Correct Disposal and Recycling

Please read the information on the correct disposal and recycling of electrical and electronic equipment and old batteries.

All electrical and electronic products should be disposed of separately from the municipal waste stream via designated collection facilities appointed by the government or the local authorities. The correct disposal and separate collection of your old appliance will help prevent potential negative consequences for the environment and human health. It is a precondition for reuse and recycling of used electrical and electronic equipment. For more detailed information about disposal of your old appliance, please contact your city office, waste disposal service, the shop where you purchased the product or your sales representative. The statements quoted above are only fully valid for equipment which is installed and sold in the countries of the European Union and is covered by the directive 2012/19/EU. Countries outside the European Union may have other regulations regarding the disposal of electrical and electronic equipment.

Old batteries that bear this logo are recyclable and must be included in the recycling process. Old batteries that are not recycled must be disposed of as hazardous waste in compliance with all regulations.

2.3.4 Installation Standards and Guidelines

This section provides information on the specifications you must comply with when connecting the communication systems and servers to the power supply circuit and when using shielded cabling for LAN and WAN connectors.

2.3.4.1 Connecting OpenScape Office X to the Power Supply Circuit

The OpenScape Business X communication systems have been approved for connection to TN-S power supply systems. They can also be connected to a TN-C-S power supply system in which the PEN conductor is divided into a ground wire and a neutral wire. TN-S and TN-C-S systems are defined in the IEC 60364-1 and IEC60364-5-51 standard.

Only qualified electricians should perform any work that may be required on the low-voltage network. These installation activities to connect the communication systems must be performed in compliance with IEC 60364-1 and IEC 60364-4-41 or any corresponding legal norms or national regulations.

2.3.4.2 Connecting OpenScape Business S and OpenScape Business UC Booster Server to the Power Supply Circuit

For information regarding the connection of OpenScape Business S and OpenScape Business UC Booster Server (Application Server) to the power supply circuit, please refer to the manufacturer's documentation for the server PC and the other components.

Only qualified electricians should perform any work that may be required on the low-voltage network. These installation activities to connect OpenScape Business S and the OpenScape Business UC Booster Server must be performed in compliance with IEC 60364-1 and IEC 60364-4-41 or any corresponding legal norms or national regulations (for example in the U.S. and in Canada).

2.3.4.3 Shielded Cabling for LAN and WAN Connections of OpenScape Business X

Compliance with CE requirements on electromagnetic compatibility in the OpenScape Business X communication systems and their LAN and WAN connections is subject to the following conditions:

- The communication systems should only be operated using shielded connection cables. This means that a shielded Category 5 (CAT.5) cable with a length of at least 3 m should be used between the shielded LAN and WAN sockets of the communication systems and the building installation port or the external active component port. The cable shield must be grounded at the building installation end or the external active component end (connection to the building's potential equalization terminal).

- A shielded Category 5 (CAT.5) cable should also be used for shorter connections with external active components (LAN switch or similar). However, the active component must feature a shielded LAN connection with a grounded shield connection (connection to the building's potential equalization terminal).
- The shield properties of the cable components should at least satisfy the requirements of the European standard EN 50173-1^{*)} "Information technology - Generic cabling systems" (and all references specified).^{***)}
- Building installations that are fitted with shielded symmetrical copper cables throughout in accordance with the Class-D requirements^{**)} of EN 50173-1 satisfy the above condition.^{***)}

2.3.4.4 Fire Safety Requirements

Fire safety requirements are defined on a country-specific basis in the building regulations. Please follow the valid regulations for your country.

To ensure the legal fire protection and EMC requirements, operate the OpenScape Business X communication systems only when closed. The system may only be opened temporarily for installation and maintenance purposes.

OpenScape Business system cables comply with the requirements of international norm IEC 60332-1 regarding flammability. The following norms contain similar requirements regarding cables:

IEC 60332-1 Note: IEC 60332-1 is equivalent to test method UL VW-1	EN 60332-1-1 and EN 60332-2-1	DIN EN 60332-1-1 (VDE 0482-332-1-1) and DIN EN 60332-2-1 (VDE 0482-332-2-1)
---	----------------------------------	---

The division responsible for project planning and service must check whether the IEC 60332-1 norm complies sufficiently with the relevant building regulation and any other applicable regulations.

^{*)} The European standard EN 50173-1 is derived from the international standard ISO/IEC 11801.

^{**)} Class-D is reached, for instance, if Category-5 (CAT.5) components (cables, wall outlets, connection cables, etc.) are installed.

^{***)} UTP cables (U.S. standard EIA/TIA 568 A/B) are the most widely used cables on the North American market; this has the following implications for the LAN and WAN connections in communication systems: The systems may only be operated with shielded connection cables. This means that a shielded Category 5 (CAT.5) cable with a length of at least 3 m should be used between the shielded LAN and WAN sockets of the communication systems and the building installation port or the external active component port. The cable shield must be grounded at the building installation end or the external active component end (connection to the building's potential equalization terminal).

2.3.4.5 Lightning Protection Requirements

The protection of communication systems against high-energy surges requires a low-impedance ground connection in accordance with the specifications in the *OpenScape Business Installation Guide*.

NOTICE: Once a communication system has been grounded, check the low-impedance ground connection of the system using the ground conductor of the mains power supply circuit and the low-impedance connection (of the additional permanently-connected protective ground conductor) to the building's potential equalization bus.

NOTICE:

Fire hazard due to surge voltage

Telecom lines which are over 500m in length or which must leave the building must be conducted through an additional external lightning protection.

Lightning protection of this kind is known as additional primary protection. The additional primary protection is guaranteed by the professional installation of ÜSAGs (surge arresters, gas filled) in the main distribution frame, the patch panel or at the entry point of the pipe in the building. A gas-filled surge arrester with 230 V nominal voltage is switched to ground from each wire that is to be protected.

Without this additional primary protection, lightning could irreparably damage the boards. This can cause the entire communication system to fail or result in components overheating (Fire hazard).

2.3.4.6 Markings for OpenScape Business X

The compliance of the equipment according to EU directives is confirmed by the CE mark. This Declaration of Conformity and, where applicable, other existing declarations of conformity as well as further information on regulations that restrict the usage of substances or affect the declaration of substances used in products can be found in the Unify Expert WIKI at <http://wiki.unify.com> under the section "Declarations of Conformity".

2.3.5 Notes on Electromagnetic and Radio Frequency Interference of OpenScape Business X

The OpenScape Business X communication systems are Class B devices in accordance with EN 55032.

2.3.6 Data Protection and Data Security

Please note the details below with respect to protecting data and ensuring privacy.

The communication systems and servers described in this documentation process and use personal data for purposes such as call detail recording, displays, and customer data acquisition.

In Germany, the processing and use of such data is subject to various regulations, including those of the Federal Data Protection Law (Bundesdatenschutzgesetz, BDSG). For other countries, please follow the appropriate national laws.

The aim of data protection is to protect the rights of individuals from being adversely affected by use of their personal data.

In addition, the aim of data protection is to prevent the misuse of data when it is processed and to ensure that one's own interests and the interests of other parties which need to be protected are not affected.

INFO: The customer is responsible for ensuring that the communication systems and servers are installed, operated and maintained in accordance with all applicable labor laws and regulations and all laws and regulations relating to data protection, privacy and safe labor environment.

Employees of Unify Software and Solutions GmbH & Co. KG are bound to safeguard trade secrets and personal data under the terms of the company's work rules.

In order to ensure that the statutory requirements are consistently met during service – whether on-site or remote – you should always observe the following rules. You will not only protect the interests of your and our customers, you will also avoid personal consequences.

A conscientious and responsible approach helps protect data and ensure privacy:

- Ensure that only authorized persons have access to customer data.
- Take full advantage of password assignment options; never give passwords to an unauthorized person orally or in writing.
- Ensure that no unauthorized person is able to process (store, modify, transmit, disable, delete) or use customer data in any way.

- Prevent unauthorized persons from gaining access to storage media such as backup CDs and DVDs or log printouts. This applies to service calls as well as to storage and transport.
- Ensure that storage media which are no longer required are completely destroyed. Ensure that no sensitive documents are left unprotected.
- Work closely with your customer contact; this promotes trust and reduces your workload.

2.3.7 Technical Regulations and Conformity of OpenScape Business X

Details on how the OpenScape Business X communication systems meet conformity requirements can be found [here](#).

2.3.7.1 CE Conformity

The CE certification is based on: 2014/35/EU - Low Voltage Directive (LVD); (Official Journal of the EU L96, 29.03.2014, p. 357-374) 2014/30/EU - Electromagnetic Compatibility Directive (EMC); (Official Journal of the EU L96, 29.03.2014, p. 79-106) 2011/65/EU - Restriction of the use of certain Hazardous Substances Directive (RoHS); (Official Journal of the EU L174, 01.07.2011, p. 88-110)

	Standards reference
Safety	EN 62368-1
Electromagnetic Compatibility EMC	EN55032 (EMC Emission) EN55024 (EMC Immunity Residential)

2.3.7.2 Conformity with US and Canadian Standards

	Standards reference
Safety USA and Canada	CSA/UL 62368-1
EMC Emission Canada	ICES-003 Issue 6 Class B
EMC Emission USA	FCC 47 CFR Part 15 Subpart B Class B

FCC Registration Number and Power Consumption

A label on the rear of the housing of the communication systems identifies the FCC registration number, the ringer equivalence number (REN), and other information. Upon request, this information may be disclosed to the telecommunication company.

2.3.7.3 Conformity with International Standards

	Standards reference
Safety	IEC 60950-1 and IEC 62368-1
EMC Emission	CISPR 32

2.3.8 Operating Conditions

Note the environmental and mechanical conditions for operating the OpenScape Business X and OpenScape Business S communication systems and the OpenScape Business UC Booster Server (Application Server).

2.3.8.1 Operating Conditions for OpenScape Business X

The environmental and mechanical conditions for operating the OpenScape Business X communication systems are specified.

Environmental Operating Conditions

Operating limits:

- Room temperature: + 5 to + 40 °C (41 to 104 °F)
- Absolute humidity: 1 to 25 g H₂O/m³
- Relative humidity: 5 to 80%

Ventilation of the communication systems is by convection only. Forced ventilation is required for OpenScape Business X5W when using more than 32 a/b interfaces.

NOTICE: Damage caused by local temperature increases

Avoid exposing the communication systems to direct sunlight and other sources of heat.

NOTICE: Damage caused by condensation due to humidity

Avoid any condensation of humidity on or in the communication systems before or during operation under all circumstances.

A communication system must be completely dry before you put it into service.

Mechanical Operating Conditions

The communication systems are intended for stationary use.

2.3.8.2 Operating Conditions for OpenScape Business S and OpenScape Business UC Booster Server

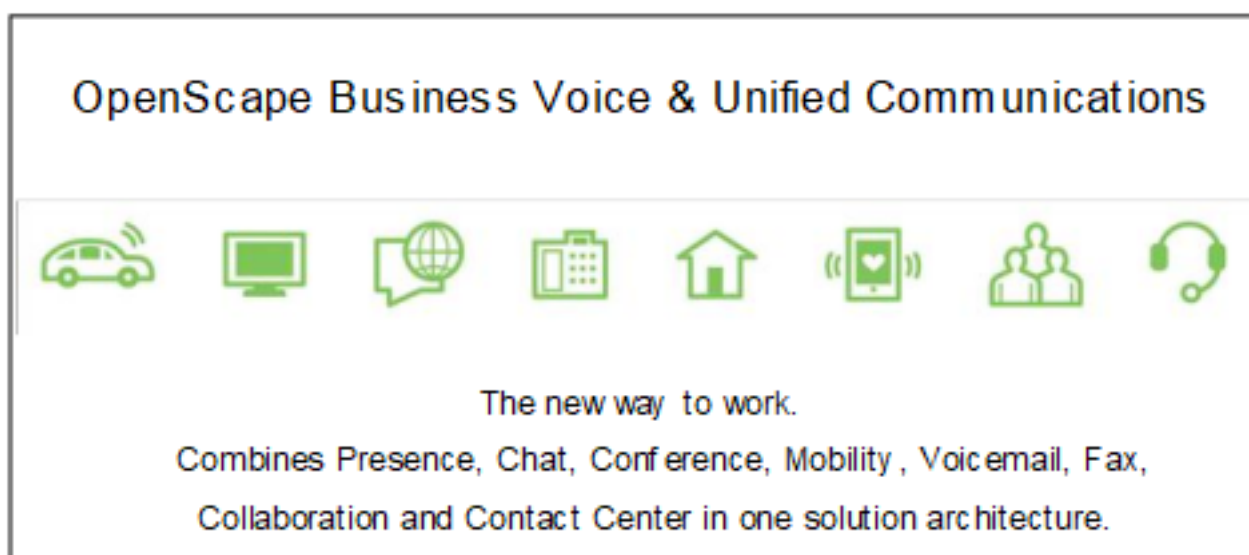

For details on the environmental and mechanical conditions for operating OpenScape Business S and OpenScape Business UC Booster Server (Application Server), please also refer to the manufacturer documentation of the server PCs and the other components.

3 System Overview

OpenScape Business offers small and medium-sized businesses the answer to their individual and diverse communication needs in a unified, flexible and scalable solution. The OpenScape Business solution architecture can be deployed independently of the existing telephony infrastructure, regardless of whether traditional telephony, IP or DECT is involved. From powerful telephony to a comprehensive Unified Communications (UC) solution, OpenScape Business always provides the right solution.

Flexible, scalable and powerful

OpenScape Business combines the best of HiPath 3000 and OpenScape Office in a new solution platform.

3.1 Highlights

OpenScape Business is the all-in-one solution for small and medium-sized enterprises and offers the following highlights.

Highlights

- Integrated voice services, presence management (presence status), drag and drop conferencing, visual voicemail (voicemail box), AutoAttendant, Multimedia Contact Center, IM (Instant Messaging), Mobility, directory access with database connection, fax, integration into business processes, and much more
- UC clients individually customized for the workplace and way of working
- Interface integration of OpenScape Web Collaboration
- The perfect solution for customers with one location or network-wide solution with multiple locations
- OpenScape Business offers a unified business solution architecture.
- Depending on the existing infrastructure, different OpenScape Business models are available for various configuration sizes.

Alternatively, it is possible to run the OpenScape Business software on a standard server (Softswitch) - also in fully virtualized environments, of course.

- The UC solution UC Smart is already provided on the mainboard. The additive UC solution UC Suite supports a larger number of UC users and offers an expanded scope of UC features. A UC Booster Card or a UC Booster Server is required for this.
- All communication interfaces are already available for diverse and heterogeneous requirements: IP, digital, analog and DECT, as well as all common trunk interfaces for voice communication

3.2 Unified Communications

Unified Communications (UC) is a technology that improves communication in enterprises by integrating various communication media in a unified application environment. Unified Communications simplify business processes in enterprises through an integrated presence management (e.g., calls are routed automatically to the mobile phone when the user is out of the office). Several other features such as dial-in conferencing, personal voicemail (voicemail box), personal fax box, Instant Messaging (IM), use of the mobile phone as an extension of the communication system, Contact Center, video and web collaboration, etc., are also combined in this unified solution.

With the flexible unified communications approach of OpenScape Business, a number of different UC solutions are offered, depending on the requirements at the workplace and the existing infrastructure. For the UC solution, you can choose between UC Smart and UC Suite (both cannot be used simultaneously).

The UC Smart solution already integrated in OpenScape Business can be migrated to the advanced UC Suite solution at any time via an upgrade license. Depending on the number of UC subscribers, OpenScape Business must then only be expanded with the internal board "UC Booster Card" or the external Linux server "UC Booster Server". As a pure softswitch, OpenScape Business S is available as a server solution with the optional UC Smart or UC Suite.

3.2.1 UC Features (Overview)

Depending on the selected UC solution (UC Smart or UC Suite) different UC functions are available to you.

The following tables are intended to help you choose the best UC solution for your requirements. Detailed functional constraints can be found in the relevant sections (UC Smart, UC Suite, Attendants) of the Feature Description and Administrator Documentation.

System Overview

UC feature	UC Smart	UC Suite			Notes

Journal	-	x	
AdHoc conference	x	x	
Scheduled, permanent and open conferences (drag & drop conference)	-	x	
Message Center	-	x	All voicemails, faxes, instant messages as well as SMS messages and emails are recorded and managed via the Message Center
Access to voicemail and fax messages of other subscribers	-	x	Must be released by each respective subscriber
Instant messaging (chat)	-	x	
Night service	x	x	

The recommended Attendant client for UC Suite is myAttendant. However, OpenScape Business Attendant can also be used with UC Suite.

Voicemail & Company AutoAttendant

UC feature	UC Smart	UC Suite	Note
Basic functionality of UC Smart Voicemail & Company AutoAttendant	x	-	
Basic functionality of UC Suite Voicemail & Company AutoAttendant	-	x	Requires UC Booster Card/Server or Business S
UC Features			
Graphical operation of voicemail for subscribers (web interface or client interface)	x	x	
Voicemail prompts for presence function	x	x	Different announcements, depending on the set UC presence
Personal rules for greetings per mailbox	-	x	The subscriber defines detailed rules for the selection of his or her personal greetings
Voicemail to Email	x	x	Voicemail is attached to email as a wave file
AutoAttendant functions			
Attendant mailboxes (Basic AutoAttendants)	100	20	
Company AutoAttendant	x	x	Central attendant console and centralized voicemail with alternative greetings for each extension
Announcement prior to answer / Parallel signaling	x	x	Announcement to the caller while the subscriber is being called For UC Suite, this is only possible in conjunction with the Contact Center
Dial-in destinations for 4 day sections / Calendar for AutoAttendant	x	x	Variable automated Attendant for different times of the day Calendar function possibly with UC Smart via the automatic night service

UC feature	UC Smart	UC Suite	Note
Central calendar for mailbox	x	x	Announcements and call handling for company-wide events such as holidays, company holidays, etc.
Custom profiles for mailbox and personal AutoAttendant	-	x	Presence-based call handling that can be individually set per subscriber
Schedules	Day and Night service	Schedule with rules (Call Control Vector, CCV)	
Templates	1 AutoAttendant configured by default	5 customizable templates	
Graphical rule editor (CCV editor)	-	x	
Concatenation of mailboxes / Multi-step AutoAttendant	x	-	The call is forwarded from one concatenated mailbox to the next, and each time the respective announcement is played
Dial by Name	-	x	
Dial by Extension	x	x	
Voicemail features			
Personalized greetings per mailbox	4	10	Save and set various announcements
Forwarding of voice messages	-	x	Forward message to another subscriber/mailboxes
Callback from the voicemail box	x	x	Callback to the caller of the message can be activated
Notification call	-	x	When a message arrives, a call is made to an external destination, e.g., a mobile phone
Representative function	-	x	Forward caller to representative with personal announcement
Caller-based voicemail / CLI routing	-	x	Call number-based handling, e.g., a greeting in the language of the caller
Central group mailbox	x	x	With announcements for departments / groups

System Overview

UC feature	UC Smart	UC Suite	Note
Live Recording	-	x	Recording of conversations with security functions In OpenScope Business S in which live recording from UC is used, G.729A is not considered.
Save messages	-	x	Subscribers can save individual voicemail messages for themselves
Automatic deletion of messages	x	x	After a retention period, messages are deleted to free storage space
Switch voicemail box language on subscriber-specific basis	-	x	Selection of automatic announcements in individual language

3.2.2 User Access to UC Features (UC Clients)

Access to the UC features occurs via UC clients. The presence status (UC Suite) and voicemail (UC Smart and UC Suite) can also be accessed through the telephone user interface (TUI).

UC clients are offered for the major operating systems. Please also note the requirements of the clients in the respective release notes.

Communication Clients (Desktop and Groupware Clients)

Client	Recommended for		Description
	UC Smart	UC Suite	
myPortal @work	x	x	UC Desktop Client for Microsoft Windows and Mac OS X
myPortal for Desktop	-	x	Advanced UC Desktop Client for Microsoft Windows and Apple Mac
myPortal for Outlook	-	x	UC Groupware Client for Microsoft Outlook Integration

Client	Recommended for		Description
	UC Smart	UC Suite	
OpenScope Desk Phone CP 400/600/600E/700/700X/710 HFA (integrated Client to phone software)	x	x	Presence control and phonebook access for UC Suite and UC Smart

Attendants/Attendant Consoles

Client	Recommended for		Description
	UC Smart	UC Suite	
OpenScope Business Attendant	X	-	UC Attendant Console including presence
myAttendant	-	X	Advanced UC Attendant Console for UC Suite

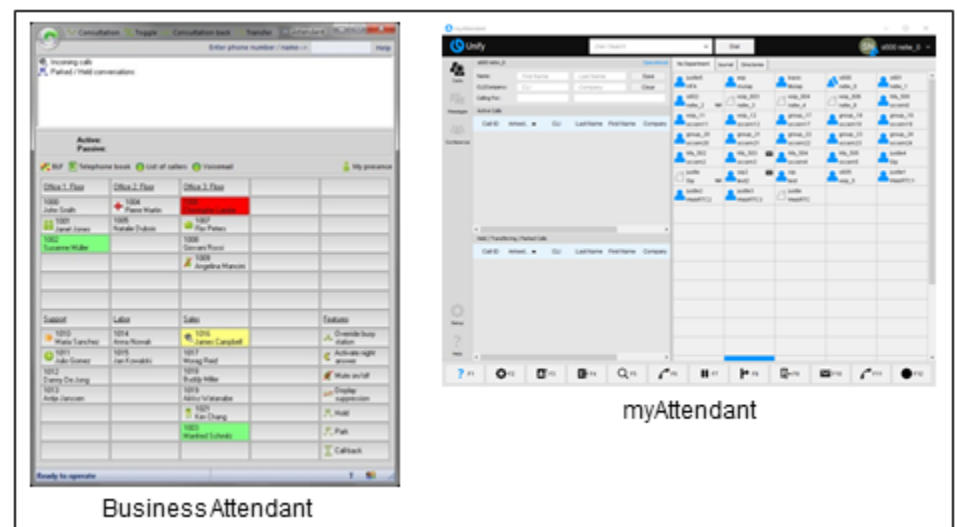

Figure 4: myAttendant

3.2.3 Integration in Business Applications

OpenScope Business can be integrated into existing IT infrastructures and business applications.

Applications

- Application Launcher for active interaction with CRM/ERP applications
- Accounting software for evaluating call charges

Integrated Services

- Directory services for information about callers and searching in internal and external directories
- Presence management and instant messaging (IM) to social media networks
- Web services for interactions with web-based applications on mobile phones and tablet PCs, for example

CTI Middleware

- First and third-party TAPI Service Provider for call control from CTI and CRM/ERP applications

Interfaces and Protocols

- CSTA for monitoring and controlling different applications
- SIP for connecting to SIP trunking based applications
- LDAP for connecting to external directories or from external LDAP clients
- HTTP and HTTPS for accessing UC functions of the integrated web server
- TCP/IP as the basic protocol for all Ethernet connections
- SQL connector for connecting SQL databases (Microsoft SQL Server, PostgreSQL, Sybase SQL Server)
- LDAP connector for external LDAP servers such as Active Directory, for example

3.3 OpenScape Business Models

Different models are available for the use of telephony and UC functionality. You can choose between hardware models and pure software models that operate on standard servers or in a virtual environment with VMware vSphere.

The UC functionality for UC Smart is already integrated in OpenScape Business X. UC Suite additionally requires either the internally pluggable board "UC Booster Card" or the external Linux server "UC Booster Server". The OpenScape Business S softswitch optionally supports either UC Smart or UC Suite.

3.3.1 Expansion Levels Available through Sales

The OpenScape Business models have different expansion levels.

	X1	X3R/X3W	X5R/X5W	X8	S
Connection to Service Provider					

	X1	X3R/X3W	X5R/X5W	X8	S

For a detailed description of the expansion levels and capacity limits, see also [Configuration Limits and Capacities](#) .

OpenScape Business UC Networking

OpenScape Business offers extensive network connectivity options:

- Extensive voice and UC networking between the various OpenScape Business X (UC Booster Card/Server required for UC networking) and OpenScape Business S
- with multiple buildings on the company premises
- with distributed locations
- Central administration, including licenses (HiPath 5000 RSM is no longer required)
- Voice networking with OpenScape Enterprise in preparation

Voice networking supports networks with up to 32 nodes. UC networking supports networks with up to 8 nodes and up to 1000 stations (1500 stations with OpenScape Business S). In addition, project-specific releases are possible.

For a detailed description of the networking scenarios, see [Configuration Limits and Capacities](#) .

3.3.2 UC Hardware Models

The OpenScape Business X communication systems offer a high degree of flexibility in terms of functionality and design. Depending on the OpenScape Business X model, up to 500 stations are supported for IP, digital (ISDN), analog (a/b) and Cordless (DECT), and connections to the public network using ITSP (SIP), ISDN (BRI and PRI), CAS and analog and onboard IP (provisioned on the mainboard).

- OpenScape Business X1W
Communication system which comes in a wall housing and must be wall mounted.
- OpenScape Business X3W
Communication system which comes in a wall housing and must be wall mounted.
- OpenScape Business X3R
Communication system which comes in a 19-inch rack housing and can be installed in a 19-inch rack, as a standalone unit (desktop operation) or wall mounted.
- OpenScape Business X5 W
Communication system which comes in a wall housing and must be wall mounted.
- OpenScape Business X5R

² 1st. value: maximum expansion with UC Booster Server / 2nd. value: maximum expansion with mainboard or UC Booster Card

³ 1st. value: maximum expansion with UC Booster Server / 2nd. value: maximum expansion with UC Booster Card

Communication system which comes in a 19-inch rack housing and can be installed in a 19-inch rack, as a standalone unit (desktop operation) or wall mounted.

- OpenScape Business X8

Modular communication system which can be used as a one-box system (base box) or two-box system (base box + expansion box). The communication system can be installed as a standalone unit or mounted in a 19-inch rack.

Figure 5: Hardware Platforms

3.3.3 UC Booster Hardware

UC Booster Hardware for OpenScape Business X.

- OpenScape Business UC Booster Card

Board for OpenScape Business X if UC Suite is to be used as a UC solution with up to 150 UC users.

- OpenScape Business UC Booster Server

External UC Booster Server (Linux) for OpenScape Business X if UC Suite is to be used as a UC solution with up to 500 UC users.

SLES 12 SP5 64 Bit is used on the UC Booster Server. The UC Booster Server can also be run in a virtual environment with VMware vSphere.

When using the UC Booster Server, the UC Booster Card is not required.

- OpenScape Business Voice Channel Booster Card

Two optional modules for the extension of OpenScape Business X with additional DSP channels (e.g., for simultaneous voice connections with IP/TDM transitions).

Eight DSP channels are provided on the mainboard. The Voice Channel Booster Card OCCB/1 provides a further 48 DSP channels, and the Voice Channel Booster Card OCCB/3 provides up to 128 DSP channels.

3.3.4 UC Software Models (Softswitch)

All-in-one server-based UC software solution that supports up to 1000 IP stations with connections to the public network using ITSP (SIP).

Independent of the platform used, OpenScape Business S can be installed on a Linux server. SLES 12 SP5 64 bit is used as the operating system. OpenScape Business S can also be run in a virtual environment with VMware vSphere. If TDM interfaces are required for connection to TDM telephones or TDM trunks, OpenScape Business X systems can be used as a gateway.

3.3.5 Structure and Environmental Conditions

	X1	X3W	X3R	X5W	X5R	X8
Structure	Wall-mount system	Wall-mount system	Rack	Wall-mount system	Rack	Standard system (rack installation also possible)

3.3.6 Supported Phones

OpenScape Business X enables telephony over IP/HFA (HiPath Feature Access), SIP, TDM, a/b, Cordless/DECT and WLAN. IP/HFA, SIP and wireless phones can be connected to OpenScape Business S.

OpenStage telephones (IP/HFA, SIP and T)	<ul style="list-style-type: none"> OpenStage 5/10/15/20/30/40/60/80
OpenScape Desk Phone (IP/HFA, SIP)	<ul style="list-style-type: none"> OpenScape Desk Phone IP 35G/55G/35G Eco OpenScape Desk Phone CP 100/200/205/400/600/600E/700/700X HFA and SIP OpenScape Desk Phone CP 110/210/710 HFA and SIP

PC clients (HFA, SIP)	<ul style="list-style-type: none"> OpenScape Personal Edition (incl. video for SIP)
SIP phones (UC Suite) / AP adapter	<ul style="list-style-type: none"> SIP phones with RFC 3725 support Mediatrix 4102S (for connecting 2 analog phones or Fax devices)
WLAN Phones	<ul style="list-style-type: none"> OpenStage WL3 professional OpenScape WLAN Phone WL4/WL4 Plus
Analog and ISDN phones	<ul style="list-style-type: none"> Analog (a/b) phones Digital (S₀) ISDN phones

Older devices (such as optiPoint 410/420/500, Gigaset M2/SL3/S4/SL4/S5 and optiPoint WL2 SIP) are supported. Optiset E devices cannot be operated.

Functions and Configuration of SIP Phones

OpenScape Business offers an extensive range of voice communication features for OpenStage HFA telephones. Many functions are also available for standard SIP phones.

System Overview

Further information

An overview of the features supported with OpenStage SIP telephones and further information can be found in the Unify wiki at the following link

http://wiki.unify.com/wiki/Features_and_Configuration_of_SIP_Devices

To control voice calls for SIP telephones using CTI (3PCC), a UC Booster Card or a UC Booster Server is required for OpenScape Business X3/X5/X8.

The control of voice calls for SIP telephones via UC Smart clients is supported for the OpenScape Business X3/X5 rack models with the Booster Card.

With the help of the DLI functions, the OpenScape Desk Phone (SIP) telephones can be centrally administered and supplied with software.

3.4 Further information

Further information can be found on the Internet and extranet. See also the release notes for limitations and recent changes.

3.4.1 Languages Supported

Several different language variants are available for the various software components (clients and WBM) and documentation/online help.

The following languages will be released as part of the country-specific introduction.

	de en	es fr it nl pt	da no sv	fi	ru	cs	pl	hr tr	hu	zh

In addition, the UC Smart TUI is also offered in the languages Belgian (Flemish) and Slovenian.

INFO: A Russian or Chinese Windows operating system is required in order to use the Russian or Chinese user interface.

The following language codes (ISO 639-1) are used for the abbreviations in the table:

- de = German
- en = English
- cs = Czech
- da = Danish
- es = Spanish
- fi = Finnish
- fr = French
- hr = Croatian
- hu = Hungarian
- it = Italian
- nl = Dutch
- no = Norwegian
- pl = Polish
- pt = Portuguese
- ru = Russian
- sv = Swedish
- tr = Turkish
- zh = Chinese

3.4.2 Internet Links

More details and possibly more up-to-date information can be found on the Unify homepage, our expert wiki and the Unify portal for partners.

Internet Links

- Unify homepage:
<http://www.unify.com>
- Expert wiki for telephones, communication systems and UC:
<http://wiki.unify.com>
- Partner Portal (registration required):
<https://www.unify.com/de/partners/partner-portal.aspx>
or
<https://www.unify.com/en/partners/partner-portal.aspx>

4 Administration Concept

The administration of the communication system is performed with the OpenScape Business Assistant.

4.1 OpenScape Business Assistant (WBM)

The OpenScape Business Assistant is web-based and is therefore also called Web-Based Management (WBM).

The scope of administrative tasks offered depends on the administrator profile being used.

An online help is available for each page of the WBM.

4.1.1 Requirements for the WBM

In order to use the WBM, the administration PC must have the appropriate software installed.

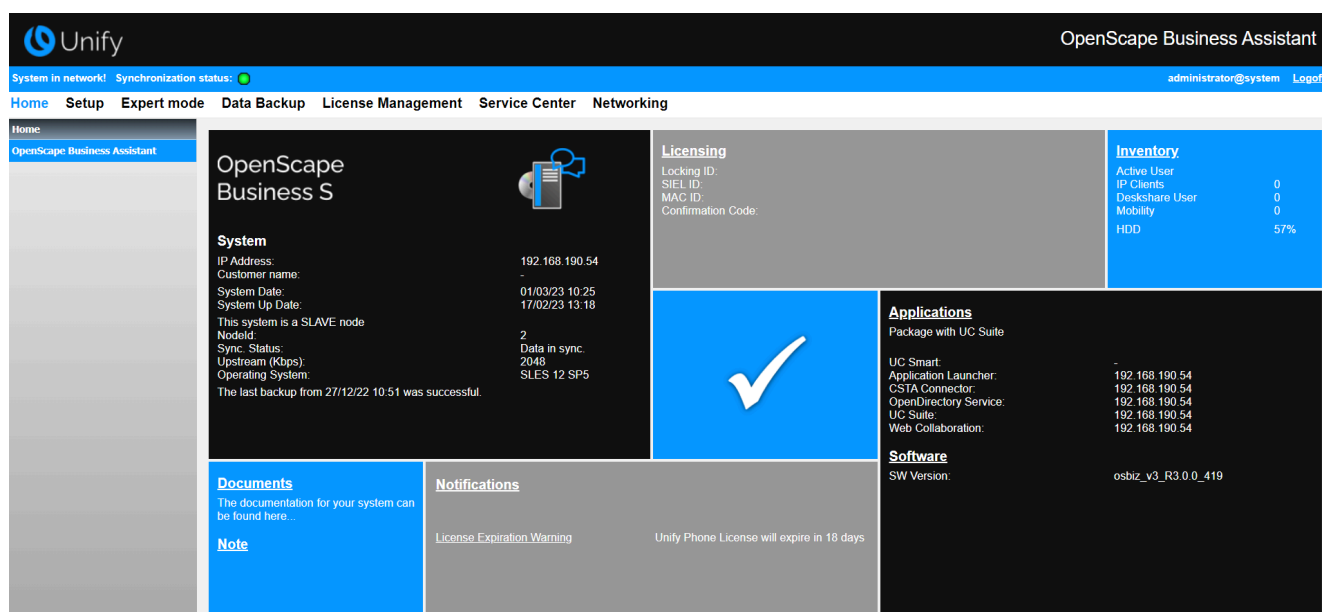

Supported Web browsers:

- Microsoft Internet Explorer 10 or later
- Microsoft Edge
- Mozilla Firefox 18 or later
- Google Chrome

4.1.2 Home Page of the WBM

The home page of WBM displays important system information, which is split into different areas (tiles). In addition, it includes notes and provides information on system errors, events and actions.

The presented system information depends on the administrator profile being used. The underlined headings in the individual areas are clickable and reference the related topic in the WBM.

The following information is displayed:

- Area: **Status** (Middle)
 - White check mark on blue background: the communication system is fully functional - Messages highlighted in red in the other fields indicate actions that should be performed.
 - White exclamation mark on red background: the communication system is not fully functional and requires the intervention of the administrator - Messages highlighted in red in the other fields indicate system errors or events that need to be resolved.
- Area: **System**
 - Brand
 - IP address of the communication system
 - Current date and time
 - Date and time of the last system restart
 - Notes when operating in an internetwork (system is master or slave, display of node ID)
 - Synchronization status
 - Bandwidth Upstream in kbps
 - SDHC Health Status
 - Notes on performing a backup and restore
 - Booster Card status
- Area: **Documents**
 - Link to the documentation
- Area: **Notifications**
 - Various notifications about the system
- Area: **Note**
 - Displays the latest information entered by an administrator. Clicking on the underlined title opens a text window in which all the information is displayed and further information can be entered.

Data of the Note field are not included in the backup set of the system. Consequently, when restoring a back up set these data will not be restored.

- Area: **Licensing**
 - Locking ID for licensing
 - SIEL ID for licensing
 - Note on the licensing status, indicating if the system is in "Permanent" license mode or in "Pay As You Go" mode.
- Area: **Inventory**
 - Type and number of active stations
 - Number of activated ITSPs and a link to the ITSP status dialog in Service Center of active stations
- Area: **Applications** and Software

Applications:

- Used application package (UC Smart or UC Suite) and its components, including the IP addresses of the servers used.
- Indicates whether a UC Booster Card is inserted.

Software:

- Version of the installed communication system software
- Indicates whether a UC Booster Card is inserted. If the Booster Card is additionally accessible via an IP address, the version of the installed UC Booster Card software is displayed.

The UC Booster Card and the communication system should always be on the same software version.

- Expiration date of the 3-year software support.

After the expiration date the message "Software Support licence has been expired, please update the Software Support licence" is displayed.

- Note on the new software version

4.1.3 Introduction to the WBM

WBM is the web-based application for the administration of the system.

Language of the User Interface

You can select one of the following languages at login:

- German
- English
- French
- Italian
- Dutch (The online help is only available in English)
- Portuguese
- Spanish

Ranking of the User Interfaces Described

Any tasks which can be performed in a wizard are described for the corresponding wizard only.

Any additional tasks which can be performed in Expert mode are described for the Expert mode only.

Any other remaining tasks are described for E Manager.

User Interface Elements

- Navigation bar (1)

The navigation is the primary navigation aid and always shows the same links to main task centers, i.e., **Home, Administrators, Setup, Expert Mode, Data Backup, License Management, Service Center** as well as the current user name and the **Logout** link. When you click on one of these task centers, the associated navigation tree opens in the navigation area, and the home page of the task center appears in the workspace.

- Navigation area (2)

The navigation area is the secondary aid and contains the navigation tree with the menu items of the selected task center. The name of the selected task center is displayed at the top of the navigation tree with expandable and collapsible menu groups and menu items below it. Different menu items are displayed in the menu groups, depending on the situation. Clicking on a menu item displays the associated page in the workspace.

- Workspace (3)

The workspace is where administration tasks are performed. It is usually opened in a separate window. The number and selection of messages and actions displayed depends on the menu item selected in the navigation tree. In Expert mode, the menu tree is displayed on the left in the workspace.

Navigating in the Menu Tree

The menu tree is used for navigation in the Expert mode of the WBM. The menu tree contains folders (e.g., **Maintenance**) with further elements (e.g., **Restart / Reload**).

You can navigate in the menu tree by clicking on a folder (which toggles its expanded or collapsed state).

Automatic Logout After Timeout

You are automatically logged off after 30 minutes of inactivity. You must log in again to continue working with the WBM. If you make some changes and then take a break, to be on the safe side, you should reload the page before making any further changes so that no changes are lost due the automatic logout.

4.1.3.1 How to Log into the WBM

Prerequisites

You must have access to your user credentials (user name and password). If not, obtain this from your administrator.

TLS 1.2 is enabled in your web browser settings.

Step by Step

1. Open the login page in your web browser by entering the following address: `https://<IP address of communication system>`. The default IP address is 192.168.1.2.
2. Click on the language code at the top right and select the language in which the user interface of the WBM is to be displayed from the menu. The Login page will be displayed in the selected language.
3. Enter the user name under **Login** in the first field. "@system" is added automatically on exiting the field.
4. Enter your password in the second field under **Login**. Note case usage and the status of the **Num** key. The password is shown with asterisks (*).
5. Click **Login**.

If you enter invalid credentials, a message is displayed after the third failed login attempt, informing you that the account is blocked for 5 minutes. You can try to login again after this time period.

For any further failed login attempt, this time period is doubled reaching 160 minutes in the eighth failed attempt. For every consequent failed attempt the account blocking time is 160 minutes.

4.1.3.2 How to Log out from the WBM

Procedure

- Click **Logout** at the top right of the screen.

4.1.4 WBM User Management

You can configure and manage up to 16 administrators for WBM (web-based management). Every administrator is assigned a profile that specifies the scope of his or her authorization. You can also change the password of a Manager E administrator.

The users of WBM are also referred to as administrators.

The default Administrator is `administrator@system` with the default password `administrator` and has the profile **Advanced**. This password must be changed on logging in for the first time. The password for an administrator must consist of at least 8 characters and a maximum of 128 characters, of which at least one character must be a digit. In addition, for a secure password, at least an uppercase letter, one lowercase letter and one special character should be included in the password.

Profiles

The WBM supports four profiles with different classes of service (authorizations) for administrators with different levels of technical expertise and tasks.

In order to prevent that no malicious user could login via ISDN and change the default password when logging in for the first time, it is compulsory for the user to change the password via Manager E as an installation step.

NOTICE: A password, which consists of 5 characters (*****), will not be accepted by the system for security reasons.

Table 1: Profile Classes of Service

Profile	Class of Service
Basic Basic knowledge of configuring the system	System information on the home page Key Programming wizard Phone Book / Speed Dialing wizard Call Detail Recording wizard Music on Hold / Announcements wizard Station name and release wizard Access to Administrators (only to change their own passwords) Access to License Management > License Information Access to Service Center > Documents Access to Service Center > Software
Enhanced Good knowledge of configuring the system	As for the Basic profile, plus: Access to all wizards (except the Basic Installation, UC Suite and UC Smart wizards) <hr/> NOTICE: Access to all wizards is not supported in OpenScape Business S systems. <hr/> Access to Administrators (only to change their own passwords) Access to Backup And Restore Access to License Management (excluding registration, license activation and settings) Access to Service Center > Inventory Access to Service Center > Restart / Reload (without reload) Access to Service Center > Diagnostics > Status Access to Service Center > Diagnostics > Event Viewer
Advanced Trained users	As for the Enhanced profile, plus: Access to all wizards Access to Administrators (only to change their own passwords) Access to the complete License Management Access to the complete Service Center Access to Networking

Profile	Class of Service
Expert Trained service technicians	As for the Advanced profile, plus: Access to Administrators (complete) Access to the Expert mode

Table 2: Profile Management

Profile	Maintenance
Basic Basic knowledge of configuring the system	Can change own password. Does not see any other configured administrators except himself or herself.
Enhanced Good knowledge of configuring the system	Can change own password. Does not see any other configured administrators except himself or herself.
Advanced Trained users	Can change own password. Does not see any other configured administrators except himself or herself.
Expert Trained service technicians	Can change own password and the user names and passwords of other administrators. Sees all configured administrators. Can add, edit and remove administrators.

NOTICE: As long as no administrator with the **Expert** profile exists, administrators with the **Advanced** profile can add, edit and remove further administrators. As soon as an administrator with the **Expert** profile exists, only administrators with the **Expert** profile can add, edit and remove further administrators.

Administrator Management in the Internetwork

The direct management of administrators is only possible in the WBM of the master node. The **Administrator** menu is not displayed on slave nodes. All administrator configurations are transmitted to the slave nodes. It is, however, possible to call up the WBM of the master node from within the WBM of the slave node via the Node View. The **Administrator** menu is displayed here, and administrators can only be displayed.

NOTICE: The Add/Edit/Delete of the users is not possible via slave mode WBM access (but only via Master mode WBM access).

Manager E Password Administration

An administrator can change (but not create a new user role) the password of the existing users which can access the embedded system through Manager E.

User will be prompted to change passwords only for the existing users and will not be able to change the user's Group and options like Created, Last Used are not viewable. This is a security feature and thus it does not provide the whole Manager E's administration screen.

4.1.4.1 How to Add an Administrator

Prerequisites

You are logged on to the WBM with the **Advanced** profile. (As long as no administrator with the **Expert** profile exists.)

You are logged into the WBM with the **Expert** profile. (If an administrator with the **Expert** profile already exists.)

Step by Step

1. Click on **Administrators** in the navigation bar.
2. Click on **Add...**
3. Enter the following data: **Login Name, First Name, Last Name, Password, Retype Password.**
4. Select the desired user profile from the **User Role** drop-down list.
5. Click on **OK & Next.**

4.1.4.2 How to Edit an Administrator

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. Click on **Administrators** in the navigation bar.
2. Select the check box for the desired administrator in the **Administrators List.**
3. Click on **Edit.**
4. Edit the data (login name, first name and last name, password, and user role) as required.
5. Click **OK & Next.**

4.1.4.3 How to Change your Own Administrator Password

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. Click on **Administrators** in the navigation bar.
2. Enter the new password in the **Password** and **Retype Password** fields.

NOTICE: A password, which consists of 5 stars (*****), will not be accepted by the system for security reasons.

3. Click **OK & Next**.

Related concepts

[Immediate Backup](#) on page 1219

4.1.4.4 How to Delete an Administrator

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. Click on **Administrators** in the navigation bar.
2. Select the check box for the relevant administrator in the relevant **Administrators List**.
3. Click on **Delete...**

4.1.4.5 How to change a Manager E Administrator password

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. Click on **Administrators** in the navigation bar.
2. Click on Manager E **AdministratorsList**.
3. Edit the data (User Accounts, New Password, Confirm Password) as required.
4. Click on **Save**.

NOTICE: The password must consist of at least 5 digits. The use of letters or other characters is not allowed. Also, old passwords cannot be reused.

4.1.5 Wizards

Wizards make it easy to install and configure the system. Only selected subset of the wizards are available to a customer administrator (with the **Basic** profile). A trained service technician

or an administrator with expertise (with the **Advanced** profile), by contrast, can access all the wizards.

The available wizards depend on the system configuration (UC Smart or UC Suite). Wizards can consist of several pages in succession. OK & Next saves changes and switches to the next page in the wizard. There is no undo function for changes committed with OK & Next. If no changes were saved, **Abort** closes the wizard. Clicking the **X** symbol in the upper right corner of the wizard window terminates the wizard and retains the changes previously saved with OK & Next.

4.1.5.1 Wizards – Basic Installation

The wizards under **Basic Installation** support the simple basic installation.

The following wizards are available under **Basic Installation**:

- **Initial installation**
Single usage at initial setup. Country initialization, System IP address and DHCP server.
- **Basic Installation**
Basic setup of system with station data, trunks, network parameters and Internet.
- **Licensing**
Activating licenses online via the License Server.
- **Networking Configuration**
Setup of system as part of a network.
- **Power Management**
Setup and Activation of Power Management

4.1.5.2 Wizards – Network / Internet

The wizards under **Network / Internet** support the simple configuration of networks and the Internet access.

The following wizards are available under **Network / Internet**:

- **Network Configuration**
Set up DHCP, IP Routing and DNS Server.
- **Internet Configuration**
Access parameters of the Internet Provider data, e.g., User Account and Password.
- **VPN Configuration**
Connection of workplaces via the Internet.

4.1.5.3 Wizards – Telephones / Subscribers

The wizards under **Telephones / Subscribers** support the simple configuration of phones and subscribers.

The following wizards are available under **Telephones / Subscribers**:

- **IP devices**
Set up system-specific IP and SIP telephones, FAX call numbers as well as IP/analog adapters.
- **UP0 devices**
Set up UP0 Telephones, FAX call numbers.
- **Portable parts (DECT devices)**
Set up DECT phone, FAX call numbers.
- **ISDN devices**
Unpowered ISDN ports for ISDN cards / modems and S0 stations.
- **Analog Terminals**
Analog DTMF and CLIP-capable ports for Fax and Telephone.
- **Key programming**
Name and function key programming for system-specific IP devices and UP0 devices.

4.1.5.4 Wizards – Central Telephony

The wizards under **Central Telephony** support the simple configuration of central telephony features.

The following wizards are available under **Central Telephony**:

- **CO Trunk ISDN / Analog / ITSP**
Point-to-multipoint connections (MSN) and PABX number for ISDN connections, and assignment of analog and ITSP trunks.
- **Internet Telephony**
Access parameters of the Internet Telephony Service Provider (ITSP), e.g., user account, password, SIP station number.
- **Phone book / Speed Dialing**
Set up central speed-dial destinations for the system's internal phone book.
- **Call Detail Recording**
Set up call detail recording connection parameters for call detail applications.
- **Music on Hold / Announcements**
Record new melodies and announcements for Music on Hold and announcement before answering.
- **Entrance Telephone (Door Opener)**
Set up call allocation and access authorization for the entrance telephone at the analog station connection.
- **SmartVM**

Setup of the UC Smart voicemail box (SmartVM).

- **Blacklist for incoming calls**

Define a list of numbers to block unwanted callers permanently.

- **Active Directory Integration Service**

Set up the Active Directory.

4.1.5.5 Wizards – User Telephony

The wizards under **User Telephony** support the simple configuration of user telephony features.

The following wizards are available under **User Telephony**:

- **Class of Service**

Set up classes of service with external call numbers that can be assigned to subscribers, e.g., emergency numbers, allowed numbers, denied numbers and assignment of class of service for night service.

- **Station Name and Release**

Edit station and group names and reset lock code for individual stations.

- **Group call / Hunt group**

Set up incoming calls for station groups (parallel, linear or cyclical call order).

- **Call Forwarding**

Set up central system-wide station number assignments, and forwarding "after timeout" and "on busy".

- **Call pickup**

Configure stations in a pickup group with the option of answering each other's calls.

- **Team Configuration**

Setting up stations which are called concurrently with the main station for incoming calls and which can use its station number for outgoing calls.

- **Mobile Phone Integration**

Set up a link between a mobile phone and an internal station with the goal of enabling incoming and outgoing availability under one station number (One Number Service).

- **Executive / Secretary**

Set up a link between one or more Executive phones and one or more Secretary phones with the goal of enabling simplified call transfers and ring transfers.

- **UCD**

Set up an automatic intelligent call distribution to a group with selected stations.

- **Attendant Console**

Set up stations as attendant console numbers and station behavior for on busy, incorrect dialing and no answer.

- **Station Profiles**

Assign stations to a profile and import/export profile data.

4.1.5.6 Wizards – Security

The wizards under **Security** support the simple configuration of the firewall.

The following wizards are available under **Security**:

- **Firewall**

Configure port opening to restrict Internet traffic.

4.1.5.7 Wizards - UC Smart (only with UC Smart)

The setup of the UC solution UC Smart is supported by wizards under **UC Suite**.

The following wizards are available under **UC Smart** :

- **UC Smart**

Basic Setup and User Configuration for UC Smart.

4.1.5.8 Wizards - UC Suite (only with UC Suite)

The setup of the UC solution UC Suite is supported by wizards under **UC Suite**.

The following wizards are available under **UC Suite**:

- **User Directory**

Configuration of users.

- **Departments**

Configuration of departments.

- **Groups**

Configuration of voicemail and fax groups.

- **Templates**

Configuration of SMS templates.

- **External Directory**

Manual addition of individual contacts to the external directory.

- **External Providers Config**

Input of access data for the Exchange or LDAP server.

- **Contact Center**

Configuration of the Contact Center.

- **Schedules**

- Configuration of schedules.
- **File Upload**
Uploading of audio files for announcements and music on hold.
- **Conferencing**
Configuration of conference calls.
- **Profiles**
Creation of user profiles.
- **Fax Headlines**
Configuration of fax headers.
- **Skin Settings**
Management of user interfaces.

4.1.5.9 Wizards – Circuit

The wizards under **Circuit** support the usage of Circuit functionality.

The following wizards are available under **Circuit**:

- **Circuit Connectivity**
Basic settings configuration for Circuit including hUTC.
- **Circuit user instance**
Configure Circuit users instance.

4.1.5.10 Wizards – Unified Directory

The wizards under **Unified Directory** support the importing and editing of directory contacts.

The following wizards are available under **Unified Directory**:

- **Import Contacts**
The Wizard will guide you through the import of contact data to the Global Directory from CSV.
- **Edit Contacts**
Manually add or edit Global Directory entries.

4.1.6 Service Center

The **Service Center** of the WBM offers various maintenance functions, starts the software update and makes the documentation and software available.

4.1.6.1 Service Center – Documents

The **Documents** option provides documentation, CSV templates and links to related information. The documentation can be accessed in all the supported languages in PDF format.

Depending on the system configuration, the following contents are available:

Contents	UC Smart	UC Suite
Administrator Documentation (PDF)	-	x
User Documentation (PDF)	-	x
Links (Wiki)	x	x
Templates (CSV Templates) for importing data for <ul style="list-style-type: none">• Stations• System Speed Dialing• External directory	x	x
EULA	x	x

Related concepts

[Accounting Tools](#) on page 1196

4.1.6.2 Service Center – Software

The **Software** option provides the software for the UC clients, USB drivers and tools.

The following contents are available:

Contents	UC Smart	UC Suite
Installation files for the software of the UC clients	x	x
USB drivers	x	x
Tools	x	x
Links for direct access to the installation files	-	x

4.1.6.3 Service Center – Inventory > System

System provides an overview of the basic configuration data of the system.

4.1.6.4 Service Center – Inventory > Call Numbers

Call Numbers provides a list of all assigned call numbers.

4.1.6.5 Service Center – Inventory > Network Overview

Network Overview provides a list with information about the systems currently in the network.

4.1.6.6 Service Center – Software Update

Software Update checks whether a software update is available on the web server and performs the update.

4.1.6.7 Service Center – E-mail Forwarding

E-mail Forwarding enables the sending of e-mails with system messages from the UC Suite to the administrator and e-mails with attached voicemail or fax messages to subscribers.

4.1.6.8 Service Center – Remote Access

Remote Access is used to configure access for the site-independent administration of the system.

4.1.6.9 Service Center – Restart / Reload

Restart / Reload enables a restart of the system, optionally resetting it back to factory settings.

4.1.6.10 Service Center – Diagnostics > Status

Status provides status information on the network, subscribers, call setup, ITSP and VPN.

See also [Inventory Management](#) .

4.1.6.11 Service Center – Diagnostics > Event Viewer

Event Viewer logs system events.

See also [Traces](#) .

4.1.6.12 Service Center – Diagnostics > Trace

Trace provides options for fault logging.

See also [Traces](#) .

4.1.6.13 Service Center – Diagnostics > Service log

Service log logs several system data in the form of HiPath 3000 Event.

It is necessary to be on WBM View mode, to refresh or download the file.

4.1.7 Expert Mode

The Expert mode provides trained service technicians (**Expert** profile) with several menus and functions to configure and maintain the system.

Detailed information can be found in the section on [Expert mode](#).

4.1.8 Online Help

The integrated online help describes key concepts and operating instructions. The online help is context-sensitive and opens the associated Help topic for each opened WBM page.

Navigation

The buttons in the online help provide the following functions:

- **Contents**
provides you with an overview of the structure
- **Index**
provides direct access to a topic using keywords
- **Search**
allows you to do a full-text search and selectively find all relevant topics

4.1.8.1 How to Invoke the Context-Sensitive Online Help

Prerequisites

You are logged in at the WBM.

Procedure

- Click in the open WBM window on either the question mark icon at the top right or the Help button at the bottom left.

4.2 Manager E

Manager E is a service tool with integrated help that runs under Windows and can be used for tasks which cannot be performed via the WBM.

Manager E can be used for OpenScape Business X1, OpenScape Business X3, OpenScape Business X5 and OpenScape Business X8. OpenScape Business S cannot be administered using Manager E.

It is advisable to make configuration changes via Manager E only when you cannot perform them via WBM, for example, attenuation, ring pulse, tone frequency etc. Changes done via Manager E must be sent via delta mode.

Manager E is intended for trained service personnel and includes the following function blocks:

- Generation (including off-line generation)
- Copying and backing up customer data
- Service orders, such as restarting boards
- Resetting activated features
- Creation and printing of:
 - Key labels for optiPoint 500
 - Customer data printouts
 - Main distribution frame layout
- Separate user and password administration for after sales service.
- Database conversion routine for customer database (CDB).

System access via Manager requires a user name and a password. The Online mode can be used to perform changes quickly. The functionality of the Online mode corresponds to the Assistant T user interface.

The following features can no longer be administered using Manager E:

- Licensing
- Network
 - SNMP Partner
 - PSTN Peer
 - Routing
 - Mapping
 - Gatekeeper
 - Ext. H.323
 - IP Ports
- Maintenance
 - Error History
 - Event Log
 - Trace settings
 - Error Reaction Table
 - V.24 Status
 - DMA
- Traces

Working with the Customer Database (CDB)

The basic steps are as follows:

- Load the CDB from the system into Manager E
- Make any necessary changes in E Manager
- Use Manager E to store the CDB back on the system

4.2.1 How to Load the CDB into Manager E

Perform the following steps, and then proceed to perform configuration tasks in E Manager.

Step by Step

1. Start Manager E on the admin PC.
2. Enter the **User name** for Manager E.
3. Enter the **Password** for Manager E.
4. Click on **File > Transfer**.
5. Click on the **Communications** tab.
6. Select the appropriate option in the **Access** area, depending on the type of connection from the admin PC to the communication system.
7. Activate the **Read/write database** option.
8. Click on **System -> PC**.
9. Click on **OK**. The CDB is transferred from the system to Manager E.
10. Click **OK** once the transfer has been successfully completed.
11. Click on **Close**.

4.2.2 How to Load the CDB Back into the System

The configuration saved in Manager E can be loaded back into the system by performing the following steps:

Step by Step

1. Click on **File > Transfer**.
2. Click on the **Communications** tab.
3. Select the appropriate option in the **Access** area, depending on the type of connection from the admin PC to the communication system.
4. Activate the **Read/write database** option.
5. Click on **PC -> system**.
6. Click on **OK**. The CDB is transferred from Manager E to the system.
7. Click **OK** once the transfer has been successfully completed.
8. Click on **Close**.

5 Initial Setup for OpenScape Business X

This chapter describes the initial setup of OpenScape Business X1/X3/X5/X8. The communication system and its components are integrated into an existing infrastructure consisting of a customer LAN and a TDM telephony network. Internet access and the trunk connection are set up and the connected stations are configured.

The initial setup of OpenScape Business X1/X3/X5/X8 (i.e., the communication system) is carried out using the OpenScape Business Assistant administration program (web-based management, also called WBM).

The standard initial setup of commonly used components is described here. The specific installation steps depend on the communication system and the components (e.g., the UC Booster Card) involved. During the initial setup, you may need to choose between multiple options in some places or even skip some configurations entirely. It is also possible that the installation steps described here do not appear in your communication system.

The detailed configurations of features not covered by the standard initial setup are described in subsequent chapters.

The initial setup requires the creation of an IP address scheme and a dial plan.

The most important installation steps are as follows:

- IP addresses and DHCP settings
- Country and Time Settings
- System Phone Numbers and Networking
- ISDN Configuration
- Internet access
- Internet telephony
- Station configuration
- Licensing
- System hardening
- Data backup

5.1 Prerequisites for the Initial installation

Meeting the prerequisites for the initial installation ensures the proper operation of the communication system.

General

Depending on the existing hardware (boards, phones, ...) and infrastructure, the following general conditions apply:

- The infrastructure (LAN, TDM telephony network) is available and usable.
- The hardware is installed and connected properly.
- One LAN port each is required to integrate the mainboard and the UC Booster Card in the customer LAN.

Initial Setup for OpenScape Business X

Components

- The communication system has not yet been connected to the LAN.
- If the UC Booster Card is used, it should be inserted prior to the initial installation.
- Internet access is available through an Internet Service Provider.
- An ISDN S₀ or ISDN Primary Rate Interface is required for using ISDN outside lines.
- A CAS trunk connection is required for using a CAS outside line.
- An analog trunk connection is required for using an analog outside line.
- An IP address scheme exists and is known (see [IP Address Scheme](#)).
- A dial plan (also called a numbering plan) is present and known (see [Dial Plan](#)).

Admin PC

The following prerequisites must be fulfilled for the Administration PC (Admin PC) that is used for initially setting up the system and for the subsequent administration of the communication system:

- Network interface:
The admin PC requires an available LAN port.
- Operating system:
Configuring the communication system with the Manager E is only possible on a Windows operating system (Windows XP and later).
WBM configuration, however, is browser-based and therefore platform-independent.
- Web browser:
The following web browsers are supported:
 - Microsoft Internet Explorer Version 10 and later.
 - Microsoft Edge
 - Mozilla Firefox Version 17 and later.
 - Google Chrome
If an older version of the Web browser is installed, you will need to install an up-to-date version before you can start setting up the system.
- Java:
Oracle Java 8 or higher or alternatively OpenJDK 8 must be installed. If an older version is installed, you will need to update it to the latest version before you can start setting up the system.

5.2 Components

The various components of the installation example are described and outlined below.

The installation example includes the following components:

- OpenScape Business X

The communication system is integrated in the existing customer LAN via the LAN interface.

- Admin PC

The admin PC is also connected to the communication system via a LAN interface.

- IP stations (IP clients)

The IP stations (IP system phones, client PCs, WLAN Access Points, etc.) are integrated in the LAN via one or more switches.

- UP0 stations

UP0 stations (e.g., OpenStage 60 T TDM system telephones) are connected directly to the communication system.

- Analog stations

Analog stations (e.g., analog fax devices) are connected directly to the communication system.

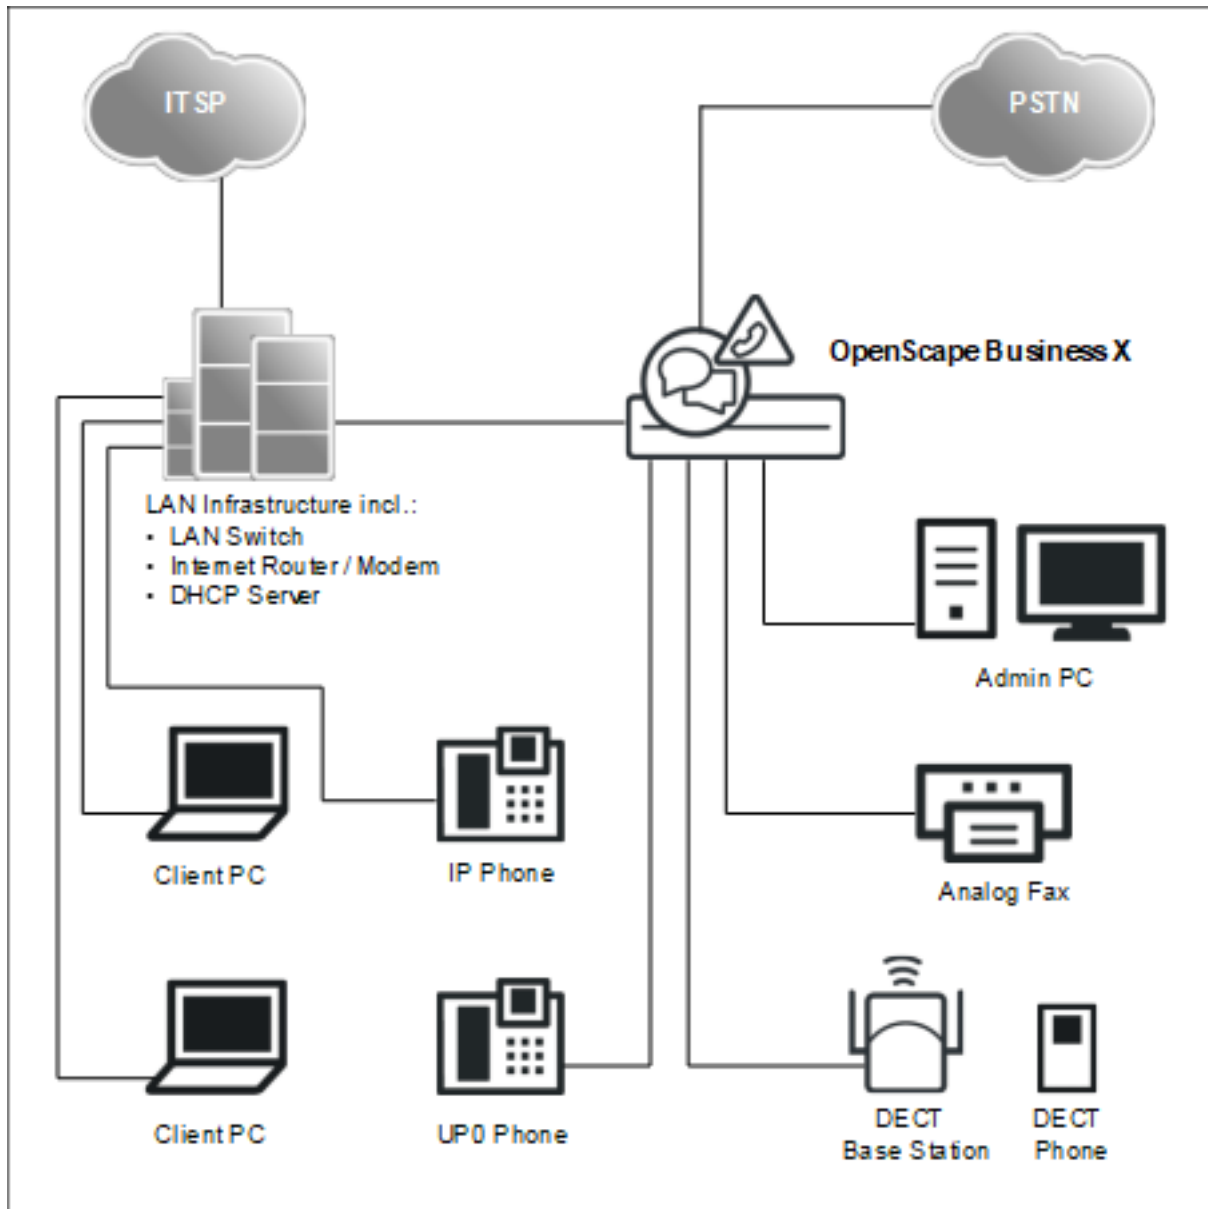

- DECT stations

DECT stations are logged on to the communication system via a base station.

The IP clients receive their IP addresses dynamically from an internal or external DHCP server (e.g., an Internet router).

Initial Setup for OpenScape Business X

Dial Plan

5.3 Dial Plan

A dial plan is a list of all phone numbers available in the communication system. It includes, among other things, the internal call numbers, DID numbers and group call numbers.

Default Dial Plan

The internal call numbers are preassigned default values. These values can be adapted to suit individual requirements as needed (e.g., to create individual dial plans).

Extract from the default dial plan:

Type of call numbers	X1	X3/X5/X8
Internal station numbers	11-30	100-742
User direct inward dialing numbers	11-30	100-742
Trunk station number	700-703	from 7801 onward
Seizure codes (external codes):	0 = World / 9	0 = World / 9
Trk. Grp 1 (trunk: ISDN, analog)	= USA	= USA
Rte. 8 (UC Suite)	-	851
Trk. Grp 12-15 (trunk: ITSP)	not preset	855-858
Rte. 16 (Networking)	not preset	859
Call number for remote access	not preset	not preset
Call number for voicemail	351	351
UC Smart	-	not preset
UC Suite		

Individual Dial Plan

An individual dial plan can be imported via an XML file during basic configuration.

The XML file contains several tabs. Besides the names and phone numbers of subscribers, the "Customer" tab also includes additional subscriber data such as the subscriber types and e-mail addresses of the subscribers.

A sample XML file with the appropriate explanations can be found in the WBM under **Service Center > Documents > CSV Templates**. You can also use the XML file stored there as a template for your data. It can be edited with Microsoft Excel, for example.

5.4 IP Address Scheme

An IP address scheme is a definition of how the IP addresses are used in the customer LAN. It includes the IP addresses of PCs, servers, Internet routers, IP phones, the communication system, etc.

To provide a better overview of the assignment of IP addresses, an IP address scheme should be created.

Example of an IP address scheme with the IP address range

192.168.1." -x:

IP address range	Clients
192.168.1.1 to 192.168.1.19	Clients with a fixed IP address:
192.168.1.1	Internet router (gateway)
192.168.1.2	Communication system

IP address range	Clients
192.168.1.3	Application Board (optional)
192.168.1.10	E-mail server
192.168.1.50 to 192.168.1.254	Client PCs & IP phones, also the IP address range of the DHCP server; IP addresses are assigned automatically to the clients

The following IP address ranges are internally reserved and must not be used:

Connected IP address ranges	Description
10.0.0.1; 10.0.0.2	Reserved for the license server
10.186.237.65; 10.186.237.66	Reserved for remote ISDN (obsolete)
192.168.3.2	Internal IP address of the communication system
192.168.2.1	IP address of the LAN3 port (Admin port)

This list can also be found in the WBM under **Service Center > Diagnostics > Status > Overview of IP Addresses**.

Expanding the netmask when using the default network segment

Both the internal IP address of the communication system and the IP address of the LAN3 port (Admin port) must not be in the same network segment as the IP address of the communication system.

Default network segment configuration:

- 192.168.1.2: IP address of the communication system
- 255.255.255.0: Netmask
- 192.168.3.2: Internal IP address of the communication system
- 192.168.2.1: IP address of the LAN3 port (Admin port)

If the netmask when using the default network segment of 255.255.255.0 was expanded to 255.255.0.0, for example, then the above IP addresses need to be changed:

Example of a modified configuration:

- 192.168.1.2: IP address of the communication system
- 255.255.0.0: Netmask
- 192.**169**.3.2: Internal IP address of the communication system

The change is made via **Expert mode > Telephony > Payload > HW Modules > Edit DSP Settings**

- 192.**170**.2.1: IP address of the LAN3 port (Admin port)

The change is made via **Expert mode > Telephony > Network Interfaces > Mainboard > LAN 3 (Admin)**

5.5 Initial Startup

Initial startup includes starting up the communication system, connecting and configuring the admin PC and starting the OpenScape Business Assistant (WBM) administration program for the first time.

The initial startup of the communication system must be performed prior to integrating the communication system into the internal LAN. Problems can occur if the pre-configured IP address of the communication system already exists in the internal LAN and/or if a DHCP server is already in use. In such cases, the IP address of the communication system must first be reconfigured and/or the DHCP server of the communication system must be deactivated. Only then can the communication system be integrated into the internal LAN.

NOTICE: Prior to initial startup, please follow the instructions on data protection and data security.

DANGER: OpenScape Business X8 may only be powered up if all system boxes are sealed at the rear with the connection and filler panels provided.

DANGER: OpenScape Business X3/X5 must not be powered on unless the housing front is closed. Always use dummy panels (C39165-A7027-B115) to cover slots that are not equipped with boards.

DANGER: The OpenScape Business X1W/X3W/X5W must only be switched on when the housing is closed.

Connecting the admin PC

To configure the communication system, the admin PC is directly connected to the "LAN" interface of the communication system. The communication system is then configured to obtain its IP address from the internal DHCP server of the communication system. After successful installation, the admin PC can be integrated into the internal LAN without any further configuration changes.

5.5.1 How to Restart the Communication System

Prerequisites

The hardware was correctly installed (see *OpenScape Business Installation Guide*).

The memory card (with the system software) was inserted.

The communication system has not been integrated into the customer LAN yet.

Step by Step

Connect the communication system to the power supply.

WARNING:

Risk of electric shock through contact with live wires

Make sure that the communication system (and for OpenScape Business X8, each system box) is grounded by a separate ground wire (see *OpenScape Business Installation Guide*).

The communication system is now started up. During this process, the system LEDs light up in different colors and sequences (see the *OpenScape Business Installation Guide* for details). During startup, the communication system must not be disconnected from the power supply.

After completion of the startup, the "Run" LED on the mainboard flashes green at 1Hz (0.5 sec on / 0.5 sec off).

5.5.2 How to Connect the Admin PC to the Communication System

Prerequisites

The communication system is ready for use.

Step by Step

1. Start the admin PC.
2. Check whether a dynamic IP address can be assigned to the PC. If not, you will have to reconfigure the admin PC. To do this you must have Administrator rights.

NOTICE: The IP settings described here apply to Windows 7. For more detailed information on the configuration for other Windows operating systems, please refer to the appropriate operating system instructions.

- a) Select **Start > Control Panel**, double-click on **Network and Internet** and then click **Network and Sharing Center**.
- b) Click on **LAN connection** for the appropriate active network and then click **Properties**.
- c) On the **Networking** tab, use the left mouse button to select the **Internet Protocol Version 4(TCP/IPv4)** entry and then click on **Properties**.
- d) Click on the **General** and ensure that the radio button **Obtain an IP address automatically** is enabled. If it is not, then activate it.
- e) Close all open windows with **OK**.

3. Connect the just configured LAN port of the admin PC to the LAN port "LAN" of the communication system using a LAN cable. The admin PC is assigned a dynamic IP address via this interface.

NOTICE: You can also connect the admin PC to the LAN port "Admin" of the communication system, but you will then need to assign a fixed IP address in the range 192.168.2.xxx (e.g., 192.168.2.40) and the network mask 255.255.255.0 to the admin PC. The communication system has the IP address 192.168.2.1 via the LAN port "Admin" - important for WBM access!

5.5.3 How to Start the WBM

Prerequisites

The communication system is ready for use. The "Run" LED on the mainboard flashes green at 1Hz (0.5 sec on / 0.5 sec off).

The admin PC and the communication system can communicate with one another over the LAN.

Step by Step

1. Start the web browser on the admin PC and open the login page of the OpenScape Business Assistant (WBM) at the following address:

`https://192.168.1.2`

NOTICE: If the WBM cannot be started, check the LAN connection and repeat the call. If it still cannot be started, check whether the IP address has been blocked by your PC's internal firewall. More detailed information can be found in the documentation of your firewall

2. If the browser reports a problem with a security certificate, install the certificate (using the example of Internet Explorer V10).
 - a) Close the web browser.
 - b) Open the web browser with administrator rights by clicking the right mouse button on the web browser icon and selecting the menu item **Run as administrator** from the context menu.
 - c) Allow the User Account Control.
 - d) Open the login page of the OpenScape Business Assistant (WBM) at the following address:

`https://192.168.1.2`

- e) Click on **Continue to this website**.
- f) Click on the message **Certificate Error** in the navigation bar of the web browser.
- g) Click on **View Certificates**.
- h) Click on **Install Certificate** (only visible with administrator rights).

- i) Select the option **Local Computer** and confirm with **Next**.
- j) Select the option **Place all certificates in the following store**, click **Browse** and specify **Trusted Root Certification Authorities**.
- k) Confirm with **OK** and then with **Next** and **Finish**.
- l) Confirm the certificate import with **OK** and close the certificate window **OK**.
- m) Close the web browser.
- n) Start the web browser again (without administrator rights) and open the login page of the OpenScape Business Assistant (WBM) at the following address:

`https://192.168.1.2`

- 3. Click on the language code at the top right and select the language in which the user interface of the WBM is to be displayed from the menu. The Login page will be displayed in the selected language.
- 4. In the field under **Login**, enter the default user name `administrator@system` for access as an administrator.

NOTICE: If you go to the **Password** field after entering `administrator`, `@system` will be added automatically.

- 5. In the second field under **Login**, enter the default password `administrator` for access as an administrator.
- 6. Click **Login**.
- 7. The following steps are only required once when first logging on to the WBM:
 - a) Reenter the default password **administrator** in the `Password` field.
 - b) Enter a new password in the **New Password** and **Confirm New Password** fields to protect the system against misuse. Note case usage and the status of the `Num` und `CapsLock` keys. The password is displayed as a string of asterisks (*).

NOTICE: The password must be at least 8 characters long and include a digit. Make sure that you remember your new password.

- c) Click **Login**.
- d) Select the current date and enter the correct time.
- e) Click **OK & Next**. You are automatically logged out of the WBM.
- f) In the field under **Login**, enter the default user name `administrator@system` for access as an administrator.

NOTICE: If you go to the **Password** field after entering `administrator`, `@system` will be added automatically.

- g) In the second field under **Login**, enter your new password for access as an administrator.
- h) Click **Login**. The home page of the WBM appears.

Next steps

Start the initial installation.

5.6 Integration into the Customer LAN

The WBM wizard **Initial Installation** is used for integration into the customer LAN. This wizard guides you through the basic settings for integrating the communication system into the existing LAN.

5.6.1 How to Start the Initial Installation Wizard

Prerequisites

The WBM has been started.

Step by Step

1. In the navigation bar, click on **Setup**.
2. Click on **Edit** to start the **Initial Installation** wizard.

NOTICE: If the size of the browser window cannot display the workspace in its entirety at low screen resolutions, a horizontal or vertical scroll bar appears at the sides and can be used to scroll to the required section.

Next steps

Perform initial installation as described in the following step-by-step instructions. Fields that are not described here are preset for the default scenario and should only be changed if they are not appropriate for your network data. For detailed information, refer to the descriptions provided in the Administrator documentation for the individual wizards.

5.6.2 System Settings

The **System Settings** window is used to configure the system settings of the communication system.

Proceed as follows:

- 1) Set the display logo and the product name

Specify a display text to be displayed on the display of the system phones. Additionally, you can also select the product name.

- 2) Edit IP addresses (if required)

By default, the communication system is assigned an IP address and a subnet mask. You may need to adjust the IP address and/or subnet mask to your own IP address range.

In addition, you can specify the IP address of your default router, e.g., the IP address of the Internet router.

Initial Setup for OpenScape Business X

The Application Board (UC Booster Card) also requires an IP address. You can assign an IP address from your IP address range regardless of whether or not the board is installed.

If the netmask is to be expanded, e.g., from 255.255.**255**.0 to 255.255.**0**.0, both the internal IP address of the communication system and the IP address of the LAN3 port (Admin port) must be changed because they are not allowed to be in the same network segment as the IP address of the communication system (see also [IP Address Scheme](#)).

5.6.2.1 How to Set the Display Logo and the Product Name

Prerequisites

You are in the **System Settings** window.

Setup - Wizards - Basic Installation - Initial Installation

System Settings

Display Logo:

Brand:

OpenScape Business

OpenScape Business - IP address:

OpenScape Business - Netmask:

OpenScape Business - Default Routing via:

OpenScape Business - IP Address of Default Router:

Application Board

Application Board - IP address:

Application Board - Netmask:

Application Board - IP Address of Default Router:

Step by Step

1. In the **Display Logo** field, enter a text of your choice (e.g., OpenScape Biz). The text can contain up to 16 characters. Avoid the use of diacritical characters such as umlauts and special characters.
2. Select the desired time product name in the **Brand** drop-down list.

Next steps

Edit IP addresses (if required) or configure DHCP.

5.6.2.2 How to Specify the IP Addresses (Optional)

Prerequisites

You know the IP address range of your internal network.

You are in the **System Settings** window.

Setup - Wizards - Basic Installation - Initial Installation	
System Settings	
	Display Logo: <input type="text" value="OSBiz"/>
	Brand: <input type="text" value="OpenScape Business"/>
OpenScape Business	OpenScape Business - IP address: <input type="text" value="192.168.186.13"/> OpenScape Business - Netmask: <input type="text" value="255.255.255.0"/> OpenScape Business - Default Routing via: <input type="text" value="LAN"/> OpenScape Business - IP Address of Default Router: <input type="text" value="192.168.186.22"/>
Application Board	Application Board - IP address: <input type="text" value="192.168.1.3"/> Application Board - Netmask: <input type="text" value="255.255.255.0"/> Application Board - IP Address of Default Router: <input type="text" value="192.168.186.22"/>

Step by Step

1. Specify the IP address of the communication system:

- In the field **OpenScape Business - IP address**, enter an IP address that lies within the IP address range of your internal network (e.g., internal network: 192.168.1.x, OpenScape Business: 192.168.1.2).

NOTICE: The IP address for OpenScape Business must not be assigned to any other existing network client, since this would result in an IP address conflict.

- Enter the subnet mask of your internal network (e.g., 255.255.255.0) in the **OpenScape Business - Subnet Mask** field.

2. Specify the IP address of the default router:

- In the **OpenScape Business - Default Routing via** field, select the entry **LAN**.
- Enter the IP address of your default router in the **OpenScape Business - IP Address of Default Router** field (e.g., internal network: 192.168.1.x, Internet router as default router: 192.168.1.1).

3. Specify the IP address of the UC Booster Card (required if installed):

4. Click on **OK & Next**.

Next steps

Configure DHCP.

5.6.2.3 How to Specify the Device Name

Prerequisites

You are in the **System Settings** window.

System is in DTAG mode.

Step by Step

1. Check the **Automatic RSP.servicelink registration** checkbox:

Device Name field is editable.

2. Specify the **Device Name**.

By selecting the Automatic RSP.servicelink registration, system will try automatically every 10 minutes to register and connect to RSP servers using the provided Device Name.

3. Click on **OK & Next**.

Next steps

Configure DHCP.

5.6.3 DHCP Settings

In the window **DHCP global settings** enable and configure or disable the internal DHCP server of the communication system.

A DHCP server automatically assigns a unique IP address to each IP station (IP system phones, PCs, etc.) and provides the IP stations with network-specific data such as the IP address of the default gateway (Internet router), for example.

The DHCP server can be an external DHCP server (e.g., the DHCP server of the Internet router) or the internal DHCP Server of the Linux server integrated into the communication system.

Either the integrated DLI of the communication system or an external DLS server can be used for automatically updating the software of the IP system phones ([Deployment Service \(DLS and DLI\)](#)). The IP address of the integrated DLI or the external DLS server must be known to the DHCP server.

You have the following options:

- Enable and configure the internal DHCP server

If the internal DHCP server of the communication system is used, an external DHCP server (e.g., the DHCP server of the Internet router) must be deactivated. The settings of the internal DHCP server may have to be adapted to the customer LAN. If the internal DHCP server and the internal DLI are used, the system phones are updated automatically. If an external DLS server is used, its IP address must be entered in the internal DHCP server using Expert mode ([Deployment Service \(DLS and DLI\)](#)).

- Disable the internal DHCP server

If an external DHCP server is used, the internal DHCP server of the communication system must be disabled. For IP system phones to be automatically supplied with the latest phone software, network-specific data (such as the IP address of the internal DLI or the external DLS server) must be specified on the external DHCP server.

NOTICE: Not all external DHCP servers support the entry of network-specific data! In this case, the data must be entered manually on all IP system phones.

5.6.3.1 How to Disable the Internal DHCP Server

Prerequisites

An external DHCP server (e.g., the DHCP server of the Internet router) is enabled in the internal network.

You are in the **DHCP Global Settings** window.

Step by Step

1. Clear the **Enable DHCP Server** check box.
2. Click on **OK & Next**.

Next steps

Configure country and time settings.

5.6.3.2 How to Enable and Configure the Internal DHCP Server

Prerequisites

The external DHCP server (e.g., the DHCP server of the Internet router) has been disabled in the internal network.

You are in the **DHCP Global Settings** window.

Setup - Wizards - Network / Internet - Network Configuration

DHCP Global Settings

In Expert Mode, DHCP was set to Relay Agent. If you now switch the DHCP server on, the IP addresses HiPath OpenOffice will be distributed. Network problems may occur as a result.

Enable DHCP Server: ☒

Netmask:

Broadcast Address: (optional)

Preferred Gateway:

Domain Name:

Preferred Server:

Lease time in hours (0 infinite):

Enable Dynamic DNS Update: ☐

Step by Step

1. Leave the **Enable DHCP Server** check box enabled.
2. Go to the **Netmask** field and adjust the subnet mask to your IP address range (for example, 255.255.255.0).
3. In the field **Preferred Gateway**, enter the IP address of the Internet router (e.g., 192.168.1.1).
4. In the field **Preferred Server**, enter the IP address of the DNS server (e.g., the IP address of the Internet router, 192.168.1.1).

5. Click on **OK & Next**. The **DHCP Address Pool** window appears.

6. Specify the values for **Subnet address**, **Netmask** and **Address range 1** in order to define the IP address range to be managed by the internal DHCP server.

If the internal network uses static IP addresses (e.g., for a printer server), the IP address range (DHCP address pool) must be selected so that the fixed IP addresses are not included within this range.

Example:

Internet router: 192.168.1.1

OpenScape Business: 192.168.1.2

UC Booster Card: 192.168.1.3

Subnet address: 192.168.1.0

Subnet mask: 255.255.255.0

Printer Server: 192.168.1.10

DHCP address pool: 192.168.1.50 to 192.168.1.254

7. Click on **OK & Next**.

Next steps

Configure country and time settings.

5.6.4 Country and Time Settings

In the **Basic Configuration** window, select your country and the language for the event logs and set the date and time. If you are using the integrated Cordless solution, enter the system-wide DECT system ID here.

Proceed as follows:

1) Select the country code and the language to be used for event logs

For country initialization to work correctly, you must select the country in which the communication system is operated. In addition, you can select the language in which the event logs (system event logs, errors logs, etc.) are to be stored.

2) Enter the DECT system identification (only for integrated Cordless solution)

If you are using the integrated Cordless solution, enter the system-wide DECT system ID here.

3) Setting Date and Time

- How to Set the Date and Time Manually

The communication system and the stations (IP phones, TDM phones, client PCs) should have a uniform time base (date and time). If no SNTP server has been specified for time synchronization, the date and time can also be entered manually.

NOTICE: The date and time are also updated when a connection is set up via an ISDN trunk.

- How to Obtain the Date and Time from an SNTP Server

The communication system and IP stations (IP phones, client PCs) should have a uniform time base (date and time). This time base can be provided by an SNTP server. The SNTP server can be located on the internal network or the Internet.

The IP phones receive the date and time automatically from the communication system. The client PCs on which the UC clients run must be set so that they are synchronized with the communication system (see the operating system instructions for the client PCs).

5.6.4.1 How to Select the Country Code and the Language for Event Logs

Prerequisites

You are in the **Basic Configuration** window.

Step by Step

1. In the **System Country Code** drop-down list, select the country where the communication system is operated.
2. In the **Language for Customer Event Log** field, enter the language in which the event logs (system event logs, error logs, etc.) are to be output.

Next steps

Enter the DECT system identification (only for integrated Cordless solution)

or

Initial Setup for OpenScape Business X

Set the date and time manually or obtain the date and time from an SNTP server.

5.6.4.2 How to Enter the DECT System ID

Prerequisites

You are in the **Basic Configuration** window.

The screenshot shows the 'Basic Configuration' window in the 'Setup - Wizards - Basic Installation - Initial Installation' wizard. The window is divided into several sections: 'Language settings', 'Time settings', 'Detect date and time via an SNTP server', and 'CMI data'. In the 'Language settings' section, 'System Country Code' is set to 'Germany' and 'Language for Customer Trace Log' is set to 'English'. In the 'Time settings' section, 'Date and Time' is set to '03' for Day, '03' for Month, and '2023' for Year, with a time of '10:40:00'. The 'Timezone' is set to '(UTC +02:00) Athens, Beirut, Istanbul, Minsk'. In the 'Detect date and time via an SNTP server' section, 'Date and Time via an external SNTP Server' is checked, 'IP Address / DNS Name of External Time Server' is '192.168.142.49', and 'Poll Interval for External Time Server' is 'Continuous'. In the 'CMI data' section, 'System ID' is '00000000'.

Step by Step

In the **CMI data** area under **System ID**, enter the 8-digit hexadecimal DECT system ID that you received on purchasing your integrated Cordless solution.

Next steps

Set the date and time manually or obtain the date and time from an SNTP server.

5.6.4.3 How to Set the Date and Time Manually

Prerequisites

You are in the **Basic Configuration** window.

The screenshot shows the 'Basic Configuration' window in the 'Setup - Wizards - Basic Installation - Initial Installation' wizard. The window is divided into several sections: 'Language settings', 'Time settings', 'Detect date and time via an SNTP server', and 'CMI data'. In the 'Language settings' section, 'System Country Code' is set to 'Germany' and 'Language for Customer Trace Log' is set to 'English'. In the 'Time settings' section, 'Date and Time' is set to '03' for Day, '03' for Month, and '2023' for Year, with a time of '10:40:00'. The 'Timezone' is set to '(UTC +02:00) Athens, Beirut, Istanbul, Minsk'. In the 'Detect date and time via an SNTP server' section, 'Date and Time via an external SNTP Server' is checked, 'IP Address / DNS Name of External Time Server' is '192.168.142.49', and 'Poll Interval for External Time Server' is 'Continuous'. In the 'CMI data' section, 'System ID' is '00000000'.

Step by Step

1. Enter the current values for **Date and Time**.
2. Select the desired time zone in the **Timezone** field.
3. Click on **OK & Next**.

NOTICE: In case the Timezone setting is changed, then at the last step of Initial Wizard **the system will be restarted**.

If Timezone setting remain untouched then system will not be restarted.

Next steps

Specify UC solution.

5.6.4.4 How to Obtain the Date and Time from an SNTP Server**Prerequisites**

You are in the **Basic Configuration** window.

Setup - Wizards - Basic Installation - Initial Installation

Basic Configuration

Language settings

System Country Code:

Language for Customer Trace Log:

Time settings

Date and Time: Day Month Year hh:mm:ss

Timezone:

Detect date and time via an SNTP server

Date and Time via an external SNTP Server: ☒

IP Address / DNS Name of External Time Server:

Poll Interval for External Time Server:

CMI data

System ID:

Step by Step

1. Select the **Date and Time via an external SNTP Server** check box.
2. Enter the IP address or the DNS name of the SNTP server (e.g., 0.de.pool.ntp.org) in the **IP Address / DNS Name of External Time Server** field).
3. From the drop-down list **Poll Interval for External Time Server**, select after how many hours the Date and Time should be synchronized by the SNTP Server (recommended value: 4 h).
4. Click on **OK & Next**.

Next steps

Specify UC solution.

5.6.5 UC Solution

In the **Change application selection** window, select the UC solution to be used.

You have the following options:

- **Package with UC Smart**

The UC solution UC Smart is integrated on the OpenScape Business X mainboard.

- **Package with UC Suite**

The UC solution UC Suite is integrated on the additional internally pluggable "UC Booster Card".

- **Package with UC Suite on OSBiz UC Booster Server**

The UC solution UC Smart is integrated on the external Linux server "OpenScape Business UC Booster Server".

- **Package with UC Suite on OSBiz UC Booster Server**

The UC solution UC Suite is integrated on the external Linux server "OpenScape Business UC Booster Server".

5.6.5.1 How to Define the UC Solution

Prerequisites

You have purchased licenses for either of the UC solutions, UC Smart or UC Suite.

You are in the **Application Selection** window.

Application Selection	
Package with UC Smart:	<input type="radio"/>
Package with UC Suite:	<input checked="" type="radio"/>
UC Smart:	-
Application Launcher:	192.168.190.54
CSTA Connector:	192.168.190.54
OpenDirectory Service:	192.168.190.54
UC Suite:	192.168.190.54
Web Collaboration:	Demo Mode

Step by Step

1. If you are using the UC solution UC Smart without a UC Booster Server, click **Package with UC Smart**.
2. If you are using the UC solution UC Smart with the UC Booster Server, click on **Package with UC Smart on OSBiz UC Booster Server**. In addition, enter the IP address of the external Linux server "OpenScape Business UC Booster Server" in the **IP address of OSBiz UC Booster Server** field.
3. If you want to use the UC solution UC Suite with the UC Booster Card, click on **Package with UC Suite**.
4. If you are using the UC solution UC Suite with the UC Booster Server, click on **Package with UC Suite on OSBiz UC Booster Server**. In addition, enter the IP address of the external Linux

server "OpenScape Business UC Booster Server" in the **IP address of OSBiz UC Booster Server** field.

5. Click on **OK & Next**.
6. The **Initial installation** wizard is closed. Click **Finish**.
7. Exit the WBM by right-clicking the **Logout** link on the top right of the screen and then close the window.

NOTICE: If IP addresses or DHCP server settings have been changed, the communication system performs a restart. This can take a few minutes.

Next steps

Connect the communication system to the customer LAN.

5.6.6 Connecting the Communication System to the Customer LAN

After a successful initial installation, the communication system is connected to the existing customer LAN.

5.6.6.1 How to Connect the Communication System to the Customer LAN

Prerequisites

The communication system is ready for use.

Step by Step

1. Remove the LAN cable of the admin PC from the central LAN port "LAN" and integrate the admin PC in the customer's LAN by connecting it to a switch, for example.
2. Connect a LAN cable to the middle "LAN" port of the communication system.
3. Integrate the communication system via this LAN cable in the customer LAN by connecting it to a switch, for example.
4. If a UC Booster Card (Application Board) is plugged in, connect another LAN cable to the "LAN2" port of the UC Booster Card (right/lower of the two LAN interfaces) and integrate the UC Booster Card via this LAN cable in the customer LAN by connecting it to a switch, for example.

Next steps

Start the basic configuration.

5.7 Basic Configuration

The **Basic Installation** wizard is used for basic configuration. Basic configuration includes the most important settings for operating the communication system.

The Basic Installation Wizard includes a progress indicator showing the current step, as well as the steps that follow.

5.7.1 How to Start the Basic Installation Wizard

Prerequisites

The **Initial installation** has been completed.

The communication system is integrated in the customer LAN

The communication system is ready for use. The "Run" LED on the mainboard flashes green at 1Hz (0.5 sec on / 0.5 sec off).

Step by Step

1. Open the WBM login page on the admin PC by entering the following address in your web browser:
`https://<IP address of OpenScape Business>`
The default IP address for OpenScape Business is 192.168.1.2, i.e., `https://192.168.1.2`, for example.
2. In the **User Name** field, enter the default user name `administrator@system` for access as an administrator.
3. Enter the password you defined at initial startup in the **Password** field.
4. Click on **Login**.
5. In the navigation bar, click on **Setup**.
6. Click on **Edit** to start the **Basic Installation** wizard.

Next steps

Perform basic installation as described in the following step-by-step instructions. Fields that are not described here are preset for the default scenario and should only be changed if they are not appropriate for your network data. For detailed information, refer to the descriptions provided in the Administrator documentation for the individual wizards.

5.7.2 System Phone Numbers and Networking

Enter the system phone numbers (PABX number, country and area code, international prefix) in the **Overview** window and specify whether OpenScape Business is to be networked with other OpenScape Business systems.

Proceed as follows:

- 1) Enter system phone numbers
 - Enter system phone numbers for point-to-point connection
Here you enter the system phone number for your point-to-point connection and the country code and area code.
The entry of the country code is mandatory for Internet telephony and conference server functionality.

The international prefix is preset, depending on the previously dialed country code.

- Enter system phone numbers for point-to-multipoint connection

Here you enter the country code and area code for your point-to-multipoint connection.

The entry of the country code is mandatory for Internet telephony and Meet-Me conferences.

The international prefix is preset, depending on the previously dialed country code.

2) Activate or deactivate networking

If OpenScape Business is to be networked with other OpenScape Business systems, networking must be enabled, and OpenScape Business must be assigned a node ID. Every OpenScape Business must have a unique node ID in the network.

5.7.2.1 How to Enter the System Phone Numbers for a Point-to-Point connection

Prerequisites

You have a point-to-point connection.

You are in the **System Overview** window of the **Basic Installation** wizard.

Setup - Wizards - Basic Installation - Basic Installation

1 System Overview 2 Central Functions for Stations 3 Provider configuration and activation for Internet Telephony 4 Select a station 5 Configured Stations 6 Automatic Configuration of Application Suite 7 Configure MeetMe Conference 8 Configure E-Mail Forwarding

Note: changes done in expert mode must be reviewed/repeated after running through the wizard.
 Note: At least the configuration of the 'Country code' is needed for features such as 'Internet telephony' and 'MeetMe conference'.
 If you want your OpenScape Business in "OpenScape Business Network Integration" you should select the "Network Integration" check box and enter a node ID. In this case, make sure that this node ID is unique within the whole network integration.
 Normally, this integration is done by a Service Technician.
 For a standalone OpenScape Business clear the 'Network Integration' check box.

PABX number

Country code: 00 (49) (mandatory)
 Local area code: 0 (186) (optional)
 PABX number: 27 (optional)

General

International Prefix: 00

Network Parameters

Network Integration: ☐
 Node ID: 2

Upstream of your Internet connection

Upstream up to (Kbps): 2048

Step by Step

1. In the **Country Code** field, enter the country code prefix, e.g., 49 for Germany or 1 for the U.S.
2. Enter the local area code, e.g., 89 for Munich, in the **Local area code** field.
3. Enter the system phone number of your trunk connection, e.g., 7007 (your connection number), in the **PABX number** field.
4. Change the **International Prefix** field only if required. The applicable values for Germany and the United States are 00 and 011, respectively.

Initial Setup for OpenScape Business X

For international calls, the phone number is preceded by the international prefix and the country code, e.g., "00-1-..." for calls from Germany to the USA and "011-49-..." for calls from the USA to Germany.

Next steps

Activate or deactivate networking

5.7.2.2 How to Enter the System Phone Numbers for a Point-to-Multipoint Connection

Prerequisites

You have a point-to-multipoint connection.

You are in the **System Overview** window of the **Basic Installation** wizard.

Setup - Wizards - Basic Installation - Basic Installation

1 System Overview 2 Central Functions for Stations 3 Provider configuration and activation for Internet Telephony 4 Select a station 5 Configured Stations 6 Automatic Configuration of Application Suite 7 Configure MeetMe Conference 8 Configure E-Mail Forwarding

Note: changes done in expert mode must be reviewed/repeated after running through the wizard.
Note: At least the configuration of the 'Country code' is needed for features such as 'Internet telephony' and 'MeetMe conference'.
If you want your OpenScape Business in "OpenScape Business Network Integration" you should select the "Network Integration" check box and enter a node ID. In this case, make sure that this node ID is unique within the whole network integration.
Normally, this integration is done by a Service Technician.
For a standalone OpenScape Business clear the 'Network Integration' check box.

PABX number

Country code: 00 49 (mandatory)
Local area code: 0 186 (optional)
PABX number: 27 (optional)

General

International Prefix: 00

Network Parameters

Network Integration: ☐
Node ID: 2

Upstream of your internet connection

Upstream up to (Kbps): 2048

Step by Step

1. In the **Country Code** field, enter the country code prefix, e.g., 49 for Germany or 1 for the U.S.
2. Enter the local area code, e.g., 89 for Munich, in the **Local area code** field.
3. Leave the **PABX number** field empty.
4. Change the **International Prefix** field only if required. The applicable values for Germany and the United States are 00 and 011, respectively.

For international calls, the phone number is preceded by the international prefix and the country code, e.g., "00-1-..." for calls from Germany to the USA and "011-49-..." for calls from the USA to Germany.

Next steps

Activate or deactivate networking

5.7.2.3 How to Activate or Deactivate Networking

Prerequisites

You are in the **System Overview** window of the **Basic Installation** wizard.

Setup - Wizards - Basic Installation - Basic Installation

1 System Overview 2 Central Functions for Stations 3 Provider configuration and activation for Internet Telephony 4 Select a station 5 Configured Stations 6 Automatic Configuration of Application Suite 7 Configure MeetMe Conference 8 Configure E-Mail Forwarding

Note: changes done in expert mode must be reviewed/repeated after running through the wizard.
 Note: At least the configuration of the 'Country code' is needed for features such as 'Internet telephony' and 'MeetMe conference'.
 If you want your 'OpenScape Business In' 'OpenScape Business Network Integration' you should select the 'Network Integration' check box and enter a node ID. In this case, make sure that this node ID is unique within the whole network integration.
 Normally, this integration is done by a Service Technician.
 For a standalone OpenScape Business clear the 'Network Integration' check box.

PABX number

Country code: 00 49 (mandatory)
 Local area code: 0 186 (optional)
 PABX number: 27 (optional)

General

International Prefix: 00

Network Parameters

Network Integration: ☐
 Node ID: 2

Upstream of your internet connection

Upstream up to (Kbps): 2048

Step by Step

1. If the communication system is to be networked with other communication systems:
 - a) Select the **Network Integration** check box.
 - b) In the **Node ID** field for the communication system, enter a node ID that is unique in the internetwork (digits from 1 through 100 are possible).
2. If the communication system is not to be networked with other communication systems, leave the **Network Integration** check box disabled.

Next steps

Configure the upstream of your Internet connection.

5.7.3 Station Data

If necessary, you can configure your own individual dial plan instead of the predefined default dial plan in the **Central Functions for Stations** window and import additional station data. In an internetwork, the default dial plan must be adapted to the dial plan of the internetwork.

The default dial plan contains predefined numbers for different types of stations (IP phones, analog phones, ...) and for special functions (Internet telephony, voicemail box, AutoAttendant, ...).

The station data includes the internal call numbers, DID numbers and names of the stations. This data and other station data can be imported into the communication system during the basic configuration via an XML file in UTF-8 format.

NOTICE: An XML template with the appropriate explanations can be found in the WBM under **Service Center > Documents > CSV Templates**. You can enter your data in this template by using Microsoft Excel, for example.

You have the following options:

- **Configure station data without an internetwork**

Proceed as follows:

- 1) Display the station data**

You can have all preconfigured station numbers and station data displayed.

- 2) Delete all station numbers (optional)**

If you use an individual dial plan, you must delete all preconfigured station numbers.

- 3) Adapt preconfigured station numbers for the individual dial plan (optional)**

If you are using an individual dial plan, you can adapt the preconfigured phone numbers to your own dial plan.

NOTICE: If the user passes through the **Change preconfigured functional call numbers**, any existing custom configuration done in UC Suite must be reviewed or repeated (e.g., pilot queues)

- 4) Import station data from an XML file (optional)**

You can easily import your individual station numbers, including any additional station data, during the basic configuration via an XML file.

- **Configure station data with an internetwork**

Proceed as follows:

- 1) Delete all station numbers**

If the UC Suite is used in an internetwork, a closed numbering plan is required, i.e., all station numbers in the internetwork must be unique. For this reason, any preconfigured station numbers must be deleted and only stations numbers adapted for the internetwork must be used.

- 2) Import station data from an XML file**

The station numbers adapted for the internetwork and any additional station data can be easily imported during the basic configuration via an XML file. This file can contain all stations in the internetwork. During import, only the station numbers and the station data assigned to the previously specified node ID of the communication system will be transferred.

[How to Reset the LCR Entries](#) on page 1389

Related reference

[LCR > LCR flags](#) on page 1588

5.7.3.1 How to Display the Station Data

Prerequisites

You are in the **Central Functions for Stations** window of the **Basic Installation** wizard.

Step by Step

1. Select the **Display stations configuration** radio button.
2. Click on **Execute function**. A list of stations with the preconfigured phone numbers (default dial plan) is displayed.
3. Click on **OK**. You are taken back to the **Central Functions for Stations** window.
4. If you do not want to change any station data, click **OK & Next**.

5.7.3.2 How to Delete all Call Numbers

Prerequisites

You are in the **Central Functions for Stations** window of the **Basic Installation** wizard.

Step by Step

1. Enable the radio button **Delete all station call numbers**.
2. Enable the check box **Delete All Call Addresses**.
3. Click on **Execute function**. All preset call numbers are deleted except **Announcement Player**, **Remote Admin call number** and **Licensing call number**. The **Change preconfigured call and functional numbers** window then appears.

Setup - Wizards - Basic Installation - Basic Installation

Change preconfigured call and functional numbers

- The Internet Telephony numbers must be available; it is not possible to delete these numbers.
- Please keep in mind, that these numbers are not available for station or group dialing use.
- Automatic changes may be applied. Please check LCR dial plan and correct if necessary.

Preconfiguration for Internet Telephony	<input type="text"/>	<input type="text"/>	<input type="text"/>
Announcement Player	<input type="text" value="659999"/>	<input type="text"/>	<input type="text"/>
Voicemail call number (Smart VM)	<input type="text"/>	<input type="text"/>	<input type="text"/>

Functional number for MeetMe Conferencing	<input type="text" value="-"/>	<input type="text"/>	<input type="text"/>

Initial Setup for OpenScape Business X

- Adjust the codes and special call numbers to suit your preferences, and then click **OK**. You are taken back to the **Central Functions for Stations** window.
- If you do not want to change any further station data, click **OK & Next**.

5.7.3.3 How to Adapt Preconfigured Station Numbers for the Individual Dial Plan

Prerequisites

You are in the **Central Functions for Stations** window of the **Basic Installation** wizard.

Step by Step

- Enable the radio button **Change preconfigured call and functional numbers**.
- Click on **Execute function**. The **Change preconfigured call and functional numbers** window appears.

Setup - Wizards - Basic Installation - Basic Installation

Change preconfigured call and functional numbers

- The Internet Telephony numbers must be available; it is not possible to delete these numbers.
- Please keep in mind, that these numbers are not available for station or group dialing use.
- Automatic changes may be applied. Please check LCR dial plan and correct if necessary.

Preconfiguration for Internet Telephony	<input type="text"/>	<input type="text"/>	<input type="text"/>
Announcement Player	<input type="text" value="659999"/>	<input type="text"/>	<input type="text"/>
Voicemail call number (Smart VM)	<input type="text"/>		
Autoattendant call number (Smart VM)	<input type="text"/>		
Attendant code	<input type="text"/>		
Remote Admin call number	<input type="text" value="659995"/>		
Licensing call number	<input type="text" value="659994"/>		
Functional numbers for Conferencing	<input type="text" value="-"/>	<input type="text" value="-"/>	<input type="text" value="-"/>
Functional number for MeetMe Conferencing	<input type="text" value="-"/>		

- Adjust the preconfigured call numbers to suit your preferences, and then click **OK**. You are taken back to the **Central Functions for Stations** window.
- If you do not want to change any further station data, click **OK & Next**.

5.7.3.4 How to Import the Station Data from an XML File

Prerequisites

You are in the **Central Functions for Stations** window of the **Basic Installation** wizard.

An XML file with the entered data is available in UTF-8 format. An XML template can be found under **Service Center > Documents > CSV Templates**.

Step by Step

1. Enable the radio button **Import CSV/XML file with station data**.
2. Click **Execute function**.
3. Use **Browse** to select the created XML file and click **Open**.
4. Click **OK** when finished. The station data is imported.
5. Click **OK & Next**.

5.7.3.5 How to display Mass data**Prerequisites**

- You are in the **Central Functions for Stations** window of the **Basic Installation** wizard.
- You can also have access to **Mass Data** wizard from **Setup > Wizards**.

Step by Step

1. Enable the **Mass Data wizard** button.
2. Click on **Execute function**.
3. In the **Mass Data Wizard** window you can validate the entries of the system, by clicking on **Validate**. There are two types of validation, the Front End Consistency Check and the Back End Consistency Check.
The green color in validation field indicates only the actions that have been recently validated. The validation of data is not saved, so if the values are changed the user has to validate again the data.
4. During Back End Consistency Check and after the successful validation of data no editing in **Mass Data Wizard** window is possible. After the successful validation **OK&Next** becomes available with Edit restrict mode. If the user clicks on **Back**, Edit mode becomes available but **OK&Next** disappears. When the validation is unsuccessful Edit mode remains intact and **OK&Next** stays hidden.

NOTICE: The user can click on **Back** to re-edit the data and the window returns to Edit mode again. The Edit restrict mode ensures that the user cannot click on OK&Next and submit changes that are not validated.

5. When **Mass Data Wizard** is configured successfully click on **Finish**. In the finish page is displayed a sum up with all the changes.

Fields that are not editable are already filled in with the relevant values obtained by the Database. As a result Copy/paste function will have no effect in data.

Type field is a selectable drop down menu with editing functionality. However the only options accepted are No Port, System Client, SIP Client, Deskshare User and potentially a

predefined value based on the Board it belongs. If the user tries to enter something else then this will not be accepted and drop down menu will not be disappear persisting in providing a proper entry.

Another restriction is that some ports are not changeable (for instance ports belonging in an Analog card, type is not changeable and should remain Analog Station). All restrictions apply when the user tries to perform copy paste on top of Type column. If the user tries to paste irrelevant data not compromising with the rules above paste will not be performed at all.

Copy and paste can be applied on the whole table as well as on specific parts.

NOTICE: When selecting two following cells, with a numeric value, and you pull down the fields the following columns are not filled in with ascending numbers but they are filled in with a copy of the selected cells.

5.7.4 ISDN Configuration

In the **ISDN Configuration** window, you specify whether ISDN stations are to be connected and whether ISDN is to be used for the trunk connection. The ISDN trunk connection can be set up as an ISDN point-to-point connection and/or an ISDN-point-to-multipoint connection. Depending on the communication system and board used, different S_0 ports are available for this purpose.

You have the following options:

- Enable ISDN configuration:

- 1) Configure an ISDN point-to-point connection**

You can set up an ISDN trunk connection as a point-to-point connection with DID numbers.

- 2) Configure an ISDN point-to-multipoint connection**

You can set up an ISDN trunk connection as a point-to-multipoint connection with MSN.

- 3) Set up a connection for ISDN subscribers (optional)**

One or more S_0 interfaces can be configured as internal S_0 connections in order to connect ISDN stations (ISDN phones or ISDN fax devices). A station license is required for each ISDN station.

- Disable ISDN configuration

If you do not have an ISDN trunk connection, you must disable the ISDN configuration. All S_0 interfaces automatically configured as internal S_0 ports.

Other options for trunk connections

Instead of setting up an ISDN trunk connection, you can also set up an analog trunk connection or a trunk connection through an Internet Telephony Service Provider (ITSP, SIP provider). Basic installation must be complete before the analog trunk connection can be configured.

5.7.4.1 How to Configure the Connection of ISDN Stations

Prerequisites

You are in the **ISDN Configuration** window of the **Basic Installation** wizard.

Box	Slot	S0-Port	Board Type	Point-to-point connection	Point-to-multipoint connection	Internal S0 connection	Settings configured in expert mode
1	1	1	STLS2N	<input type="radio"/>	<input type="radio"/>	<input checked="" type="radio"/>	
1	1	2	STLS2N	<input type="radio"/>	<input type="radio"/>	<input checked="" type="radio"/>	

Step by Step

1. Clear the check box **No call via ISDN trunk line (S0)**.
2. Activate the **Internal S0 connection** radio button for the desired S₀ port.

Next steps

Configure ISDN point-to-point connection and/or configure ISDN point-to-multipoint connection.

5.7.4.2 How to Configure the ISDN Point-to-Point Connection

Prerequisites

You are in the **ISDN Configuration** window of the **Basic Installation** wizard.

Box	Slot	S0-Port	Board Type	Point-to-point connection	Point-to-multipoint connection	Internal S0 connection	Settings configured in expert mode
1	1	1	STLS2N	<input type="radio"/>	<input type="radio"/>	<input checked="" type="radio"/>	
1	1	2	STLS2N	<input type="radio"/>	<input type="radio"/>	<input checked="" type="radio"/>	

Step by Step

1. To configure the ISDN trunk connection, clear the check box **No call via ISDN trunk line (S0)**.

Initial Setup for OpenScape Business X

- 2. Enable the radio button **Point-to-point connection** for the desired S₀ port.
- 3. Click on **OK & Next**.

5.7.4.3 How to Configure the ISDN Point-to-Multipoint Connection

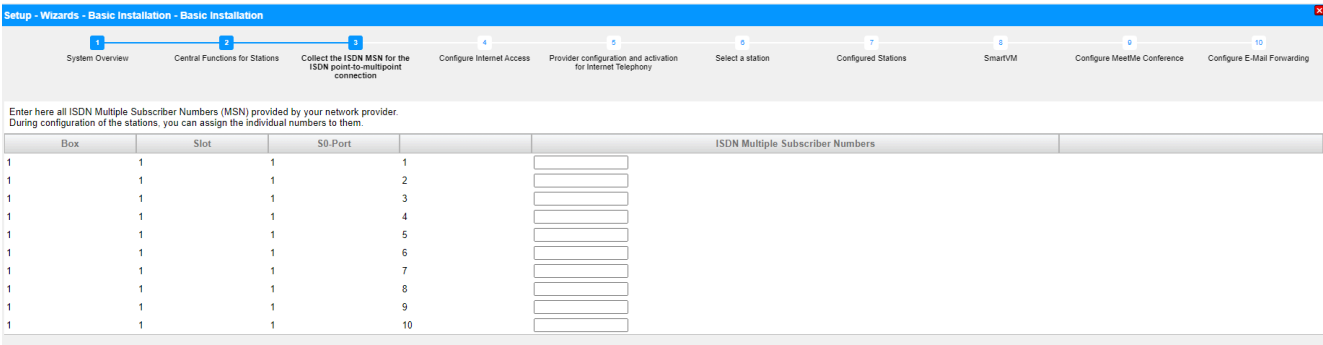

Prerequisites

You are in the **ISDN Configuration** window of the **Basic Installation** wizard.

Step by Step

- 1. To configure the ISDN trunk connection, clear the check box **No call via ISDN trunk line (S0)**.
- 2. Enable the radio button **Point-to-multipoint connection** for the desired S₀ port.
- 3. Click on **OK & Next**.

- 4. Enter all phone numbers (MSNs) supplied by your provider in the **ISDN multiple subscriber numbers** column. You can enter up to 10 MSNs for each S₀ port. The number of the S₀ connections depends on the communication system and possibly the board being used.
- 5. Click on **OK & Next**.

5.7.4.4 How to Deactivate the ISDN Configuration

Prerequisites

You are in the **ISDN Configuration** window of the **Basic Installation** wizard.

Step by Step

1. Select the **No call via ISDN trunk line (S0)** check box.

NOTICE: Calls can also be conducted via an Internet Telephony Service Provider; see [Internet Telephony](#).

2. Click on **OK & Next**.

5.7.5 Internet Access

The **Configure Internet Access** window can be used to configure Internet access.

The configuration of Internet access in the WBM depends on whether the Internet connection has already been set up in an external router or whether it occurs via an Internet modem and thus needs to be set up in the WBM.

Only one of the options listed here may be selected.

- Internet access through an Internet modem (**DSL at WAN port directly**)

You want to operate the communication system directly at an Internet modem (DSL, cable, UMTS ...). OpenScape Business has the Internet router integrated. Enter the access data of the Internet Service Provider (ISP) directly in the communication system and use the WAN port of the communication system.

You have the following options:

- **Internet access via a preconfigured ISP**
- **Internet access via the standard ISP PPPoE**
- **Internet access via the standard ISP PPTP**

If your ISP is not listed under the preconfigured ISPs, use the default ISP PPPoE or PPTP.

- Internet access via an external Internet router

Initial Setup for OpenScape Business X

You want to operate the communication system at an external Internet router. The Internet Service Provider is already configured in the Internet router.

You have the following options:

- **Internet access via an external Internet router at the WAN port**
(TCP/IP at WAN port via an external router)

To do this, you use the WAN port of the communication system. OpenScape Business either knows the Internet router or works as a DHCP client. This option can be used if the Internet router is located in another network segment and has its own DHCP server.

- **Internet access via an external Internet router at the LAN port**
(TCP/IP at LAN port via an external router)

To do this, you use the LAN port of the communication system. OpenScape Business knows only the default router and not the underlying infrastructure. To activate the connection to the Internet router, the IP address of the default router and that of the DNS server must be made known to the communication system.

- Deactivate Internet access (default setting)

You do not want to use the Internet.

5.7.5.1 How to Configure Internet Access via an External Internet Router over the LAN Port

Prerequisites

The communication system must be connected to the customer LAN via the "LAN" interface. The connection must not use the WAN port, since the WAN port will be disabled.

You are in the **Configure Internet Access** window of the **Basic Installation** wizard.

Step by Step

1. Disable the **No Internet Access** check box.
2. Activate the radio button **TCP/IP at LAN Port via an external router**, enter the upload speed of your Internet connection in the **Upstream up to (Kbps)** field and click **OK & Next**.

Setup - Wizards - Basic Installation - Basic Installation

DNS Server

IP Address of primary DNS Server: 192.168.186.22

Default Router

IP Address of Default Router: 192.168.186.22

Application Board - IP Address of Default Router: 192.168.186.22

3. Enter the IP address of the local DNS server (e.g., the Internet router) or the Internet DNS server (for Internet telephony, for example) in the **IP address of the preferred DNS server** field.
4. Enter the IP address of the external Internet router in the **IP Address of Default Router** field.
5. Click on **OK & Next**.

5.7.5.2 How to Configure Internet Access via an External Internet Router over the WAN Port

Prerequisites

The communication system must be connected to the LAN segment of the customer LAN in which the Internet router is located via the LAN interface "WAN".

You are in the **Configure Internet Access** window of the **Basic Installation** wizard.

Step by Step

1. Disable the **No Internet Access** check box.
2. Activate the radio button **TCP/IP at WAN Port via an external router** and click **OK & Next**.

Setup - Wizards - Basic Installation - Basic Installation

System Overview Central Functions for Stations ISDN Configuration Internet Access Provider configuration and activation for Internet Telephony Select a station Configured Stations SmartVM Configure Meetlife Conference Configure E-Mail Forwarding

Automatic Address Configuration (via DHCP): ☐

IP Address: 0.0.0.0

Subnet Mask: 0.0.0.0

MAC Address: 00:1a:e8:5d:37:83

Ethernet Link Mode: Auto

Max. Data Packet Size (bytes): 1500

Network Address Translation: ☐

Bandwidth Control for Voice Connections: None

Bandwidth for Downloads: 10000

Bandwidth for Uploads: 10000

Bandwidth Used for Voice/Fax (%): 80

IEEE802.1p/q Tagging: ☐

IEEE802.1p/q VLAN ID: 0

3. If the network-specific data for the WAN interface are to be obtained from an already active DHCP server:

- a) Select the check box **Automatic Address Configuration (with DHCP)**.
 - b) Select the **Accept IP Address of the Default Router** check box if you want this IP address to be used.
 - c) Select the check box **Accept IP Address of the DNS Server** if required.
 - d) Select the check box **Accept IP Address of the SNTP Server** if required.
4. If a fixed IP address is to be assigned to the WAN interface:
- a) Clear the check box **Automatic Address Configuration (with DHCP)**.
 - b) Enter the desired **IP address** and **Netmask** of the WAN interface.
5. Enable the **NAT** check box.
6. If you also want to use Internet Telephony, select the item **Upload only** or **Upload and Download** as needed from the **Bandwidth Control for Voice Connections** drop-down list. If the download bandwidth is high and the upload bandwidth is low, bandwidth control should only be activated for the upload direction to ensure that the download bandwidth reserved for voice transmission is not unnecessarily high.
7. In the **Bandwidth for Downloads** and **Bandwidth for Uploads** fields, enter the bandwidth in Kbps for downloads and uploads, respectively, as provided by your Internet Service Provider.
8. Click on **OK & Next**.

5.7.5.3 How to Configure Internet Access via a Preconfigured ISP

Prerequisites

You are in the **Configure Internet Access** window of the **Basic Installation** wizard.

Your ISP's Internet access data is available (for example, user account, password, bandwidth for upload and download, etc.).

Optional: The data for a DynDNS account is available to you (name, password, host name, domain name of the DynDNS provider)

Step by Step

1. Disable the **No Internet Access** check box.
2. Activate the radio button **DSL directly at Mainboard WAN Port** and click **OK & Next**.

3. Select your ISP from the **Internet Service Provider Selection** drop-down list.
4. Enter the access data that you received from your ISP in the **Internet Access Data for...** area. The fields in this area are provider-specific. When entering your data, bear in mind that the input is case-sensitive!
5. Depending on your tariff model, select one of the following two options under **Full-Time Circuit** in the **Router Settings** area:
 - If you have a flat rate tariff model, enable the radio button **On**. In the **Forced Disconnect at (hour:min)** field, enter the time at which the Internet connection is to be interrupted (e.g., 01:30). Make sure that no data is exchanged with the Internet (e.g., software downloads or Internet telephony) during this time.
 - If you have a time-based tariff model, enable the radio button **Off**. In the **Disconnect automatically after (seconds)** field, enter the duration of inactivity after which the connection is to be dropped (e.g., 60 seconds).
6. Set the following values in the **QoS Parameters** area:
 - a) In the **Bandwidth for Downloads** and **Bandwidth for Uploads** fields, enter the bandwidth in Kbps for downloads and uploads, respectively, as provided by your ISP.
 - b) If you want to use Internet Telephony as well, open the drop-down list **Bandwidth Control for Voice Connections** and select the item **Upload only** or **Upload and Download**, as required. In the field **Bandwidth Used for Voice/Fax (%)**, enter how much bandwidth is to be reserved for voice and fax connections as a percentage value (default value: 80%).
7. Click **OK & Next**. You are taken to the **Configure DynDNS-Account** window.
8. If you want to use a VPN or remote access and do not have a public static IP address, you will need to have already applied for and set up a DynDNS account (at dyndns.org, for example).
 - a) If your desired DynDNS provider is included in the **Domain name** drop-down list, select it from that list (e.g., dyndns.org).
 - b) If your desired DynDNS provider is not included in the **Domain name** drop-down list, select the **User defined Domain** check box. Enter the desired DynDNS provider in the **Domain name** field and enter the update URL of the DynDNS

provider in the **Update URL** field. The structure of this URL depends on the DynDNS provider. In addition, customer-specific parameters (shown in *italics* in the example) must be supplemented.

`http://www.anydns.info/update.php?`

`user=<username>&password=<pass>&host=<domain>&ip=<ipaddr>`

- c) Enter the **User name** and the **Password** of your DynDNS account.
 - d) Enter the host name assigned to you by the DynDNS provider, omitting the domain name, for instance, myhost, in the **Hostname** field. Your complete domain name would then be myhost.dyndns.org, for example.
 - e) Test the DynDNS account with **Connection test**.
 - f) After the test succeeds, click **OK**.
 - g) Click **OK & Next**.
9. If you have a public static IP address or do not want to use a VPN or remote access, click **No DynDNS**.
10. Click **OK & Next**.

5.7.5.4 How to Configure Internet Access via the Standard ISP PPPoE

Prerequisites

You are in the **Configure Internet Access** window of the **Basic Installation** wizard.

The following ISP-specific Internet access data is available to you:

Field	Description	Value from ISP
IP Parameters (only for a fixed IP address)		
Remote IP Address of the PPP Connection	IP address of your ISP's server.	
Local IP Address of the PPP Connection	IP address that was assigned to you by your ISP for Internet access.	
Authentication (via PAP or CHAP). PAP is seldom used, since the authentication is unencrypted.		
PPP User Name	User name that was assigned to you by your ISP for the PPP connection.	
PAP Authentication Mode	Authentication mode for the PPP connection over PAP: PAP Client , PAP Host or Not used .	
PAP Password	Password assigned to you by the ISP for PAP authentication	
CHAP Authentication Mode	Authentication mode for PPP connection via CHAP: CHAP Client , CHAP Host , CHAP Client and Host or Not used .	

Field	Description	Value from ISP
CHAP Password	Password assigned to you by the ISP for CHAP authentication	
QoS Parameters of Interface		
Bandwidth for Downloads	Value of the full download bandwidth in Kbps provided by the ISP.	
Bandwidth for Uploads	Value of the full upload bandwidth in Kbps provided by the ISP.	

Optional: The data for a DynDNS account is available to you (name, password, host name, domain name of the DynDNS provider)

Step by Step

1. Disable the **No Internet Access** check box.
2. Activate the radio button **DSL at WAN Port directly** and click **OK & Next**.
3. From the **Internet Service Provider Selection** drop-down list, select the standard ISP Type **Provider PPPoE**.
4. The **IP parameters** check box in the **IP Parameters** area should only be enabled if the ISP requires an adjustment of these parameters. In this case, enter the values that you have received from your ISP in the **Remote IP Address of the PPP Connection**, **Local IP Address of the PPP Connection** and **Max. Data Packet Size (bytes)** fields. From the **IP Address Negotiation** drop-down list, select the item **Use configured IP address**.
5. Depending on your tariff model, select one of the following two options under **Full-Time Circuit** in the **Router Settings** area:
 - If you have a flat rate tariff model, enable the radio button **On**. In the **Forced Disconnect at (hour:min)** field, enter the time at which the Internet connection is to be interrupted (e.g., 01:30). Make sure that no data is exchanged with the Internet (e.g., software downloads or Internet telephony) during this time.
 - If you have a time-based tariff model, enable the radio button **Off**. In the **Disconnect automatically after (seconds)** field, enter the duration of inactivity after which the connection is to be dropped (e.g., 60 seconds).
6. The settings in the **Authentication** area depend on whether or not the ISP requires authentication via PPP.
 - Authentication required by ISP: Make sure that the check box **PPP Authentication** is enabled. Enter the Internet access name of the ISP as the PPP user name. The customary standard is the **CHAP Client** authentication mode.
 - Authentication not required by ISP: Make sure that the check box **PPP Authentication** is disabled.
7. If you want to use NAT, enable the **NAT** check box (enabled by default) in the **Address Translation** area.

8. Set the following values in the **QoS Parameters of Interface** area:
 - a) In the **Bandwidth for Downloads** and **Bandwidth for Uploads** fields, enter the bandwidth in Kbps for downloads and uploads, respectively, as provided by your ISP.
 - b) If you want to use Internet Telephony as well, open the drop-down list **Bandwidth Control for Voice Connections** and select the item **Upload only** or **Upload and Download**, as required. In the field **Bandwidth Used for Voice/Fax (%)**, enter how much bandwidth is to be reserved for voice and fax connections as a percentage value (default value: 80%).
9. Click **OK & Next**. You are taken to the **Configure DynDNS-Account** window.
10. If you want to use a VPN or remote access and do not have a public static IP address, you will need to have already applied for and set up a DynDNS account (at dyndns.org, for example).
 - a) If your desired DynDNS provider is included in the **Domain name** drop-down list, select it from that list (e.g., dyndns.org).
 - b) If your desired DynDNS provider is not included in the **Domain name** drop-down list, select the **User defined Domain** check box. Enter the desired DynDNS provider in the **Domain name** field and enter the update URL of the DynDNS provider in the **Update URL** field. The structure of this URL depends on the DynDNS provider. In addition, customer-specific parameters (shown in *italics* in the example) must be supplemented.

```
http://www.anydns.info/update.php?
user=<username>&password=<pass>&host=<domain>&ip=<ipaddr>
```
 - c) Enter the **User name** and the **Password** of your DynDNS account.
 - d) Enter the host name assigned to you by the DynDNS provider, omitting the domain name, for instance, myhost, in the **Hostname** field. Your complete domain name would then be myhost.dyndns.org, for example.
 - e) Test the DynDNS account with **Connection test**.
 - f) After the test succeeds, click **OK**.
 - g) Click **OK & Next**.
11. If you have a public static IP address or do not want to use a VPN or remote access, click **No DynDNS**.
12. Click **OK & Next**.

5.7.5.5 How to Configure Internet Access via a Standard ISP PPTP

Prerequisites

You are in the **Configure Internet Access** window of the **Basic Installation** wizard.

The following ISP-specific Internet access data is available to you:

Field	Description	Value from ISP
IP Parameters (only for a fixed IP address)		
Remote IP Address of the PPP Connection	IP address of your ISP's server.	
Local IP Address of the PPP Connection	IP address that was assigned to you by your ISP for Internet access.	
PPTP Parameter		
Local IP Address of the Control Connection	IP address that was assigned to you by your ISP for the PPTP connection. The default value is 10.0.0.140.	
Remote IP Address of the Control Connection	IP address of your ISP's server for the PPTP connection. The default value is 10.0.0.138.	
Remote Netmask for the Control Connection	Subnet mask that was assigned to you by your ISP for the PPTP connection. The default value is 255.255.255.248.	
Authentication (via PAP or CHAP). PAP is seldom used, since the authentication is unencrypted.		
PPP User Name	User name that was assigned to you by your ISP for the PPP connection.	
PAP Authentication Mode	Authentication mode for the PPP connection over PAP: PAP Client , PAP Host or Not used .	
PAP Password	Password assigned to you by the ISP for PAP authentication	
CHAP Authentication Mode	Authentication mode for PPP connection via CHAP: CHAP Client , CHAP Host , CHAP Client and Host or Not used .	
CHAP Password	Password assigned to you by the ISP for CHAP authentication	
QoS Parameters of Interface		
Bandwidth for Downloads	Value of the full download bandwidth in Kbps provided by the ISP.	
Bandwidth for Uploads	Value of the full upload bandwidth in Kbps provided by the ISP.	

Optional: The data for a DynDNS account is available to you (name, password, host name, domain name of the DynDNS provider)

Step by Step

1. Disable the **No Internet Access** check box.

2. Activate the radio button **DSL at WAN Port directly** and click **OK & Next**.
3. From the **Internet Service Provider Selection** drop-down list, select the standard ISP Type **Provider PPTP**.
4. The **IP parameters** check box in the **IP Parameters** area should only be enabled if the ISP requires an adjustment of these parameters. In this case, enter the values that you have received from your ISP in the **Remote IP Address of the PPP Connection**, **Local IP Address of the PPP Connection** and **Max. Data Packet Size (bytes)** fields. From the **IP Address Negotiation** drop-down list, select the item **Use configured IP address**.
5. Enter the values that you received from your ISP in the **PPTP Parameter** area.
6. If you have a time-based tariff model, select the **Short Hold** check box. In the **Short Hold Time (sec)** field, enter the duration of inactivity after which the connection is to be dropped (e.g., 60 seconds).
7. The settings in the **Authentication** area depend on whether or not the ISP requires authentication via PPP.
 - Authentication required by ISP: Make sure that the check box **PPP Authentication** is enabled. Enter the Internet access name of the ISP as the PPP user name. Make the PAP and CHAP settings, as assigned to you by your ISP.
 - Authentication not required by ISP: Make sure that the check box **PPP Authentication** is disabled.
8. If you want to use NAT, enable the **NAT** check box (enabled by default) in the **Address Translation** area.
9. Set the following values in the **QoS Parameters of Interface** area:
 - a) In the **Bandwidth for Downloads** and **Bandwidth for Uploads** fields, enter the bandwidth in Kbps for downloads and uploads, respectively, as provided by your ISP.
 - b) If you want to use Internet Telephony as well, open the drop-down list **Bandwidth Control for Voice Connections** and select the item **Upload only** or **Upload and Download**, as required. In the field **Bandwidth Used for Voice/Fax (%)**, enter how much bandwidth is to be reserved for voice and fax connections as a percentage value (default value: 80%).
10. Click **OK & Next**. You are taken to the **Configure DynDNS-Account** window.
11. If you want to use a VPN or remote access and do not have a public static IP address, you will need to have already applied for and set up a DynDNS account (at dyndns.org, for example).
 - a) If your desired DynDNS provider is included in the **Domain name** drop-down list, select it from that list (e.g., dyndns.org).
 - b) If your desired DynDNS provider is not included in the **Domain name** drop-down list, select the **User defined Domain** check box. Enter the desired DynDNS provider in the **Domain name** field and enter the update URL of the DynDNS provider in the **Update URL** field. The structure of this URL

depends on the DynDNS provider. In addition, customer-specific parameters (shown in *italics* in the example) must be supplemented.

```
http://www.anydns.info/update.php?
user=<username>&password=<pass>&host=<domain>&ip=<ipaddr>
```

- c) Enter the **User name** and the **Password** of your DynDNS account.
 - d) Enter the host name assigned to you by the DynDNS provider, omitting the domain name, for instance, myhost, in the **Hostname** field. Your complete domain name would then be myhost.dyndns.org, for example.
 - e) Test the DynDNS account with **Connection test**.
 - f) After the test succeeds, click **OK**.
 - g) Click **OK & Next**.
- 12.** If you have a public static IP address or do not want to use a VPN or remote access, click **No DynDNS**.
- 13.** Click **OK & Next**.

5.7.5.6 How to Disable Internet Access

Prerequisites

You are in the **Configure Internet Access** window of the **Basic Installation** wizard.

Step by Step

1. Leave the **No Internet Access** check box enabled.
2. Click on **OK & Next**.

5.7.6 Internet Telephony

The **Provider configuration and activation for Internet telephony** window is used to configure Internet telephony. You can configure predefined or new Internet Telephony Service Providers (ITSPs). You can configure one or several accounts for each ITSP. Up to 8 ITSPs may be active simultaneously.

You have the following options:

- **Configure a predefined ITSP**

You can use predefined ITSP templates. To do this, the own access data and phone numbers are entered in the template, and this is then activated.

- **Configure a new ITSP**

You can also add and activate a new ITSP.

Configuring a new ITSP is seldom required and can be very time-consuming. This option is therefore not described in the initial installation. Detailed information can be found in the chapter [Configuring an ITSP](#).

- **Disable Internet telephony**

You can disable Internet telephony.

NOTICE: Configuration examples can be found on the Internet at the **Unify Experts Wiki** under *OpenScape Business - SIP / ITSP Connectivity - PDF "OSBiz V2 Configuration for ITSP"*.

Assigning the ITSP Phone Numbers

- In the case of an **Internet Telephony Station Connection**, the ITSP provides individual numbers such as 70005555, 70005556, etc. These individual call numbers are then assigned manually as the internal call numbers of the subscribers.
- In the case of an **Internet telephony point-to-point connection**, the ITSP provides a call number range, e.g., (+49) 89 7007-100 to (+49) 89 7007-147. The call numbers from the range are then assigned manually as the internal call numbers of the subscribers.

These two connection types can be combined as appropriate.

Alternatively, the ITSP phone numbers can be entered as the DID call numbers of the subscriber for both connection types during the station configuration.

Internal call number	Name	DID
100	Andreas Richter	897007100
101	Susanne Mueller	897007101
102	Buddy Miller	897007102
104	Juan Martinez	70005555
105	Emilio Carrara	70005556

The ITSP call numbers thus result from the configured PABX number (e.g., country code 49) and the entered DID numbers in long format. This has advantages for the digit analysis and call management, even in an internetwork. The ITSP connection is thus DID-enabled for another node, for example.

A further CO trunk connection via ISDN is only possible to a limited extent in this case (useful for emergency calls, for example).

5.7.6.1 How to Configure a Predefined ITSP

Prerequisites

You are in the **Provider configuration and activation for Internet Telephony** window of the **Basic Installation** wizard.

The Internet connection is operational.

Your ITSP's Internet telephony access data is available (for example, user account, password and Internet telephony numbers).

Step by Step

1. Clear the **No call via Internet** check box. A country-specific list of the possible ITSPs is displayed. The list contains the predefined ITSPs for the selected country and any already created ITSPs.

Setup - Wizards - Basic Installation - Basic Installation

System Overview Central Functions for Stations ISDN Configuration **Configure Internet Access** Provider configuration and activation for Internet Telephony Select a station Configured Stations SmartVM Configure MeetLife Conference Configure E-Mail Forwarding

No call via Internet: ☐

Country specific view: Germany

Note: changes done in expert mode must be reviewed/repeated after running through the wizard.

Help Abort Back **OK & Next** Display Status

2. If you want to change the preset country, select the desired country from the **Country specific view** drop-down list to display the ITSPs that are available for this country.
3. If required, click **Display Status** to check which ITSPs have already been activated and which Internet telephony subscribers have already been configured under each ITSP. You can activate a maximum of 8 ITSPs. Click **OK** when finished.
4. To configure Internet telephony stations, click **Edit** in the line associated with the relevant ITSP.
5. Activate the check box **Enable Provider**.
6. Click **OK & Next**.
7. Click **Add** to configure your ITSP accounts with the corresponding Internet telephony numbers. The fields that will then be displayed are provider-specific.

Setup - Wizards - Basic Installation - Basic Installation

Internet Telephony Station for SIPGate

Internet telephony station:

Authorization name:

Password:

Confirm Password:

Call number assignment

Use public number (DID) ▼

ITSP-multiple route: ☐

Default Number:

Default Number
ITSP as primary CO access
Enter one of the call numbers supplied by your network provider here. This will be used in outgoing calls as the calling party number in case no other number is available for the respective call.
All call numbers supplied by your network provider are to be entered within the trunk and telephones configuration (DID field) primary CO access.

8. Enter the credentials for your account in the **Internet Telephony Station** field. You received this data from your ITSP.

Initial Setup for OpenScape Business X

Depending on the ITSP, different designations are used for this, for example: SIP User, SIP ID, etc.

9. Enter the authorization name in the **Authorization name** field. You received this data from your ITSP. If you have not received any authorization name, enter the same data you entered under **Internet Telephony Station**.
10. Enter the password you received from the ITSP in the **New Password** and **Confirm Password** fields. Depending on the ITSP, different designations are used for this, for example: Password, SIP Password, etc.
11. Assignment of Internet telephony phone numbers - Option 1:
Use public number (DID): the Internet telephony phone numbers of your Internet telephony station connection or Internet telephony point-to-point connection are not entered here during the ITSP configuration, but when the configuring the stations, i.e. the telephones and subscribers (in the **DID** fields).

The screenshot shows the 'Internet Telephony Station for SIPGate' configuration window. The 'Call number assignment' section is active, showing a dropdown menu set to 'Use public number (DID)'. Below this, there is a checkbox for 'ITSP-multiple route' and a text field for 'Default Number'. At the bottom, there is a 'Default Number' section with a note: 'Enter one of the call numbers supplied by your network provider here. This will be used in outgoing calls as the calling party number in case no other number is available for the respective call. All call numbers supplied by your network provider are to be entered within the trunk and telephones configuration (DID field) primary CO access.'

- a) Select the option field **Use public number (DID)** in the **Call number assignment** area.
- b) Under **Default Number**, enter the phone number to be used for outgoing calls to subscribers who do not have their own phone number.
- c) If your ITSP supports the "Mobile Extension (MEX)" feature, enter the MEX number provided by the ITSP (8 positions, digits only) under **MEX Number**.

12. Assignment of Internet telephony phone numbers - Option 2:
Use internal number (Callno) / Single entries: You have an Internet telephony station connection and have received individual call numbers as Internet telephony phone numbers (e.g. 70005555, 70005556,...). Then assign these single numbers to the internal call numbers of the subscribers.

The screenshot shows the 'Internet Telephony Station for SIPGate' configuration window. The 'Call number assignment' section is active, showing a dropdown menu set to 'Use internal number (Callno) / Single entries'. Below this, there is a checkbox for 'ITSP-multiple route' and a text field for 'Default Number'. At the bottom, there is a 'Default Number' section with a note: 'Enter one of the call numbers supplied by your network provider here. This will be used in outgoing calls as the calling party number in case no other number is available for the respective call. All call numbers supplied by your network provider are to be entered within the trunk and telephones configuration (DID field) primary CO access.'

- a) Select the option field **Use internal number (Callno) / Single entries** in the **Call number assignment** area.

- b) In the **Internet Telephony Phone Numbers** area, enter one of the Internet telephony phone numbers provided by the ITSP in the field next to the **Add** button and then click **Add**.
- c) To assign further Internet telephony numbers to the account, repeat step b).

13. Assignment of Internet telephony phone numbers - Option 3:

Use internal number (Callno) / Range entry: You have an Internet telephony point-to-point connection and have received a call number range as Internet telephony phone numbers (e.g., +49) 89 7007-100 to (+49) 89 7007-147. You then assign the call numbers from the call number range as the internal call numbers of the subscribers.

- a) Select the option field **Use internal number (Callno) / Range entry** in the **Call number assignment** area.
- b) Enter the system phone number under **System phone number (prefix)**.
- c) Enter the desired DID number range for the Internet telephony station in the 'from' and 'to' fields after Direct inward dialing band. The range entered by default is 100 - 147.

14. Click on **OK & Next**.

- 15. If you want to configure additional accounts and their associated Internet telephony numbers, repeat steps 7 through 14.
- 16. Click **OK & Next**. You will see an overview of which Internet telephony phone numbers are assigned to accounts.
- 17. Assign one internal station number each to every Internet telephony phone number.

This step is not required if you have selected option 1 for the assignment of the Internet telephony phone numbers. In this case, the assignment is made when the configuring the stations (i.e., the telephones and subscribers) in the **DID** field.

- a) To do this, select an internal call number in the appropriate line from the **Internal Call Number** drop-down list.
- b) If subscribers without Internet telephony phone numbers or members of a call group are to be allowed to make external calls via the Internet, the radio button **Use as PABX number**

for outgoing calls must be activated. The radio button can be activated for only one single Internet telephony phone number.

18. Click **OK & Next**. Here you see again the list of predefined and newly added ITSPs. The enabled ITSPs are identified with a check mark in the **Enable Provider** column. If you are having connection problems with already activated ITSP, you can register it again with **Restart ITSP**.
19. Click **OK & Next**.
20. Enter the upload speed of your Internet connection in the **Upstream up to (Kbps)** field. Please do not confuse this with the download speed!

NOTICE: The number of simultaneous Internet calls permitted is displayed in the **Number of Simultaneous Internet calls** field. If the voice quality deteriorates due to the network load, you will need to reduce the number.

For more information about the number of simultaneous Internet calls, please refer to [Limiting the Number of Simultaneous Calls via an ITSP](#) on page 797.

21. Click **OK & Next**.
22. If you did not activate the full-time circuit when setting up your Internet access, you can now do this here. Without a permanent connection (full-time circuit), you cannot receive calls over the Internet. If the full-time circuit has already been set up, the fields described under a) to c) will not appear.
 - a) Enable the radio button **On** under **Full-Time Circuit**.
 - b) In the **Forced Disconnect at (hour:min)** field, enter the time at which the Internet connection is to be deactivated (e.g., 04:59).
 - c) Click **OK & Next**.
23. Enter the special numbers you want in the **Dialed digits** column.

Setup - Wizards - Basic Installation - Basic Installation

1 System Overview 2 Central Functions for Stations 3 ISDN Configuration 4 Configure Internet Access 5 Special phone numbers 6 Select a station 7 Configured Stations 8 SmartVM 9 Configure MeetLife Conference 10 Configure E-Mail Forwarding

Note:
Please make sure that all special call numbers are supported by the selected provider without fail.

Special phone number	Dialed digits	Dial over Provider
1	@C112	Sipgate ▼
2	@C110	Sipgate ▼
3	@C0137Z	Sipgate ▼
4	@C0138Z	Sipgate ▼
5	@C0900Z	Sipgate ▼
6	@C118Z	Sipgate ▼
7	@C116Z	Sipgate ▼
8	@C115	Sipgate ▼
9	@C010Z	Sipgate ▼

The following station number entries are valid:

- 0 to 9: allowed digits
- -: Field separator
- X: Any digit from 0 to 9
- N: Any digit from 2 to 9
- Z: One or more digits to follow up to the end of dialing
- C: Simulated dial tone (can be entered up to three times)

24. Use the **Dial over Provider** column to specify whether the special number should be dialed via ISDN or an ITSP. Only the active ITSP is displayed.

NOTICE: Ensure that emergency numbers can always be dialed. If you want to dial emergency numbers via an Internet Telephony Service Provider, you must make sure that the ITSP supports this feature.

25. Click **OK & Next**. The status of your ITSP will be displayed.

The configured ITSPs at which you are already registered are marked in green.

The configured ITSPs at which you are not yet registered are marked in orange.

26. Click **Next** followed by **Finish**.

5.7.6.2 How to Deactivate Internet Telephony

Prerequisites

You are in the **Provider configuration and activation for Internet Telephony** window of the **Basic Installation** wizard.

Step by Step

1. Leave the **No call via Internet** check box selected.
2. Click **OK & Next** twice.

5.7.7 Stations

In the **Select a station - ...** window, you can configure the stations connected to the communication system.

Proceed as follows:

1) Configure ISDN stations

ISDN stations include ISDN phones or ISDN fax devices, for example. ISDN stations can only be configured if an S₀ interface has been set up as the internal S₀ port.

2) Configure analog stations

Analog stations include analog phones or analog fax devices, for example.

3) Configure UP0 stations

UP0 stations include system phones such as OpenStage 60 T.

4) Configure DECT stations

DECT stations are Cordless/DECT phones. DECT stations can only be configured if one or more Cordless base stations are connected and if the DECT phones have been registered at the base stations. Manager E is used to perform the configuration. For more detailed information on the Cordless configuration, see [Configuring the Integrated Cordless Solution](#)

5) Configure the IP and SIP stations

IP and SIP stations include LAN phones or WLAN phones, for example.

5.7.7.1 How to Configure ISDN Stations

Prerequisites

You are in the **Select a station - ISDN Devices** window of the **Basic Installation** wizard.

The S₀ ports to which the ISDN phones are to be connected must be configured as internal S₀ports.

Box	Slot	S0-Port	Callno	First Name	Last Name	Display	DID	Fax Callno	Fax DID	Class of service	Call pickup
1	1	1	-	-	-	-	-	-	-	International	-
1	1	2	-	-	-	-	-	-	-	International	-

Step by Step

1. If you want a different direct inward dialing number for the station than the call number, enter a DID number for the station under **DID** in the row of the desired station:
 - Only for a point-to-point connection:

Click in the desired field and type in the DID number using the keyboard. The DID number may also be identical to the internal station number.
 - Only for a point-to-multipoint connection:

Select an MSN in the desired field via the drop-down list. The station can be internally reached via the internal station number 101, for example, and externally via the MSN 654321.
 - For point-to-point and point-to-multipoint connections:

Select the entry **xxx - modifiable** (xxx is the internal station number) via the drop-down list in the desired field and type in the DID number using the keyboard or select an MSN from the drop-down list.
2. Enter the internal station number for the subscriber under **Call No** in the appropriate row of the desired subscriber. You can use the preset phone number or assign some other free number.

3. In the row of the desired station, under **Name**, enter a name in the format **Last Name, First Name** or **First Name Last Name**.

NOTICE: The name can consist of up to 16 characters, but must not include any diacritical characters such as umlauts or special characters.

4. If you want to set up a fax box for the subscriber (which can be used with the UC clients **myPortal for Desktop** or **myPortal for Outlook**, for example), proceed as follows:
- In the row of the desired station, in the **Fax No.** field, enter the desired internal fax number at which the user can receive internal fax messages.
 - If you want to configure a DID number for the fax box, enter the desired external fax number under which the subscriber can receive external fax messages in the **Fax Direct Inward Dialing** field in the row of the desired subscriber.
5. Choose the desired Class of Service group in the row of the desired subscriber from the **Class of Service** drop-down list.
6. To add the subscriber to a call pickup group, select a call pickup group from the **Call pickup group** drop-down list in the row of the desired subscriber.
7. Make the settings described under this step only if needed:
- Click in the row of the desired ISDN station on the pencil icon **Edit**.

Setup - Wizards - Telephones / Subscribers - ISDN Devices

Change Station

- In the **Clip/Lin** field, enter a phone number (DID number or MSN) to be displayed at the called party's extension instead of the own phone number in the case of an external call.

NOTICE: This feature must be released by the network provider.

NOTICE: At least one DID number should be configured. If not, the system does not take into account caller's CLIP number and the internal call number is formatted and sent as the Calling Party Number for the external call.

- c) Select the type of ISDN terminal from the **Extension Type** drop-down list.
- d) Select a DID number from the drop-down list in the **Direct inward dialing for Internet Telephony** area. A drop-down list is displayed for every active ITSP.

NOTICE: The **DID for Internet Telephony** field is not visible if Internet telephony is not configured or if no Internet Telephony Service Provider has been activated.

- e) From the **Call signaling internal** drop-down list, select and assign one of a total of eight possible acoustic call signals for internal calls. The station then will then send the modified ringing tone to other internal stations, thus enabling its calls to be distinguished from other internal stations (default: Ring type 1).
 - f) From the **Call signaling external** drop-down list, select and assign one of a total of three possible acoustic call signals for external calls (default: Ring type 1).
 - g) Click on **OK & Next**.
 - h) Change the station flags as needed. For a description of the station flags, see [Station > Station Parameters](#).
 - i) Click on **OK & Next**.
8. If you want to configure additional ISDN stations, click on **Store data** and repeat steps 1 through 7.
9. Click on **OK & Next**.

5.7.7.2 How to Configure Analog Stations

Prerequisites

You are in the **Select a station - A/B Phones** window of the **Basic Installation** wizard.

A mainboard or a board with analog interfaces is available.

Setup - Wizards - Basic Installation - Basic Installation

1 System Overview 2 Central Functions for Stations 3 ISDN Configuration 4 Configure Internet Access 5 Provider configuration and activation for Internet Telephony 6 Select a station - A/B Phones 7 Configured Stations 8 SmartVM 9 Configure MeetMe Conference 10 Configure E-Mail Forwarding

☒ Take DID from changed call number

9. Click on **OK & Next**.

5.7.7.3 How to Configure UP0 Stations

Prerequisites

You are in the **Select a station - UP0 Stations** window of the **Basic Installation** wizard.

A mainboard or a board with UP0 interfaces is available.

Box	Slot	UP0-Port	CallNo	First Name	Last Name	Display	DID	Fax CallNo	Fax DID	Class of service	Call pickup
1	2	1 M	-	-	-	-	-	-	-	International	-
1	2	2 M	-	-	-	-	-	-	-	International	-
1	2	3 M	-	-	-	-	-	-	-	International	-
1	2	4 M	-	-	-	-	-	-	-	International	-
1	2	5 M	-	-	-	-	-	-	-	International	-
1	2	6 M	-	-	-	-	-	-	-	International	-
1	2	7 M	-	-	-	-	-	-	-	International	-
1	2	8 M	-	-	-	-	-	-	-	International	-
1	2	1 S	-	-	-	-	-	-	-	International	-
1	2	2 S	-	-	-	-	-	-	-	International	-

Step by Step

1. If you want a different direct inward dialing number for the station than the call number, enter a DID number for the station under **DID** in the row of the desired station:
 - Only for a point-to-point connection:

Click in the desired field and type in the DID number using the keyboard. The DID number may also be identical to the internal station number.
 - Only for a point-to-multipoint connection:

Select an MSN in the desired field via the drop-down list. The station can be internally reached via the internal station number 101, for example, and externally via the MSN 654321.
 - For point-to-point and point-to-multipoint connections:

Select the entry **xxx - modifiable** (xxx is the internal station number) via the drop-down list in the desired field and type in the DID number using the keyboard or select an MSN from the drop-down list.
2. Enter the internal station number for the subscriber under **Call No** in the appropriate row of the desired subscriber. You can use the preset phone number or assign some other free number.

3. In the row of the desired station, under **Name**, enter a name in the format **Last Name, First Name** or **First Name Last Name**.

NOTICE: The name can consist of up to 16 characters, but must not include any diacritical characters such as umlauts or special characters.

4. If you want to set up a fax box for the subscriber (which can be used with the UC clients **myPortal for Desktop** or **myPortal for Outlook**, for example), proceed as follows:
 - a) In the row of the desired station, in the **Fax No.** field, enter the desired internal fax number at which the user can receive internal fax messages.
 - b) If you want to configure a DID number for the fax box, enter the desired external fax number under which the subscriber can receive external fax messages in the **Fax Direct Inward Dialing** field in the row of the desired subscriber.
5. Choose the desired Class of Service group in the row of the desired subscriber from the **Class of Service** drop-down list.
6. To add the subscriber to a call pickup group, select a call pickup group from the **Call pickup group** drop-down list in the row of the desired subscriber.
7. Make the settings described under this step only if needed:
 - a) Click in the row of the desired station on the pencil icon **Edit**.

Voicemail

UC Smart Mailbox type:
 Recording: ☐
 Greeting:
 Password Reset: ☐

- b) In the **Clip/Lin** field, enter a phone number (DID number or MSN) to be displayed at the called party's extension instead of the own phone number in the case of an external call.

NOTICE: This feature must be released by the network provider.

NOTICE: At least one DID number should be configured. If not, the system does not take into account caller's CLIP number and the internal call number is formatted and sent as the Calling Party Number for the external call.

- c) Select the type of TDM terminal from the **Extension Type** drop-down list.
- d) Do not change the default selection in the **Language** drop-down list. This setting has no relevance for TDM terminals.
- e) Select a DID number from the drop-down list in the **Direct inward dialing for Internet Telephony** area. A drop-down list is displayed for every active ITSP.

NOTICE: The **DID for Internet Telephony** field is not visible if Internet telephony is not configured or if no Internet Telephony Service Provider has been activated.

- f) From the **Call signaling internal** drop-down list, select and assign one of a total of eight possible acoustic call signals for internal calls. The station then will then send the modified ringing tone to other internal stations, thus enabling its calls to be distinguished from other internal stations (default: Ring type 1).
 - g) From the **Call signaling external** drop-down list, select and assign one of a total of three possible acoustic call signals for external calls (default: Ring type 1).
 - h) Click on **OK & Next**.
 - i) Change the station flags as needed. For a description of the station flags, see [Station > Station > Station Parameters](#).
 - j) Click on **OK & Next**.
- 8.** If you want to configure another UP0 station, click on **Store data** and repeat steps [1](#) through [7](#).
- 9.** Click on **OK & Next**.

5.7.7.4 How to Configure DECT Stations

Prerequisites

You are in the **Select a station - DECT Stations** window of the **Basic Installation** wizard.

To configure DECT stations, a base station must be connected, and the DECT phones must be logged in there. If this is not the case, skip this window. You can also configure the DECT stations later (see [Configuring Stations](#)).

Initial Setup for OpenScape Business X

Setup - Wizards - Telephones / Subscribers - DECT phones

Add Station - DECT Stations

CMI data

System ID: 00000000

System ID	Slot	SLC No	Number of Phones	Add	SLC Call number	Access
-----------	------	--------	------------------	-----	-----------------	--------

Step by Step

1. If you want a different direct inward dialing number for the station than the call number, enter a DID number for the station under **DID** in the row of the desired station:
 - Only for a point-to-point connection:
Click in the desired field and type in the DID number using the keyboard. The DID number may also be identical to the internal station number.
 - Only for a point-to-multipoint connection:
Select an MSN in the desired field via the drop-down list. The station can be internally reached via the internal station number 101, for example, and externally via the MSN 654321.
 - For point-to-point and point-to-multipoint connections:
Select the entry **xxx - modifiable** (xxx is the internal station number) via the drop-down list in the desired field and type in the DID number using the keyboard or select an MSN from the drop-down list.
2. Enter the internal station number for the subscriber under **Call No** in the appropriate row of the desired subscriber. You can use the preset phone number or assign some other free number.
3. If you want to set up a fax box for the subscriber (which can be used with the UC clients **myPortal for Desktop** or **myPortal for Outlook**, for example), proceed as follows:
 - a) In the row of the desired station, in the **Fax No.** field, enter the desired internal fax number at which the user can receive internal fax messages.
 - b) If you want to configure a DID number for the fax box, enter the desired external fax number under which the subscriber can receive external fax messages in the **Fax Direct Inward Dialing** field in the row of the desired subscriber.
4. In the row of the desired station, under **Name**, enter a name in the format `Last Name, First Name` or `First Name Last Name`.

NOTICE: The name can consist of up to 16 characters, but must not include any diacritical characters such as umlauts or special characters.

5. Choose the desired Class of Service group in the row of the desired subscriber from the **Class of Service** drop-down list.
6. To add the subscriber to a call pickup group, select a call pickup group from the **Call pickup group** drop-down list in the row of the desired subscriber.

7. If you want to change the DECT phone code (PIN), enter the new code in the row of the desired subscriber under **Mobile code**. The DECT subscribers must log on at the base station again with this code.
8. Make the settings described under this step only if needed:
 - a) Click in the row of the desired station on the pencil icon **Edit**.

- b) In the **Clip/Lin** field, enter a phone number (DID number or MSN) to be displayed at the called party's extension instead of the own phone number in the case of an external call.

NOTICE: This feature must be released by the network provider.

NOTICE: At least one DID number should be configured. If not, the system does not take into account caller's CLIP number and the internal call number is formatted and sent as the Calling Party Number for the external call.

- c) Select the type of cordless device from the **Extension Type** drop-down list.
- d) Do not change the default selection in the **Language** drop-down list. This setting has no relevance for cordless devices.
- e) Select a DID number from the drop-down list in the **Direct inward dialing for Internet Telephony** area. A drop-down list is displayed for every active ITSP.

NOTICE: The **DID for Internet Telephony** field is not visible if Internet telephony is not

configured or if no Internet Telephony Service Provider has been activated.

- f) From the **Call signaling internal** drop-down list, select and assign one of a total of eight possible acoustic call signals for internal calls. The station then will then send the modified ringing tone to other internal stations, thus enabling its calls to be distinguished from other internal stations (default: Ring type 1).
 - g) From the **Call signaling external** drop-down list, select and assign one of a total of three possible acoustic call signals for external calls (default: Ring type 1).
 - h) Click on **OK & Next**.
 - i) Change the station flags as needed. For a description of the station flags, see [Station > Station > Station Parameters](#).
 - j) Click on **OK & Next**.
9. If you want to configure another station, click on **Store Data** and repeat steps 1 through 8.
 10. Click on **OK & Next**.

5.7.7.5 How to Configure IP and SIP Stations

Prerequisites

You are in the **Select a station - LAN Phones** window of the **Basic Installation** wizard.

A functional wireless LAN network is needed to operate WLAN phones.

Callno	First Name	Last Name	Display	DID	Type	Fax Callno	Fax DID	Class of service	Call pickup
pp00		s051000	s051000_pp00		System Client			International	
651001	hfa1	hfa1	hfa1_651001		System Client			International	
651002	hfa2	hfa2	hfa2_651002		System Client			International	
651003	hfa3	hfa3	hfa3_651003		System Client			International	
651004	hfa4	hfa4	hfa4_651004		System Client			International	
651005	hfa5	hfa5	hfa5_651005		System Client			International	
651007	hfa7	hfa7	hfa7_651007		System Client			International	
651009	hfa9	hfa9	hfa9_651009		System Client			International	
					No Port			International	
					No Port			International	

Step by Step

1. If you want a different direct inward dialing number for the station than the call number, enter a DID number for the station under **DID** in the row of the desired station:
 - Only for a point-to-point connection:

Click in the desired field and type in the DID number using the keyboard. The DID number may also be identical to the internal station number.
 - Only for a point-to-multipoint connection:

Select an MSN in the desired field via the drop-down list. The station can be internally reached via the internal station number 101, for example, and externally via the MSN 654321.
 - For point-to-point and point-to-multipoint connections:

Select the entry **xxx - modifiable** (xxx is the internal station number) via the drop-down list in the desired field and type in the DID number using the keyboard or select an MSN from the drop-down list.

2. Enter the internal station number for the subscriber under **Call No** in the appropriate row of the desired subscriber. You can use the preset phone number or assign some other free number.
3. In the row of the desired station, under **Name**, enter a name in the format `Last Name, First Name`.

NOTICE: The name can consist of up to 16 characters, but should not include any diacritical characters such as umlauts or special characters. The name specified here will be entered as the Last Name at the UC clients, but can be edited there.

4. Select the type of IP station (e.g., "System Client" or "SIP Client") from the **Type** drop-down list in the row of the desired station.
5. If you want to set up a fax box for the subscriber (which can be used with the UC clients **myPortal for Desktop** or **myPortal for Outlook**, for example), proceed as follows:
 - a) In the row of the desired station, in the **Fax No.** field, enter the desired internal fax number at which the user can receive internal fax messages.
 - b) If you want to configure a DID number for the fax box, enter the desired external fax number under which the subscriber can receive external fax messages in the **Fax Direct Inward Dialing** field in the row of the desired subscriber.
6. Choose the desired Class of Service group in the row of the desired subscriber from the **Class of Service** drop-down list.
7. To add the subscriber to a call pickup group, select a call pickup group from the **Call pickup group** drop-down list in the row of the desired subscriber.
8. Make the settings described under this step only if needed or for a SIP phone:
 - a) Click in the row of the desired station on the pencil icon **Edit**.

5.7.8 Configuring UC Suite

You can perform the automatic configuration of the UC solution UC Suite in the **Automatic Configuration of the Application Suite** window.

NOTICE: This window appears only if **Package with UC Suite** was selected during the application selection in the **Initial Installation** wizard.

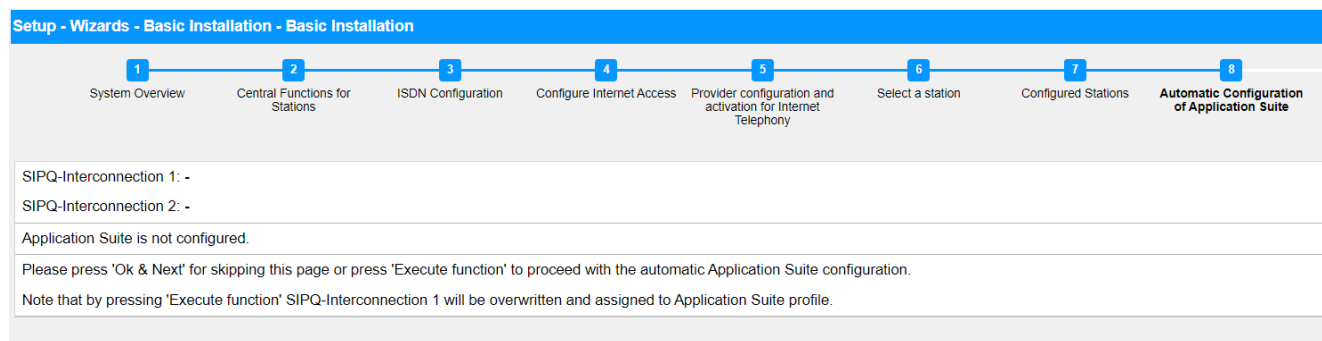

The automatic configuration of the UC solution UC Suite requires a number of free trunk lines which will be statically occupied for the application. This number depends on system specification capacities and is listed in section [Maximum values for lines](#) on page 1416 (see *MEB Trunk channels for UC Suite* in the tables). In case the overall limit of 250 trunks is exceeded, the configuration of the UC Suite is not possible.

5.7.8.1 How to Configure the UC Suite

Prerequisites

You are in the **Automatic Configuration of Application Suite** window of the **Basic Installation** wizard.

Initial Setup for OpenScape Business X

Step by Step

1. If no UC Booster Card is integrated into the communication system, click on **OK & Next**. The configuration will be skipped.
2. If the UC Booster Card is integrated into the communication system, click on **Execute function**. The UC Suite is configured automatically. Once the progress bar shows 100%, click on **OK & Next**.

5.7.9 Configuring UC Smart Mailboxes

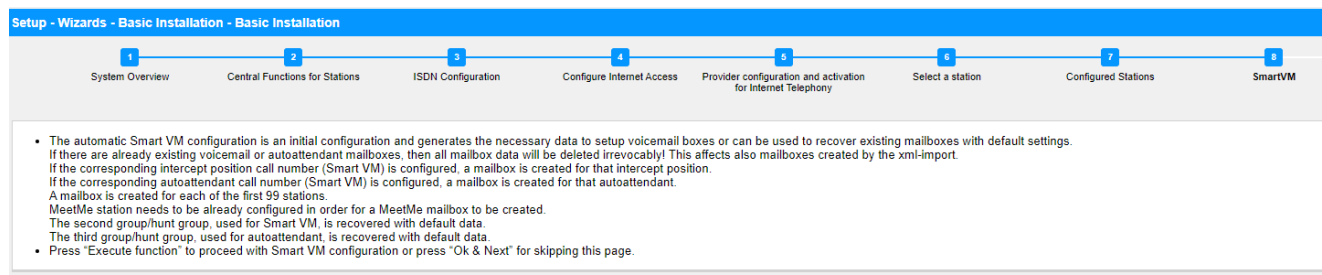

If you are using the UC solution UC Smart, you can perform the automatic configuration of the UC Smart voicemail boxes (Smart VM, Smart VoiceMail) in the **Automatic Configuration of Smart VM** window.

NOTICE: This window appears only if **Package with UC Smart** was selected during the application selection in the **Initial Installation** wizard.

5.7.9.1 How to Configure UC Smart Voicemail Boxes

Prerequisites

You are in the **Automatic Configuration of Smart VM** window of the **Basic Installation** wizard.

Step by Step

1. If the UC Smart voicemail boxes are not to be used, click on **OK & Next**. The configuration of the voicemail boxes will be skipped.
2. If the UC Smart voicemail boxes are to be used, click on **Execute function**. Voicemail boxes are then automatically configured for the first 100 subscribers. Once the progress bar shows 100%, click on **OK & Next**.

NOTICE: Existing UC Smart or UC Smart AutoAttendant voicemail boxes are irrevocably deleted in the process.

5.7.10 Conference Server Settings

The **MeetMe Conference** settings window can be used to define the call numbers and the dial-in numbers for conferences.

5.7.10.1 How to Edit the Conference Server Settings

Prerequisites

You are in the **Configure MeetMe Conference** window of the **Basic Installation** wizard.

Setup - Wizards - Basic Installation - Basic Installation

1 System Overview 2 Central Functions for Stations 3 ISDN Configuration 4 Configure Internet Access 5 Provider configuration and activation for Internet Telephony 6 Select a station 7 Configured Stations 8 Automatic Configuration of Application Suite 9 **Configure MeetMe Conference**

Call number:

Direct inward dialing:

(Number for Direct Inward Dialing)

Step by Step

1. Enter a phone number for the conference in the **Phone Number** field.
2. Enter the dial-in number for the conference (conference DID) with which subscribers can dial into an existing conference in the **Direct inward dialing** field.
3. Click on **OK & Next**.

5.7.11 E-mail Delivery (Optional)

You can configure the delivery of e-mails in the **Configure E-Mail Forwarding** window. These e-mails notify users of voicemail and fax messages and administrators of system messages.

You have the following options:

- Configuring the Sending of E-mails

You can specify an external E-mail server via which the e-mails are to be sent by OpenScape Business. Voicemails, fax messages and internal system messages can then be sent via this E-mail server to one or several different configurable e-mail addresses.

NOTICE: Entering the e-mail server is important if an e-mail with a link to the installation file(s) is to be automatically sent to the users of the UC Suite.

5.7.11.1 How to Configure the Sending of E-mails

Prerequisites

If the external E-mail server has been configured to use basic authentication, make sure an e-mail account with a password exists with an e-mail provider, and you know the access data for this account.

If the external E-mail server has been configured to use modern authentication (Microsoft OAuth 2.0 token-based authorization), as in the case of Exchange Online, make sure that:

- The sender's email account must be allowed to use Authenticated SMTP (by default this option is inactive in Microsoft 365 tenant). Once Authenticated SMTP is activated, the OAUTH 2.0 email forwarding works normally with all OpenScape Business mainboards.
- An application with the required permissions has been registered in Microsoft Azure Active Directory (Azure AD) for your OpenScape Business system to send emails.
- You know the Application (client) ID and the Directory (tenant) ID of the registered application.

Ask your Azure AD administrator to provide these values, if required.

- The email address that will appear as the sender of the emails belongs to the same Azure AD or tenant as the registered application.

You are in the **Configure E-Mail Forwarding** window of the **Basic Installation** wizard.

Figure 6: E-mail forwarding options when basic authentication method is selected

Step by Step

1. Enter the **Outgoing mail server (SMTP)** for the e-mail server to be used for sending e-mails, e.g., `smtp.web.de`. Ask your e-mail provider for the outgoing mail server if required.

NOTICE: Make sure that the name of the outgoing mail server can be resolved. If not, you must start the e-mail sending function via **Service Center > E-mail Forwarding** and then enter the IP address of the outgoing mail server instead of its name.

2. Enter the **Outgoing mail server port** for the server port to be used for sending e-mails. Ask your e-mail provider for the outgoing mail server if required.
3. If a secure connection is required, enable the **This server requires an encrypted connection (TLS/SSL)** check box. If required, check with your e-mail provider whether this option needs to be enabled.
4. If the external E-mail server has been configured to use basic authentication, proceed as follows:
 - a) From the **Authentication method** drop-down list, select **Basic**.
 - b) Enter the **User Name** of the e-mail account, e.g.,: `john.doe`.
 - c) Enter the **Password** for the e-mail account and repeat it in the **Confirm Password** field.
5. If the external E-mail server has been configured to use modern authentication, proceed as follows:
 - a) From the **Authentication method** drop-down list, select **Microsoft OAuth 2.0**.
 - b) Enter the Application (client) ID obtained from the Microsoft Azure portal in the **Application ID** field.

- c) Enter the Directory (tenant) ID obtained from the Microsoft Azure portal in the **Tenant** field.
6. Enter the **E-mail Address** that will appear as the sender of the emails, for example: john.doe@web.de.
7. Enter the **E-mail Address 1** to get a notification email when ALI tolerance has been used. You may also enter a second email address in the **E-mail Address 2** field.
8. In the **Emergency Recipient** field, enter the e-mail address of an on-site security officer to which an e-mail is sent when an emergency number is dialed.

The subject of the e-mail will be "New emergency call". The call number and the name of the caller, if configured, are included in the e-mail which are retrieved from the database of the system.
9. If you have selected **Microsoft OAuth 2.0** as authentication method, proceed as follows:
 - a) Click on **OK & Next**.
 - b) Wait for an authorization link and user code to appear.

The authorization code expires after some minutes.
 - c) Open the authorization link and enter the user code on the pop-up.
 - d) Sign in with the email address you have entered in step 6 on page 190 (**E-mail Address**).

The email address must be in the same Azure AD or tenant as the registered application.
 - e) After successful authentication, the pop-up displays a message as below:

You have signed in to the <application-name> on your device. You may now close this window..
 - f) Close the pop-up and return to WBM. If the authentication was successful, you will see the message The authentication was successful!.
10. If you want to check the entered e-mail settings, proceed as follows:
 - a) Click on **Check e-mail forwarding**.
 - b) Under **Send to e-mail address**, enter the e-mail address of any e-mail box that you can access. The test e-mail will be sent to that e-mail address.
 - c) Under **Subject in the e-mail**, enter a descriptive text so that you can identify the e-mail in your e-mail inbox.
 - d) Click on **Send Test E-mail**. The e-mail settings are verified, and the e-mail is sent to the specified e-mail address.
 - e) Check whether the e-mail has arrived in your e-mail inbox.
 - f) If the e-mail was sent correctly, click **Back** and proceed to the next step.
 - g) If the e-mail delivery failed, click **Back** and correct your e-mail settings.
11. Click on **OK & Next** followed by **Finish**. The basic installation is finished. Before you perform the backup mentioned in the wizard, you should activate the licenses.

5.8 Closing Activities

After the initial installation and the basic installation with the WBM have been completed, some important settings must still be made for the operation of OpenScape Business.

Proceed as follows:

1) Activate and assign licenses

The licenses procured with OpenScape Business must be activated within a period of 30 days. The time period begins the next time you log on to the WBM. After this time period expires, the communication system will only operate in restricted mode. Once the licenses have been activated successfully, they must be assigned to the stations and lines. In a standalone system, system-wide features are enabled automatically upon activation.

2) Provision the UC Smart client for installation (only for UC Smart)

3) How to Provision the UC Suite Clients for Installation (for UC Suite only)

The UC Suite clients are part of UC Suite. The installation files for the UC Client are accessible via the WBM and can be made available to the IP stations automatically or manually.

In addition, the administrator has the option of performing a silent installation. The silent installation/uninstallation is a command-line based method to automatically install, uninstall or modify UC Suite PC clients on a PC without requiring any further user inputs. For more information, see [Silent Installation/Uninstallation for UC Suite PC Clients](#).

4) Perform a data backup

All previous changes to OpenScape Business must be backed up. The backup can be stored as a backup set on a USB storage device or in the internal network.

5.8.1 How to Activate and Assign the Licenses

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

You know the LAC (License Authorization Code) for releasing the license and have a user ID and password for accessing the license server.

You need Internet access to connect to the license server.

Step by Step

1. Activate license online:

- a) In the navigation bar, click on **Setup**.
- b) In the navigation tree, click **Wizards > Basic Installation**.
- c) Click on **Edit** to start the **Licensing** wizard.

Initial Setup for OpenScape Business X

Setup - Wizards - Basic Installation - Licensing

Activate License Online

Licenses with Locking ID: 00-1a-e8-5d-37-81

License Authorization Code (LAC)

I have the user name and password for the License Server and want to log on. ☒

User name

Password

Note: The response from the License Server can take up to 90 seconds !

Please enter the registration data first. Only then can the license file be activated.

- d) Enter the appropriate LAC in the **License Authorization Code (LAC)** field.
 - e) Select the check box **I have the user name and password for the License Server and want to log on.**
 - f) Enter the **User Name** and **Password** for logging into the License Server.
 - g) Click on **OK & Next**. The connection to the license server is established, and the licenses are released.
- 2. Assign licenses to stations:**
- a) Click on **License Management** in the navigation bar.
 - b) In the navigation tree, navigate to the desired type of subscriber under **Local User Licenses** > You will be shown a list of all subscribers of the selected subscriber type.
 - c) In the row of the desired subscriber, select the check box in the **User license** column (first column with check boxes).

Abort Apply

- d) Activate the user-oriented licenses in the row of the desired subscriber by selecting the appropriate check boxes.

NOTICE: User-oriented licenses can be assigned to a subscriber only if a station license (user license) was assigned to the subscriber earlier (step c).

- e) Click on **OK & Next**. A check is performed to determine whether there are enough licenses for your assignment.
If sufficient licenses are available, the licensing of the subscriber is completed.
- f) If licenses are missing, the errors are indicated by displaying a check box shaded in red. Correct these errors and repeat step e.

3. Assign licenses to trunks:

- a) In the navigation tree, click **CO trunks**. The number of trunk licenses purchased will be displayed in the **CO trunks** area.
- b) For SIP trunks: In the **License demand for number of simultaneous Internet calls in this node** area, enter the number of Internet calls that can be conducted simultaneously via an ITSP.
- c) For S_{2M} trunks: In the **S2M** area, in the row of the desired slot, select the number of desired B-channels in the drop-down list of the **Demands** column.
- d) For T1 trunks (only for the U.S.): In the **T1** area, in the row of the desired slot, select the number of desired B-channels in the drop-down list of the **Demands** column.
- e) Click on **OK & Next**.

NOTICE: The number of licensed SIP trunks and S_{2M}/T1 trunks must not exceed the number of trunk licenses purchased.

5.8.2 How to Provision the UC Smart Client for Installation

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

The hardware and software for using UC @work are available.

NOTICE: Licenses are required to use the UC Smart client myPortal @work.

Step by Step

1. Click on **Service Center** in the navigation bar.
2. Click on **Software** in the navigation tree.
3. Click on the Download icon of **myPortal @work** and save the installation file on a shared network drive.
4. Send the two installation files to the users of myPortal @work.

- Alternatively, you can also send the users of myPortal @work the link with which they can access the installation file:

```
https://<IP address of the communication system>/  
management/downloads/myPortalAtWorkSetup.exe
```

5.8.3 How to Provision the UC Suite Clients for Installation

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

The hardware and software for using the UC Suite are available.

NOTICE: Licenses are required to use the UC Suite clients.

Step by Step

- To enable the installation files to be provided automatically to a station, make sure that the following steps have been performed:
 - The e-mail addresses of the stations and the associated subscriber data must have either been already imported via an XML file or entered later under **Setup > UC Suite > User Directory**.
 - An e-mail server must have been specified.

NOTICE: You can also enter an E-mail server later under **Service Center > E-mail Forwarding**.

All subscribers whose e-mail addresses are known receive an e-mail with a link to the installation directory of the UC clients and Getting Started Instructions. The installation folder also includes a Readme file with information on installing the software on client PCs.

- If the required steps for automatic notification are not fulfilled, you can also make the installation files available manually. To do this, proceed as follows:
 - Click on **Service Center** in the navigation bar.
 - Click on **Software** in the navigation tree.
 - Click on the desired UC client and save the zipped installation file on a shared network drive.
 - Click in the navigation tree on **Documents** and select **User Documentation** from the drop-down list.
 - Click on the documentation of the desired UC client and save the documentation file on a shared network drive.
 - Send the zipped installation file and the documentation file to the users of the UC clients by e-mail or inform the users about the storage location of these files.
 - The zip file with the installation files also includes a Readme file. Notify the users that the installation of the UC clients must

be performed in accordance with the installation notes in the Readme file.

3. Alternatively, you can also send the UC users links through which they can directly access the installation files of the UC clients.
 - a) Click on **Service Center** in the navigation bar.
 - b) Click on **Software** in the navigation tree.
 - c) Click on the **Show Application Links** button. You will be presented with multiple links, depending on the used operating system and the desired UC client. For example:

```
https://<IP address of the communication system>/  
management/downloads/install-common.zip
```

5.8.4 How to Perform a Data Backup

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

For a backup to a USB storage device (USB stick or USB hard disk), the USB device must be connected to the USB server port.

NOTICE: For more information on backing up data, see [Immediate Backup](#) .

Step by Step

1. Click on **Backup and Restore** in the navigation bar.
2. In the navigation tree, click **Backup - Immediate**.
3. Enter a comment for the backup set in the **Comment** field in the **Name** area so that the backup set can be easily identified if needed later for a restore. Avoid the use of diacritical characters such as umlauts and special characters in your input.
4. Activate the target drive on which the backup set is to be saved in the **Devices** area.
5. Click on **OK & Next**. The progress of the backup process is displayed in a separate window.
6. The backup was successful if the message **Backup completed successfully!** appears. Click on **Finish**.
7. If you are using a USB stick as the backup medium, wait until the LED of the USB stick stops blinking. This ensures that the backup has been successfully saved on the USB stick. You can then safely remove the USB stick.
8. This completes the initial startup with WBM. Exit the WBM by right-clicking the **Logout** link on the top right of the screen and then close the window.

NOTICE: If a new software version for the communication system is available, you will be notified about this on the home page of the WBM, provided the Internet connection was set up correctly. If a new software version is available,

perform an update (see [Updating the Communication System](#)).

5.9 Commissioning of IP Phones

The commissioning of IP phones can be facilitated by the existence of a DHCP server that supplies an IP phone with important (network-specific) data that is needed to log into the communication system.

Network-Specific Data

In order to log into the communication system, an IP phone requires some network-specific data. This data can be stored in the DHCP server or be entered directly at the IP phone. The advantage of a DHCP server is that all connected IP phones are automatically supplied with the relevant data.

The following data is required by the IP phone:

- IP address of the communication system
- IP address of DLS server

In addition, the IP phone needs its own call number. This must be entered manually when logging in at the phone.

Registration of SIP Phones

For security reasons, it is recommended that SIP phones register at the communication system. To do this, the registration information on the IP phone and the communication system must match.

The following data is required for the login:

- SIP user ID
- SIP password
- SIP realm (optional)

Use a non-trivial SIP password that complies with the following rules:

- At least 8 characters
- At least one uppercase letter (A - Z)
- At least one lowercase letter (a - z)
- At least one digit (0-9)
- At least one special character

Use a SIP user ID that does not include the phone number.

NOTICE: More information on configuring SIP telephones can be found at http://wiki.unify.com/wiki/SIP_devices_configuration_examples.

Using the Internal DHCP Server

If the internal DHCP server of the communication system is used, the network-specific data will already be stored there. In order to enable an IP phone to register at the communication system, only the specified call number must be entered at the IP phone. In the case

of SIP phones, the SIP registration data at the SIP phone and at the communication system must match.

Using an External DHCP Server with Network-specific Data

If an external DHCP server is used, the network-specific data must be stored there. In order to enable an IP phone to register at the communication system, only the specified call number must be entered at the IP phone. In the case of SIP phones, the SIP registration data at the SIP phone and at the communication system must match.

Using an External DHCP Server without Network-specific Data

If an external DHCP server in which the network-specific data cannot be stored is used, this must be entered at the IP phone. To enable an IP phone to register at the communication system, the defined call number and IP address of the communication system must be entered at the phone, and the settings for the Deployment Service may need to be changed. In the case of SIP phones, the SIP registration data at the SIP phone and at the communication system must match.

5.9.1 How to Configure an IP Phone

Prerequisites

The IP phone is connected to the internal network and operational.

NOTICE: The sample configuration described here uses an OpenStage 40/60/80 IP system telephone. The same settings must also be made for any other IP phone. For more information, refer to the manual supplied with your IP phone.

Step by Step

1. To reach the administration mode of the IP system telephone, press the appropriate key for the Settings/Applications menu on the phone.
2. Scroll through the `Settings` options until `Admin` and confirm this with the OK key.
3. Enter administrator password (123456 by default) and confirm your selection with the OK key.
4. If you are using the DHCP server of the communication system in the internal network, skip the next step.
5. If you are not using the DHCP server of the communication system in the internal network, you will need to enter the IP addresses of the Deployment Server (DLS) and the communication system so that the software of the IP system telephone can be updated automatically. This applies only to IP system telephones. Proceed as follows:
 - a) Scroll to `Network` and confirm your selection with the OK key.

- b) Scroll to `Update service (DLS)` and confirm your selection with the OK key.
 - c) Scroll to `DLS address` and confirm your selection with the OK key.
 - d) Specify the IP address of the communication system (`192.168.1.2` by default) as the Deployment Server and confirm your entry with the OK key.
 - e) Scroll to `Save & Exit` and confirm your selection with the OK key.
 - f) Scroll to `IPv4 configuration` and confirm your selection with the OK key.
 - g) Scroll to `Route (default)` and confirm your selection with the OK key.
 - h) Specify the IP address of the communication system (`192.168.1.2` by default) and confirm your entry with the OK key.
 - i) Scroll to `Save & Exit` and confirm your selection with the OK key.
 - j) Navigate one menu level back with the Back key.
6. Specify the call number of the phone:
- a) Scroll to `System` and confirm your selection with the OK key.
 - b) Scroll to `Identity` and confirm your selection with the OK key.
 - c) Scroll to `Terminal number` and confirm your selection with the OK key.
 - d) Enter the set phone number (e.g., `120`) and confirm your selection with the OK key.
 - e) Scroll to `Save & Exit` and confirm your selection with the OK key.
7. Navigate one menu level back with the Back key.
8. If the system telephone needs to be restarted due to the changes made, the menu item `Restart` will appear in the `Admin` menu. Confirm the `Restart` with the OK key and then also confirm `Yes` with the OK key. The system telephone performs a reboot and logs in to the communication system.

5.9.2 How to Configure a SIP Phone

Prerequisites

The SIP phone is connected to the customer LAN and operational.

NOTICE: The configuration described here uses an OpenStage 40/60/80 SIP system telephone as an example. The same settings must also be made for another SIP phone. For more information, refer to the manual supplied with your SIP phone.

Step by Step

1. To reach the administration mode of the SIP system telephone, press the appropriate key for the Settings/Applications menu on the phone.
2. Scroll through the `Settings` options until `Administrator (Admin)` and confirm this with the OK key.
3. Enter administrator password (123456 by default) and confirm your selection with the OK key.
4. If you are using the DHCP server of the communication system in the internal network, skip the next step.
5. If you are not using the DHCP server of the communication system in the internal network, you will need to enter the IP addresses of the Deployment Server (DLS) and the communication system so that the software of the SIP system telephone can be updated automatically. This applies only to SIP system telephones. Proceed as follows:
 - a) Scroll to `Network` and confirm your selection with the OK key.
 - b) Scroll to `Update service (DLS)` and confirm your selection with the OK key.
 - c) Scroll to `DLS address` and confirm your selection with the OK key.
 - d) Specify the IP address of the communication system (192.168.1.2 by default) as the Deployment Server and confirm your entry with the OK key.
 - e) Scroll to `Save & Exit` and confirm your selection with the OK key.
 - f) Scroll to `IPv4 configuration` and confirm your selection with the OK key.
 - g) Scroll to `Route (default)` and confirm your selection with the OK key.
 - h) Specify the IP address of the communication system (192.168.1.2 by default) and confirm your entry with the OK key.
 - i) Scroll to `Save & Exit` and confirm your selection with the OK key.
 - j) Navigate one menu level back with the Back key.
6. Specify the SNTP time settings:
 - a) Scroll to `Date and time` and confirm your selection with the OK key.
 - b) Scroll to `Time source` and confirm your selection with the OK key.
 - c) Scroll to `SNTP IP address` and confirm your selection with the OK key.
 - d) Specify the IP address of the communication system (192.168.1.2 by default) and confirm your entry with the OK key.
 - e) Scroll to `Timezone offset` and confirm your selection with the OK key.
 - f) Enter the deviation between the local time and UTC (Universal Time Coordinated) in hours (Germany: 1) and confirm this with the OK button.

Initial Setup for OpenScape Business X

How to collect diagnostic traces for error incident

- g) Scroll to `Save & Exit` and confirm your selection with the OK key.
- h) Navigate one menu level back with the Back key.
- 7. Specify the call number of the phone:
 - a) Scroll to `System` and confirm your selection with the OK key.
 - b) Scroll to `Identity` and confirm your selection with the OK key.
 - c) Scroll to `Terminal number` and confirm your selection with the OK key.
 - d) Enter the set phone number (e.g., 120) and confirm your selection with the OK key.
 - e) Scroll to `Save & Exit` and confirm your selection with the OK key.
- 8. Specify the SIP authentication data:
 - a) Scroll to `Registration` and confirm your selection with the OK key.
 - b) Scroll to `SIP Session` and confirm your selection with the OK key.
 - c) Note the `Realm`, or enter a new realm (e.g., `OSBIZ-SIP`), if necessary.
 - d) Note the `User ID`, or enter a new user ID (e.g., `SIP-120`), if necessary.
 - e) Specify a `Password` for registering at the SIP server.
 - f) Scroll to `Save & Exit` and confirm your selection with the OK key.
- 9. Use the Back key to go back to the `Admin` menu.
- 10. If the system telephone needs to be restarted due to the changes made, the menu item `Restart` will appear in the `Admin` menu. Confirm the `Restart` with the OK key and then also confirm `Yes` with the OK key. The system telephone performs a reboot and logs in to the communication system.

5.10 How to collect diagnostic traces for error incident

You can automatically collect the necessary diagnostic traces data for an error incident. The **Error Management** wizard will guide you through the whole process.

You must run the **Error Management** wizard twice: before and after the execution of the problematic scenario. During the first run (Phase 1), you activate the diagnostic traces collection. After execution of the problematic scenario, run the wizard again to collect the diagnostic trace data (Phase 2). Once the Phase 2 is complete, you can download the trace file to include them in the ticket system.

Perform the following steps to collect the diagnostic trace data for the error incident:

Step by Step

1. In the navigation bar, click on **Setup**.
2. Click on **Edit** next to **Error Management**.

3. Click on **OK & Next**
4. If you want to collect the Default Traces click on the **Default Traces** check-box.
5. If you want to specify the types of traces to collect, select the desired ones from the list of traces. More than one selection is possible.
For more information about the traces, see the Troubleshooting guide.
6. Click **OK & Next**.
7. A list with additional information, relevant documentation and hints is displayed. Click **OK & Next**.
8. The scenarios and type of traces that you will collect are displayed. Click **Finish**.
9. Continue by executing the problematic scenario.
10. Once you complete the scenario navigate again to **Setup > Error Management** and click **Edit**.
You are redirected to the Step 2 of the diagnostic traces collection. If you want to stop the process and initiate it again you can click the **Abort** button.
11. Click **OK & Next**.
12. Enter the required information and click **OK & Next**.
13. A list with necessary information and some further actions is displayed.
14. Click **OK & Next**.
15. Click **Finish** to start downloading the diagnostic trace data.

5.11 Reflashing

Following the steps below you can easily change the software type of a device.

The concept behind this feature is to simplify the way of getting a SIP device (out of the box) and registering it to OSBiz system as an HFA device. The only requirements are:

- the phone must get the DLI address (either from DHCP server or manually)
- the administrator must enter the phone's number (which must be preconfigured as a System Client)

Once the customer gets a new device it will be pre-configured as a SIP device(factory settings). The steps to reflash this device to an HFA device are as follows:

Step by Step

1. Configure in the OSBIZ database the desired phone number as a System Client (HFA).

Initial Setup for OpenScape Business X

Callno	DID	First Name	Last Name	Display	Type	Clip/Lin
ppc0	x651000	hfa1	hfa1, 651001	System Client	-	
651001	hfa2	hfa2, 651002	System Client	-		
651002	hfa3	hfa3, 651003	System Client	-		
651003	hfa4	hfa4, 651004	System Client	-		
651004	hfa5	hfa5, 651005	System Client	-		
651005	hfa7	hfa7, 651007	System Client	-		
651007	hfa9	hfa9, 651009	System Client	-		
-	-	-	-	No Port	-	
-	-	-	-	No Port	-	
-	-	-	-	No Port	-	
justle	Sip	Sip, justle	SIP Client	-		
justle	WebRTC	WebRTC, justle	System Client	-		
-	-	-	-	No Port	-	

- Configure the DHCP server to send the IP address of DLI. This can be done either at the external DHCP Server or the internal DHCP server.

Global Parameters

Enable DHCP Server: ☒

Netmask: 255.255.255.0

Broadcast Address: 0.0.0.0 (optional)

Default Gateway

Gateway 1: 192.168.1.2

Gateway 2: 0.0.0.0

Gateway 3: 0.0.0.0

DNS Server

Domain Name:

Server 1: 192.168.1.2

Server 2: 0.0.0.0

Server 3: 0.0.0.0

Lease time in hours (0 infinite): 1

Enable Dynamic DNS Update: ☐

Use Internal DLI: ☒

- If there is no DHCP server used, then you must configure the DLI IP on the phone manually.
- Once the SIP phone gets an IP and the DLI IP, the phone device will be registered into the DLI database, and a prompt will be displayed to enter the extension number.
- Enter the terminal number on the phone (the number should be the same configured in the first step, e.g. 4111).
- The reflash will start and the new HFA image will be downloaded to the phone. When the phone reboots it will be registered as an HFA phone and the plug and play data will be sent by the system towards the phone.
- To reflash an already registered SIP phone:**
- Change the working SIP device to "System Client".

-	-	justle	WebRTC	WebRTC, justle	System Client	-
-	-	-	-	-	No Port	-

9. Restart the phone

10. The reflash will start and the new HFA image will be downloaded to the phone. When the phone reboots it will be registered as an HFA phone and the plug and play data will be sent by the system towards the phone.

6 Initial Setup for OpenScape Business S

The initial setup of OpenScape Business S (also referred to as the Softswitch in short) is described here. This includes the integrating the softswitch and related components into the existing customer LAN as well as setting up Internet access for Internet telephony and configuring the connected stations.

For OpenScape Business S, the OpenScape Business communication software is installed on the Linux operating system SLES 12 SP5 64 bit. The communication software can be operated directly on a Linux server or in a virtual environment with VMware vSphere or Microsoft Hyper-V. The installation of the Linux operating system is described in the installation guide *OpenScape Business, Installing the Linux Server*.

The initial setup of OpenScape Business S is carried out using the OpenScape Business Assistant administration program (web-based management, also called WBM in short).

This section describes the configuration of the most common components. Not all of these components may be used by you. During the initial setup, you may need to choose between multiple options in some places or even skip some configurations entirely, depending on which components you use.

The detailed administration of any features that are not covered by the initial setup is described in subsequent chapters.

The initial setup requires the creation of an IP address scheme and a dial plan.

Summary of the most important installation steps:

- System settings
- System Phone Numbers and Networking
- Internet Telephony
- Station configuration
- Licensing
- System hardening
- Data backup

6.1 Prerequisites for the Initial Setup

Meeting the prerequisites for the initial setup ensures the proper operation of OpenScape Business S.

General

Depending on the used hardware (phones, ...) and the existing infrastructure, the following general conditions apply:

- The LAN infrastructure (Internet routers, switches, etc.) is present and usable.
- The IP phones are connected to the customer LAN.

- The Linux server required for OpenScape Business S was installed as per the instructions in the *OpenScape Business Linux Server Installation Guide*, was integrated into the customer LAN, and is ready for use.
- All licenses required for OpenScape Business S are present (e.g., UC clients, Directory Services, etc.).
- An IP address scheme exists and is known.
- A dial plan (also called a numbering plan) is present and known.

Software

The following software is required for the installation of OpenScape Business S:

- DVD or .ISO image with the OpenScape Business communication software

Contains the OpenScape Business communication software. This DVD or .ISO image is included in the delivery package.

- DVD with Linux operating system SLES 12 SP5

The Linux DVD may be needed during the installation of the OpenScape Business communication software, since some software packages (RPM) required for the communication software may need to be installed later from this DVD or .ISO image.

Administration

For the initial setup of OpenScape Business S with the OpenScape Business Assistant (WBM), the Linux server or the Admin PC can be used. The WBM is browser-based and is thus independent of the operating system.

- Web browsers:

The following HTML 5-enabled web browsers are supported:

- Microsoft Internet Explorer Version 11 and later (Admin PC).
- Microsoft Edge
- Mozilla Firefox Version 37.x and 38.x
- Mozilla Firefox ESR Version 24.x and 31.x
- Google Chrome

If an older version of the web browser is installed, you will need to install an up-to-date version before you can start the initial setup of the system.

- Java:

Oracle Java 8 or higher or alternatively OpenJDK 8 must be installed. If an older version is installed, you will need to update it to the latest version before you can start setting up the system for the first time.

- Screen resolution: 1024x768 or higher

Firewall

When connected to the Internet, a firewall is needed for the Linux server to prevent unauthorized access from outside. After installing Linux, the Linux firewall is enabled. The installer of the

communication software adjusts the firewall settings so that the communication software can be operated properly. The ports for the communication software are opened, and all other ports are closed.

If an external firewall is used in the network, the Linux firewall must be disabled, and the addresses and ports required for the communication software must be opened (see [Used Ports](#)).

Internet Access

The Server PC must have broadband Internet access for:

- Security patches and general Linux software updates

OpenScape Business requires an Internet connection for:

- OpenScape Business software updates
- OpenScape Business features such as Internet telephony, for example
- OpenScape Business Mobility Clients such as myPortal to go, for example
- Remote Service

E-mail Server (Optional)

OpenScape Business requires access to an e-mail server in order to send e-mails. For this purpose, the access data to the E-mail server must be entered in OpenScape Business, and the relevant accounts (IP address, URL, login data of the E-mail server) must be set up in the E-mail server.

If the e-mail functionality is not used within OpenScape Business, this data need not be entered.

Internet Telephony, VoIP (Optional)

If Internet telephony is used within OpenScape Business, then OpenScape Business will require broadband access to the Internet and to an Internet Telephony Service Provider (ITSP, SIP Provider) for SIP telephony over the Internet. To do this, the appropriate accounts must be obtained from the ITSP, and the access data for the ITSP (IP address, URL, login data of the SIP Provider) must be set up in OpenScape Business.

Second LAN Port

If OpenScape Business S (or the Linux server) has a second LAN port, you can use this as a WAN interface for Internet access and Internet telephony via an ITSP. The first LAN port is used as usual as a LAN interface for the internal phones and PCs. The configuration of Internet access occurs in the external Internet router of the customer LAN. The setup of the second LAN port occurs directly during the initial setup of Linux or can be performed later using YaST. In the WBM, the second LAN port only needs to be activated as a WAN interface.

Fax as PDF

If faxes are to be saved in PDF format, the server PC requires at least 4 GB RAM. If OpenScape Business S is being operated in a virtual environment, the virtual machine must also be assigned 4GB RAM.

6.2 Components

The various components of the installation example are described and outlined below.

The installation example includes the following components:

- OpenScape Business S

The Linux server with the OpenScape Business S communication software is integrated in the existing customer LAN via its LAN interface.

- Admin PC

The admin PC is also integrated in the existing customer LAN via its LAN interface.

- IP stations (IP clients)

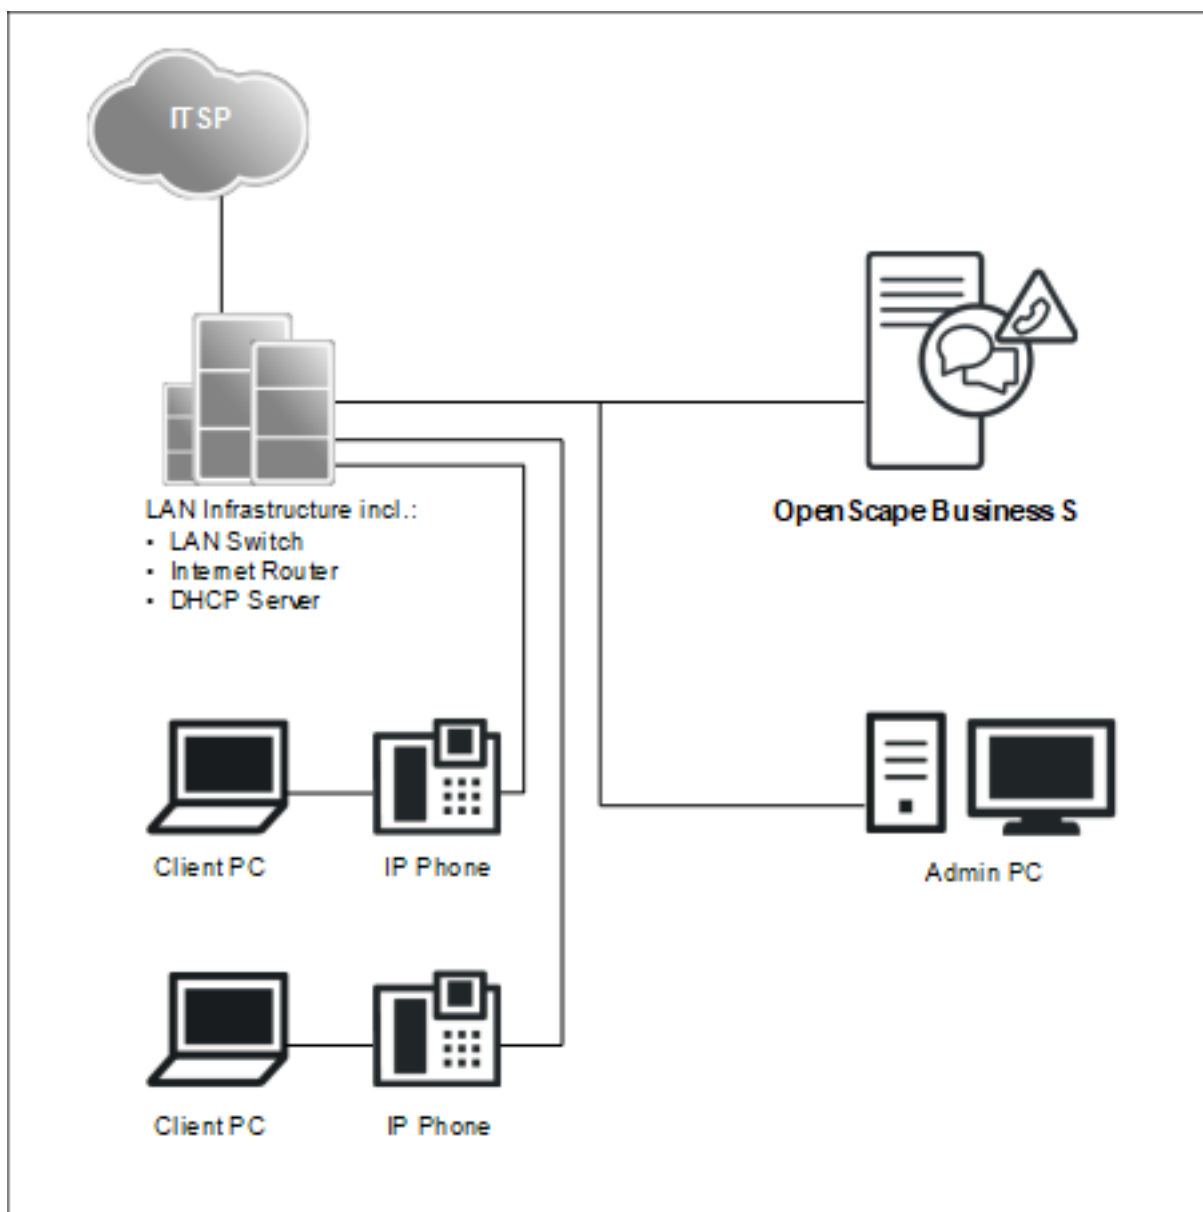

The IP stations (IP system phones, client PCs, WLAN Access Points, etc.) are integrated in the LAN via one or more switches.

The IP clients obtain their IP addresses dynamically from an internal DHCP server (DHCP server of the Linux server) or from an external DHCP server (DHCP server of the Internet router, for example).

Internet access is configured in the Internet router.

Initial Setup for OpenScape Business S

IP Address Scheme

6.3 IP Address Scheme

An IP address scheme is a definition of how the IP addresses are used in the customer LAN. It includes the IP addresses of PCs, servers, Internet routers, IP phones, etc.

To provide a better overview of the assignment of IP addresses, an IP address scheme should be created.

Example of an IP address scheme with the IP address range 192.168.5.x:

IP address range	Clients
192.168.5.1 through 192.168.5.49	Clients with a fixed IP address

IP address range	Clients
192.168.5.1	Internet router (gateway)
192.168.5.10	Server PC (OpenScape Business S)
192.168.5.20	E-mail server
192.168.5.100 to 192.168.5.254	Client PCs & IP phones, also the IP address range of the DHCP server; IP addresses are assigned automatically to the clients

6.4 Dial Plan

A dial plan is a list of all phone numbers available in the communication system. It comprises internal phone numbers, DID numbers, and group station numbers.

Default Dial Plan

The internal call numbers are preassigned default values. These values can be adapted to suit individual requirements as needed (e.g., to create individual dial plans).

Extract from the default dial plan:

Type of call numbers	Default call numbers
Internal station numbers	100-349, 500-709
User direct inward dialing numbers	100-349, 500-709
Group station numbers	350-439
Voicemail call number	71
Announcement Player call number	72
Seizure codes (external codes): Central Office ITSP	855-858
Call number for conferences	7400-7404
Call number for parking	7405
Call number for AutoAttendant	7410-7429
Call number for MeetMe conference	7430

Individual Dial Plan

An individual dial plan can be imported in the WBM via an XML file during the basic configuration.

The XML file contains several tabs. Besides the names and phone numbers of subscribers, the "Customer" tab also includes additional

subscriber data such as the subscriber types and e-mail addresses of the subscribers.

A sample XML file with the appropriate explanations can be found in the WBM under **Service Center > Documents > Templates > CSV Templates**. You can also use the XML file stored there as a template for your data. It can be edited with Microsoft Excel, for example.

6.5 Installing the Communication Software

The OpenScape Business S communication software is installed on the Linux server.

Make sure that the IP addresses and network masks to be configured are appropriate for the customer LAN.

DHCP Server

A DHCP server automatically assigns a unique IP address to each IP station (IP phones, PCs, etc.) and provides the IP stations with network-specific data such as the IP address of the default gateway, for example.

Either an external DHCP server (e.g., the DHCP server of the Internet router or of the communication system) or the DHCP server of the Linux server can be used as a DHCP server. If the DHCP server of the Linux server is used, the external DHCP server must be disabled. The configuration of the Linux DHCP server can be performed during the installation of the OpenScape Business communication software.

Virtual Environment

The communication software can run in a virtual environment. There are two ways to perform the installation:

- Separate installation of Linux and the communication software
To do this, the virtualization software (host operating system) must be first installed and configured on the server PC. Linux is installed in the virtual environment as a guest operating system. Within the Linux operating system, the communication software is installed last with the help of the OpenScape Business DVD or .ISO file (see *OpenScape Business Linux Server, Installation Guide* for more details).
- Combined installation of Linux and the communication software (VMWare only)
To do this, the virtualization software (host operating system) must be first installed and configured on the server PC. An OVA image (Open Virtualization Appliance), which includes Linux and the communication software, is installed in the virtual environment. The OVA image is provided through the software supply server (SWS).
For more than 50 users, the home partition must be resized after the installation to 100 GB (for 50 to 100 users) or 200 GB (for up to 500 users or for OpenScape Business Contact Center) or 500 GB (for more than 500 users).

For Linux updates, you will also need the OpenScape Business SLES upgrade key in order to be able to register with Linux.

Use of snapshots on virtual machines (VM):

Snapshots can be a valuable maintenance mechanism, for example, to perform a fast rollback to a predefined operating state of the VM after a mass distribution script has failed.

- Snapshots cannot be created during normal operation. The current operating state of the virtual machine is frozen while taking a snapshot. Consequently, connected terminals and applications such as IP phones or the UC clients may lose the connection to the server.
- Snapshots can cause internal server processes to lose their synchronization, which means that the stable operation of the communication system can then no longer be guaranteed. A server reboot following the snapshot should therefore also be planned within the maintenance timeframe.
- Previous snapshots should not remain on the production environment during normal operation.
- Snapshots can be taken during a planned maintenance window or within the framework of the installation.
- Snapshots are used internally by backup tools such as VDP or VDR. It must be ensured that these backup operations are scheduled outside of business hours and that the snapshots generated by these tools are deleted at the end of the operation.

More information regarding snapshots can be found in the VMware knowledge base (KB). A good starting point is the KB article 1025279 – Best Practices for virtual machine snapshots in the VMware environment (<http://kb.vmware.com/kb/1025279>).

All information about snapshots in Microsoft Hyper-V can be found in the technet library at technet.microsoft.com within the Hyper-V chapter.

6.5.1 How to Install the Communication Software

Prerequisites

- The SLES 12 SP5 operating system has been correctly installed and started on the Linux server.
- DVD or .ISO file with OpenScape Business communication software.
- DVD or .ISO file with the Linux operating system SLES 12 SP5 64-bit for any subsequent installation of software packages (RPM) that may be required.
- The root access data (user name and password) for logging into the Linux server is available.

IMPORTANT: The OpenScape Business communication software overwrites any existing configuration files (e.g., for DHCP, FTP, Postfix, etc.) during the installation.

Step by Step

1. Log into the Linux server with root privileges.
2. Insert the OpenScape Business DVD or .ISO file into the DVD drive.
3. Confirm the message with **Run**. The "Welcome" window appears.
4. Select the desired setup language (e.g., **English**) and click **Start**. The rest of the installation is described here for the English language.
5. Select the desired product from the list and click on **Select**. A check is performed to determine whether the hardware meets all the requirements for the installation. A warning is displayed for minor shortfalls in meeting the requirements. After confirmation, the installation can then be continued. For severe shortfalls, the installation is canceled automatically.
6. A check is performed to determine whether additional RPM packages need to be installed. If yes, confirm this with **Confirm**. If this occurs, you will need to switch back to SLES 12 DVD or .ISO file later.
7. A window with the terms of the license (i.e., the End User License Agreement or EULA) appears. Read the terms of the license and accept the license agreement with **Yes**.
8. If a DHCP server is already present in the customer LAN (e.g., the DHCP server of the Internet router), stop the configuration of the Linux DHCP server here with **No** and proceed to step 12 to continue.

NOTICE: In order to ensure that the software of system telephones can be updated automatically even when using an external DHCP server, you have two options:

a) The IP address of the Linux server must be entered as the DLS address at each system telephone.

b) The network-specific data must be entered at the external DHCP server. The parameters for this can be found under `/var/log/OPTI.txt`.

9. If you want to use the Linux DHCP server, click on **Yes** to enable and configure the Linux DHCP server.
10. Enter the following values (preset with default values):
 - **Default Route:** IP address of the default gateway; as a rule, the IP address for the Internet router, e.g., 192.168.5.1.
 - **Domain** (optional): the domain specified during the Linux installation, e.g., <customer>.com
 - **DNS-Server** (optional): IP address of the DNS server specified during the Linux installation. If no DNS server is available in the internal network, you can enter the IP address of the Internet router (e.g., 192.168.5.1) here.
 - **SNTP Server:** IP address of the internal or external NTP server.

- **DLS/DLI Server:** IP address of DLS server, i.e., the IP address of the Linux server (e.g.: 192.168.5.10).
- **Subnet:** appropriate subnet for the IP address range, e.g.: 192.168.5.0.
- **Netmask:** Subnet mask of the Linux server that was specified during the Linux installation, e.g.: 255.255.255.0.
- **IP range begin** and **IP range end:** IP address range from which the DHCP server may assign IP addresses, e.g.: 192.168.5.100 to 192.168.5.254.

11. Click on **Continue**.

12. After the installation, the Linux operating system needs to be restarted. Select the check box **PC Reboot** and confirm with **Continue**.

13. If additional RPM packages need to be installed, you will be prompted to insert the SLES 12 DVD or .ISO file. Insert the DVD or .ISO file and confirm with **Continue**. Following the successful installation of the RPM packages, reinsert the OpenScape Business DVD or .ISO file and confirm this with **Continue**, followed by **Run**.

14. The OpenScape Business communication software is installed. The operating system then automatically performs a restart.

15. After the restart, log in with the user account that was set up earlier during the Linux installation.

16. Right-click on the DVD drive icon on the desktop and select the menu item **Eject**. Remove the OpenScape Business DVD from the DVD drive.

NOTICE: It takes a few minutes until all components of the OpenScape Business communication software are active.

6.6 Starting Up

The basic settings are made using the **Initial Installation** wizard of the WBM.

6.6.1 How to Start the Initial Installation Wizard

Prerequisites

The WBM has been started.

Step by Step

- 1.** In the navigation bar, click on **Setup**.
- 2.** Click on **Edit** to start the **Initial Installation** wizard.

NOTICE: If the size of the browser window cannot display the workspace in its entirety at low screen resolutions, a horizontal or vertical scroll bar appears

at the sides and can be used to scroll to the required section.

Next steps

Perform initial installation as described in the following step-by-step instructions. Fields that are not described here are preset for the default scenario and should only be changed if they are not appropriate for your network data. For detailed information, refer to the descriptions provided in the Administrator documentation for the individual wizards.

6.6.2 System Settings

The **System Settings** window is used to configure the system settings of the communication system.

Proceed as follows:

1) Set the display logo and the product name

Specify a display text to be displayed on the display of the system phones. Additionally, you can also select the product name.

2) Select the country code and the language to be used for event logs

For country initialization to work correctly, you must select the country in which the communication system is operated. In addition, you can select the language in which the event logs (system event logs, errors logs, etc.) are to be stored.

3) Only if required: Activate another LAN port as a WAN interface

If OpenScape Business S (or the Linux server) has a second LAN port, you can use this as a WAN interface for Internet access and Internet telephony via an ITSP. The first LAN port is used as usual as a LAN interface for the internal phones and PCs.

6.6.2.1 How to Set the Display Logo and the Product Name

Prerequisites

You are in the **System Settings** window.

The screenshot shows the 'System Settings' window in the 'Setup - Wizards - Basic Installation - Initial Installation' wizard. The window is divided into four sections: 'OpenScape Business', 'Dial Plan', 'Language settings', and 'System Settings'. The 'System Settings' section is currently active and contains the following fields:

- Display Logo:** A text field containing 'OS Business S'.
- OpenScape Business - IP address:** A dropdown menu showing '192.168.190.54 - eth0'.
- OpenScape Business - Netmask:** A text field containing '255.255.255.0'.
- WAN:** A checkbox that is currently unchecked.
- Initialize the Dial Plan with 4 digits:** A checkbox that is currently unchecked.
- System Country Code:** A dropdown menu showing 'Germany'.
- Language for Customer Trace Log:** A dropdown menu showing 'English'.

Step by Step

1. In the **Display Logo** field, enter a text of your choice (e.g., OS Business S). The text can contain up to 16 characters. Avoid the use of diacritical characters such as umlauts and special characters.
2. Select the desired time product name in the **Brand** drop-down list.

Next steps

Select the country code and language to be used for the event logs.

6.6.2.2 How to Select the Country Code and the Language for Event Logs

Prerequisites

You are in the **System Settings** window.

The screenshot shows the 'System Settings' window in the 'Setup - Wizards - Basic Installation - Initial Installation' wizard. The window has a blue header bar with the title 'Setup - Wizards - Basic Installation - Initial Installation'. Below the header, the title 'System Settings' is centered. The main content area is divided into sections by horizontal lines. The first section is 'Display Logo' with a text input field containing 'OS Business S'. The second section is 'OpenScape Business' with a blue header bar. It contains two text input fields: 'OpenScape Business - IP address' with the value '192.168.190.54' and a dropdown arrow, and 'OpenScape Business - Netmask' with the value '255.255.255.0'. Below these is a 'WAN' checkbox which is unchecked. The third section is 'Dial Plan' with a blue header bar and an 'Initialize the Dial Plan with 4 digits' checkbox which is unchecked. The fourth section is 'Language settings' with a blue header bar. It contains two dropdown menus: 'System Country Code' with 'Germany' selected, and 'Language for Customer Trace Log' with 'English' selected.

Step by Step

1. In the **System Country Code** drop-down list, select the country where the communication system is operated.
2. In the **Language for Customer Event Log** field, enter the language in which the event logs (system event logs, error logs, etc.) are to be output.

Next steps

Start the basic configuration.

6.6.2.3 How to Activate an Additional LAN Port as a WAN Interface

Prerequisites

You are in the **System Settings** window.

Initial Setup for OpenScape Business S

Setup - Wizards - Basic Installation - Initial Installation

System Settings

Display Logo: OS Business S

OpenScape Business

OpenScape Business - IP address: 192.168.190.54 - eth0

OpenScape Business - Netmask: 255.255.255.0

WAN: ☐

Dial Plan

Initialize the Dial Plan with 4 digits: ☐

Language settings

System Country Code: Germany

Language for Customer Trace Log: English

Step by Step

1. Select the **WAN** check box.
2. Select the desired LAN port (e.g., `eth1` or `eth2`) from the **OpenScape Business - IP Address (WAN)** drop-down list. If only two LAN ports are available, the second LAN port `eth1` is activated automatically.

NOTICE: The assignment of IP addresses and subnet masks to the LAN ports is done during the initial installation of Linux or subsequently via YaST.

Next steps

Specify UC solution.

6.6.3 UC Solution

In the **Change application selection** window, select the UC solution to be used.

You have the following options:

- **Package with UC Smart**

The UC solution UC Smart is integrated in OpenScape Business S.

- **Package with UC Suite**

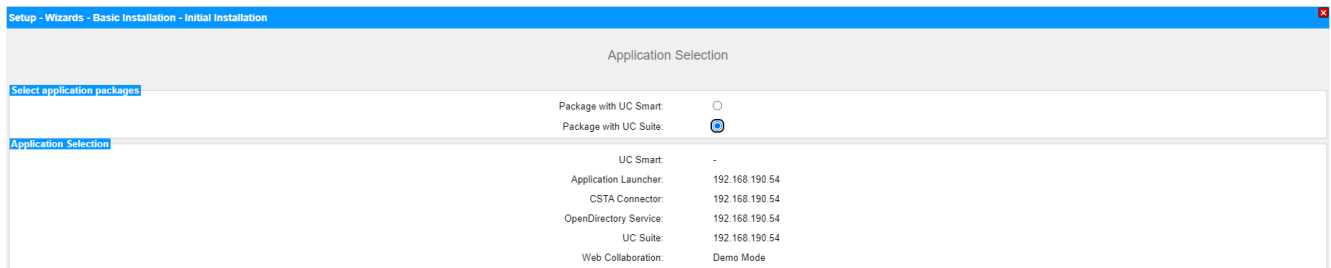

The UC solution UC Suite is integrated in OpenScape Business S.

6.6.3.1 How to Define the UC Solution

Prerequisites

You have purchased licenses for either of the UC solutions, UC Smart or UC Suite.

You are in the **Application Selection** window.

Step by Step

1. If you use the UC solution UC Smart, click **Package with UC Smart**.
2. If you are using the UC solution UC Suite, click on **Package with UC Suite**.
3. Click on **OK & Next**.
4. The **Initial installation** wizard is closed. Click on **Finish**.

Next steps

Start the basic configuration.

6.7 Basic Configuration

The **Basic Installation** wizard is used for basic configuration. Basic configuration includes the most important settings for operating the communication system.

The Basic Installation Wizard includes a progress indicator showing the current step, as well as the steps that follow.

6.7.1 How to Start the Basic Installation Wizard

Prerequisites

The **Initial installation** has been completed.

Step by Step

1. In the navigation bar, click on **Setup**.
2. Click on **Edit** to start the **Basic Installation** wizard.

Next steps

Perform basic installation as described in the following step-by-step instructions. Fields that are not described here are preset for the default scenario and should only be changed if they are not appropriate for your network data. For detailed information, refer to the descriptions provided in the Administrator documentation for the individual wizards.

6.7.2 System Phone Numbers and Networking

Enter the system phone numbers (PABX number, country and area code, international prefix) in the **Overview** window and specify whether OpenScape Business is to be networked with other OpenScape Business systems.

Proceed as follows:

1) Enter system phone numbers

- Enter system phone numbers for point-to-point connection

Here you enter the system phone number for your point-to-point connection and the country code and area code.

The entry of the country code is mandatory for Internet telephony and conference server functionality.

The international prefix is preset, depending on the previously dialed country code.

- Enter system phone numbers for point-to-multipoint connection

Here you enter the country code and area code for your point-to-multipoint connection.

The entry of the country code is mandatory for Internet telephony and Meet-Me conferences.

The international prefix is preset, depending on the previously dialed country code.

2) Activate or deactivate networking

If OpenScape Business is to be networked with other OpenScape Business systems, networking must be enabled, and OpenScape Business must be assigned a node ID. Every OpenScape Business must have a unique node ID in the network.

6.7.2.1 How to Enter the System Phone Numbers for a Point-to-Point connection

Prerequisites

You have a point-to-point connection.

You are in the **System Overview** window of the **Basic Installation** wizard.

Setup - Wizards - Basic Installation - Basic Installation

1 System Overview 2 Central Functions for Stations 3 Provider configuration and activation for Internet Telephony 4 Select a station 5 Configured Stations 6 Automatic Configuration of Application Suite 7 Configure MeetMe Conference 8 Configure E-Mail Forwarding

Note: changes done in expert mode must be reviewed/repeated after running through the wizard.
 Note: At least the configuration of the 'Country code' is needed for features such as 'Internet telephony' and 'MeetMe conference'.
 If you want your OpenScape Business in "OpenScape Business Network Integration" you should select the "Network Integration" check box and enter a node ID. In this case, make sure that this node ID is unique within the whole network integration.
 Normally, this integration is done by a Service Technician.
 For a standalone OpenScape Business clear the 'Network Integration' check box.

PABX number

Country code: 00 (mandatory)
 Local area code: 0 (optional)
 PABX number: (optional)

General

International Prefix:

Network Parameters

Network Integration: ☐
 Node ID:

Upstream of your Internet connection

Upstream up to (Kbps):

Step by Step

1. In the **Country Code** field, enter the country code prefix, e.g., 49 for Germany or 1 for the U.S.
2. Enter the local area code, e.g., 89 for Munich, in the **Local area code** field.
3. Enter the system phone number of your trunk connection, e.g., 7007 (your connection number), in the **PABX number** field.
4. Change the **International Prefix** field only if required. The applicable values for Germany and the United States are 00 and 011, respectively.

For international calls, the phone number is preceded by the international prefix and the country code, e.g., "00-1-..." for calls from Germany to the USA and "011-49-..." for calls from the USA to Germany.

Next steps

Activate or deactivate networking

6.7.2.2 How to Enter the System Phone Numbers for a Point-to-Multipoint Connection

Prerequisites

You have a point-to-multipoint connection.

You are in the **System Overview** window of the **Basic Installation** wizard.

Initial Setup for OpenScape Business S

Setup - Wizards - Basic Installation - Basic Installation

1 System Overview 2 Central Functions for Stations 3 Provider configuration and activation for Internet Telephony 4 Select a station 5 Configured Stations 6 Automatic Configuration of Application Suite 7 Configure MeetMe Conference 8 Configure E-Mail Forwarding

Note: changes done in expert mode must be reviewed/repeated after running through the wizard.
Note: At least the configuration of the 'Country code' is needed for features such as 'Internet telephony' and 'MeetMe conference'.
If you want your OpenScape Business in "OpenScape Business Network Integration" you should select the "Network Integration" check box and enter a node ID. In this case, make sure that this node ID is unique within the whole network integration.
Normally, this integration is done by a Service Technician.
For a standalone OpenScape Business clear the 'Network Integration' check box.

PABX number

Country code: 00 49 (mandatory)
Local area code: 0 186 (optional)
PABX number: 27 (optional)

General

International Prefix: 00

Network Parameters

Network Integration: ☐
Node ID: 2

Upstream of your internet connection

Upstream up to (Kbps): 2048

Step by Step

1. In the **Country Code** field, enter the country code prefix, e.g., 49 for Germany or 1 for the U.S.
2. Enter the local area code, e.g., 89 for Munich, in the **Local area code** field.
3. Leave the **PABX number** field empty.
4. Change the **International Prefix** field only if required. The applicable values for Germany and the United States are 00 and 011, respectively.

For international calls, the phone number is preceded by the international prefix and the country code, e.g., "00-1-..." for calls from Germany to the USA and "011-49-..." for calls from the USA to Germany.

Next steps

Activate or deactivate networking

6.7.2.3 How to Activate or Deactivate Networking

Prerequisites

You are in the **System Overview** window of the **Basic Installation** wizard.

Setup - Wizards - Basic Installation - Basic Installation

1 System Overview 2 Central Functions for Stations 3 Provider configuration and activation for Internet Telephony 4 Select a station 5 Configured Stations 6 Automatic Configuration of Application Suite 7 Configure MeetMe Conference 8 Configure E-Mail Forwarding

Note: changes done in expert mode must be reviewed/repeated after running through the wizard.
Note: At least the configuration of the 'Country code' is needed for features such as 'Internet telephony' and 'MeetMe conference'.
If you want your OpenScape Business in "OpenScape Business Network Integration" you should select the "Network Integration" check box and enter a node ID. In this case, make sure that this node ID is unique within the whole network integration.
Normally, this integration is done by a Service Technician.
For a standalone OpenScape Business clear the 'Network Integration' check box.

PABX number

Country code: 00 49 (mandatory)
Local area code: 0 186 (optional)
PABX number: 27 (optional)

General

International Prefix: 00

Network Parameters

Network Integration: ☐
Node ID: 2

Upstream of your internet connection

Upstream up to (Kbps): 2048

Step by Step

1. If the communication system is to be networked with other communication systems:
 - a) Select the **Network Integration** check box.
 - b) In the **Node ID** field for the communication system, enter a node ID that is unique in the internetwork (digits from 1 through 100 are possible).
2. If the communication system is not to be networked with other communication systems, leave the **Network Integration** check box disabled.

Next steps

Configure the upstream of your Internet connection.

6.7.2.4 How to Configure the Upstream of your Internet connection

Prerequisites

You are in the **Summary** window.

Step by Step

1. In the **Upstream up to (Kbps)** field, enter the speed of your Internet connection.
2. Click on **OK & Next**.

Next steps

Configure the station data.

6.7.3 Station Data

If necessary, you can configure your own individual dial plan instead of the predefined default dial plan in the **Central Functions for Stations** window and import additional station data. In an internetwork, the default dial plan must be adapted to the dial plan of the internetwork.

The default dial plan contains predefined numbers for different types of stations (IP phones, analog phones, ...) and for special functions (Internet telephony, voicemail box, AutoAttendant, ...).

The station data includes the internal call numbers, DID numbers and names of the stations. This data and other station data can be imported into the communication system during the basic configuration via an XML file in UTF-8 format.

NOTICE: An XML template with the appropriate explanations can be found in the WBM under **Service Center > Documents > CSV Templates**. You can enter your data in this template by using Microsoft Excel, for example.

You have the following options:

- **Configure station data without an internetwork**

Proceed as follows:

- 1) Display the station data**

You can have all preconfigured station numbers and station data displayed.

- 2) Delete all station numbers (optional)**

If you use an individual dial plan, you must delete all preconfigured station numbers.

- 3) Adapt preconfigured station numbers for the individual dial plan (optional)**

If you are using an individual dial plan, you can adapt the preconfigured phone numbers to your own dial plan.

NOTICE: If the user passes through the **Change preconfigured functional call numbers**, any existing custom configuration done in UC Suite must be reviewed or repeated (e.g., pilot queues)

- 4) Import station data from an XML file (optional)**

You can easily import your individual station numbers, including any additional station data, during the basic configuration via an XML file.

- **Configure station data with an internetwork**

Proceed as follows:

- 1) Delete all station numbers**

If the UC Suite is used in an internetwork, a closed numbering plan is required, i.e., all station numbers in the internetwork must be unique. For this reason, any preconfigured station numbers must be deleted and only stations numbers adapted for the internetwork must be used.

- 2) Import station data from an XML file**

The station numbers adapted for the internetwork and any additional station data can be easily imported during the basic configuration via an XML file. This file can contain all stations in the internetwork. During import, only the station numbers and the station data assigned to the previously specified node ID of the communication system will be transferred.

Related tasks

[How to display Mass data](#) on page 151

[How to Reset the LCR Entries](#) on page 1389

Related reference

[LCR > LCR flags](#) on page 1588

6.7.3.1 How to Display the Station Data

Prerequisites

You are in the **Central Functions for Stations** window of the **Basic Installation** wizard.

Step by Step

1. Select the **Display stations configuration** radio button.
2. Click on **Execute function**. A list of stations with the preconfigured phone numbers (default dial plan) is displayed.
3. Click on **OK**. You are taken back to the **Central Functions for Stations** window.
4. If you do not want to change any station data, click **OK & Next**.

6.7.3.2 How to Delete all Call Numbers

Prerequisites

You are in the **Central Functions for Stations** window of the **Basic Installation** wizard.

Step by Step

1. Enable the radio button **Delete all station call numbers**.
2. Enable the check box **Delete All Call Addresses**.
3. Click on **Execute function**. All preset call numbers are deleted except **Announcement Player**, **Remote Admin call number** and **Licensing call number**. The **Change preconfigured call and functional numbers** window then appears.

Setup - Wizards - Basic Installation - Basic Installation

Change preconfigured call and functional numbers

- The Internet Telephony numbers must be available; it is not possible to delete these numbers.
- Please keep in mind, that these numbers are not available for station or group dialing use.
- Automatic changes may be applied. Please check LCR dial plan and correct if necessary.

Preconfiguration for Internet Telephony	<input type="text"/>	<input type="text"/>	<input type="text"/>

3. Adjust the preconfigured call numbers to suit your preferences, and then click **OK**. You are taken back to the **Central Functions for Stations** window.
4. If you do not want to change any further station data, click **OK & Next**.

6.7.3.4 How to Import the Station Data from an XML File

Prerequisites

You are in the **Central Functions for Stations** window of the **Basic Installation** wizard.

An XML file with the entered data is available in UTF-8 format. An XML template can be found under **Service Center > Documents > CSV Templates**.

Step by Step

1. Enable the radio button **Import CSV/XML file with station data**.
2. Click **Execute function**.
3. Use **Browse** to select the created XML file and click **Open**.

4. Click **OK** when finished. The station data is imported.
5. Click **OK & Next**.

6.7.4 Internet Telephony

The **Provider configuration and activation for Internet telephony** window is used to configure Internet telephony. You can configure predefined or new Internet Telephony Service Providers (ITSPs). You can configure one or several accounts for each ITSP. Up to 8 ITSPs may be active simultaneously.

You have the following options:

- **Configure a predefined ITSP**

You can use predefined ITSP templates. To do this, the own access data and phone numbers are entered in the template, and this is then activated.

- **Configure a new ITSP**

You can also add and activate a new ITSP.

Configuring a new ITSP is seldom required and can be very time-consuming. This option is therefore not described in the initial installation. Detailed information can be found in the chapter [Configuring an ITSP](#).

- **Disable Internet telephony**

You can disable Internet telephony.

NOTICE: Configuration examples can be found on the Internet at the **Unify Experts Wiki** under *OpenScape Business - SIP / ITSP Connectivity - PDF "OSBiz V2 Configuration for ITSP"*.

Assigning the ITSP Phone Numbers

- In the case of an **Internet Telephony Station Connection**, the ITSP provides individual numbers such as 70005555, 70005556, etc. These individual call numbers are then assigned manually as the internal call numbers of the subscribers.
- In the case of an **Internet telephony point-to-point connection**, the ITSP provides a call number range, e.g., (+49) 89 7007-100 to (+49) 89 7007-147. The call numbers from the range are then assigned manually as the internal call numbers of the subscribers.

These two connection types can be combined as appropriate.

Alternatively, the ITSP phone numbers can be entered as the DID call numbers of the subscriber for both connection types during the station configuration.

Internal call number	Name	DID
100	Andreas Richter	897007100

Internal call number	Name	DID
101	Susanne Mueller	897007101
102	Buddy Miller	897007102
104	Juan Martinez	70005555
105	Emilio Carrara	70005556

The ITSP call numbers thus result from the configured PABX number (e.g., country code 49) and the entered DID numbers in long format. This has advantages for the digit analysis and call management, even in an internetwork. The ITSP connection is thus DID-enabled for another node, for example.

A further CO trunk connection via ISDN is only possible to a limited extent in this case (useful for emergency calls, for example).

6.7.4.1 How to Configure a Predefined ITSP

Prerequisites

You are in the **Provider configuration and activation for Internet Telephony** window of the **Basic Installation** wizard.

The Internet connection is operational.

Your ITSP's Internet telephony access data is available (for example, user account, password and Internet telephony numbers).

Step by Step

1. Clear the **No call via Internet** check box. A country-specific list of the possible ITSPs is displayed. The list contains the predefined ITSPs for the selected country and any already created ITSPs.

Setup - Wizards - Basic Installation - Basic Installation

1 System Overview 2 Central Functions for Stations 3 ISDN Configuration 4 Configure Internet Access 5 Provider configuration and activation for Internet Telephony 6 Select a station 7 Configured Stations 8 SmartVM 9 Configure Meetlife Conference 10 Configure E-Mail Forwarding

No call via Internet: ☐
Country specific view:

Note: changes done in expert mode must be reviewed/repeated after running through the wizard.

Help Abort Back OK & Next Display Status

2. If you want to change the preset country, select the desired country from the **Country specific view** drop-down list to display the ITSPs that are available for this country.
3. If required, click **Display Status** to check which ITSPs have already been activated and which Internet telephony subscribers have already been configured under each ITSP. You can activate a maximum of 8 ITSPs. Click **OK** when finished.
4. To configure Internet telephony stations, click **Edit** in the line associated with the relevant ITSP.
5. Activate the check box **Enable Provider**.
6. Click **OK & Next**.
7. Click **Add** to configure your ITSP accounts with the corresponding Internet telephony numbers. The fields that will then be displayed are provider-specific.

Setup - Wizards - Basic Installation - Basic Installation

Internet Telephony Station for SIPGate

Internet telephony station:
Authorization name:
Password:
Confirm Password:

Call number assignment

Use public number (DID)
ITSP-multiple route: ☐
Default Number:

Default Number
ITSP as primary CO access
Enter one of the call numbers supplied by your network provider here. This will be used in outgoing calls as the calling party number in case no other number is available for the respective call.
All call numbers supplied by your network provider are to be entered within the trunk and telephones configuration (DID field) primary CO access.

8. Enter the credentials for your account in the **Internet Telephony Station** field. You received this data from your ITSP. Depending on the ITSP, different designations are used for this, for example: SIP User, SIP ID, etc.
9. Enter the authorization name in the **Authorization name** field. You received this data from your ITSP. If you have not received

Initial Setup for OpenScape Business S

any authorization name, enter the same data you entered under **Internet Telephony Station**.

10. Enter the password you received from the ITSP in the **New Password** and **Confirm Password** fields. Depending on the ITSP, different designations are used for this, for example: Password, SIP Password, etc.
11. Assignment of Internet telephony phone numbers - Option 1:
Use public number (DID): the Internet telephony phone numbers of your Internet telephony station connection or Internet telephony point-to-point connection are not entered here during the ITSP configuration, but when the configuring the stations, i.e. the telephones and subscribers (in the **DID** fields).

- a) Select the option field **Use public number (DID)** in the **Call number assignment** area.
- b) Under **Default Number**, enter the phone number to be used for outgoing calls to subscribers who do not have their own phone number.
- c) If your ITSP supports the "Mobile Extension (MEX)" feature, enter the MEX number provided by the ITSP (8 positions, digits only) under **MEX Number**.

12. Assignment of Internet telephony phone numbers - Option 2:

Use internal number (Callno) / Single entries: You have an Internet telephony station connection and have received individual call numbers as Internet telephony phone numbers (e.g. 70005555, 70005556,...). Then assign these single numbers to the internal call numbers of the subscribers.

- a) Select the option field **Use internal number (Callno) / Single entries** in the **Call number assignment** area.
- b) In the **Internet Telephony Phone Numbers** area, enter one of the Internet telephony phone numbers provided by the ITSP in the field next to the **Add** button and then click **Add**.

c) To assign further Internet telephony numbers to the account, repeat step b).

13. Assignment of Internet telephony phone numbers - Option 3:

Use internal number (Callno) / Range entry: You have an Internet telephony point-to-point connection and have received a call number range as Internet telephony phone numbers (e.g., +49) 89 7007-100 to (+49) 89 7007-147. You then assign the call numbers from the call number range as the internal call numbers of the subscribers.

- Select the option field **Use internal number (Callno) / Range entry** in the **Call number assignment** area.
- Enter the system phone number under **System phone number (prefix)**.
- Enter the desired DID number range for the Internet telephony station in the 'from' and 'to' fields after Direct inward dialing band. The range entered by default is 100 - 147.

14. Click on **OK & Next**.

15. If you want to configure additional accounts and their associated Internet telephony numbers, repeat steps 7 through 14.

16. Click **OK & Next**. You will see an overview of which Internet telephony phone numbers are assigned to accounts.

17. Assign one internal station number each to every Internet telephony phone number.

This step is not required if you have selected option 1 for the assignment of the Internet telephony phone numbers. In this case, the assignment is made when the configuring the stations (i.e., the telephones and subscribers) in the **DID** field.

- To do this, select an internal call number in the appropriate line from the **Internal Call Number** drop-down list.
- If subscribers without Internet telephony phone numbers or members of a call group are to be allowed to make external calls via the Internet, the radio button **Use as PABX number for outgoing calls** must be activated. The radio button can be activated for only one single Internet telephony phone number.

Initial Setup for OpenScape Business S

18. Click **OK & Next**. Here you see again the list of predefined and newly added ITSPs. The enabled ITSPs are identified with a check mark in the **Enable Provider** column. If you are having connection problems with already activated ITSP, you can register it again with **Restart ITSP**.
19. Click **OK & Next**.
20. Enter the upload speed of your Internet connection in the **Upstream up to (Kbps)** field. Please do not confuse this with the download speed!

NOTICE: The number of simultaneous Internet calls permitted is displayed in the **Number of Simultaneous Internet calls** field. If the voice quality deteriorates due to the network load, you will need to reduce the number.

For more information about the number of simultaneous Internet calls, please refer to [Limiting the Number of Simultaneous Calls via an ITSP](#) on page 797.

21. Click **OK & Next**.
22. If you did not activate the full-time circuit when setting up your Internet access, you can now do this here. Without a permanent connection (full-time circuit), you cannot receive calls over the Internet. If the full-time circuit has already been set up, the fields described under a) to c) will not appear.
 - a) Enable the radio button **On** under **Full-Time Circuit**.
 - b) In the **Forced Disconnect at (hour:min)** field, enter the time at which the Internet connection is to be deactivated (e.g., 04:59).
 - c) Click **OK & Next**.
23. Enter the special numbers you want in the **Dialed digits** column.

Special phone number	Dialed digits	Dial over Provider
1	@C112	Sipgate
2	@C110	Sipgate
3	@C0137Z	Sipgate
4	@C0138Z	Sipgate
5	@C0900Z	Sipgate
6	@C118Z	Sipgate
7	@C116Z	Sipgate
8	@C115	Sipgate
9	@C010Z	Sipgate

The following station number entries are valid:

- 0 to 9: allowed digits
- -: Field separator
- X: Any digit from 0 to 9
- N: Any digit from 2 to 9
- Z: One or more digits to follow up to the end of dialing
- C: Simulated dial tone (can be entered up to three times)

24. Use the **Dial over Provider** column to specify whether the special number should be dialed via ISDN or an ITSP. Only the active ITSP is displayed.

NOTICE: Ensure that emergency numbers can always be dialed. If you want to dial emergency numbers via an Internet Telephony Service Provider, you must make sure that the ITSP supports this feature.

25. Click **OK & Next**. The status of your ITSP will be displayed.

The configured ITSPs at which you are already registered are marked in green.

The configured ITSPs at which you are not yet registered are marked in orange.

26. Click **Next** followed by **Finish**.

6.7.4.2 How to Deactivate Internet Telephony

Prerequisites

You are in the **Provider configuration and activation for Internet Telephony** window of the **Basic Installation** wizard.

Step by Step

1. Leave the **No call via Internet** check box selected.
2. Click **OK & Next** twice.

6.7.5 Stations

In the **Select a station - ...** window, you can configure the stations connected to the communication system.

Proceed as follows:

- 1) Configure the IP and SIP stations

IP and SIP stations include LAN phones or WLAN phones, for example.

6.7.5.1 How to Configure IP and SIP Stations

Prerequisites

You are in the **Select a station - LAN Phones** window of the **Basic Installation** wizard.

A functional wireless LAN network is needed to operate WLAN phones.

Step by Step

- If you want a different direct inward dialing number for the station than the call number, enter a DID number for the station under **DID** in the row of the desired station:
 - Only for a point-to-point connection:

Click in the desired field and type in the DID number using the keyboard. The DID number may also be identical to the internal station number.
 - Only for a point-to-multipoint connection:

Select an MSN in the desired field via the drop-down list. The station can be internally reached via the internal station number 101, for example, and externally via the MSN 654321.
 - For point-to-point and point-to-multipoint connections:

Select the entry **xxx - modifiable** (xxx is the internal station number) via the drop-down list in the desired field and type in the DID number using the keyboard or select an MSN from the drop-down list.
- Enter the internal station number for the subscriber under **Call No** in the appropriate row of the desired subscriber. You can use the preset phone number or assign some other free number.
- In the row of the desired station, under **Name**, enter a name in the format `Last Name, First Name`.

NOTICE: The name can consist of up to 16 characters, but should not include any diacritical characters such as umlauts or special characters. The name specified here will be entered as the Last Name at the UC clients, but can be edited there.

- Select the type of IP station (e.g., "System Client" or "SIP Client") from the **Type** drop-down list in the row of the desired station.
- If you want to set up a fax box for the subscriber (which can be used with the UC clients **myPortal for Desktop** or **myPortal for Outlook**, for example), proceed as follows:
 - In the row of the desired station, in the **Fax No.** field, enter the desired internal fax number at which the user can receive internal fax messages.
 - If you want to configure a DID number for the fax box, enter the desired external fax number under which the subscriber

can receive external fax messages in the **Fax Direct Inward Dialing** field in the row of the desired subscriber.

6. Choose the desired Class of Service group in the row of the desired subscriber from the **Class of Service** drop-down list.
7. To add the subscriber to a call pickup group, select a call pickup group from the **Call pickup group** drop-down list in the row of the desired subscriber.
8. Make the settings described under this step only if needed or for a SIP phone:
 - a) Click in the row of the desired station on the pencil icon **Edit**.

Setup - Wizards - Telephones / Subscribers - ISDN Devices

Change Station

Station	Fax
First Name: <input type="text"/> Last Name: <input type="text"/> Display: <input type="text"/> (for Subscriber): Call number: <input type="text"/> Direct inward dialing: <input type="text"/> (Number for Direct Inward Dialing)	<input type="text"/> <input type="text"/>
Assign Internet Telephony Phone Number to station	
Sippate <input type="text"/> <input type="text"/>	
Parameter	
Device Type: S0 Extension Clip/Lin: <input type="text"/> Access: STLS2N 1-2-1 Extension Type: <input type="text"/> Language: <input type="text"/> Call signaling internal: <input type="text"/> (Ringer pitch for internal calls): Call signaling external: <input type="text"/> (Ringer pitch for external calls): ITSP Loc-ID: <input type="text"/>	
Voicemail	
UC Smart Mailbox type: <input type="text"/> Recording: <input type="checkbox"/> Greeting: <input type="text"/> Password Reset: <input type="checkbox"/>	

- b) For SIP phones: If the SIP phone is to be operated in conjunction with a dual-mode mobile phone, enter the dialout prefix followed by the telephone number of the mobile phone (e.g., **0016012345678**) in the **Mobility** area under **Mobile phone number**. In addition, select this SIP client from the **Web Feature ID** drop-down list. (see [Dual-Mode Telephony](#)).
- c) In the **Clip/Lin** field, enter a phone number (DID number or MSN) to be displayed at the called party's extension instead of the own phone number in the case of an external call.

NOTICE: This feature must be released by the network provider.

NOTICE: At least one DID number should be configured. If not, the system does not take into account caller's CLIP number and the internal call number is formatted and sent as the Calling Party Number for the external call.

- d) Select the language for the menu controls on the phone from the **Language** drop-down list.

- e) From the **Call signaling internal** drop-down list, select and assign one of a total of eight possible acoustic call signals for internal calls. The station then will then send the modified ringing tone to other internal stations, thus enabling its calls to be distinguished from other internal stations (default: Ring type 1).
 - f) From the **Call signaling external** drop-down list, select and assign one of a total of three possible acoustic call signals for external calls (default: Ring type 1).
 - g) Only for SIP phones: Enter the authentication password in the **Password** and **Confirm password** fields.
 - h) Only for SIP phones: Enter the user ID for the authentication in the **SIP User ID / Username** field.
 - i) Only for SIP phones: Enter the associated zone for the authentication in the **Realm** field.
 - j) Click on **OK & Next**.
 - k) Change the station flags as needed. For a description of the station flags, see [Station > Station > Station Parameters](#).
 - l) Click on **OK & Next**.
- 9. If you want to configure another IP station, click on **Store data** and repeat steps 1 through 8.
 - 10. Click on **OK & Next**. A list of all configured stations appears. This list is effectively a dial plan.
 - 11. If required, click **Print** to print out the data of the configured stations.
 - 12. Then click **OK & Next**.

[Multilingual Text Output](#) on page 1203

6.7.6 Configuring UC Suite

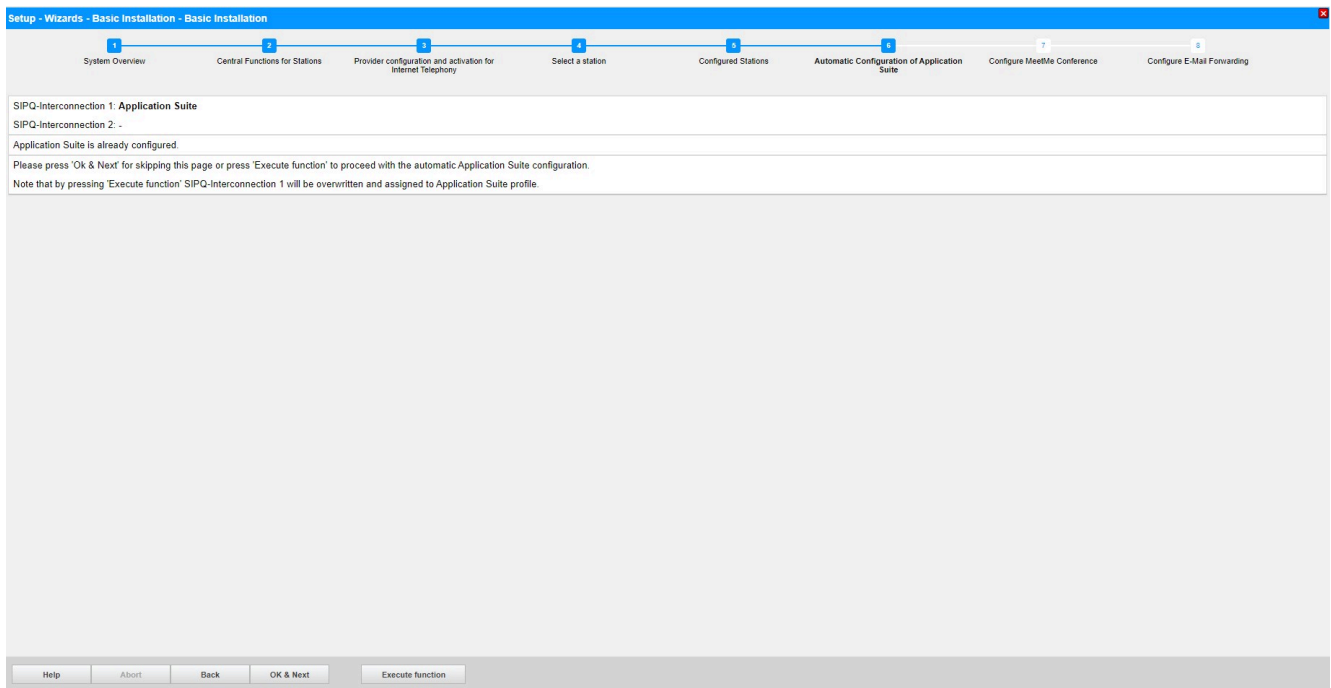

You can perform the automatic configuration of the UC solution UC Suite in the **Automatic Configuration of the Application Suite** window.

NOTICE: This window appears only if **Package with UC Suite** was selected during the application selection in the **Initial Installation** wizard.

6.7.6.1 How to Configure the UC Suite

Prerequisites

You are in the **Automatic Configuration of Application Suite** window.

Step by Step

Click on **Execute function**. The UC Suite is configured automatically. Once the progress bar shows 100%, click on **OK & Next**.

6.7.7 Configuring UC Smart Mailboxes

If you are using the UC solution UC Smart, you can perform the automatic configuration of the UC Smart voicemail boxes (Smart VM, Smart VoiceMail) in the **Automatic Configuration of Smart VM** window.

NOTICE: This window appears only if **Package with UC Smart** was selected during the application selection in the **Initial Installation** wizard.

6.7.7.1 How to Configure UC Smart Voicemail Boxes

Prerequisites

You are in the **Automatic Configuration of Smart VM** window.

Initial Setup for OpenScape Business S

Setup - Wizards - Basic Installation - Basic Installation

1 System Overview 2 Central Functions for Stations 3 ISDN Configuration 4 Configure Internet Access 5 Provider configuration and activation for Internet Telephony 6 Select a station 7 Configured Stations 8 SmartVM

- The automatic Smart VM configuration is an initial configuration and generates the necessary data to setup voicemail boxes or can be used to recover existing mailboxes with default settings. If there are already existing voicemail or autoattendant mailboxes, then all mailbox data will be deleted irrevocably! This affects also mailboxes created by the xml-import. If the corresponding intercept position call number (Smart VM) is configured, a mailbox is created for that intercept position. If the corresponding autoattendant call number (Smart VM) is configured, a mailbox is created for that autoattendant. A mailbox is created for each of the first 99 stations. MeetMe station needs to be already configured in order for a MeetMe mailbox to be created. The second group/hunt group, used for Smart VM, is recovered with default data. The third group/hunt group, used for autoattendant, is recovered with default data.
- Press "Execute function" to proceed with Smart VM configuration or press "Ok & Next" for skipping this page.

Step by Step

1. If the UC Smart voicemail boxes are not to be used, click on **OK & Next**. The configuration of the voicemail boxes will be skipped.
2. If the UC Smart voicemail boxes are to be used, click on **Execute function**. Voicemail boxes are then automatically configured for the first 100 subscribers. Once the progress bar shows 100%, click on **OK & Next**.

NOTICE: Existing UC Smart or UC Smart AutoAttendant voicemail boxes are irrevocably deleted in the process.

6.7.8 Conference Server Settings

The **MeetMe Conference** settings window can be used to define the call numbers and the dial-in numbers for conferences.

6.7.8.1 How to Edit the Conference Server Settings

Prerequisites

You are in the **Configure MeetMe Conference** window of the **Basic Installation** wizard.

Setup - Wizards - Basic Installation - Basic Installation

1 System Overview 2 Central Functions for Stations 3 ISDN Configuration 4 Configure Internet Access 5 Provider configuration and activation for Internet Telephony 6 Select a station 7 Configured Stations 8 Automatic Configuration of Application Suite 9 Configure MeetMe Conference

Call number:

Direct inward dialing:

(Number for Direct Inward Dialing)

Step by Step

1. Enter a phone number for the conference in the **Phone Number** field.
2. Enter the dial-in number for the conference (conference DID) with which subscribers can dial into an existing conference in the **Direct inward dialing** field.
3. Click on **OK & Next**.

6.7.9 E-mail Delivery (Optional)

You can configure the delivery of e-mails in the **Configure E-Mail Forwarding** window. These e-mails notify users of voicemail and fax messages and administrators of system messages.

You have the following options:

- Configuring the Sending of E-mails

You can specify an external E-mail server via which the e-mails are to be sent by OpenScape Business. Voicemails, fax messages and internal system messages can then be sent via this E-mail server to one or several different configurable e-mail addresses.

NOTICE: Entering the e-mail server is important if an e-mail with a link to the installation file(s) is to be automatically sent to the users of the UC Suite.

6.7.9.1 How to Configure the Sending of E-mails

Prerequisites

If the external E-mail server has been configured to use basic authentication, make sure an e-mail account with a password exists with an e-mail provider, and you know the access data for this account.

If the external E-mail server has been configured to use modern authentication (Microsoft OAuth 2.0 token-based authorization), as in the case of Exchange Online, make sure that:

- The sender's email account must be allowed to use Authenticated SMTP (by default this option is inactive in Microsoft 365 tenant). Once Authenticated SMTP is activated, the OAUTH 2.0 email forwarding works normally with all OpenScape Business mainboards.
- An application with the required permissions has been registered in Microsoft Azure Active Directory (Azure AD) for your OpenScape Business system to send emails.
- You know the Application (client) ID and the Directory (tenant) ID of the registered application.

Ask your Azure AD administrator to provide these values, if required.

- The email address that will appear as the sender of the emails belongs to the same Azure AD or tenant as the registered application.

You are in the **Configure E-Mail Forwarding** window of the **Basic Installation** wizard.

Initial Setup for OpenScape Business S

Setup - Wizards - Basic Installation - Basic Installation

E-Mail Address 2

Emergency Notifications Recipient

Emergency Recipient

Help Abort Back OK & Next Check e-mail forwarding

Figure 7: E-mail forwarding options when basic authentication method is selected

Step by Step

1. Enter the **Outgoing mail server (SMTP)** for the e-mail server to be used for sending e-mails, e.g., `smtp.web.de`. Ask your e-mail provider for the outgoing mail server if required.

NOTICE: Make sure that the name of the outgoing mail server can be resolved. If not, you must start the e-mail sending function via **Service Center > E-mail Forwarding** and then enter the IP address of the outgoing mail server instead of its name.

2. Enter the **Outgoing mail server port** for the server port to be used for sending e-mails. Ask your e-mail provider for the outgoing mail server if required.
3. If a secure connection is required, enable the **This server requires an encrypted connection (TLS/SSL)** check box. If required, check with your e-mail provider whether this option needs to be enabled.
4. If the external E-mail server has been configured to use basic authentication, proceed as follows:
 - a) From the **Authentication method** drop-down list, select **Basic**.
 - b) Enter the **User Name** of the e-mail account, e.g.,: `john.doe`.
 - c) Enter the **Password** for the e-mail account and repeat it in the **Confirm Password** field.
5. If the external E-mail server has been configured to use modern authentication, proceed as follows:
 - a) From the **Authentication method** drop-down list, select **Microsoft OAuth 2.0**.
 - b) Enter the Application (client) ID obtained from the Microsoft Azure portal in the **Application ID** field.

- c) Enter the Directory (tenant) ID obtained from the Microsoft Azure portal in the **Tenant** field.
6. Enter the **E-mail Address** that will appear as the sender of the emails, for example: john.doe@web.de.
7. Enter the **E-mail Address 1** to get a notification email when ALI tolerance has been used. You may also enter a second email address in the **E-mail Address 2** field.
8. In the **Emergency Recipient** field, enter the e-mail address of an on-site security officer to which an e-mail is sent when an emergency number is dialed.

The subject of the e-mail will be "New emergency call". The call number and the name of the caller, if configured, are included in the e-mail which are retrieved from the database of the system.
9. If you have selected **Microsoft OAuth 2.0** as authentication method, proceed as follows:
 - a) Click on **OK & Next**.
 - b) Wait for an authorization link and user code to appear.
The authorization code expires after some minutes.
 - c) Open the authorization link and enter the user code on the pop-up.
 - d) Sign in with the email address you have entered in step 6 on page 239 (**E-mail Address**).

The email address must be in the same Azure AD or tenant as the registered application.
 - e) After successful authentication, the pop-up displays a message as below:

You have signed in to the <application-name> on your device. You may now close this window..
 - f) Close the pop-up and return to WBM. If the authentication was successful, you will see the message The authentication was successful!.
10. If you want to check the entered e-mail settings, proceed as follows:
 - a) Click on **Check e-mail forwarding**.
 - b) Under **Send to e-mail address**, enter the e-mail address of any e-mail box that you can access. The test e-mail will be sent to that e-mail address.
 - c) Under **Subject in the e-mail**, enter a descriptive text so that you can identify the e-mail in your e-mail inbox.
 - d) Click on **Send Test E-mail**. The e-mail settings are verified, and the e-mail is sent to the specified e-mail address.
 - e) Check whether the e-mail has arrived in your e-mail inbox.
 - f) If the e-mail was sent correctly, click **Back** and proceed to the next step.
 - g) If the e-mail delivery failed, click **Back** and correct your e-mail settings.
11. Click on **OK & Next** followed by **Finish**. The basic installation is finished. Before you perform the backup mentioned in the wizard, you should activate the licenses.

6.8 Closing Activities

After the initial installation and the basic installation with the WBM have been completed, some important settings must still be made for the operation of OpenScape Business.

Proceed as follows:

1) Activate and assign licenses

The licenses procured with OpenScape Business must be activated within a period of 30 days. The time period begins the next time you log on to the WBM. After this time period expires, the communication system will only operate in restricted mode. Once the licenses have been activated successfully, they must be assigned to the stations and lines. System-wide features are enabled automatically upon activation.

2) Provision the UC Smart client for installation (only for UC Smart)

3) Provision the UC Clients for installation

The UC clients are part of the UC Suite. The installation files for the UC Client are accessible via the WBM and can be made available to the IP stations automatically or manually.

In addition, the administrator has the option of performing a silent installation. The silent installation/uninstallation is a command-line based method to automatically install, uninstall or modify UC Suite PC clients on a PC without requiring any further user inputs. For more information, see [Silent Installation/Uninstallation for UC Suite PC Clients](#).

4) Perform a data backup

All previous changes to OpenScape Business must be backed up. The backup can be stored as a backup set in the internal network, for example.

6.8.1 How to Activate and Assign the Licenses

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

You know the LAC (License Authorization Code) for releasing the license and have a user ID and password for accessing the license server.

You need Internet access to connect to the license server.

Step by Step

1. Activate license online:

- In the navigation bar, click on **Setup**.
- In the navigation tree, click **Wizards > Basic Installation**.
- Click on **Edit** to start the **Licensing** wizard.

Setup - Wizards - Basic Installation - Licensing

Activate License Online

Licenses with Locking ID: 00-1a-e8-5d-37-81

License Authorization Code (LAC)

I have the user name and password for the License Server and want to log on. ☒

User name

Password

Note: The response from the License Server can take up to 90 seconds !

Please enter the registration data first. Only then can the license file be activated.

- d) Enter the appropriate LAC in the **License Authorization Code (LAC)** field.
 - e) Select the check box **I have the user name and password for the License Server and want to log on.**
 - f) Enter the **User Name** and **Password** for logging into the License Server.
 - g) Click on **OK & Next**. The connection to the license server is established, and the licenses are released.
2. Assign licenses to stations:
- a) Click on **License Management** in the navigation bar.
 - b) In the navigation tree, navigate to the desired type of subscriber under **Local User Licenses > ...**. You will be shown a list of all subscribers of the selected subscriber type.
 - c) In the row of the desired subscriber, select the check box in the **User license** column (first column with check boxes).

Initial Setup for OpenScape Business S

- d) Activate the user-oriented licenses in the row of the desired subscriber by selecting the appropriate check boxes.

NOTICE: User-oriented licenses can be assigned to a subscriber only if a station license (user license) was assigned to the subscriber earlier (step c).

- e) Click on **OK & Next**. A check is performed to determine whether there are enough licenses for your assignment.
- If sufficient licenses are available, the licensing of the subscriber is completed.
- f) If licenses are missing, the errors are indicated by displaying a check box shaded in red. Correct these errors and repeat step e.

3. Assign licenses to trunks:

- a) In the navigation tree, click **CO trunks**. The number of trunk licenses purchased will be displayed in the **CO trunks** area.
- b) For SIP trunks: In the **License demand for number of simultaneous Internet calls in this node** area, enter the number of Internet calls that can be conducted simultaneously via an ITSP.
- c) Click on **OK & Next**.

6.8.2 How to Provision the UC Smart Client for Installation

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

The hardware and software for using UC @work are available.

NOTICE: Licenses are required to use the UC Smart client myPortal @work.

Step by Step

1. Click on **Service Center** in the navigation bar.
2. Click on **Software** in the navigation tree.
3. Click on the Download icon of **myPortal @work** and save the installation file on a shared network drive.
4. Send the two installation files to the users of myPortal @work.
5. Alternatively, you can also send the users of myPortal @work the link with which they can access the installation file:

`https://<IP address of the communication system>/management/downloads/myPortalAtWorkSetup.exe`

6.8.3 How to Provision the UC Suite Clients for Installation

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

The hardware and software for using the UC Suite are available.

NOTICE: Licenses are required to use the UC Suite clients.

Step by Step

1. To enable the installation files to be provided automatically to a station, make sure that the following steps have been performed:
 - a) The e-mail addresses of the stations and the associated subscriber data must have either been already imported via an XML file or entered later under **Setup > UC Suite > User Directory**.
 - b) An e-mail server must have been specified.

NOTICE: You can also enter an E-mail server later under **Service Center > E-mail Forwarding**.

All subscribers whose e-mail addresses are known receive an e-mail with a link to the installation directory of the UC clients and Getting Started Instructions. The installation folder also includes a Readme file with information on installing the software on client PCs.

2. If the required steps for automatic notification are not fulfilled, you can also make the installation files available manually. To do this, proceed as follows:
 - a) Click on **Service Center** in the navigation bar.
 - b) Click on **Software** in the navigation tree.

- c) Click on the desired UC client and save the zipped installation file on a shared network drive.
 - d) Click in the navigation tree on **Documents** and select **User Documentation** from the drop-down list.
 - e) Click on the documentation of the desired UC client and save the documentation file on a shared network drive.
 - f) Send the zipped installation file and the documentation file to the users of the UC clients by e-mail or inform the users about the storage location of these files.
 - g) The zip file with the installation files also includes a Readme file. Notify the users that the installation of the UC clients must be performed in accordance with the installation notes in the Readme file.
3. Alternatively, you can also send the UC users links through which they can directly access the installation files of the UC clients.
- a) Click on **Service Center** in the navigation bar.
 - b) Click on **Software** in the navigation tree.
 - c) Click on the **Show Application Links** button. You will be presented with multiple links, depending on the used operating system and the desired UC client. For example:

```
https://<IP address of the communication system>/  
management/downloads/install-common.zip
```

6.8.4 How to Perform a Data Backup

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

NOTICE: For more information on backing up data, see [Immediate Backup](#) .

Step by Step

- 1. Click on **Backup and Restore** in the navigation bar.
- 2. In the navigation tree, click **Backup - Immediate**.
- 3. Enter a comment for the backup set in the **Comment** field in the **Name** area so that the backup set can be easily identified if needed later for a restore. Avoid the use of diacritical characters such as umlauts and special characters in your input.
- 4. Activate the target drive on which the backup set is to be saved (e.g., a network drive) in the **Devices** area.
- 5. Click on **OK & Next**. The progress of the backup process is displayed in a separate window.
- 6. The backup was successful if the message **Backup completed successfully!** appears. Click on **Finish**.
- 7. This completes the initial startup with WBM. Exit the WBM by right-clicking the **Logout** link on the top right of the screen and then close the window.

6.9 Commissioning of IP Phones

The commissioning of IP phones can be facilitated by the existence of a DHCP server that supplies an IP phone with important (network-specific) data that is needed to log into the communication system.

Network-Specific Data

In order to log into the communication system, an IP phone requires some network-specific data. This data can be stored in the DHCP server or be entered directly at the IP phone. The advantage of a DHCP server is that all connected IP phones are automatically supplied with the relevant data.

The following data is required by the IP phone:

- IP address of the communication system
- IP address of DLS server

In addition, the IP phone needs its own call number. This must be entered manually when logging in at the phone.

Registration of SIP Phones

For security reasons, it is recommended that SIP phones register at the communication system. To do this, the registration information on the IP phone and the communication system must match.

The following data is required for the login:

- SIP user ID
- SIP password
- SIP realm (optional)

Use a non-trivial SIP password that complies with the following rules:

- At least 8 characters
- At least one uppercase letter (A - Z)
- At least one lowercase letter (a - z)
- At least one digit (0-9)
- At least one special character

Use a SIP user ID that does not include the phone number.

NOTICE: More information on configuring SIP telephones can be found at http://wiki.unify.com/wiki/SIP_devices_configuration_examples.

Using the Internal DHCP Server

If the internal DHCP server of the communication system is used, the network-specific data will already be stored there. In order to enable an IP phone to register at the communication system, only the specified call number must be entered at the IP phone. In the case of SIP phones, the SIP registration data at the SIP phone and at the communication system must match.

Using an External DHCP Server with Network-specific Data

If an external DHCP server is used, the network-specific data must be stored there. In order to enable an IP phone to register at the communication system, only the specified call number must be entered at the IP phone. In the case of SIP phones, the SIP registration data at the SIP phone and at the communication system must match.

Using an External DHCP Server without Network-specific Data

If an external DHCP server in which the network-specific data cannot be stored is used, this must be entered at the IP phone. To enable an IP phone to register at the communication system, the defined call number and IP address of the communication system must be entered at the phone, and the settings for the Deployment Service may need to be changed. In the case of SIP phones, the SIP registration data at the SIP phone and at the communication system must match.

6.9.1 How to Configure an IP Phone

Prerequisites

The IP phone is connected to the internal network and operational.

NOTICE: The sample configuration described here uses an OpenStage 40/60/80 IP system telephone. The same settings must also be made for any other IP phone. For more information, refer to the manual supplied with your IP phone.

Step by Step

1. To reach the administration mode of the IP system telephone, press the appropriate key for the Settings/Applications menu on the phone.
2. Scroll through the `Settings` options until `Admin` and confirm this with the OK key.
3. Enter administrator password (`123456` by default) and confirm your selection with the OK key.
4. If you are using the DHCP server of the communication system in the internal network, skip the next step.
5. If you are not using the DHCP server of the communication system in the internal network, you will need to enter the IP addresses of the Deployment Server (DLS) and the communication system so that the software of the IP system telephone can be updated automatically. This applies only to IP system telephones. Proceed as follows:
 - a) Scroll to `Network` and confirm your selection with the OK key.
 - b) Scroll to `Update service (DLS)` and confirm your selection with the OK key.

- c) Scroll to `DLS address` and confirm your selection with the OK key.
 - d) Specify the IP address of the communication system (`192.168.1.2` by default) as the Deployment Server and confirm your entry with the OK key.
 - e) Scroll to `Save & Exit` and confirm your selection with the OK key.
 - f) Scroll to `IPv4 configuration` and confirm your selection with the OK key.
 - g) Scroll to `Route (default)` and confirm your selection with the OK key.
 - h) Specify the IP address of the communication system (`192.168.1.2` by default) and confirm your entry with the OK key.
 - i) Scroll to `Save & Exit` and confirm your selection with the OK key.
 - j) Navigate one menu level back with the Back key.
6. Specify the call number of the phone:
- a) Scroll to `System` and confirm your selection with the OK key.
 - b) Scroll to `Identity` and confirm your selection with the OK key.
 - c) Scroll to `Terminal number` and confirm your selection with the OK key.
 - d) Enter the set phone number (e.g., `120`) and confirm your selection with the OK key.
 - e) Scroll to `Save & Exit` and confirm your selection with the OK key.
7. Navigate one menu level back with the Back key.
8. If the system telephone needs to be restarted due to the changes made, the menu item `Restart` will appear in the `Admin` menu. Confirm the `Restart` with the OK key and then also confirm `Yes` with the OK key. The system telephone performs a reboot and logs in to the communication system.

6.9.2 How to Configure a SIP Phone

Prerequisites

The SIP phone is connected to the customer LAN and operational.

NOTICE: The configuration described here uses an OpenStage 40/60/80 SIP system telephone as an example. The same settings must also be made for another SIP phone. For more information, refer to the manual supplied with your SIP phone.

Step by Step

1. To reach the administration mode of the SIP system telephone, press the appropriate key for the Settings/Applications menu on the phone.

2. Scroll through the `Settings` options until `Administrator (Admin)` and confirm this with the OK key.
3. Enter administrator password (123456 by default) and confirm your selection with the OK key.
4. If you are using the DHCP server of the communication system in the internal network, skip the next step.
5. If you are not using the DHCP server of the communication system in the internal network, you will need to enter the IP addresses of the Deployment Server (DLS) and the communication system so that the software of the SIP system telephone can be updated automatically. This applies only to SIP system telephones. Proceed as follows:
 - a) Scroll to `Network` and confirm your selection with the OK key.
 - b) Scroll to `Update service (DLS)` and confirm your selection with the OK key.
 - c) Scroll to `DLS address` and confirm your selection with the OK key.
 - d) Specify the IP address of the communication system (192.168.1.2 by default) as the Deployment Server and confirm your entry with the OK key.
 - e) Scroll to `Save & Exit` and confirm your selection with the OK key.
 - f) Scroll to `IPv4 configuration` and confirm your selection with the OK key.
 - g) Scroll to `Route (default)` and confirm your selection with the OK key.
 - h) Specify the IP address of the communication system (192.168.1.2 by default) and confirm your entry with the OK key.
 - i) Scroll to `Save & Exit` and confirm your selection with the OK key.
 - j) Navigate one menu level back with the Back key.
6. Specify the SNTP time settings:
 - a) Scroll to `Date and time` and confirm your selection with the OK key.
 - b) Scroll to `Time source` and confirm your selection with the OK key.
 - c) Scroll to `SNTP IP address` and confirm your selection with the OK key.
 - d) Specify the IP address of the communication system (192.168.1.2 by default) and confirm your entry with the OK key.
 - e) Scroll to `Timezone offset` and confirm your selection with the OK key.
 - f) Enter the deviation between the local time and UTC (Universal Time Coordinated) in hours (Germany: 1) and confirm this with the OK button.
 - g) Scroll to `Save & Exit` and confirm your selection with the OK key.
 - h) Navigate one menu level back with the Back key.
7. Specify the call number of the phone:
 - a) Scroll to `System` and confirm your selection with the OK key.

- b) Scroll to `Identity` and confirm your selection with the OK key.
 - c) Scroll to `Terminal number` and confirm your selection with the OK key.
 - d) Enter the set phone number (e.g., 120) and confirm your selection with the OK key.
 - e) Scroll to `Save & Exit` and confirm your selection with the OK key.
- 8.** Specify the SIP authentication data:
- a) Scroll to `Registration` and confirm your selection with the OK key.
 - b) Scroll to `SIP Session` and confirm your selection with the OK key.
 - c) Note the `Realm`, or enter a new realm (e.g., `OSBIZ-SIP`), if necessary.
 - d) Note the `User ID`, or enter a new user ID (e.g., `SIP-120`), if necessary.
 - e) Specify a `Password` for registering at the SIP server.
 - f) Scroll to `Save & Exit` and confirm your selection with the OK key.
- 9.** Use the Back key to go back to the `Admin` menu.
- 10.** If the system telephone needs to be restarted due to the changes made, the menu item `Restart` will appear in the `Admin` menu. Confirm the `Restart` with the OK key and then also confirm `Yes` with the OK key. The system telephone performs a reboot and logs in to the communication system.

6.10 Uninstalling the Communication Software

The software communication can be uninstalled via a text console.

6.10.1 How to Uninstall the Communication Software

Step by Step

- 1.** Open a terminal (e.g., a GNOME terminal).
- 2.** Enter the command `su` (for superuser = root) in the shell interface and confirm it by pressing the Enter key.
- 3.** Enter the password for the "root" user in the shell interface and confirm it by pressing the Enter key.
- 4.** Enter the command `oso_deinstall.sh` in the shell interface and confirm it by pressing the Enter key. Follow the instructions of the uninstallation program.

6.11 Used Ports

The OpenScape Business system components use different ports, which may need to be opened in the firewall as required. For the ports of the web-based clients (e.g., myPortal to go), port forwarding must be configured in the router.

Initial Setup for OpenScape Business S

An actual and complete list of all used ports of OpenScape Business is available in the "Interface Management Database" (IFMD) which can be accessed via the Partner Portal of Unify (<https://unify.com/en/partners/partner-portal>).

NOTICE: The ports identified with "O" in the list below are optional, i.e., are not permanently open in the firewall.

Description	TCP	UDP	Port number	OpenScape Business X	UC Booster Card	OpenScape Business S	UC Booster Server
System components							
Admin Portal (https)	X		443	X	X	X	X
CAR Update Registration	X		12061	X		X

Web-based clients (http)	X		8801	X	X	X	X
Web-based clients (https)	X		8802	X	X	X	X

NOTICE: For security reasons, we recommend that only https be used for the web-based clients and that port forwarding be set up from external TCP/443 to internal TCP/8802.

6.12 How to collect diagnostic traces for error incident

You can automatically collect the necessary diagnostic traces data for an error incident. The **Error Management** wizard will guide you through the whole process.

You must run the **Error Management** wizard twice: before and after the execution of the problematic scenario. During the first run (Phase 1), you activate the diagnostic traces collection. After execution of the problematic scenario, run the wizard again to collect the diagnostic trace data (Phase 2). Once the Phase 2 is complete, you can download the trace file to include them in the ticket system.

Perform the following steps to collect the diagnostic trace data for the error incident:

Step by Step

1. In the navigation bar, click on **Setup**.
2. Click on **Edit** next to **Error Management**.
3. Click on **OK & Next**
4. If you want to collect the Default Traces click on the **Default Traces** check-box.
5. If you want to specify the types of traces to collect, select the desired ones from the list of traces. More than one selection is possible.
For more information about the traces, see the Troubleshooting guide.
6. Click **OK & Next**.
7. A list with additional information, relevant documentation and hints is displayed. Click **OK & Next**.
8. The scenarios and type of traces that you will collect are displayed. Click **Finish**.
9. Continue by executing the problematic scenario.
10. Once you complete the scenario navigate again to **Setup > Error Management** and click **Edit**.
You are redirected to the Step 2 of the diagnostic traces collection. If you want to stop the process and initiate it again you can click the **Abort** button.
11. Click **OK & Next**.
12. Enter the required information and click **OK & Next**.
13. A list with necessary information and some further actions is displayed.
14. Click **OK & Next**.
15. Click **Finish** to start downloading the diagnostic trace data.

6.13 Reflashing

Following the steps below you can easily change the software type of a device.

The concept behind this feature is to simplify the way of getting a SIP device (out of the box) and registering it to OSBiz system as an HFA device. The only requirements are:

- the phone must get the DLI address (either from DHCP server or manually)
- the administrator must enter the phone's number (which must be preconfigured as a System Client)

Once the customer gets a new device it will be pre-configured as a SIP device(factory settings). The steps to reflash this device to an HFA device are as follows:

Step by Step

1. Configure in the OSBIZ database the desired phone number as a System Client (HFA).

Callno	DID	First Name	Last Name	Display	Type	Clip/Lin
Search:						
-	-	ppc0	x651000	x651000, ppc0	System Client	-
-	-	651001	hfa1	hfa1, 651001	System Client	-
-	-	651002	hfa2	hfa2, 651002	System Client	-
-	-	651003	hfa3	hfa3, 651003	System Client	-
-	-	651004	hfa4	hfa4, 651004	System Client	-
-	-	651005	hfa5	hfa5, 651005	System Client	-
-	-	651007	hfa7	hfa7, 651007	System Client	-
-	-	651009	hfa9	hfa9, 651009	System Client	-
-	-	-	-	-	No Port	-
-	-	-	-	-	No Port	-
-	-	-	-	-	No Port	-
-	-	justle	Sip	Sip, justle	SIP Client	-
-	-	justle	WebRTC	WebRTC, justle	System Client	-
-	-	-	-	-	No Port	-

2. Configure the DHCP server to send the IP address of DLI. This can be done either at the external DHCP Server or the internal DHCP server.

Global Parameters

Enable DHCP Server: ☒

Netmask: 255.255.255.0

Broadcast Address: 0.0.0.0 (optional)

Default Gateway

Gateway 1: 192.168.1.2

Gateway 2: 0.0.0.0

Gateway 3: 0.0.0.0

DNS Server

Domain Name:

Server 1: 192.168.1.2

Server 2: 0.0.0.0

Server 3: 0.0.0.0

Lease time in hours (0 infinite): 1

Enable Dynamic DNS Update: ☐

Use Internal DLI: ☒

Initial Setup for OpenScape Business S

3. If there is no DHCP server used, then you must configure the DLI IP on the phone manually.
4. Once the SIP phone gets an IP and the DLI IP, the phone device will be registered into the DLI database, and a prompt will be displayed to enter the extension number.
5. Enter the terminal number on the phone (the number should be the same configured in the first step, e.g. 4111).
6. The reflash will start and the new HFA image will be downloaded to the phone. When the phone reboots it will be registered as an HFA phone and the plug and play data will be sent by the system towards the phone.
7. **To reflash an already registered SIP phone:**
8. Change the working SIP device type to "System Client".

Expert mode - Telephony Server

-	-	justle	WebRTC	WebRTC, justle	System Client	-
-	-	-	-	-	No Port	-

9. Restart the phone.
10. The reflash will start and the new HFA image will be downloaded to the phone. When the phone reboots it will be registered as an HFA phone and the plug and play data will be sent by the system towards the phone.

7 Initial Setup of OpenScape Business UC Booster

This section describes the initial installation and configuration of the OpenScape Business UC Booster at the OpenScape Business X3/X5/X8 communication system. Note that a distinction is made here, depending on whether the OpenScape Business UC Booster Card or the OpenScape Business UC Booster Server is to be used for the UC Booster functionality.

The initial setup of the OpenScape Business UC Booster is carried out using the OpenScape Business Assistant administration program (web-based management, also called WBM in short).

The detailed administration of any features that are not covered by the initial setup is described in subsequent chapters.

Initial Setup of the OpenScape Business UC Booster Card

The OpenScape Business UC Booster Card is installed in the OpenScape Business X3/X5/X8 communication system and configured for operation. This is followed by the configuration of the OpenScape Business UC Booster functionality.

The specific installation steps required for the initial setup differ, depending on whether the UC Booster Card is being put into operation with the OpenScape Business X3/X5/X8 communication system for the first time or whether it is being integrated later in an existing and already configured OpenScape Business X3/X5/X8 communication system.

Overview of the installation steps for both options:

Integration in a New Communication System	Integration in an Existing Communication System
	Backing up the Configuration Data of the Communication System
<p>Installing the UC Booster Card</p> <p>The UC Booster Card is installed in the OpenScape Business X3/X5/X8 communication system.</p> <p>For a description, see the OpenScape Business Service Documentation, Hardware Installation - Description of the Boards.</p>	<p>Installing the UC Booster Card</p> <p>The UC Booster Card is installed in the OpenScape Business X3/X5/X8 communication system.</p> <p>For a description, see the OpenScape Business Service Documentation, Hardware Installation - Description of the Boards.</p>

Initial Installation of the OpenScape Business UC Booster Server

The OpenScape Business UC Booster Server is integrated together with the OpenScape Business X3/X5/X8 communication system in the customer LAN.

The OpenScape Business communication software for the OpenScape Business UC Booster Server, which provides the OpenScape Business UC Booster functionality, is installed on the Linux operating system SLES 12 SP5 64 bit. The communication software can be operated directly on a Linux server or in a virtual environment with VMware vSphere. The installation of the Linux operating system is described in the installation guide *OpenScape Business, Installing the Linux Server*.

The OpenScape Business UC Booster Server has its own WBM. This WBM is used for software updates, backing up the configuration data and diagnostics of the OpenScape Business UC Booster Server. The initial installation of the OpenScape Business UC Booster server is performed with the WBM of the communication system.

The specific installation steps required for the initial installation differ, depending on whether the UC Booster Server is being put into operation with the OpenScape Business X3/X5/X8 communication system for the first time or whether it is being connected later to an existing and already configured OpenScape Business X3/X5/X8 communication system.

Overview of the installation steps for both options:

Integration in a New Communication System	Integration in an Existing Communication System
	Backing up the Configuration Data of the Communication System

For a description, see the Integration into the Customer LAN . For the specifics of the configuration, see Configuring the UC Booster Server
Basic Configuration The basic configuration is performed together with the initial installation of the OpenScape Business X3/X5/X8 communication system. For a description, see the Basic Configuration .	Basic Configuration The basic configuration is performed later on an already configured OpenScape Business X3/X5/X8 communication system. For a description, see the Basic Configuration . For the special features of the basic configuration, see Basic Configuration
Closing Activities The closing activities (including the licensing of the UC Clients) are performed together with the initial installation of the OpenScape Business X3/X5/X8 communication system. For a description, see the Closing Activities .	Closing Activities The closing activities (including the licensing of the UC Clients) are performed together with the initial installation of the OpenScape Business X3/X5/X8 communication system. For a description, see the Closing Activities . For the special features of the closing activities, see Closing Activities

7.1 Prerequisites for the Initial Setup

Meeting the requirements for the initial setup ensures the proper operation of the OpenScape Business UC Booster.

General

Depending on the used hardware (phones, ...) and the existing infrastructure, the following general conditions apply:

- The OpenScape Business X3/X5/X8 communication system is configured and ready for use.
- The LAN infrastructure (Internet routers, switches, etc.) is present and usable.
- The IP phones are connected to the customer LAN.
- A broadband Internet connection is recommended for software updates and remote access.
- All licenses required for the OpenScape Business UC Booster are present (e.g., UC clients, Directory Services, etc.). When integrating in an already licensed communication system, there is no activation period.
- An IP address scheme exists and is known.
- A dial plan (also called a numbering plan) is present and known.

For UC Booster Card

The following requirements must be observed for the operation of the UC Booster Card.

- OpenScape Business Hardware:

The UC Booster Card is installed.

- Networking equipment:

An IPv6-enabled networking equipment through which the UC Booster Card is connected with the communication system is mandatory for proper operation. This causes the UC Booster Card to automatically receive an IP address during the initial setup and after every restart of the system.

If the networking equipment is not IPv6-enabled, the red LED of the communication system flashes. In this case, the Admin port of the system must be connected to the second LAN port of the UC Booster Card using an additional Ethernet cable. This causes the UC Booster Card to automatically receive an IPv4 IP address via the IPv6 protocol. As soon as the UC Booster Card is reachable over IP, the red LED of the communication system goes out. The desired IP address for the UC Booster Card can then be entered during the initial setup and after every restart of the system. Communication between the system and UC Booster Card now takes place through the IPv4 connection of the switch.

NOTICE: The additional Ethernet cable should be left connected in case a restart or a reload is required.

- Fan kit:

The UC Booster Card requires an additional fan. The fan kit depends on the communication system.

- Housing cover:

For the OpenScape Business X3W, a new housing cover is required for the UC Booster Card fan kit.

When migrating from HiPath 3000 systems, new housing covers to accommodate the UC Booster Card fan kit are required for OpenScape Business X3W/X5W and X3R/X5R.

- Communication software:

The software of the communication system must be upgraded to the latest released software version. Note that the image including the UC Booster Card software must be used for this purpose.

- Web browsers:

The Admin PC is used for the initial setup of the UC Booster Card with the OpenScape Business Assistant (WBM). The WBM is browser-based and is thus independent of the operating system. A screen resolution of 1024 x 768 or higher is required.

The following HTML 5-enabled web browsers are supported:

- Microsoft Internet Explorer Version 10 and later.
- Microsoft Edge
- Mozilla Firefox Version 17 and later
- Google Chrome

If an older version of the web browser is installed, you will need to install an up-to-date version before you can start the initial setup of the system.

NOTICE: Unrestricted network access is needed between OSCC and OCAB.

For UC server Booster

The following requirements must be observed for the operation of the UC Booster Server.

- Linux server:

The Linux server required for OpenScape Business S was installed as per the instructions in the *OpenScape Business Linux Server Installation Guide*, was integrated into the customer LAN, and is ready for use.

- OpenScape Business communication software:

The installation DVD with the OpenScape Business communication software is available. After the software installation, the software of the communication system and communication software of the UC Booster Server must be updated separately to the same, latest released software version.

- DVD with Linux operating system SLES 12 SP5 64 bit

The Linux DVD may be needed during the installation of the OpenScape Business communication software, since some software

Initial Setup of OpenScape Business UC Booster

Backing up the Configuration Data of the Communication System

packages (RPM) required for the communication software may need to be installed later from this DVD.

- Web browsers:

For the initial setup of the UC Booster Server with the OpenScape Business Assistant (WBM), either the Linux server or the Admin PC can be used. The WBM is browser-based and is thus independent of the operating system. A screen resolution of 1024 x 768 or higher is required.

The following HTML 5-enabled web browsers are supported:

- Microsoft Internet Explorer Version 10 and later (Admin PC).
- Microsoft Edge
- Mozilla Firefox Version 17 and later (Linux server / Admin PC)
- Google Chrome

If an older version of the web browser is installed, you will need to install an up-to-date version before you can start the initial setup of the system.

- Firewall:

When connected to the Internet, a firewall is needed for the Linux server to prevent unauthorized access from outside. After installing Linux, the Linux firewall is enabled. The installer of the communication software adjusts the firewall settings so that the communication software can be operated properly. The ports for the communication software are opened, and all other ports are closed.

If an external firewall is used in the network, the Linux firewall must be disabled, and the addresses and ports required for the communication software must be opened (see [Used Ports](#)).

7.2 Backing up the Configuration Data of the Communication System

Before installing the OpenScape Business UC Booster, the existing configuration data of the OpenScape Business communication system must always be saved by creating a backup.

The backup is performed at the WBM of the OpenScape Business communication system.

It can be stored on different backup media (such as a USB drive or a network drive).

7.2.1 How to Perform a Data Backup

Prerequisites

You are logged in at the WBM of the communication system with the **Advanced** profile.

For a data backup on a USB device, the USB device must be connected to the USB server interface of the communication system.

Step by Step

1. Click on **Backup and Restore** in the navigation bar.
2. In the navigation tree, click **Backup - Immediate**.
3. Enter a comment for the backup set in the **Comment** field in the **Name** area so that the backup set can be easily identified if needed later for a restore. Avoid the use of diacritical characters such as umlauts and special characters in your input.
4. Activate the target drive on which the backup set is to be saved in the **Devices** area.
5. Click on **OK & Next**. The progress of the backup process is displayed in a separate window.
6. The backup was successful if the message **Backup completed successfully!** appears. Click on **Finish**.
7. If you are using a USB stick as the backup medium, wait until the LED of the USB stick stops blinking. This ensures that the backup has been successfully saved on the USB stick. You can then safely remove the USB stick.
8. This completes the backup with the WBM. Exit the WBM by right-clicking the **Logout** link on the top right of the screen and then close the window.

7.3 Commissioning the UC Booster Card

The commissioning of the UC Booster Card includes the installation in the OpenScape Business communication system and the initial configuration for proper operation.

After completing the configuration successfully, a software update must be performed.

7.3.1 Installing the UC Booster Card

The UC Booster Card is integrated into the OpenScape Business communication system. The slot used for the UC Booster Card depends on the communication system.

The installation of the UC Booster Card is described in detail in the service documentation Hardware Installation under the section "Description of the Boards".

The UC Booster Card can be integrated into the following OpenScape Business communication systems:

- OpenScape Business X3R and X5R (OCCMR)
UC Booster Card with additional fan kit.
- OpenScape Business X3W and X5W (OCCM)
UC Booster Card with additional fan kit.

For the OpenScape Business X3W, a new housing cover for the fan kit is also required.

- OpenScape Business X8 (OCCL)

UC Booster Card with additional fan kit.

7.3.2 Configuring the UC Booster Card

During the configuration, the basic settings for the operation of UC Booster Card are set up.

The configuration of the UC Booster Card is performed with the **Initial Installation** wizard in the WBM of the communication system. The description of the configuration can be found in the section Initial installation of OpenScape Business X3/X5/X8.

The **Initial Installation** wizard of the WBM includes the initial configuration of the entire communication system. The following configuration components are important for the operation of the OpenScape Business UC Booster Card:

- IP address of the UC Booster Card

The UC Booster Card requires a separate IP address from the network segment of the communication system.

- Selection of the UC solution

You can select whether the UC solution UC Smart or UC Suite is to be used.

Changing the IP address of the UC Booster Card or UC solution leads to a restart of the communication system.

7.3.3 Updating the Software for the UC Booster Card

In order to enable the UC Booster Card to operate correctly, the software of the communication system needs to be updated. All missing software components for the UC Booster Card will then be installed.

If the software of the communication system is already up-to-date, the system must be updated again with the latest software to ensure that all components required for the UC Booster Card functionality are now installed.

The software update can be optionally performed via the Internet or via an image file, which can be obtained from the Software Download Server. When performing the update via the image file, make sure that the image file containing the UC Booster Card portions (osbiz..._ocab.tar) is used.

7.3.3.1 How to Perform a Software Update

Prerequisites

Access to the Internet is available.

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. Click on **Service Center** in the navigation bar.
2. In the navigation tree, click on **Software Update > Update via Internet**. The currently installed software version is displayed to you.
3. Click on **OK & Next**.
4. Read the license agreement (EULA) fully and then enable the radio button **I accept the license agreement**.
5. Click on **OK & Next**.
6. Select the radio button **Start Action - Immediately / Immediately after transfer**.
7. Click on **OK & Next**. The software update is loaded into the communication system in the background and automatically activated after the transmission. After two restarts, the software is up-to-date.

NOTICE: You can close the browser window at any time.

8. You can check the current status of the update with the WBM under **Service Center > Software Update > Status**.

7.4 Commissioning the UC Booster Server

The commissioning of the the UC Booster Server includes the installation of the OpenScape Business communication software on the Linux server and the initial configuration for proper operation.

After completing the configuration successfully, a software update must be performed.

7.4.1 Installing the Communication Software

The OpenScape Business communication software is installed on the Linux server using the OpenScape Business DVD.

Make sure that the IP addresses and network masks to be configured are appropriate for the customer LAN.

DHCP Server

A DHCP server automatically assigns a unique IP address to each IP station (IP phones, PCs, etc.) and provides the IP stations with network-specific data such as the IP address of the default gateway, for example.

Either an external DHCP server (e.g., the DHCP server of the Internet router or of the communication system) or the DHCP server of the Linux server can be used as a DHCP server. If the DHCP server of the Linux server is used, the external DHCP server must be disabled. The configuration of the Linux DHCP server can be performed during the installation of the OpenScape Business communication software.

Virtual Environment

The communication software can run in a virtual environment. To do this, the virtualization software (host operating system) must be first installed and configured on the server PC. Linux is then installed as a guest operating system. Within the Linux operating system, the communication software is installed last (see the *OpenScape Business Linux Server Installation Guide* for more details).

Use of snapshots on virtual machines (VM):

Snapshots can be a valuable maintenance mechanism, for example, to perform a fast rollback to a predefined operating state of the VM after a mass distribution script has failed.

- Snapshots cannot be created during normal operation. While a snapshot is being taken, the current operating state of the virtual machine is frozen. Consequently, connected devices and applications such as IP phones or the UC clients can lose the connection to the server.
- Snapshots can cause internal server processes to lose their synchronization, which means that the stable operation of the communication system can then no longer be guaranteed. A server reboot following the snapshot should therefore also be planned within the maintenance timeframe.
- Previous snapshots should not remain on the production environment during normal operation.
- Snapshots can be taken during a planned maintenance window or within the framework of the installation.
- Snapshots are used internally by backup tools such as VDP or VDR. It must be ensured that these backup operations are scheduled outside of business hours and that the snapshots generated by these tools are deleted at the end of the operation.

More information regarding snapshots can be found in the VMware knowledge base (KB). A good starting point is the KB article 1025279 – Best Practices for virtual machine snapshots in the VMware environment (<http://kb.vmware.com/kb/1025279>).

7.4.1.1 How to Install the Communication Software

Prerequisites

- The SLES 12 SP5 operating system has been correctly installed and started on the Linux server.
- DVD or .ISO file with OpenScape Business communication software.
- DVD or .ISO file with the Linux operating system SLES 12 SP5 64-bit for any subsequent installation of software packages (RPM) that may be required.
- The root access data (user name and password) for logging into the Linux server is available.

IMPORTANT: The OpenScape Business communication software overwrites any existing configuration files (e.g., for DHCP, FTP, Postfix, etc.) during the installation.

Step by Step

1. Log into the Linux server with root privileges.
2. Insert the OpenScape Business DVD or .ISO file into the DVD drive.
3. Confirm the message with **Run**. The "Welcome" window appears.
4. Select the desired setup language (e.g., **English**) and click **Start**. The rest of the installation is described here for the English language.
5. Select the desired product from the list and click on **Select**. A check is performed to determine whether the hardware meets all the requirements for the installation. A warning is displayed for minor shortfalls in meeting the requirements. After confirmation, the installation can then be continued. For severe shortfalls, the installation is canceled automatically.
6. A check is performed to determine whether additional RPM packages need to be installed. If yes, confirm this with **Confirm**. If this occurs, you will need to switch back to SLES 12 DVD or .ISO file later.
7. A window with the terms of the license (i.e., the End User License Agreement or EULA) appears. Read the terms of the license and accept the license agreement with **Yes**.
8. If a DHCP server is already present in the customer LAN (e.g., the DHCP server of the Internet router), stop the configuration of the Linux DHCP server here with **No** and proceed to step 12 to continue.

NOTICE: In order to ensure that the software of system telephones can be updated automatically even when using an external DHCP server, you have two options:

a) The IP address of the Linux server must be entered as the DLS address at each system telephone.

b) The network-specific data must be entered at the external DHCP server. The parameters for this can be found under `/var/log/OPTI.txt`.

-
9. If you want to use the Linux DHCP server, click on **Yes** to enable and configure the Linux DHCP server.
 10. Enter the following values (preset with default values):
 - **Default Route:** IP address of the default gateway; as a rule, the IP address for the Internet router, e.g., 192.168.5.1.
 - **Domain** (optional): the domain specified during the Linux installation, e.g., <customer>.com

- **DNS-Server** (optional): IP address of the DNS server specified during the Linux installation. If no DNS server is available in the internal network, you can enter the IP address of the Internet router (e.g., 192.168.5.1) here.
- **SNTP Server**: IP address of the internal or external NTP server.
- **DLS/DLI Server**: IP address of DLS server, i.e., the IP address of the Linux server (e.g.: 192.168.5.10).
- **Subnet**: appropriate subnet for the IP address range, e.g.: 192.168.5.0.
- **Netmask**: Subnet mask of the Linux server that was specified during the Linux installation, e.g.: 255.255.255.0.
- **IP range begin** and **IP range end**: IP address range from which the DHCP server may assign IP addresses, e.g.: 192.168.5.100 to 192.168.5.254.

11. Click on **Continue**.
12. After the installation, the Linux operating system needs to be restarted. Select the check box **PC Reboot** and confirm with **Continue**.
13. If additional RPM packages need to be installed, you will be prompted to insert the SLES 12 DVD or .ISO file. Insert the DVD or .ISO file and confirm with **Continue**. Following the successful installation of the RPM packages, reinsert the OpenScape Business DVD or .ISO file and confirm this with **Continue**, followed by **Run**.
14. The OpenScape Business communication software is installed. The operating system then automatically performs a restart.
15. After the restart, log in with the user account that was set up earlier during the Linux installation.
16. Right-click on the DVD drive icon on the desktop and select the menu item **Eject**. Remove the OpenScape Business DVD from the DVD drive.

NOTICE: It takes a few minutes until all components of the OpenScape Business communication software are active.

7.4.2 Configuring the UC Booster Server

During the initial configuration, the basic settings for the operation of the UC Booster Server are defined.

The configuration of the UC Booster Server is performed with the **Initial Installation** wizard of the WBM of the communication system. A description of the configuration can be found in the section "Initial installation of OpenScape Business X".

The **Initial Installation** wizard of the WBM includes the initial configuration of the entire communication system. The following configuration components are important for the operation of the OpenScape Business UC Booster Server:

- Selection of the UC solution

You can select whether the UC solution UC Smart or UC Suite is to be used. The IP address of the Linux server must be entered for this purpose.

Changing the UC solution leads to a restart of the communication system.

In addition, the IP address of the communication system must be made known at the WBM of the UC Booster Server.

7.4.2.1 Announcing the IP Address of the Communication System

Prerequisites

The UC Booster Server is integrated in the customer LAN and operational.

The OpenScape Business communication system is operational.

Step by Step

1. Start the web browser on the Linux PC and invoke the WBM of the OpenScape Business server at the following address:
`https://<IP address of the Linux server>, e.g.,
https://192.168.1.10`
2. If the browser reports a problem with a security certificate, install the certificate (using the example of Internet Explorer V10).
 - a) Close the web browser.
 - b) Open the web browser with administrator rights by clicking the right mouse button on the web browser icon and selecting the menu item **Run as administrator** from the context menu.
 - c) Allow the User Account Control.
 - d) Open the WBM of the OpenScape Business server at the following address:
`https://<IP address of the Linux server>, e.g.,
https://192.168.1.10`
 - e) Click on **Continue to this website**.
 - f) Click on the message **Certificate Error** in the navigation bar of the web browser.
 - g) Click on **View Certificates**.
 - h) Click on **Install Certificate** (only visible with administrator rights).
 - i) Select the option **Local Computer** and confirm with **Next**.
 - j) Select the option **Place all certificates in the following store**, click **Browse** and specify **Trusted Root Certification Authorities**.
 - k) Confirm with **OK** and then with **Next** and **Finish**.
 - l) Confirm the certificate import with **OK** and close the certificate window **OK**.
 - m) Close the web browser.
 - n) Start the web browser again (without administrator rights) and invoke the WBM of the OpenScape Business sever at the following address:

`https://<IP address of the Linux server>, e.g.,
https://192.168.1.10`

3. Click on the language code at the top right and select the language in which the user interface of the WBM is to be displayed from the menu. The Login page will be displayed in the selected language.
4. In the field under **Login**, enter the default user name `administrator@system` for access as an administrator.

NOTICE: If you go to the **Password** field after entering `administrator`, `@system` will be added automatically.

5. In the second field under **Login**, enter the dStart the web browser on the Linux PC and invoke the WBM of the OpenScape default password `administrator` for access as an administrator.
6. Click **Login**.
7. The following steps are only required once when first logging on to the WBM:
 - a) Reenter the default password **administrator** in the `Password` field.
 - b) Enter a new password in the **New Password** and **Confirm New Password** fields to protect the system against misuse. Note case usage and the status of the `Num` and `CapsLock` keys. The password is displayed as a string of asterisks (*).

NOTICE: The password must be at least 8 characters long and include a digit. Make sure that you remember your new password.

- c) Click **Login**.
- d) Select the current date and enter the correct time.
- e) Click **OK & Next**. You are automatically logged out of the WBM.
- f) In the field under **Login**, enter the default user name `administrator@system` for access as an administrator.

NOTICE: If you go to the **Password** field after entering `administrator`, `@system` will be added automatically.

- g) In the second field under **Login**, enter your new password for access as an administrator.
- h) Click **Login**. The home page of the WBM appears.
- i) Click on **Administrators** in the navigation bar.
- j) In the **Administrators List**, select the check box before the list item **Administrator**.
- k) Click **Edit**.
- l) In the **User role** drop-down list, select the user profile **Expert**.
- m) Click **OK & Next**.

- n) Log out from the WBM via the **Log Out** link at the top right.
- o) Log into the WBM again with the default user name `administrator@system` and the newly defined password.
- 8.** In the navigation bar, click on **Expert Mode**.
- 9.** Click **Maintenance > Configuration** in the navigation tree.
- 10.** On the **Change Gateway IP Address** tab, under **Gateway IP Address**, enter the IP address of the communication system (e.g., 192.168.1.2).
- 11.** Click **Apply**.

7.4.3 Updating the Software for the UC Booster Server

In order to ensure that the UC Booster Server operates correctly, the software of the communication system and the communication software of the UC Booster Server must be updated to the same software level.

If the software of the communication system is already up-to-date, only the software of the UC Booster Server needs to be updated.

The software update can be optionally performed via the Internet or via an image file, which can be obtained from the Software Download Server. When updating the UC Booster Server via the image file, make sure that the image file containing the UC Booster Server portions (osbiz..._pcx.tar) is used.

7.5 Basic Configuration

During the basic configuration, the most important settings for the operation of the OpenScape Business UC Booster are defined.

The basic configuration for both the UC Booster Card and the UC Booster Server are performed by using the **Basic Installation** wizard of the WBM of the communication system. A description of the basic configuration can be found in the section Initial Installation of OpenScape Business X.

The basic configuration covers the configuration of the entire communication system. The following configuration items are important for the operation of the OpenScape Business UC Booster:

- **Station data**
Special phone numbers required for the operation of the OpenScape Business UC Booster can be adapted as required. For example, the call number of the UC Suite voicemail box must be specified here.
- **Configuring the UC Booster Card**
If a UC Booster Card is integrated in the communication system, the automatic configuration of the UC Booster Card must be initiated.
- **Meet-Me conference settings**

The Meet-Me conference feature is available with OpenScape Business UC Booster. The pre-assigned call number and the pre-assigned dial-in number for the Meet-Me conference can be changed.

7.6 Closing Activities

After the initial installation and the basic installation with the WBM have been completed, some important settings must still be made for the operation of the OpenScape Business UC Booster.

The closing activities for both the UC Booster Card and the UC Booster Server are performed with the WBM of the communication system. A description of the closing activities can be found in the online help or in the OpenScape Business Administrator Documentation under the section "Initial Installation of OpenScape Business X".

The following closing activities are important for the operation of the OpenScape Business UC Booster:

- Activate and assign licenses

If the OpenScape Business UC Booster is being integrated in an already licensed communication system, the licenses must be activated immediately in order to use its functionality. If the OpenScape Business UC Booster is being integrated in a communication system that has not yet been licensed, the licenses must be activated within a period of 30 days. Once the licenses have been activated successfully, they must be assigned to the stations. In a standalone system, system-wide features are enabled automatically upon activation.

- Provision the UC Clients for installation

The UC clients are part of the UC Suite. The installation files for the UC Client are accessible via the WBM and can be made available to the IP stations automatically or manually.

- Perform a data backup

All previous changes to OpenScape Business must be backed up. The backup can be stored as a backup set on a USB storage device or on the internal network.

For the UC Booster Card, it is sufficient to perform a backup of the communication system. For the UC Booster Server, the data of the communication system and the data of the communication software of the UC Booster Server must be backed up separately.

7.7 Uninstalling the Communication Software

The software communication can be uninstalled via a text console.

7.7.1 How to Uninstall the Communication Software

Step by Step

1. Open a terminal (e.g., a GNOME terminal).
2. Enter the command `su` (for superuser = root) in the shell interface and confirm it by pressing the Enter key.
3. Enter the password for the "root" user in the shell interface and confirm it by pressing the Enter key.
4. Enter the command `oso_deinstall.sh` in the shell interface and confirm it by pressing the Enter key. Follow the instructions of the uninstallation program.

7.8 Upgrading from the UC Booster Card to the UC Booster Server

In order to upgrade an OpenScape Business communication system with an integrated UC Booster Card to an OpenScape Business communication system with a connected UC Booster Server, the following steps must be performed as described below:

Upgrade Steps

Perform the following steps in sequence:

1) Back up the configuration data

Perform a backup of the configuration data of the communication system.

For a description of the backup procedure, see [Backing up the Configuration Data of the Communication System](#).

2) Change the IP address of the UC Booster Card

Using the **Initial Installation** wizard in the WBM of the communication system, change the IP address of the UC Booster Card to an unused IP address. The UC clients will be disconnected.

For a description of how to change the IP address, see [System Settings](#).

3) Change the application selection

Using the **Initial Installation** wizard in the WBM of the communication system, change the application selection from **Package with UC Suite** to **Package with UC Suite on OSBiz UC Booster Server** if you are using UC Suite (or from **Package with UC Smart** to **Package with UC Smart on OSBiz UC Booster Server** if you are using UC Smart) and enter the former IP address of the UC Booster Card as the IP address of the UC Booster Server.

For a description of the application selection, see [UC Solution](#).

4) Installing the Linux Server

The Linux operating system approved for the UC Booster Server must be installed on the Linux server.

A description of the Linux installation can be found in the OpenScape Business Linux Server Installation Guide.

5) Change the IP address of the UC Booster Server.

The former IP address of the UC Booster Card must be specified as the IP address of the UC Booster Server (= IP address of the Linux server). You can enter the IP address of the Linux server during the installation of the Linux operating system or change this later using YaST.

For a description of IP address assignment during the Linux installation, see the OpenScape Business Linux Server Installation Guide.

6) Install the communication software

The OpenScape Business communication software must be installed on the Linux server.

For a description of the installation of the communication software, see [Installing the Communication Software](#).

7) Configuring the UC Booster Server

Enter the IP address of the communication system in the WBM of the UC Booster Server.

For a description of IP address assignment of the communication system, see [Configuring the UC Booster Server](#).

8) Restart the communication software

Restart the UC Booster Server communication software via the WBM of the UC Booster Server.

For a description of the restart, see [Restarting the UC Application](#).

9) Update the software

The software of the communication system and the UC Booster Server must be updated to the same software level.

For a description of the software update, see [Updates](#).

10) Restore the configuration data

Restore the backed up configuration data of the communication system in the WBM of the communication system. The communication system and the communication software are subsequently restarted, and the connections to the UC Suite clients are restored.

For a description of how to restore data, see [Restore](#).

7.9 Used Ports

The OpenScape Business system components use different ports, which may need to be opened in the firewall as required. For the ports of the web-based clients (e.g., myPortal to go), port forwarding must be configured in the router.

An actual and complete list of all used ports of OpenScape Business is available in the "Interface Management Database" (IFMD) which

Initial Setup of OpenScape Business UC Booster

can be accessed via the Partner Portal of Unify (<https://unify.com/en/partners/partner-portal>).

NOTICE: The ports identified with "O" in the list below are optional, i.e., are not permanently open in the firewall.

Description	TCP	UDP	Port number	OpenScape Business X	UC Booster Card	OpenScape Business S	UC Booster Server
System components

Web-based clients (https)	X		8802	X	X	X	X

NOTICE: For security reasons, we recommend that only https be used for the web-based clients and that port forwarding be set up from external TCP/443 to internal TCP/8802.

8 Licensing

The flexible licensing concept of OpenScape Business allows customers to adapt the functional scope to their own requirements through licenses. All OpenScape Business X and OpenScape Business S communication systems are subject to this license concept. Phones, UC clients, UC functions and system-wide features can thus be unlocked according to individual customer needs. Uniform licenses are used for all OpenScape Business communication systems.

OpenScape Business can be expanded or equipped with additional features at a later date by purchasing additional licenses.

All licenses are always bound to the basic license of the communication system and enable the use of the purchased features for the associated version of OpenScape Business.

90-day evaluation licenses can be ordered to allow customers to test and evaluate special features.

NOTICE: It is advisable not to install license files or run any wizard if the system is live, as active calls may be dropped.

Activation Period

The license activation must be completed within the activation period (duration of 30 days). The activation period begins when the current date is entered in the WBM. The expiration date of the activation period is stored in the process.

During the activation period, the product is fully functional, and the maximum number of licenses are available for use.

If the system loses the current date within the activation period (e.g., due to a discharged battery on the mainboard), the date must be updated in the WBM as soon as possible so that the system can continue to be used without restrictions during the activation period.

If the licensing is not completed before the activation period expires, the functionality of the communication system will be severely restricted. Internal communication between the individual stations is still possible, but only the first two active phones can make external calls (e.g., for emergency calls). Access to the communication system via Remote Access is still possible. The system also remains in this restricted state when the initial installation is carried out only with Manager E, since this does not start the activation period.

License Structure

The licenses for the communication system are structured as follows:

- A basic license permanently activates the software of the communication system. This basic license is also required for activating all other licenses.
- Station licenses activate the phones for external voice communications.
- User-oriented licenses to unlock specific user features.

- System licenses to unlock general system-wide features.

Migration

Existing HiPath 3000 V9 customers are being offered an upgrade license for license migration. License migration ensures investment protection for customers through continued use of telephones and voice features.

NOTICE: For information regarding licensing and upgrading or migrating systems in a network, please see **Network - Licensing** section in [Updates](#) chapter.

[Stations](#) on page 403

8.1 Licensing Procedure

Licensing is handled via the centralized OpenScape License Management procedure for the administration and activation of licenses. This ensures that a customer can use precisely the system configuration or features for which that customer has acquired the appropriate licenses (usage rights).

The licenses of the OpenScape Business communication systems are bound to the Locking ID or the Advanced Locking ID of the communication system (see [Locking ID and Advanced ID Locking](#)).

The customer orders the required features and receives a License Activation Code (LAC). After a successful initial installation of the communication system, the customer activates the acquired licenses via a license file. The license file provides the system with a license pool with all purchased licenses available for the subsequent allocation of licenses.

The WBM provides wizard-driven functions for the customer registration, license activation and the license assignments for standalone systems and systems in an OpenScape Business internetwork. Licensing with Manager E is not possible.

Steps for Successful Licensing

- 1) Configuration of the system within the activation period
- 2) Registration of customer data
- 3) License Activation
- 4) Assigning Licenses

Customer Registration

Within the framework of licensing, the input of the customer data of each respective system is mandatory for the registration of the customer. The customer data is used to retrieve information quickly in the case of security-related issues, especially in the context of product recalls. In addition, customers receive information on

prevention of license misuse by third parties, e.g., via the new link to the license information.

License Activation

During the license activation, the purchased licenses are bound to the communication system using the license management of the WBM. Two methods are available for this:

- Online activation

For online activation, after the LAC is entered via the Internet, a connection to the Central License Server (CLS) is set up, and the license file is automatically transferred to the integrated license agent (Customer License Agent, CLA) in the communication system. The licenses are then automatically activated.

- Offline activation

With offline activation, the communication system is not connected to the Central License Server (CLS). The license file is generated at the CLS by an authorized partner and must be transmitted manually during the license activation to the integrated license agent (Customer License Agent, CLA) in the communication system.

Assigning Licenses

All purchased licenses are permanently assigned to stations via the license management of the WBM.

To assign licenses to stations, the stations must be first set up with the WBM, e.g., during the initial installation. Each system configuration can be set independently of the existing licenses. However, the corresponding feature can only be used once the license have been assigned.

When assigning licenses, a distinction is made between the configuration and actual licensing. For station and user-oriented licenses, licence requests are first configured. If a license is available in the license pool for a license request, the corresponding feature is unlocked. If no license is available in the license pool, the configured license request is retained, but the corresponding feature is not unlocked. Missing licenses must be purchased if needed.

Licensing in an Internetwork

For an OpenScope Business internetwork, a network-wide license file (network license file) is generated by an authorized partner at the Central License Server (CLS). This network-wide license file is managed by the Central License Agent (CLA) of the master node and provides the licenses for the individual nodes. The assignment of the licenses occurs via the WBM of each individual node. Within an internetwork, the network licenses can be shifted freely by using the WBM.

Online activation is not possible when licensing an internetwork.

Pay As You Go

Apart from the traditional licensing scheme, OpenScope Business supports subscription licensing model (Pay As You Go). "Pay As You

Go" gives the opportunity to invoice only for the used licenses on each billing period and use extra licenses without extending the license file. There is no need to decide the amount of the licenses beforehand

A permanent internet connection from OpenScape Business system to the Central License Server (CLS) is required. It can be activated either online with a License Activation Code (LAC) or with file upload. After installing, configuring the solution according to the custom needs and activating "Pay As You Go" a periodically report of the used licenses are sent to the Central License Server (CLS) and is evaluated. Once a month, a final report is created on the Central License Server (CLS) product site and the content of used licenses of this final report is used for license accounting.

With subscription licensing a new time period is introduced, the qualifying period. The qualifying period starts with the system startup or if a "Pay As You Go" license file is activated. The period starts consecutively and during this period a license configuration done in WBM will not lead to license usage update. The maximum duration of the qualifying period is 2 hours.

NOTICE: In order the firewall to have access to CLS the following actions are needed:-

- 7790 port for outgoing IP traffic released
- 188.64.16.4 released for outgoing IP traffic

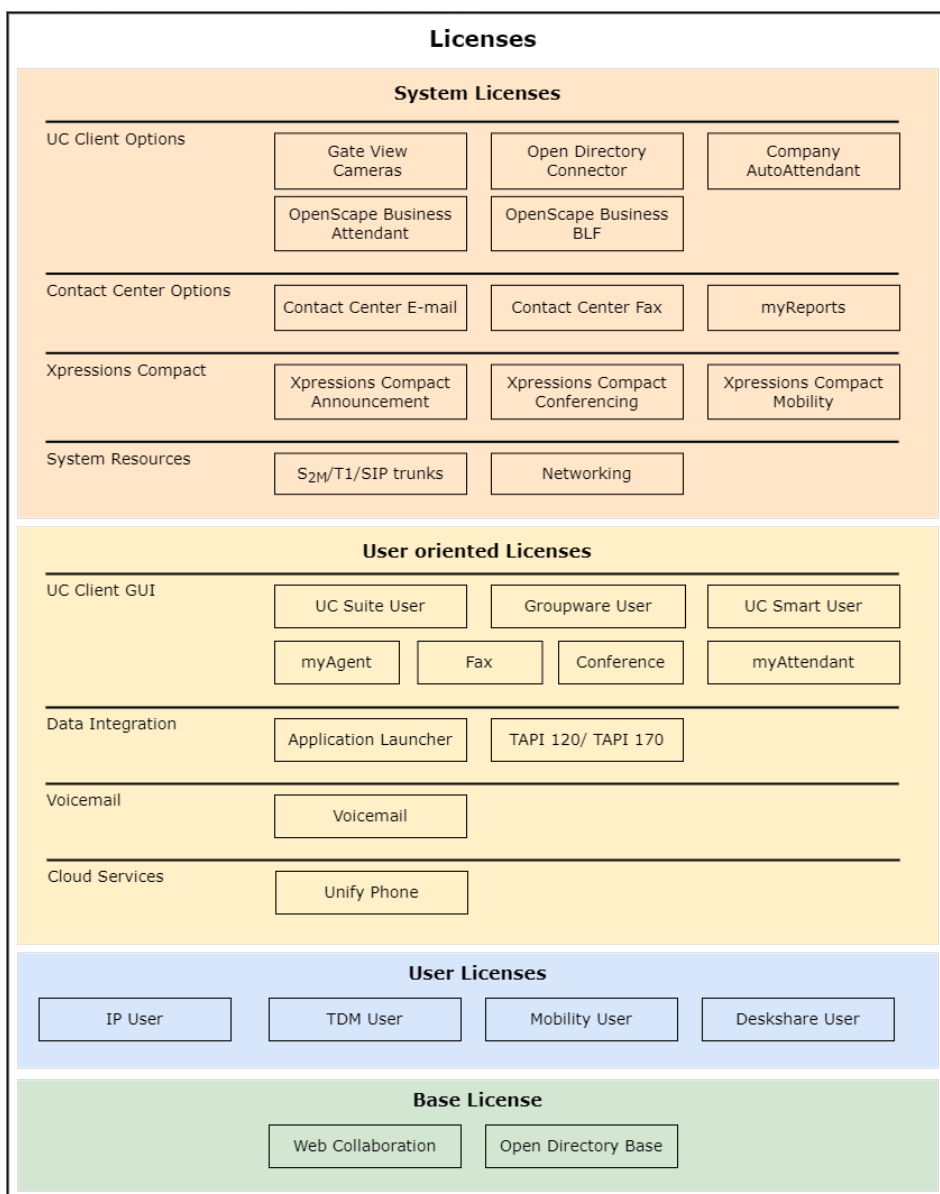

Newer V3R3 software systems utilize port 7791 for online license activation.

8.2 Licenses

To use the features of the communication system, licenses must be purchased. The purchased licenses must be activated within a given period of time (activation period).

Licenses are categorized thematically into license groups. The following license groups are available:

- Basic Licenses
- Station Licenses
- User-oriented Licenses
- System licenses

The above licenses can be used for OpenScape Business X, OpenScape Business S and the OpenScape Business UC Booster Server. There is no basic license for the UC Booster Server. The licenses cover all features and can be combined in accordance with the wishes of the customer. The possible combinations of licenses are explained in greater detail in the "Assigning Licenses and License Profiles" section.

Station licenses and user-oriented licenses are permanently assigned to subscribers.

8.2.1 Basic License

A basic license permits the basic use of the communication system. It is also required for activating all other licenses.

Internet telephony and emergency operation is also possible without a basic license.

The following basic licenses are available:

- **OpenScape Business V2 X1 Base**

for unlocking the V2 functionality of

- OpenScape Business X1

The basic license additionally includes the licenses OpenDirectory Base for using the Open Directory Service (ODS) and Web Collaboration for starting a web collaboration session. This makes it possible for the UC solution UC Smart to be connected to an external database.

- **OpenScape Business V2 Base**

for unlocking the V2 functionality of

- OpenScape Business X3/X5/X8 with or without UC Booster (UC Booster Card or UC Booster Server) or
- OpenScape Business S

The basic license additionally includes the license OpenDirectory Base for using the Open Directory Service (ODS) and Web Collaboration for starting a web collaboration session. This makes it possible to connect the UC solutions UC Suite or UC Smart to an external database.

8.2.2 User Licenses

Every subscriber connected to the communication system requires a user license to make external calls. This license is permanently bound to the call number of the subscriber via the WBM.

User licenses include the comprehensive voice functionality of OpenScape Business. Additional licenses are required to use the UC solutions UC Smart or UC Suite (see [User-oriented Licenses](#)).

The following station licenses are available:

- **IP User**

For the use of IP system telephones (HFA) and SIP telephones.

- **TDM User**

For the use of UP0 system phones, analog phones, analog fax devices, ISDN phones, ISDN fax and DECT phones.

- **Mobility User**

For the use of GSM/mobile phones, smartphones and tablet PCs as an extension of the communication system. For the use of myPortal to go and Mobility Entry. The assignment of an additional desk phone is not required. For the use of the Unify Phone client in combination with OpenScape Business.

- **DeskShare User**

For use of the DeskSharing feature. Only a phone number and no physical phone is permanently assigned to such users. DeskShare users can operate specific IP system phones using their

permanently assigned phone number, and they can access their personal phone settings on these phones.

- **Fallback User**

For basic telephony use in case of an event of failure of a system node. The license is supported as a time based Pay As You Go license. So, the usage time is calculated based on the days the system is hosting users from other nodes. The licenses are only effective during this hosting time. In a normal operation mode fallback users are like unlicensed users.

Flexible User Licensing

With the flexible user licensing, TDM, Mobility and Deskshare users can also be licensed with IP user licenses. If all the acquired TDM, DeskShare and Mobility user licenses have already been assigned to subscribers, and further TDM, DeskShare and Mobility users are required, then any remaining IP User licenses can be used to meet this demand.

The use of flexible user licensing requires the software version V1R3.3 and a newly generated license file at the CLS, which must be imported into the OpenScape Business and activated.

UC-Suite Flexible User Licensing

With the UC-Suite flexible user licensing, myPortal for Desktop users can also be licensed with myPortal for Outlook user licenses. If all the acquired myPortal for Desktop licenses have already been assigned, and further users are required, then the myPortal for Outlook User licenses can be used to meet this demand.

The use of flexible user licensing requires the software version V2 and a newly generated license file at the CLS, which must be imported into the OpenScape Business and activated.

8.2.3 User-oriented Licenses

User-oriented licenses are station-based and authorize the use of unified communications features and data integration applications. A user-oriented license also requires a station license and is permanently assigned to the phone number of the subscriber.

The following user-oriented licenses are available:

Voicemail

- **Voicemail**

For the use of a personal voicemail box via the telephone (TUI) and via the user interface of the UC solutions UC Smart or UC Suite.

NOTICE: If the UC solution UC Smart is expanded to UC Suite, the existing voicemail licenses and the assignments to the stations are retained.

NOTICE: When assigning a VoiceMail license to an extension, a UC Suite user is created and all active call forwardings are reset.

Cloud Services

- **Unify Phone**

For the use of the Unify Phone client in combination with OpenScape Business.

UC Client User Interface

- **UC Smart User**

For the use of UC Smart functions of the communication clients myPortal @work, myPortal to go and other Web Services clients.

- **UC Suite User**

For the use of UC Suite functions of the communications clients myPortal @work, myPortal for Desktop, myPortal to go and other Web Services clients.

- **Groupware user**

For the use of UC Suite functions of the communications clients myPortal @work, myPortal for Outlook, myPortal to go and other Web Services clients.

- **Fax**

For use of a fax box within the UC Suite. As a prerequisite, one UC User or Groupware User license is required additionally.

- **Conference**

For the use of the UC Suite conference management features, such as managing and initiating permanent and recurring conferences. As a prerequisite, one UC User license or Groupware User license is required additionally.

No license is required for participating in conferences.

- **myAttendant**

For use of the UC Suite Attendant features.

- **myAgent**

For the use of Contact Center functions such as information about queues, pop-ups with customer information on incoming calls, and access to the call history.

NOTICE: For the mobile client myPortal to go, besides the Mobility User license, an additional UC User license or Groupware User license is required for the UC solution UC Smart or for the UC solution UC Suite.

Data Integration

- **Application Launcher**

For call-related control of applications on a client PC during incoming and outgoing calls, e.g., launching an application or displaying caller information. Application Launcher can be operated with UC Smart, UC Suite or myAgent and additionally requires a UC User / Groupware User license or a myAgent license. It can optionally use the Open Directory Service.

- **OpenScape Business TAPI**

For the use of TAPI compliant applications and for PC-supported telephony with the customer's own applications from various software vendors. The UC Booster (UC Booster Card or UC Booster Server) is a prerequisite.

8.2.4 System Licenses

System licenses are not subscriber-specific and unlock the system-wide features. These features can be used by all subscribers of the communication system.

Overview of system license requirements

Trunktype	SSP license	Trunk licenses/ channel	Networking license
ITSP	yes	yes	no
Native SIP trunk	yes	no	yes
Skype for Business	yes	yes	no
Circuit	yes	no	no
Unify Phone	yes	no	no
SIPQ-Interconnection	no	no	yes

The following system licenses are available:

System Resources

- **S_{2M}/T1/SIP trunks**

For the use of S_{2M}/T1 and ITSP channels. S₀ channels do not need to be licensed. This also includes connections to S₀ Fax servers in PP mode. For the primary multiplex connections S_{2M} or T1 (USA), the individual voice channels are licensed. For ITSP connections, the number of simultaneous connections to one or more ITSP providers (SIP providers) is licensed. The number of possible simultaneous connections depends on the bandwidth of the connection.

- **Networking**

For IP networking via SIP-Q/native SIP and/or TDM networking via CorNet-NQ or QSIG. For networking the UC Suite applications. One license is required per node.

NOTICE: The networking license unlocks the lines for voice networking and UC Suite networking for a node. No S_{2M}/T1/SIP trunk licenses are required for network trunks.

Table 3: Overview of System Resource Licenses (S_{2M}/ITSP)

Protocol	Licenses			TDM User
	No licence	OpenScape Business Networking (1x per system)	OpenScape Business S _{2M} / ITSP (1x per channel)	
S ₀ internal				
Fax Server (DSS1/QSIG)	X			per S ₀ station
Euro bus				
S ₀ - CO trunks				
EURO CO PP	X			
Euro CO PMP	X			
S _{2M} - CO trunks				
EURO CO PP			X	
ITSP - Provider				
ITSP 1 to 8			X	
S ₀ networking				
QSIG		X		
CorNet-NQ		X		
S _{2M} - Networking				
QSIG-Network		X		
CorNet-NQ		X		
SIP Networking				
SIP-Q		X		
native SIP		X		

Xpressions Compact

- Xpressions Compact Announcement**

For the use of Xpressions Compact Announcements features such as recording special announcements for information or attendant mailboxes. One license is required per Xpressions Compact.

- Xpressions Compact Conferencing**

For the use of Xpressions Compact Conference features such as managing and conducting conferences and controlling conferences

through a web client. Six licenses can be purchased per Xpressions Compact.

- **Xpressions Compact Mobility**

For the use of Xpressions Compact Mobility features such as the One Number Service (which enables a subscriber to be reached via a single phone number for all calls on all phones associated with that subscriber). Six licenses can be purchased per Xpressions Compact.

Contact Center Options

- **Contact Center Mail**

For setting up one or more email boxes to send and receive emails for Contact Center agents. A station license and a myAgent license are required for this. One license is required per node.

- **Contact Center Fax**

For setting up one or more fax boxes to send and receive faxes for Contact Center agents. A station license and a myAgent license are required for this. One license is required per node.

- **myReports**

For the compilation of statistics on the utilization of Contact Center resources based on different criteria. Using the Schedule Manager, reports can be created from over 100 predefined report templates for telephone, email and fax contacts. The report templates are managed via the Report Manager, with functions for regrouping as well as adding and deleting newly created report templates.

UC Client Options

- **Open Directory Connector**

For connecting to the Open Directory Service (ODS) in order to enable access to an external database or an external directory. A maximum of four databases can be connected per node.

- **Company AutoAttendant**

For the use of a central UC Smart or UC Suite based AutoAttendant to automatically transfer calls. One license is required per node.

Announcements of the type "music on hold" (endless loop) are only played with this license.

- **OpenScape Business Attendant**

For using the OpenScape Business Attendant (PC attendant). Up to 8 OpenScape Business Attendants may be licensed per node.

If OpenScape Business Attendant should also have access to presence information, a UC User license is additionally required.

- **OpenScape Business BLF**

For use of the additional Busy Lamp Field indicator of OpenScape Business BLF. For each subscriber, one BLF license and one UC User license is required. Up to 50 OpenScape Business BLFs may be licensed per node.

8.2.5 Evaluation Licenses

An evaluation license can be used to test special features with full functionality over a fixed time period (called the evaluation period) free of charge. If a regular license for the feature is activated during the evaluation period, the evaluation license will be disabled.

The following evaluation licenses are available:

- **OpenScape Business V3 Service Evaluation**

This evaluation license is intended for partners who want to first preconfigure the communication system in their own company and put it into service at the customer site later. The 30-day activation period begins during the preconfiguration. In order to restart the activation period of 30 days after commissioning the system, this evaluation license must be activated from the customer site after starting up the system.

The activation is possible once per system and only within the activation period. If the activation period has expired, the system must be licensed with permanent licenses.

NOTICE: When Service Evaluation is activated CLS connect cannot be activated.

- **OpenScape Business V3 UC Smart Evaluation**

This evaluation license is intended for customers who want to test the UC features of UC Smart. All UC Smart features can be used with this evaluation license.

NOTICE: This evaluation license cannot be used if the communication system is located in an internetwork and the "Networking" license is active. If voicemail licenses are already available, they are used in combination with the new UC evaluation licenses.

- **OpenScape UC Suite V3 Business Evaluation**

This evaluation license is intended for customers who want to test the UC features of UC Suite. All UC Suite features can be used with this evaluation license.

NOTICE: This evaluation license cannot be used if the communication system is located in an internetwork and the "Networking" license is active. If voicemail licenses are already available, they are used in combination with the new UC evaluation licenses.

- **OpenScape Business V3 UC Suite Contact Center Evaluation**

This evaluation license is intended for customers who want to test the Multimedia Contact Center. All features of the Multimedia Contact Centers can be used with the evaluation license.

NOTICE: If the Multimedia Contact Center is not licensed within the evaluation period, the administrator must undo the Contact Center settings (e.g., delete schedules and queues, deactivate agents, etc.) before the evaluation license expires. Otherwise, errors may occur in OpenScape Business.

- **OpenScape Business V3 CRM Evaluation**

This evaluation license is intended for customers who want to test Application Launcher, Open Directory Service and TAPI.

- **OpenScape Business V3 Attendant Evaluation**

This evaluation license is intended for customers who want to test the OpenScape Business Attendant application.

- **OpenScape Business V3 BLF Evaluation**

This evaluation license is intended for customers who want to test the OpenScape Business BLF application (e.g., to independently display the busy lamp field and presence information).

Rules

- The activation of an evaluation license occurs at the Customer License Server (CLS) and can only be performed once.
- The evaluation period is 90 days. After 60 days, the remaining time in days is counted backwards on the display of system telephones.
- When the evaluation period expires, the feature is automatically disabled.
- Multiple evaluation licenses may be active simultaneously in the system, but may then end at different times.
- If a perpetual license is active, the evaluation license is not started or, if already present, is stopped.

8.2.6 Upgrade Licenses

Upgrade licenses are required to upgrade HiPath 3000 V9, OpenScape Office V3 and OpenScape Business V1 systems to OpenScape Business V2 systems.

The license migration of HiPath 3000 systems requires a running and possibly licensed HiPath 3000 V9 system. The steps for the hardware and license migration must be carefully observed (see also the [Migration](#)). Pure HiPath 3000 TDM systems without licenses must be first upgraded to Version 9 and can then be migrated to OpenScape Business with an upgrade license.

The following upgrade licenses are available:

- **HiPath 3000 V9 Upgrade to OpenScape Business V2**

For the migration from HiPath 3000 V9 to OpenScape Business V2 X3/X5/X8.

- **HiPath 3000 V8 Upgrade to OpenScape Business V2**

For the migration from HiPath 3000 V8 to HiPath 3000 V9 and then to OpenScape Business V2 X3/X5/X8.

- **HiPath 3000 V7 Upgrade to OpenScape Business V2**

For the migration from HiPath 3000 V7 to HiPath 3000 V9 and then to OpenScape Business V2 X3/X5/X8.

- **OpenScape Office V3 MX/LX Upgrade to OpenScape Business V2**

For the migration from OpenScape Office V3 MX/LX to OpenScape Business V2.

8.2.7 Possible License Combinations

The licenses can be combined as desired. This section contains some suggestions for possible license combinations that will allow you to use the desired functions.

Please note that multiple licenses are required for some functions.

Telephony

- Required: IP User, TDM User or DeskShare User station license

NOTICE: Without a valid license, the phone can only be used for internal connections.

Telephony with UC Smart

- Telephony with voicemail box (UC Smart)
 - Required: IP User, TDM User or DeskShare User station license
 - Required: user-oriented VoiceMail license
- Telephony with Mobility Entry (DISA-based mobility)
 - Required: Mobility User station license
- Telephony with myPortal to go
 - Required: Mobility User station license
 - No Mobility User license is required in the **Desk phone** (control of the Office telephone) mode.
 - Required: user-oriented UC User license
 - Optional: user-oriented VoiceMail license
- Telephony with myPortal @work
 - Required: IP User
 - Required: user-oriented UC User license
 - Optional: user-oriented VoiceMail license
 - Optional: user-oriented Conference license
- Telephony with myPortal @work VoIP
 - Required: IP User
 - Required: user-oriented UC User license
 - Optional: user-oriented VoiceMail license

- Optional: user-oriented Conference license
- Telephony with optiClient Attendant
 - Required: IP User, TDM User or DeskShare User station license
 - Required: OpenScape Business Attendant system license
 - Optional: user-oriented VoiceMail license
 - Optional: user-oriented UC User license (for displaying the presence status)

Telephony with UC Suite

- Telephony with voicemail box (UC suite)
 - Required: IP User, TDM User or DeskShare User station license
 - Required: user-oriented VoiceMail license
- Telephony with myPortal for Desktop
 - Required: IP User, TDM User or DeskShare User station license
 - Required: user-oriented UC User license
 - Optional: user-oriented VoiceMail license
 - Optional: user-oriented Fax license
 - Optional: user-oriented Conference license
- Telephony with myPortal for Outlook
 - Required: IP User, TDM User or DeskShare User station license
 - Required: user-oriented Groupware User license
 - Optional: user-oriented VoiceMail license
 - Optional: user-oriented Fax license
 - Optional: user-oriented Conference license
- Telephony with myPortal to go
 - Required: Mobility User station license
 - No Mobility User license is required in the **Desk phone** (control of the Office telephone) mode.
 - Required: user-oriented Groupware User license or UC User license
 - Optional: user-oriented VoiceMail license
- Telephony with myPortal @work
 - Required: IP User
 - Required: user-oriented Groupware User license or UC User license
 - Optional: user-oriented VoiceMail license
 - Optional: user-oriented Conference license
- Telephony with myPortal @work VoIP
 - Required: IP User
 - Required: user-oriented Groupware User license or UC User license
 - Optional: user-oriented VoiceMail license
 - Optional: user-oriented Conference license
- Telephony with myAttendant

Licensing

Licensing a Communication System (Standalone)

- Required: IP User, TDM User or DeskShare User station license
- Required: user-oriented myAttendant license
- Optional: user-oriented VoiceMail license

Telephony with Unify Phone

- Required: IP User
- Required: user-oriented Unify Phone license
- Optional: user-oriented VoiceMail license and additional IP User license for the team configuration

Using the Contact Center

- Required: IP User, TDM User, DeskShare User or Mobility User station license
- Required: user-oriented myAgent license

At least one myAgent license must be active for the system to route and address Contact Center calls.

- Optional: Contact Center Email system license
- Optional: Contact Center Fax system license
- Optional: myReports system license

Using the Company AutoAttendant

- Required: Company AutoAttendant system license

The Company AutoAttendant system license must be active for the system to route and address Auto Attendant calls.

8.3 Licensing a Communication System (Standalone)

The licensing of a standalone system must be performed in a specific order. This order is given in our example for one of the OpenScape Business X communication systems.

The following subsections describe how Step 3 and Step 4 can be performed using the WBM.

1) License Authorization Code (LAC)

On purchasing licenses, the customer receives a License Authorization Code (LAC). The information on the licenses purchased are stored in the database of the Central License Server (CLS).

2) Installation and Configuration

The customer or service technician uses the WBM wizard to install and configure the communication system (including the stations and lines). When you first launch the WBM, you must enter the current date. This starts the activation period (i.e., the period of 30 days during which the licensing has to be completed).

3) License Activation

The customer or service technician uses the WBM to activate the licenses either online using a License Authorization Code (online

license activation) or offline using a license file (offline license activation).

4) Assigning Licenses

The customer or service technician uses the WBM to assign the purchased licenses to stations and lines. Once the licenses have been assigned successfully, the licensed features are activated.

8.3.1 CLS Connect

CLS connect allows you to make unlimited rehosts of your OpenScape Business systems. For this purpose, the **CLS Connect** flag must be activated.

NOTICE: After activation, this flag cannot be switched off.

If the system loses the connection to CLS, the failover period starts. If the connection is not reinstated after 30 days, the system gets in emergency mode, and it is considered as unlicensed.

NOTICE: When an OpenScape Business system with active CLS connect must be reprogrammed a backup file cannot be created. A reload must be performed with the same MAC ID and SIEL ID. The CLS connect cannot be activated without an active Base license. The existing license file from the CLS can be uploaded manually into the system via the WBM.

8.3.1.1 How to Activate CLS Connect

CLS connect allows you to make unlimited rehosts of your OpenScape Business systems.

Prerequisites

You are logged on to the WBM with the **Advanced** profile

You need Internet access to connect to the CLS

The following firewall settings are in place:

a) Port 7790 is released for outgoing IP traffic

Newer V3R3 software systems utilize port 7791 for online license activation.

b) IP 188.64.16.4 is released for outgoing IP traffic

NOTICE: To make the firewall rules more secure it is recommended to allow only outgoing communication.

The connection to CLS is possible; see [How to check Central License Server \(CLS\) Connection](#)

NOTICE: When you activate the CLS Connect, it is not possible to deactivate it.

Step by Step

1. Click on **License Management** in the navigation bar.
2. In the navigation tree, click **Activate CLS Connect**.
3. Activate the **CLS Connect** by selecting the check box.
4. Click on **Activate**.

NOTICE: In the landing page notification area, the following message will be displayed if the online license control is activated:

```
'License mode: "CLS Connect".'
```

8.3.1.2 Switching from CLS connect

Moving away from the CLS connect to a Permanent or PAYGO license.

If you are currently using a 'CLS Connect' license scheme and wish to move to a permanent or PAYGO license, there are a few steps you need to follow to ensure a smooth transition:

Step by Step

1. Activate the CLS Connect Stop feature for the license file of the system. This can be done by raising a CLS support ticket.
2. Activate a new license file for the OSBiz to reset the secure bit. Once this is done, you can then enable PAYGO or Permanent local license for the system on CLS. You will then receive a new file which you can activate on the system.

NOTICE: If you have a networked OSBiz environment licensed in CLS Connect, slave nodes will also have the secure bit set. If you plan to use a slave node as a separate standalone system with a non-CLS Connect license at some point, please raise a support ticket for the required steps.

8.3.2 Activating Licenses (Standalone)

After purchasing a product or feature, you must first activate the licenses provided with the product or feature. After successful activation of the licenses, the licenses are assigned.

Licenses can be activated by one of the following two methods:

- **Online license activation** (via the license authorization code)

Using the WBM, the customer or service technician transmits the license authorization code to the Central License Server (CLS) via the Internet. Together with the LAC, the Locking ID of the communication system is used for license activation. The CLS creates a license file from the data and sends this back to the system, which then activates the licenses purchased.

To access the CLS, you will need an Internet connection. The IP address of the CLS is saved in the WBM under **License Management > Settings** and can be changed by an administrator with the **Expert** profile if required.

NOTICE: By default, port 7790 is used for the online license activation. This port must be enabled in the firewall of the customer network.

Newer V3R3 software systems utilize port 7791 for online license activation.

NOTICE: Before the online licensing can be performed, the registration data must first be entered correctly.

- **Offline license activation** (using the license file)

The customer or service technician logs in at the Central License Server (CLS) and enters the license authorization code there along with the Locking ID of the communication system. The CLS generates a license file from the data entered. The customer or service technician downloads the license file and copies it into the WBM. The system then activates the purchased licenses.

The IP address of the CLS is saved in the WBM under **License Management > Settings** and can be changed by an administrator with the **Expert** profile if required.

If the communication system is to be expanded, further licenses can be purchased. On purchasing more licenses, an additional License Authorization Code (LAC) with which the newly procured licenses can be activated is supplied.

NOTICE: Additionally purchased licenses can also be activated remotely.

8.3.2.1 How to Activate Licenses Online (Standalone)

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

You know the License Authorization Code (LAC) needed to release the license.

In order to access the License server, the communication system must have access to the Internet.

Step by Step

1. Click on **License Management** in the navigation bar.
2. In the navigation tree, click on **Registration**.
3. Enter your data and click **OK**.
4. In the navigation tree, click **Activate License Online**.
5. Enter the appropriate LAC in the **License Authorization Code (LAC)** field.
6. Select the check box **I have the user name and password for the License Server and want to log on**.
7. Enter the **User Name** and **Password** for logging into the License Server.
8. Click on **Activate**. The connection to the License Server is established, and the licenses are transferred to the communication system. Following the successful release, the connection is automatically reestablished.

8.3.2.2 How to Activate Licenses Offline (Standalone)

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

The license file was generated earlier at the Central License Server and saved. You know the storage location of the license file.

Step by Step

1. Click on **License Management** in the navigation bar.
2. In the navigation tree, click **Activate License File**.
3. Under **License File**, click **Browse** and select the storage location of the license file.
4. Click on **Activate**.

8.3.3 Assigning Licenses (Standalone)

Once the purchased licenses have been activated successfully, they must be assigned to the stations and lines. In a standalone system, system-wide features are enabled automatically upon activation.

Assigning User Licenses and User-oriented Licenses

Subscribers can be assigned user licenses and user-oriented licenses.

User licenses can be assigned to the following subscriber types:

Icon	User license	Description
	IP User	For the use of IP system telephones (HFA or SIP) and SIP telephones
	TDM User	For the use of UP0 system phones, ISDN phones, analog phones and DECT phones
	Mobility User	For the use of myPortal to go, Mobility Entry and DISA (One Number Service)
	Deskshare User	For the use of Desk Sharing by IP stations

The user licenses are permanently assigned to the numbers of the subscribers. If a subscriber is deleted or if another subscriber type is assigned to a call number, the associated user license is released.

There is a red asterisk next to some licenses. This red asterisk indicates that these licenses can also be covered by assigning another license.

With the flexible licensing, TDM, Mobility and Deskshare users can also be licensed with IP user licenses. If all the acquired TDM, DeskShare and Mobility user licenses have already been assigned to subscribers, and further TDM, DeskShare and Mobility users are required, then any remaining IP User licenses can be used to meet this demand.

After a user license has been assigned to the subscriber, a user-oriented license can also be assigned to that subscriber.

The following user-oriented licenses can be assigned to the stations:

Icon	User-oriented license	Description
	Voicemail	For the use of the voicemail box.
	Groupware user	For the use of the UC Suite features via myPortal for Outlook.
	UC User	For the use of the UC Suite features via myPortal for Desktop.

Icon	User-oriented license	Description
	Fax	For use of a fax box within the UC Suite. As a prerequisite, one UC User or Groupware User license is required.
	Conference	For use of the UC Suite conference features. As a prerequisite, one UC User or Groupware User license is required.
	myAttendant	For use of the UC Suite Attendant features.
	myAgent	For the use of Contact Center functions.
	Application Launcher	For call-related control of applications on a client PC during incoming and outgoing calls, e.g., launching an application or displaying caller information.
	Unify Phone	For the use of the Unify Phone client in combination with OpenScape Business.
	TAPI	For the use of TAPI compliant applications and for PC-supported telephony with the customer's own applications from various software vendors.

You can have an overview of all user licenses and user-oriented licenses displayed (via **Local User Licenses > Overview**).

This overview also shows the statuses of the licenses for each subscriber.

Possible license states:

<input checked="" type="checkbox"/> Successfully licensed	<input checked="" type="checkbox"/> Not licensed	<input type="checkbox"/> License demand configurable	<input type="checkbox"/> License demand not configurable
<input type="checkbox"/> Unsaved license release	<input type="checkbox"/> Unsaved license demand release	<input checked="" type="checkbox"/> Unsaved license demand	

Assigning System Licenses

System licenses include licenses for trunks and for system-wide features.

Licenses can be assigned to the following types of trunks:

- S₂M/T1 trunks: number of B channels
- ITSP trunks: number of simultaneous calls conducted via a single ITSP

In a standalone system, licenses for system-wide features will have already been unlocked by default during the license activation. Consequently, no further assignment is required.

License assignment procedure

Prerequisite: The license file is activated and the stations are configured.

- How to License Stations

- 1) Assign a user license to a subscriber. This assignment triggers the generation of a license request for the subscriber while at the same time enabling the assignment of the user-oriented licenses.
- 2) Assign the user-oriented licenses to a subscriber. These assignments cause further license requests to be generated for the subscriber. Please note that some licenses require other licenses (see [Possible License Combinations](#)).
- 3) Check and unlock license requests.
- 4) If there are not enough licenses to be unlocked, the invalid assignments will be displayed via the license statuses (in red). Correct the license assignments and then check and unlock the licenses again.

NOTICE: To obtain a better overview, you can have the license assignments for all subscribers printed out as a preview (via **Local User Licenses > Overview > Print**). At the end of the printout, all invalid assignments are listed in a separate table.

- Assign trunk licenses

The trunk licenses must be distributed to the required S_{2M}/T1 and ITSP trunks.

8.3.3.1 How to License Subscribers (Standalone)

Assign the available station licenses and user-oriented licenses to the subscribers. Once the licenses have been assigned successfully, the subscribers are licensed.

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. Click on **License Management** in the navigation bar.
2. In the navigation tree, navigate to the desired type of subscriber under **Local User Licenses > ...**. You will be shown a list of all subscribers of the selected subscriber type.

Under **Remaining licenses**, you will see how many licenses you can still assign to subscribers. For TDM, Mobility and Deskshare stations, the display includes all remaining IP User licenses as well, since these licenses can also be used for the licensing of TDM, Mobility and Deskshare stations (flexible user licensing).

If the selected subscriber type is Mobility User, you will also see the total number of available Unify Phone licenses and their expiration date.

3. Activate the station license in the row of the desired subscriber by selecting the highlighted check box with a bright background (first column with check boxes). The check boxes in the other columns are enabled.

NOTICE: You can also have a selected station displayed by entering a search term in the **Station Number** or **Name** search fields and then pressing the Enter key or clicking the magnifying glass icon. All stations will be listed if you leave both search fields empty and then press the Return key or click on the magnifying glass icon.

NOTICE: User-oriented licenses can be assigned to a subscriber only if a station license was assigned to the subscriber earlier (step 3).

NOTICE: When assigning a VoiceMail license to an extension, a UC Suite user is created and all active call forwardings are reset.

NOTICE: In case of "Pay As You Go" voicemail license is checked/unchecked automatically whenever a voice user license is licensed/unlicensed but it is still possible to uncheck a voicemail license.

Groupware, UC User, Fax, myAttendant and myAgent license features are not configurable in UC Smart mode.

Groupware and UC User licenses are mutually exclusive in UC Suite mode.

- Click **OK & Next**. A check is performed to determine whether there are enough licenses for your assignment.

If sufficient licenses are available, this completes the licensing of the subscriber.

NOTICE: In case of "Pay As You Go" a pop up window appears. Click on **OK** in order to confirm your choice.

Licensing

Licensing Multiple Communication Systems (Internetwork)

6. If licenses are missing, the errors are indicated by displaying a check box shaded in red. Correct these errors and repeat step 5.

NOTICE: To remove a station license, you must acknowledge a warning message. After this, a new check box **Warnings enabled** appears. If you clear this check box, you can remove further station licenses without the warning.

8.3.3.2 How to License Trunks (Standalone)

Assign the purchased trunk licenses to SIP and S_{2M}/T1 trunks.

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. Click on **License Management** in the navigation bar.
2. In the navigation tree, click **CO trunks**. The number of licenses available for SIP and S_{2M}/T1 trunks is displayed in the **Trunks** area.
3. For SIP trunks: In the **SIP trunks** area, under **License demand for number of simultaneous Internet calls in this node**, enter the number of Internet calls that can be conducted simultaneously via an ITSP.
4. For S_{2M} trunks: In the **PRI (S_{2M}/T1)** area, in the row of the desired S_{2M} slot, select the number of desired B-channels in the drop-down list of the **Demands** column.
5. For digital T1 trunks (U.S. only): In the **PRI (S_{2M}/T1)** area, in the row of the desired T1 slot, select the number of desired B-channels in the drop-down list of the **Demands** column.
6. For analog T1 trunks (U.S. only): Activate the analog T1 line in the **PRI (S_{2M}/T1)** area by selecting the entry **1** (**0** means the line is disabled) in the drop-down list of the **Demands** column in the row of the analog T1 line).
7. Click on **OK & Next**.

NOTICE: The number of licensed SIP trunks and S_{2M}/T1 trunks must not exceed the number of trunk licenses available.

8.4 Licensing Multiple Communication Systems (Internetwork)

The licensing of a multiple communication systems must be performed in a specific sequence. This sequence is shown below for a sample internetwork consisting of one OpenScape Business S (master) and two OpenScape Business X3 (slave) systems.

When multiple OpenScape Business (nodes) systems are combined into an internetwork, licensing occurs centrally via a network license file, which is activated on the master node. In addition, each slave node in the internetwork needs its own networking system license. The node with the largest bandwidth should be the master node.

The nodes in the internetwork are configured as a master node and slave nodes via the Network Wizard of the WBM. The master node contains the central license agent (central CLA; central Customer License Agent). All slave nodes in the internetwork use this CLA for the licensing. To enable this, the IP address of the master node must be made known to the slave nodes using the WBM.

Only one network license file exists for the entire internetwork. This file is bound to the master node via the node's locking ID. If an OpenScape Business S (SoftSwitch) is the master node, the network license file is bound to the master node via either the Locking ID of the Linux server of the SoftSwitch or the Advanced Locking ID of the SoftSwitch if the SoftSwitch is used in a virtual environment. The network license file is stored in the central CLA and contains all the license information of the internetwork. It can be activated only at the master node via the WBM. Only the master node has access to the CLS; at all other nodes, the access is disabled.

No node-specific licensing should be performed in the internetwork. If separate network files exist for each node, you can combine them into a network license file at the CLS.

Behavior during Network Problems (Failover)

If the connection to the master node and thus to the central CLA fails, the message "Failover Period" appears on the displays of the system telephones. During this failover period (max. 30 days), all nodes and their features continue to operate normally. Once the network problems have been resolved and the connection to the central CLA is restored, all nodes revert to the regular license status.

If the network problems cannot be resolved within the failover period, the nodes switch to operating in emergency mode. The entire internetwork will then need to be relicensed.

Licensing Procedure in the Internetwork Based on the Above Example

OpenScape Business S (Master) and both OpenScape Business X3 (Slave) systems are already installed, configured and combined to form an internetwork.

1) License Authorization Code (LAC)

On purchasing licenses, the customer receives a License Authorization Code (LAC). The information on the licenses purchased are stored in the database of the Central License Server (CLS).

2) OpenScape Business S as master node

The customer or service technician logs into the WBM of the OpenScape Business S and installs the OpenScape Business S as the master node by using the Network Wizard.

The system has already been installed and configured and is running in the Activation Period (period of 30 days during which the licensing has to be completed).

3) Locking ID of the master node

The customer or service technician notes the Locking ID or the Advanced Locking ID of the OpenScape Business S.

For a description, see [How to Check the Locking ID of the Communication System](#)

4) OpenScape Business X3 as slave nodes

The customer or service technician first logs into the WBM of the first OpenScape Business X3 and installs the first OpenScape Business X3 as a slave node by using the Network Wizard. This process is then repeated at the WBM of the second OpenScape Business X3.

The systems have been installed and configured and are running in the Activation Period.

5) Locking IDs of OpenScape Business X3

The customer or service technician notes the Locking IDs of the two OpenScape Business X3 systems.

For a description, see [How to Check the Locking ID of the Communication System](#)

6) License Activation

The customer or service technician logs in at the CLS and generates a network license file together with the license authorization code and the locking IDs. He or she then loads this file into the master node using the WBM.

For a description, see [How to Activate Licenses Offline \(Internetwork\)](#)

The system then activates the purchased licenses.

7) Assigning Licenses

The customer or service technician now distributes the licenses to the nodes. To do this, he or she logs into the WBM of each node and assigns the desired number of licenses to the node. Note that it is important that each node be assigned a networking system license; otherwise, it will not be integrated into the internetwork.

For a description, see [How to Assign System Licenses to a Node](#)

8.4.1 License Activation (Internetwork)

After purchasing a product or feature, you must first activate the licenses provided with the product or feature. A license file is used for license activation. After successful activation of the licenses, the licenses are assigned.

Licenses can be activated as follows:

- **Offline license activation** (using the license file)

The customer or service technician logs in at the Central License Server (CLS) and enters the license authorization code there along with the Locking IDs of the communication systems. The CLS generates a license file from the data entered. The customer or service technician downloads the license file and copies it into the WBM of the master node.

The master node is checked to see whether the Locking IDs stored in the license file match those of the systems. If the check is successful, the licenses are activated, and the systems switch to the regular license status. If the check is not successful, the systems continue to run in the activation period until it expires and then only in emergency mode.

The IP address of the CLS is saved in the WBM under **License Management > Settings**.

License files can be combined as follows:

- **How to Combine License Files into a Network License File**

If one or more nodes that have already been licensed are to be combined into an internetwork, the administrator must combine the individual license files via the CLS into a single license file and load it into the central CLA. The IP address of the master node with the central license agent must then be entered at all other nodes by using the WBM's network wizard.

8.4.1.1 How to Activate Licenses Offline (Internetwork)

This example describes the generation and activation of the shared network license file consisting of one OpenScape Business S as a master node (Node 1) and two further OpenScape Business X3 systems (Node 2 and Node 3).

Prerequisites

Access to the CLS exists.

All nodes are installed and networked with one another; see [Networking OpenScape Business X and OpenScape Business S \(Multi-Gateway\)](#) .

Step by Step

1. Log into the CLS with your user name and password.
2. Under **Licenses**, select the item **Generate and download license key**.
3. Enter the License Authorization Code (LAC) under **LAC** and click **Search**.
4. Open the OpenScape Business S product and select the features to be assigned to Node 1.
5. Click on **Generate License Key**.
6. Enter the MAC address or the Advanced Locking ID of OpenScape Business S (Node 1) under **MAC Address** and then enter the MAC address or the Advanced Locking ID of

OpenScape Business S of Node 1 (master node) again under **MAC Address of the Network CLA**.

NOTICE: The MAC address of OpenScape Business S is the MAC address of the network card of the OpenScape Business S Linux server that was used when installing the Linux operating system. The Advanced Locking ID of OpenScape Business S is used instead of the MAC address when OpenScape Business S is operated in a virtual environment.

7. Enter the desired number for the features and click **Next**.
8. Verify the customer data and click **Next**.
9. Read through the legal notification and then click **Yes, I agree to the terms of use!**.
10. Click on **Execute** to generate the license key.
11. For Node 2, under **Licenses**, select the item **Generate and download license key**.
12. Enter the License Authorization Code (LAC) again under **LAC** and click **Search**.
13. Open the OpenScape Business X3 product and select the features to be assigned to Node 2.
14. Click on **Generate License Key**.
15. Enter the MAC address of Node 2 under **MAC Address** and then enter the MAC address of Node 1 (master node) under **MAC Address of the Network CLA**.
16. Enter the desired number for the features and click **Next**.
17. Click on **Next**.
18. Confirm the legal notification by selecting the check box **Yes, I agree to the terms of use!**.
19. Click on **Execute** to generate the license key.
20. Repeat steps 11 through 19 for Node 3.
21. Click on **License Key** and then on **Download** to download the network license file.
22. Save the network license file.
23. Log into the WBM of the master node by calling up the address `https://<IP address of the master node>` in your web browser and then entering your user name and password.
24. Click on **License Management** in the navigation bar.
25. In the navigation tree, click **Activate License File**.
26. Under **License File**, click **Browse** and select the storage location of the network license file.
27. Click on **Activate**.

8.4.1.2 How to Combine License Files into a Network License File

If several nodes that were previously not networked are subsequently integrated into an internetwork, the license files of the individual

nodes must be combined into a common network license file with the help of the CLS.

Prerequisites

Access to the CLS exists, and you have the access rights for the license packages of the individual nodes.

All nodes are installed and networked with one another; see [Networking OpenScape Business X and OpenScape Business S \(Multi-Gateway\)](#) .

Step by Step

1. Log into the CLS with your user name and password.
2. Under **Network Licensing**, select the item **Add/Remove System**.
3. Select the MAC address of the node that is to be integrated in the internetwork.
4. Click on the **Rehost**.
5. Enter the MAC address of the node under **MAC Address**.
6. Enter the MAC address of the master node under **MAC Address of the Network CLA**. As a rule, OpenScape Business S is the master node.

NOTICE: The MAC address of OpenScape Business S is the MAC address of the network card of the OpenScape Business S Linux server that was used when installing the Linux operating system.

7. Click on **Next**.
8. Verify the customer data and click **Next**.
9. Read through the legal notification and then click **Yes, I agree to the terms of use!**.
10. Click on **Execute** to generate the license key.
11. Repeat steps 2 through 10 for further nodes.
12. Click on **License Key** and then on **Download** to download the network license file.
13. Save the network license file.
14. Log into the WBM of the master node by calling up the address `https://<IP address of the master node>` in your web browser and then entering your user name and password.
15. Click on **License Management** in the navigation bar.
16. In the navigation tree, click **Activate License File**.
17. Under **License File**, click **Browse** and select the storage location of the network license file.
18. Click on **Activate**.

8.4.2 Assigning Licenses (Internetwork)

Once the purchased licenses have been activated successfully, they must be assigned to the stations and lines. License assignment must be performed separately on each node.

Assigning User Licenses and User-oriented Licenses

Subscribers can be assigned user licenses and user-oriented licenses.

User licenses can be assigned to the following subscriber types:

Icon	User license	Description
	IP stations	For the use of IP system telephones (HFA or SIP) and SIP telephones
	TDM stations	For the use of UP0 system phones, ISDN phones, analog phones and DECT phones
	Mobile stations	For the use of myPortal to go, Mobility Entry and DISA (One Number Service)
	DeskSharing stations	For the use of Desk Sharing by IP stations
	Fallback user	For basic telephony use in case of an event of failure.

The user licenses are permanently assigned to the numbers of the subscribers. If a subscriber is deleted or if another subscriber type is assigned to a call number, the associated user license is released.

With the flexible licensing, TDM, Mobility and Deskshare users can also be licensed with IP user licenses. If all the acquired TDM, DeskShare and Mobility user licenses have already been assigned to subscribers, and further TDM, DeskShare and Mobility users are required, then any remaining IP User licenses can be used to meet this demand.

After a user license has been assigned to the subscriber, a user-oriented license can also be assigned to that subscriber.

The following user-oriented licenses can be assigned to the stations:

Icon	User-oriented license	Description
	Voicemail	For the use of the voicemail box.
	Groupware user	For the use of the UC Suite features via myPortal for Outlook.
	UC Suite	For the use of the UC Suite features via myPortal for Desktop.

Icon	User-oriented license	Description
	Fax	For use of a fax box within the UC Suite. As a prerequisite, one UC User or Groupware User license is required.
	Conference	For use of the UC Suite conference features. As a prerequisite, one UC User or Groupware User license is required.
	myAttendant	For use of the UC Suite Attendant features.
	myAgent	For the use of Contact Center functions.
	Application Launcher	For call-related control of applications on a client PC during incoming and outgoing calls, e.g., launching an application or displaying caller information.
	Unify Phone	For the use of the Unify Phone client in combination with OpenScape Business.
	TAPI 120/170	For the use of TAPI compliant applications and for PC-supported telephony with the customer's own applications from various software vendors.

You can have an overview of all user licenses and user-oriented licenses displayed (via **Local User Licenses > Overview**).

This overview also shows the statuses of the licenses for each subscriber.

Possible license states:

<input checked="" type="checkbox"/> Successfully licensed	<input checked="" type="checkbox"/> Not licensed	<input type="checkbox"/> License demand configurable	<input checked="" type="checkbox"/> License demand not configurable
<input checked="" type="checkbox"/> Unsaved license release	<input checked="" type="checkbox"/> Unsaved license demand release	<input checked="" type="checkbox"/> Unsaved license demand	

Assigning System Licenses

System licenses include licenses for trunks and for system-wide features.

Licenses can be assigned to the following types of trunks:

- S_{2M}/T1 trunks: number of B channels
- ITSP trunks: number of simultaneous calls conducted via a single ITSP

System-wide licenses are assigned to every system (node) in the network. This configuration must be performed in direct succession (i.e., one after the other) at each node. The total number of system-wide licenses stored in the network license file on the master node is reduced by the number configured at the node.

License assignment procedure

Prerequisite: The license file is activated and the stations are configured.

- How to License Stations
 - 1) Assign a user license to a subscriber. This assignment triggers the generation of a license request for the subscriber while at the same time enabling the assignment of the user-oriented licenses.
 - 2) Assign the user-oriented licenses to a subscriber. These assignments cause further license requests to be generated for the subscriber. Please note that some licenses require other licenses (see [Possible License Combinations](#)).
 - 3) Check and unlock license requests.
 - 4) If there are not enough licenses to be unlocked, the invalid assignments will be displayed via the license statuses (in red). Correct the license assignments and then check and unlock the licenses again.

NOTICE: To obtain a better overview, you can have the license assignments for all subscribers printed out as a preview (via **Local User Licenses > Overview > Print**). At the end of the printout, all invalid assignments are listed in a separate table.

- Assign trunk licenses

The trunk licenses must be distributed to the required S_{2M}/T1 and ITSP trunks.

8.4.2.1 How to License Subscribers (Internetwork)

Assign the available station licenses and user-oriented licenses to the subscribers. Once the licenses have been assigned successfully, the subscribers are licensed.

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. Click on **License Management** in the navigation bar.
2. In the navigation tree, navigate to the desired type of subscriber under **Local User Licenses > ...**. You will be shown a list of all subscribers of the selected subscriber type.

Under **Remaining licenses**, you will see how many licenses you can still assign to subscribers. For TDM, Mobility and Deskshare stations, the display includes all remaining IP User licenses as well, since these licenses can also be used for the licensing of TDM, Mobility and Deskshare stations (flexible user licensing).

If the selected subscriber type is Mobility User, you will also see the total number of available Unify Phone licenses and their expiration date.

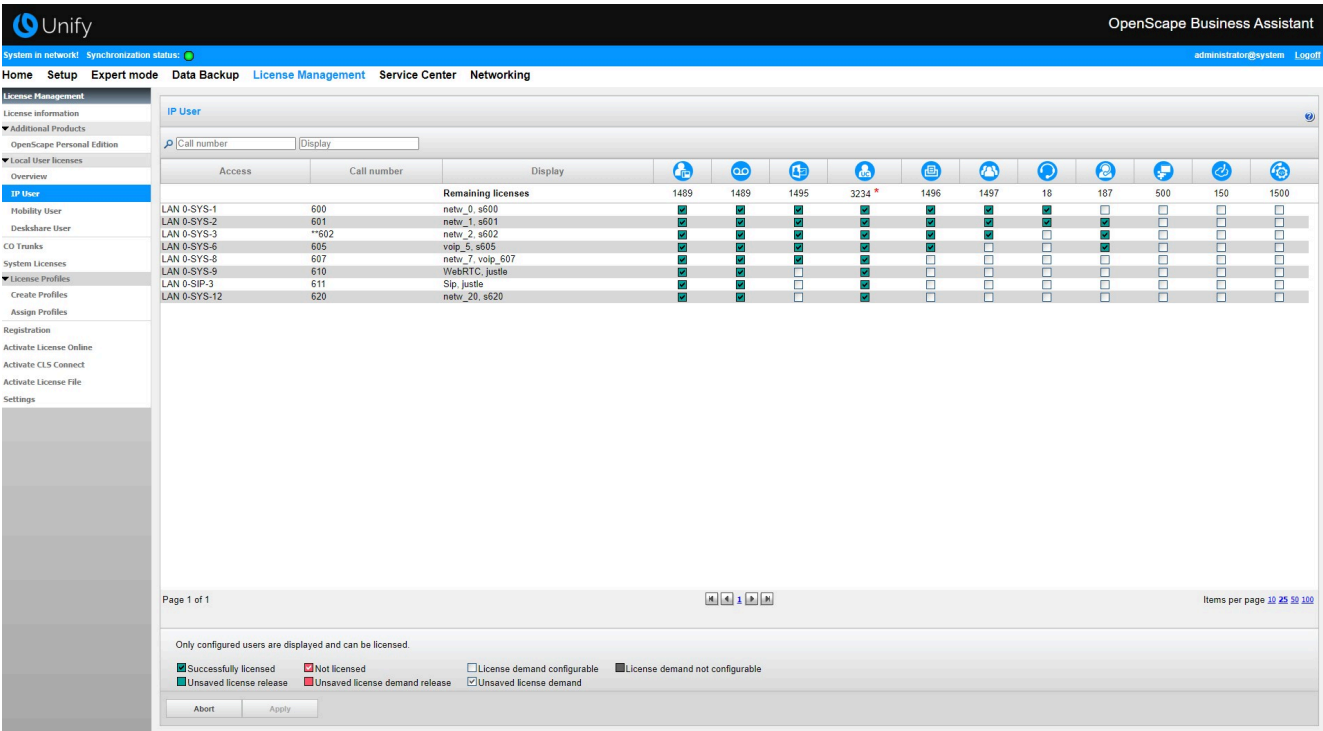

3. Activate the station license in the row of the desired subscriber by selecting the highlighted check box with a bright background (first column with check boxes). The check boxes in the other columns are enabled.

NOTICE: You can also have a selected station displayed by entering a search term in the **Station Number** or **Name** search fields and then pressing the Enter key or clicking the magnifying glass icon. All stations will be listed if you leave both search fields empty and then press the Return key or click on the magnifying glass icon.

The screenshot shows the 'IP User' license management interface. The table lists various system licenses and their activation status across different categories. The legend at the bottom indicates the following status categories:

- Successfully licensed (green checkmark)
- Not licensed (red X)
- License demand configurable (blue square)
- License demand not configurable (grey square)
- Unsaved license release (red square)
- Unsaved license demand release (red square)
- Unsaved license demand (blue square)

4. Activate the user-oriented licenses in the row of the desired subscriber by selecting the appropriate check boxes.

NOTICE: User-oriented licenses can be assigned to a subscriber only if a station license was assigned to the subscriber earlier (step 3).

NOTICE: "Pay As You Go" is not available in case of network license file.

In case of a network of OpenScape Business systems, any of the systems can utilize Pay As You Go via local Central License Agent (CLA).

- 5. Click **OK & Next**. A check is performed to determine whether there are enough licenses for your assignment.
If sufficient licenses are available, this completes the licensing of the subscriber.
- 6. If licenses are missing, the errors are indicated by displaying a check box shaded in red. Correct these errors and repeat step 5.

NOTICE: To remove a station license, you must acknowledge a warning message. After this, a new check box **Warnings enabled** appears. If you clear this check box, you can remove further station licenses without the warning.

8.4.2.2 How to License Trunks (Internetwork)

Assign the purchased trunk licenses to SIP and S_{2M}/T1 trunks.

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. Click on **License Management** in the navigation bar.
2. In the navigation tree, click **CO trunks**. The number of licenses available for SIP and S_{2M}/T1 trunks is displayed in the **Trunks** area.
3. For SIP trunks: In the **SIP trunks** area, under **License demand for number of simultaneous Internet calls in this node**, enter the number of Internet calls that can be conducted simultaneously via an ITSP.
4. For S_{2M} trunks: In the **S2M** area, in the row of the desired slot, select the number of desired B-channels in the drop-down list of the **Demands** column.
5. For T1 trunks (only for the U.S.): In the **T1** area, in the row of the desired slot, select the number of desired B-channels in the drop-down list of the **Demands** column.
6. Click on **OK & Next**.

NOTICE: The number of licensed SIP trunks and S_{2M}/T1 trunks must not exceed the number of trunk licenses available.

8.4.2.3 How to Assign System Licenses to a Node

Prerequisites

You are logged on to the WBM of the desired node.

Step by Step

1. Click on **License Management** in the navigation bar.
2. Click on **System Licenses** in the navigation tree. All available system licenses are displayed.
3. Locate the desired system licenses in the **used licenses** column and select the number of system licenses to be assigned to the node.

The **available for distribution** column indicates how many licenses are available for the entire internetwork.

NOTICE: Make sure that the node is assigned the "Networking" system license, otherwise the node will fail to be integrated into the internetwork.

4. Click on **Save**.

8.4.2.4 How to Assign the "Networking" System License to a Node

Prerequisites

You are logged on to the WBM of the desired node.

Step by Step

1. Click on **License Management** in the navigation bar.
2. Click on **System Licenses** in the navigation tree. All available system licenses are displayed.
3. For the **Networking** system license, select **1** from the drop-down list in the **used licenses** column.

The **available for distribution** column indicates how many licenses are available for the entire internetwork.

4. Click on **Save**.

8.5 License information

Information on the available and assigned licenses, products and features is displayed with the WBM. The license information on all nodes available in the internetwork can be retrieved.

The following information can be displayed:

- **MAC Address:** MAC address of the hardware platform or the Linux Server SoftSwitch to which the licenses are bound.

NOTICE: If the communication system is in the activation period, a wrong MAC address may possibly be shown here. The correct MAC address can be checked via the **Service Center** under **Inventory** ([Inventory](#)).

- **Advanced Locking ID:** Advanced Locking ID of the softswitches in a virtual environment, to which the licenses are bound.
- **Locking ID:** Locking ID of the Application Server to which the licenses are bound.
- **Node:** Name of the communication system to which the license is bound.
- **Product Name:** Name of the product for which the license is assigned.
- **Feature:** Feature for which the license has been assigned.
- **Used licenses:** Shows the number of used and available licenses.
- **Available for distribution:** Shows the licenses still available in the internetwork.
- **Status:** Status of the license.

The OpenScape Personal Edition product is licensed by its own license file. The license information for this is displayed under **Additional Products**.

8.5.1 License Information without a Network (Standalone)

All licenses assigned to the communication system and the relevant licensing information can be displayed.

8.5.1.1 How to Display License Information

Prerequisites

You are logged in at the WBM.

Step by Step

Click on **License Management** in the navigation bar. The license information for your communication system will be displayed.

Product Name	Feature	used licenses	available for distribution
OpenScape Business	OpenDirectory Connector	1	3
OpenScape Business	OpenDirectory Base	1	0
OpenScape Business	Attendant	0	8
OpenScape Business	Networking	1	0
OpenScape Business	Web Collaboration	0	1
OpenScape Business	Company Autoattendant	1	0
OpenScape Business	Contact Center Fax	0	1
OpenScape Business	Contact Center E-Mail	0	1
OpenScape Business	myReports	1	0
OpenScape Business	Gate View Cameras	0	8
OpenScape Business	CSTA License	0	1

NOTICE: In case of "Pay As You Go" used licenses are configurable except for Contact Center Fax, Contact Center E-mail and myReports in UC Smart mode.

8.5.2 License Information in an Internetwork

In an internetwork, all existing licenses and the relevant license information can be displayed. This information is read from the network license file.

All licenses of an internetwork (with the exception of the base licenses) are "floating" licenses and are managed in a license pool. If a license is no longer required by a node (communication system), it is released and can thus be used another node.

All the licenses of the internetwork as well as any shared (floating) licenses or licenses that are bound to a specific node can be displayed in an internetwork.

In addition, station licenses and user-oriented licenses can be sorted by node and displayed in a list.

8.5.2.1 How to Display all Licenses in the Internetwork

Prerequisites

The communication system is located in an internetwork.

You are logged in at the WBM.

Step by Step

1. Click on **License Management** in the navigation bar.
2. In the navigation tree, click on **License Information**. All licenses in the internetwork are displayed.

	Product Name	Feature	used licenses	Status
1	OpenScape Business	CIP V2 Integrator	0 of 1	still valid for 18 days
2	OpenScape Business	CSTA License	0 of 1	still valid for 18 days
3	OpenScape Business	Java Husim Phonetester	0 of 1	still valid for 18 days
4	OpenScape Business	OpenScape Business Application Launcher	0 of 500	still valid for 18 days
5	OpenScape Business	OpenScape Business Attendant	0 of 8	still valid for 18 days
6	OpenScape Business	OpenScape Business Base	1 of 1	still valid for 18 days
7	OpenScape Business	OpenScape Business BLF	0 of 50	still valid for 18 days
8	OpenScape Business	OpenScape Business Company Autoattendant	1 of 1	still valid for 18 days
9	OpenScape Business	OpenScape Business Conference	3 of 1500	still valid for 18 days
10	OpenScape Business	OpenScape Business Contact Center E-Mail	0 of 1	still valid for 18 days
11	OpenScape Business	OpenScape Business Contact Center Fax	0 of 1	still valid for 18 days
12	OpenScape Business	OpenScape Business Fax	4 of 1500	still valid for 18 days
13	OpenScape Business	OpenScape Business Groupware User	5 of 1500	still valid for 18 days
14	OpenScape Business	OpenScape Business Info Ready for V3 SW	1 of 1	still valid for 18 days

8.5.2.2 How to Display the Licenses Bound to a Node

Prerequisites

The communication system is located in an internetwork.

You are logged in at the WBM.

Step by Step

1. Click on **License Management** in the navigation bar.
2. In the navigation tree, click on **License Information**.
3. Click in the navigation tree on the system name or the locking ID of the desired node. The licenses specifically bound to this node will be displayed, e.g., the base license.

	Product Name	Feature	used licenses	Status
1	OpenScape Business	CIP V2 Integrator	0 of 1	still valid for 18 days
2	OpenScape Business	CSTA License	0 of 1	still valid for 18 days
3	OpenScape Business	Java Husim Phonetester	0 of 1	still valid for 18 days
4	OpenScape Business	OpenScape Business Application Launcher	0 of 500	still valid for 18 days
5	OpenScape Business	OpenScape Business Attendant	0 of 8	still valid for 18 days
6	OpenScape Business	OpenScape Business Base	1 of 1	still valid for 18 days
7	OpenScape Business	OpenScape Business BLF	0 of 50	still valid for 18 days
8	OpenScape Business	OpenScape Business Company Autoattendant	1 of 1	still valid for 18 days
9	OpenScape Business	OpenScape Business Conference	3 of 1500	still valid for 18 days
10	OpenScape Business	OpenScape Business Contact Center E-Mail	0 of 1	still valid for 18 days
11	OpenScape Business	OpenScape Business Contact Center Fax	0 of 1	still valid for 18 days
12	OpenScape Business	OpenScape Business Fax	4 of 1500	still valid for 18 days
13	OpenScape Business	OpenScape Business Groupware User	5 of 1500	still valid for 18 days
14	OpenScape Business	OpenScape Business Info Ready for V3 SIW	1 of 1	still valid for 18 days

8.5.2.3 How to Display all Shared Licenses in an Internetwork

Prerequisites

The communication system is located in an internetwork.
You are logged in at the WBM.

Step by Step

1. Click on **License Management** in the navigation bar.
2. In the navigation tree, click on **License Information**.
3. In the navigation tree, click **Floating**. All shared licenses in the internetwork are displayed.

	Product Name	Feature	used licenses	Status
1	OpenScape Business	CIP V2 Integrator	0 of 1	still valid for 18 days
2	OpenScape Business	CSTA License	0 of 1	still valid for 18 days
3	OpenScape Business	Java Husim Phonetester	0 of 1	still valid for 18 days
4	OpenScape Business	OpenScape Business Application Launcher	0 of 500	still valid for 18 days
5	OpenScape Business	OpenScape Business Attendant	0 of 8	still valid for 18 days
6	OpenScape Business	OpenScape Business Base	1 of 1	still valid for 18 days
7	OpenScape Business	OpenScape Business BLF	0 of 50	still valid for 18 days
8	OpenScape Business	OpenScape Business Company Autoattendant	1 of 1	still valid for 18 days
9	OpenScape Business	OpenScape Business Conference	3 of 1500	still valid for 18 days
10	OpenScape Business	OpenScape Business Contact Center E-Mail	0 of 1	still valid for 18 days
11	OpenScape Business	OpenScape Business Contact Center Fax	0 of 1	still valid for 18 days
12	OpenScape Business	OpenScape Business Fax	4 of 1500	still valid for 18 days
13	OpenScape Business	OpenScape Business Groupware User	5 of 1500	still valid for 18 days
14	OpenScape Business	OpenScape Business Info Ready for V3 SIW	1 of 1	still valid for 18 days

8.5.2.4 How to Display a Node-Dependent View of Station Licenses and User-Oriented Licenses

Prerequisites

The communication system is located in an internetwork.
You are logged in at the WBM.

Step by Step

1. Click on **License Management** in the navigation bar.
2. Click on **Network-wide License Overview** in the navigation tree. All station licenses and user-oriented licenses in the internetwork can be sorted by node.

8.6 Assigning License Profiles

License profiles contain predefined license assignments and can be assigned to one or more stations. License profiles are useful if more than one subscriber is to receive same license.

You can use predefined license profiles or create new license profiles.

A license profile only applies to one station type and can only be assigned to stations of this type. Several license profiles can be created and named appropriately for a station type.

License profiles can be created for the following types of stations:

- IP stations (IP system phones, SIP phones)
- TDM stations (UP0 phones, ISDN phones, analog phones, DECT phones)
- DeskSharing stations
- Mobile stations

Within a license profile, you can assign assign user-oriented licenses to the station type as needed.

If the license assignment for a station within a license profile is changed, the assignment of the station to the license profile is automatically revoked.

8.6.1 How to Add a License Profile

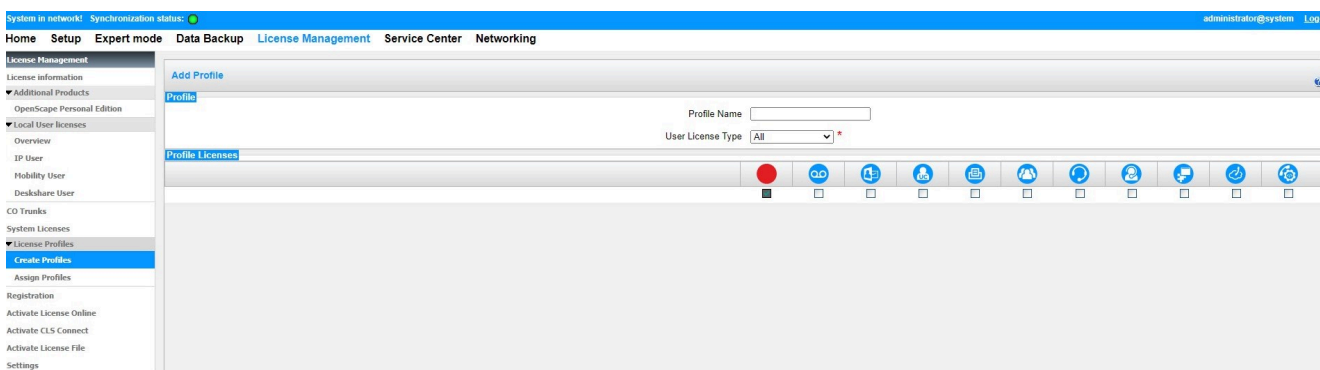

Create a new license profile.

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. Click on **License Management** in the navigation bar.
2. Click in the navigation tree on **License Profiles > Create Profiles**. All existing license profiles are displayed.
3. Click on **Add**.

4. In the **Profile Name** field, enter a name of your choice for the new profile.
5. Select the subscriber type to which the profile is to be applied from the **User License Type** drop-down list.
6. Select the user-oriented licenses by activating the appropriate check boxes.
7. Click on **OK & Next**. A check is performed to see whether the licenses are assigned correctly.
If all licenses are assigned correctly, the licensing of subscribers is considered to be complete.
8. If any of the licenses are assigned incorrectly, their check boxes will be shaded in red. Correct these errors and repeat step 7.

8.6.2 How to Edit a License Profile

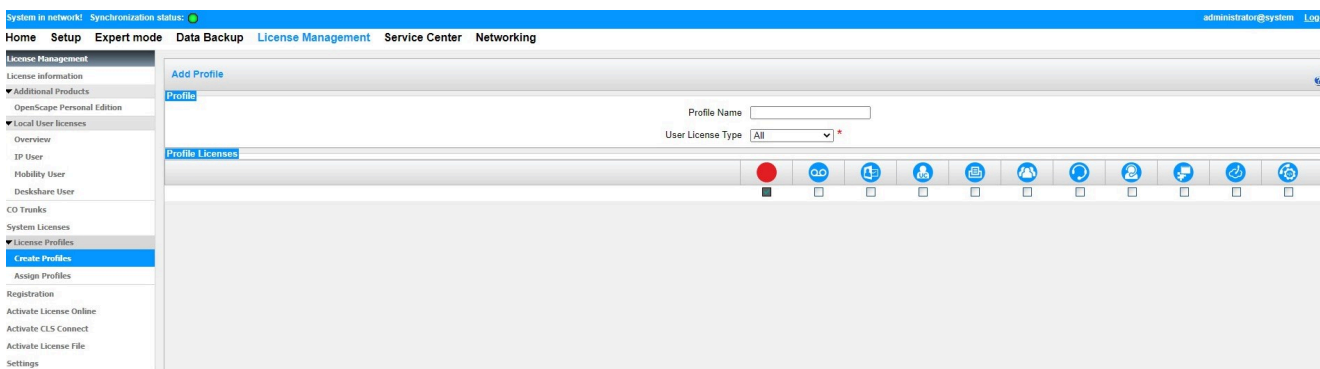

Edit an existing license profile.

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. Click on **License Management** in the navigation bar.
2. Click in the navigation tree on **License Profiles > Create Profiles**. All existing license profiles are displayed.

3. Activate the radio button in front of the desired license profile and click **Edit**.

4. Edit the license profile as desired.
5. Click on **OK & Next**. A check is performed to see whether the licenses are assigned correctly.
If all licenses are assigned correctly, license profile editing is complete.
6. If any of the licenses are assigned incorrectly, their check boxes will be shaded in red. Correct these errors and repeat step 5.

8.6.3 How to Assign a License Profile to Stations

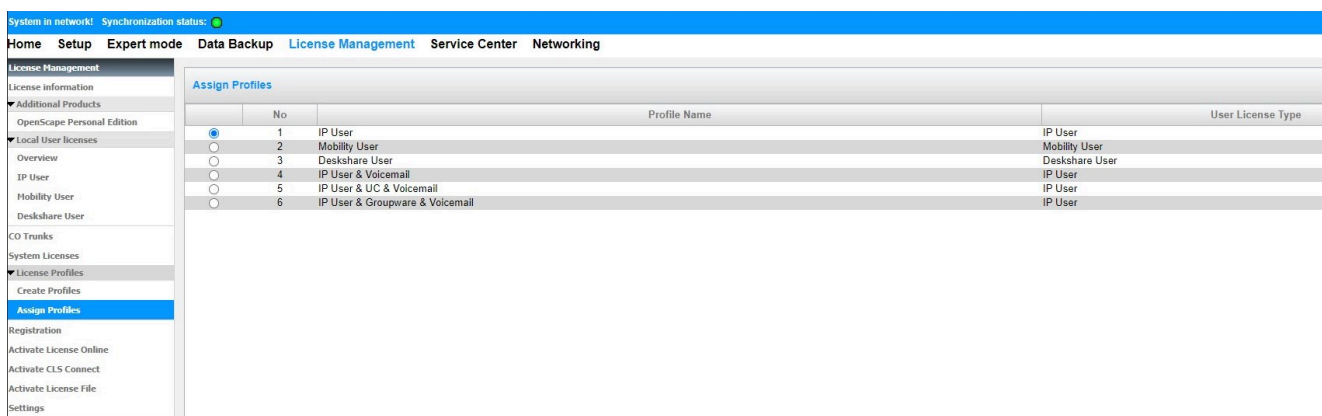

Assign a license profile to the available stations.

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. Click on **License Management** in the navigation bar.
2. Click in the navigation tree on **License Profiles > Assign Profiles**. All existing license profiles are displayed.

3. Activate the radio button in front of the desired license profile and click **OK & Next**.
4. Under **Selection** on the left, select all stations to which the license profile is to be assigned.
5. Click on **Add**. The selected stations appear in the **Members** window on the right.
6. Click on **OK & Next**. The licenses selected in the license profile are assigned to the stations.

NOTICE: In case of "Pay As You Go" a pop up window appears. Click on **OK** in order to confirm your choice.

NOTICE: Stations can also be removed from a license profile or added to it later.

8.6.4 How to Delete a License Profile

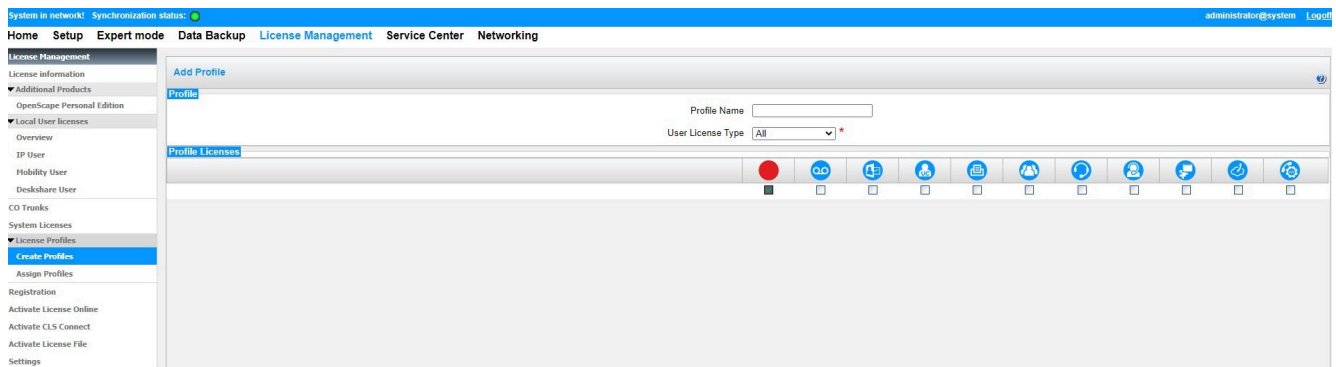

Delete an existing license profile.

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. Click on **License Management** in the navigation bar.
2. Click in the navigation tree on **License Profiles > Create Profiles**. All existing license profiles are displayed.

3. Activate the radio button in front of the desired license profile and click **Delete**.
4. Confirm the message with **OK**. The license profile is deleted.

8.7 Rehosting after Replacement of Hardware

Licenses must be updated whenever the mainboard of the hardware platform or the network card of the Linux server is replaced at the communication system. Rehosting requires the MAC address of the old hardware, the MAC address of the new hardware and the login credentials for the central license server (CLS).

After replacing the hardware, the configuration data must be restored using the latest backup set (see [Restore](#)).

Since the licenses are bound to the MAC address of the hardware, the MAC address changes on replacing the hardware, and the licenses are thus no longer valid. After a hardware replacement, the communication system reverts to the activation period. After the old and new MAC addresses have been entered at the CLS, the new license file can be generated. This is loaded into the communication system through via an offline update, and all existing licenses are then activated automatically.

For the softswitch, the MAC address of the network card of the Linux server, which was selected on installing the Linux operating system (visible via YaST), is used. The MAC address can also be read by using the WBM.

Licensing

License Server (Central License Server, CLS)

NOTICE: Every rehost is logged on the CLS. A license can be used for a rehost up to three times.

NOTICE: The IP address of the CLS can be checked via the WBM under **License Management > Settings** and changed if required.

8.7.1 How to Perform a Rehost after Replacing Hardware

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

The hardware has been replaced, and you have performed a rehost at the CLS.

The configuration data has been restored using the latest backup set.

You know the License Authorization Code (LAC) needed to release the license.

In order to access the License server, the communication system must have access to the Internet.

Step by Step

1. Click on **License Management** in the navigation bar.
2. In the navigation tree, click **Activate License Online**.
3. Enter the appropriate LAC in the **License Authorization Code (LAC)** field.
4. Leave the check boxes for accessing the License server via a user name and password disabled. Access to the Licensing Server occurs automatically. (The input of a user name and password is only required for sales partners.)
5. Click on **Activate**. The connection to the license server is established and the licenses are released. Following the successful update, the connection is reestablished automatically.
6. Restart the communication system.

Next steps

Save your configuration data in a new backup set (see [Immediate Backup](#)).

8.8 License Server (Central License Server, CLS)

The Central License Server (CLS) generates and manages the license files.

A license file is generated when the customer sends the License Authorization Code (LAC) to the CLS via the WBM. The transmission of the license file to the communication system occurs automatically via the Internet. If an automatic transmission is not possible, the

license file can also be loaded manually into the communication system.

8.8.1 How to Check or Change the IP Address of the License Server

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

If the IP address of the Central License Server has changed, you will need to know the current IP address.

Step by Step

1. Click on **License Management** in the navigation bar.
2. In the navigation tree, click on **Settings**. The IP address of the Central License Server (CLS) appears in the **IP address of the Central License Server** field. The currently valid IP address is 188.64.16.4.
3. If you need to change the IP address of the Central License Server, enter the new IP address of the Central License Server in the corresponding **IP address of the Central License Server** field in the format 123.124.125.126.
4. Click on **Activate**.

8.8.2 How to check Central License Server (CLS) Connection

Step by Step

1. Click on **License Management** in the navigation bar.
2. In the navigation tree, click on **Settings**.
3. In the **Central License Server** area, click on **Test CLS Connection**.

If there is an active internet connection, the **Successfully Connected to CLS!** message appears.

If there is no internet connection, the **No connection to CLS!** message appears.

8.9 Customer License Agent (CLA)

The Customer License Agent (CLA) is part of the OpenScape Business communication software and runs automatically in the background. It manages the license file and the licenses contained therein. The CLA checks the license requirements, and if sufficient licenses are available, it activates the licenses. There is only one CLA (local CLA) for each communication system. If several communication systems (nodes) are present in one internetwork, only one CLA (central CLA) should be used on the master node.

The following configurations are possible:

- **How to Configure the Connection to the Local License Agent**

When a node is removed from the internetwork, the connection to the central CLA will be cleared. The local CLA installed on the node is used automatically instead. If this automatic mechanism fails, the connection to the local CLA can also be made manually.

- **How to Change the Connection to the Central License Agent**

Every node in the internetwork requires the connection to the Central CLA on the master node. This connection is automatically established on running the WBM wizard **Network**. If the IP address of the master node changes, the connection to the central CLA must be reconfigured at all slave nodes.

8.9.1 How to Configure the Connection to the Local License Agent

Prerequisites

You are logged on to the WBM of the desired node.

Step by Step

1. Click on **License Management** in the navigation bar.
2. In the navigation tree, click on **Settings**.
3. Enable the **Customer License Agent (CLA) Local Host** radio button.
4. Click on **Activate**.

8.9.2 How to Change the Connection to the Central License Agent

Prerequisites

The communication system is located in an internetwork.

You are logged on to the WBM of the desired node.

Step by Step

1. Click on **License Management** in the navigation bar.
2. In the navigation tree, click on **Settings**.
3. Enable the **Central License Agent** radio button and enter the IP address of the master node (node 1) under **IP address of Central License Agent** in the format 123.124.125.126.
4. Click on **Activate**.

8.10 Locking ID and Advanced ID Locking

Each communication system is assigned a Locking ID or an Advanced Locking ID. To ensure a unique assignment of licenses, the licenses are tied to these Locking IDs.

Locking ID

With hardware platforms, the Locking ID is the MAC address of the communication system.

With softswitches, the Locking ID is the MAC address of the network card of the Linux server. If the Linux server has multiple network cards, the network card that was used at initial startup of the Linux server must be selected.

If the communication system is in the activation period, a wrong MAC address may possibly be shown under the license information. The correct MAC address can be checked via the **Service Center** under **Inventory**.

Advanced Locking ID

If a softswitch runs in a virtual environment, the Advanced Locking ID (ALI) is used instead of the Locking ID. The Advanced Locking ID is generated at the CLS using the ALI Calculator.

The following system and network parameters must be configured, since they are used to generate the 24-digit Advanced Locking ID.

- IP address of the default gateway (Linux server)
- Host name of the Linux server
- IP address of the Linux server
- IP address of the DNS server (configured in the Linux server)
- Time zone (Linux server)

If one or more of these system and network parameters are not set, then the Advanced Locking ID cannot be generated.

The Advanced Locking ID is displayed in the WBM. In some cases, it is possible that the ALI which was generated at the CLS for the license file may differ from the ALI which is displayed during the activation period in the WBM. The license file containing the deviant ALI is accepted by the system anyway.

If any of the system and network parameters listed above changes, the softswitch reverts to the unlicensed state, and a new Advanced Locking ID is generated. In order to be able to use the purchased license again, a rehost from the old to the new Advanced Locking ID must be conducted at the Central License Server (CLS).

If the system detects a change in ALI, a message is displayed on the WBM home page in Licensing area to inform the user that ALI has been changed. The user has to click on Confirm, to verify for being informed about the change. Then the message is removed from the WBM home page, until a new instance of ALI change is detected. If the user does not click on Confirm, the message is permanently displayed on the home page.

IMPORTANT: If any change is made in the Locking ID parameters (IP address, Gateway address, DNS address, Hostname for S systems, MAC address for X systems), the system license becomes invalid. You should contact an authorized partner at the Central License Server to generate a new license file and the new license file must be installed in the system.

IMPORTANT: If a user presses the confirm button, no email will be sent afterwards. An email will only be sent if the user hasn't confirmed the changes via Home page. Email mechanism is triggered every day with an 24h interval, starting from the last system restart.

8.10.1 How to Check the Locking ID of the Communication System

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. Click on **Service Center** in the navigation bar.
2. In the navigation tree, click **Inventory**. An overview of the components that make up the communication system is shown.
3. Click on **OK & Next**. Information on the hardware and software appears. The locking ID of the communication system can be found under **MAC ID for license**.

8.10.2 How to Check the Locking ID of the Softswitch

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. Click on **Service Center** in the navigation bar.
2. In the navigation tree, click **Inventory**. Information on the software of the softswitches, the available and used hard disk storage and on the application status will be displayed. The locking ID of the softswitch can be found under **MAC ID for license**.

8.10.3 How to Check the Advanced Locking ID of Softswitches

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

Click on **License Management** in the navigation bar. All existing licenses are displayed. If the softswitch is being operated in a virtualized environment, the advanced locking ID of the softswitch can be found under **Locking ID**.

8.11 How to migrate from V2 mainboard to V3 mainboard (standalone system)

Prerequisites

- Update to the latest system version.
- Unplug the IVM cards, clean the card slots and remove the IVM configuration from system.
- Make sure that the ports at range 511-532 are not configured. These ports will be reserved by SmartVM on V3 mainboard. This is needed only for systems operating in UC Smart mode.

To address issues with the UC Fax functionality during migration to the V3 mainboard system, it is recommended to configure the system's operation mode prior to migration. If the system is operating in UC Smart mode, the administrator should delete the configuration from ports 511-532 before migration takes place. If the system is operating in UC Suite mode, the additional SmartVM ports will not be created and the fax configuration will not be affected. For instance, if the backup set is coming from a UC Suite system, the V3 mainboard system operation mode should be switched to UC Suite mode before migrating the backup set.

NOTICE: When you upgrade an OpenScape Business PAYGO system, upgrade the Open Scape Business system to V3 software first and then use on the CLS **re-generate license key** function to receive a valid license file for V3 which has then the "OpenScape Business Info Ready for V3 SW F31505-K158-D129" license. After that, the re-generated license file needs to be activated manually within the OpenScape Business System WBM, under **License management**.

NOTICE: When you upgrade an OpenScape Business PAYGO system, upgrade the Open Scape Business system to V3 software first and then use on the CLS **re-generate license key** function to receive a valid license file for V3 which has then the "OpenScape Business Info Ready for V3 SW F31505-K158-D129" license. After that, the re-generated license file needs to be activated manually within the OpenScape Business System WBM, under **License management**.

Step by Step

1. Switch to appropriate system operation mode.

Backup of the system taken in one operation mode, cannot be used in another. If for example you take a backup of your system in UC Suite mode, you have to switch the upgraded system in UC Suite mode first before restoring the backup, you cannot restore a backup in UC Smart mode.

V3 mainboard system is operating in UC Smart mode:

The additional Smart VM ports will be created as today, the administrator should delete the configuration from the aforementioned port range on OCC system before the migration takes place.

V3 mainboard system is operating in UC Suite mode:

The additional SmartVM ports will not be created thus the fax configuration will not be affected.

2. Activate the system's license.

CLS Connect	Action
Activated	Regenerate the license to the V3 MAC address on CLS.
Not activated	Import the new license and activate it on the OpenScape Business V2 system. The confirmation code challenge triggers, showing the confirmation cod on the WBM home page.

3. Make a backup of V2 system including the system configuration.

If the OCC is connected with a Booster Server, a complete backup set from Booster Server is needed to be downloaded and saved.

4. Change the mainboard.

5. Import the new license

CLS Connect	Action
Activated	Import the V3 license file from CLS into the OpenScape Business and the CLS Connect will be activated on the V3 mainboard.
Not activated	Generate a new V3 license using the confirmation code on CLS with the V3 mainboard MAC Address, and import the new V3 license file into OpenScape Business.

6. Restore the V2 backup in the V3 mainboard.

7. Change the UC clients IP address configuration.

At the first connection of UC clients (after migration), please use the new IP address of the V3 mainboard.

How to migrate from V2 mainboard to V3 mainboard the master node of a networked system

Only Full duplex mode is supported with V3 mainboard.

OptiPoint 4xx/5xx devices are no longer supported with V3 mainboard.

8.12 How to migrate from V2 mainboard to V3 mainboard the master node of a networked system

Prerequisites

The system has a networking license.

Step by Step

1. Upgrade all OpenScape Business slave nodes to V3.

Scenario	Procedure to follow
Upgrade with CLS Connect	Upgrade from V2 to V3 with CLS Connect on page 328
Upgrade without CLS Connect	Upgrade from V2 to V3 without CLS Connect on page 328

2. Migrate the master node of the system.

Follow the instruction on [How to migrate from V2 mainboard to V3 mainboard \(standalone system\)](#) on page 325

Until the master node is migrated, the slave nodes will be on fail-over mode. After master node migration, they will function fully again.

8.13 How to migrate from V2 mainboard to V3 mainboard the slave node of a networked system

Prerequisites

The system has a networking license.

NOTICE: If CLS Connect is not activated, remove first the slave system from the network on CLS.

Step by Step

1. Migrate the slave system.

Follow the instruction on [How to migrate from V2 mainboard to V3 mainboard \(standalone system\)](#) on page 325

2. Upgrade or migrate the master node.

Scenario	Procedure to follow
Migration from V2 mainboard to V3 mainboard	How to migrate from V2 mainboard to V3 mainboard (standalone system) on page 325

Licensing

Migration of HiPath 3000 systems to OSBiz V3 software with V3 mainboard

Scenario	Procedure to follow
Software upgrade with CLS Connect	Upgrade from V2 to V3 with CLS Connect on page 328
Software upgrade without CLS Connect	Upgrade from V2 to V3 without CLS Connect on page 328

8.14 Migration of HiPath 3000 systems to OSBiz V3 software with V3 mainboard

Software migration is done by the normal HiPath 3000 to OSBiz migration process using Manager E tool. Existing HiPath 3000 ComScendo and S2m licenses are upgraded to the MAC address of the OCCe mainboard. TDM licenses and V3 software indicator are generated by the CLS, based on the XML file information that is created from ManagerE during this procedure.

In case of a reused OCC mainboard from a previous migration of OSBiz to OCCe, no license migration is possible. All licenses need to be purchased.

In case of an OCC from spare parts stock or newly purchased (MAC address is not blocked in CLS), an upgrade of the HiPath 3000 to that MAC address is possible and a new license file is generated (as with migration to OSBiz V2).

8.15 Upgrade from V2 to V3 with CLS Connect

The latest V2R7 is needed to be updated and **CLS Connect** is active. Existing OpenScape Business V2 licenses that are bound to the MAC address of the OCC mainboard are also valid for V3.

After software upgrade, on startup, OpenScape Business V3 software indicates on the CLS that licenses operate in combination with V3 software. V3 information is added into the license file and transferred automatically back into the system via CLS connection during startup. Manual actions are not required.

No action is required in case of software upgrade without migration for slave systems with a networking license. In this case, slave systems can be upgraded and their license will be updated automatically after master system upgrade/migration.

8.16 Upgrade from V2 to V3 without CLS Connect

Prerequisites

- CLS connect is not active
- OpenScape Business S needs Internet access
- In case of upgrade of a slave node in a networked system, remove first the slave from CLS.

Step by Step

- 1.** Activate the SW-Upgrade license on CLS as a normal license for the OpenScape Business system. Activation on SW-Upgrade license on CLS generates a new license file containing:
 - The new V3 license
 - The new (increased) license file ID
 - If the system is OSBiz S, CLS connect Start is added to the certificate.
- 2.** Import this new license file and activate it to OpenScape Business V2 system.
- 3.** Execute the software upgrade from V2 to V3.

During start up, after software upgrade to V3, the OpenScape Business system checks the license file and allows licensing functionality only if the V3 license component is available in the license file.

9 Integration into the Internal Data Network (LAN)

The integration of the communication system in the existing internal network (LAN) enables the use of UC solutions and the administration of the communication system on PCs in the internal network.

The following network parameters must be set up in the WBM:

- OpenScape Business X hardware platform: IP address and network mask of the mainboard and the UC Booster Card (if present). These settings are made during the initial installation, but can be changed later.

Softswitch OpenScape Business S: IP address and subnet mask of the Linux server on which the communication software is running. These settings are made during the Linux installation, but can be changed later.

- The communication system can be optionally set up as a DHCP server (supplied with network-specific parameters such as the subnet mask, default gateway, DNS server) or as a DHCP relay agent. The setup as a DHCP server is performed during the initial installation, but can be changed later. The setup as a DHCP relay agent is performed in Expert mode.
- IP address of the default router and the (external) DNS server for access to other IP networks (e.g., the Internet). These settings are made during the initial installation, but can be changed later.

9.1 LAN Interface

In order to integrate the communication system in the LAN infrastructure, the IP address and internal IP address range of the communication system must be adapted to the IP address scheme of the internal network (LAN).

9.1.1 IP Address and Subnet Mask of the LAN Interface

The IP address and the subnet netmask of the communication system are defined during the initial installation but can also be changed later. You may need to adapt the IP address and/or subnet mask to the IP address range of the LAN.

Hardware Platform

By default, the hardware platform is assigned an IP address and a subnet mask. The UC Booster Card also requires an IP address. The IP address of the UC Booster Card can be configured regardless of whether the UC Booster Card is installed or not.

The hardware platform uses the "LAN" interface of the mainboard for integration into the LAN. Whenever the UC Booster Card is installed, the "LAN" interface of the UC Booster Card must also be connected to the LAN. The hardware platform and UC Booster Card must be located in the same subnet.

Integration into the Internal Data Network (LAN)

To activate the changes to the IP address or subnet mask, a restart of the hardware platform is required.

The changes to the IP address and the subnet mask remain in effect after a software update, but will be reset to the default values in the event of a hardware platform reload. These changes cannot be stored in a backup set.

Softswitch

For a softswitch, the Linux server on which the communication software runs is integrated into the LAN via its network card.

The change of IP address or subnet mask takes effect after a restart of the application (see [Restart](#), [Reload](#), [Shutdown](#)).

9.1.1.1 How to Change the IP Address and Subnet Mask of the Hardware Platform

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. Click on **Edit** to start the **Initial Installation** wizard.

System Settings	
Display Logo:	OSBiz
Brand:	OpenScape Business
OpenScape Business	
OpenScape Business - IP address:	192.168.186.13
OpenScape Business - Netmask:	255.255.255.0
OpenScape Business - Default Routing via:	LAN
OpenScape Business - IP Address of Default Router:	192.168.186.22
Application Board	
Application Board - IP address:	192.168.1.3
Application Board - Netmask:	255.255.255.0
Application Board - IP Address of Default Router:	192.168.186.22

3. Under **OpenScape Business - IP Address**, edit the IP address of the hardware platform. The IP address must conform to the IP address scheme of the internal network and must not have been assigned to any network client, since this would otherwise result in an IP address conflict. By default, the IP address 192.168.1.2 is entered here.
4. Under **OpenScape Business - Netmask**, edit the subnet mask of the hardware platform. The subnet mask must match the IP address scheme of the internal network. By default, the subnet mask will have been entered as 255.255.255.0.
5. Click on **OK & Next**.
6. Keep clicking **OK & Next** until you receive a message that the feature has been installed.
7. Click on **Finish**. The hardware platform automatically performs a restart.

Integration into the Internal Data Network (LAN)

9.1.1.2 How to Change the IP Address of the UC Booster Card

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. Click on **Edit** to start the **Initial Installation** wizard.

Setup - Wizards - Basic Installation - Initial Installation

System Settings

Display Logo:

Brand:

OpenScape Business - IP address:

OpenScape Business - Netmask:

OpenScape Business - Default Routing via:

OpenScape Business - IP Address of Default Router:

Application Board - IP address:

Application Board - Netmask:

Application Board - IP Address of Default Router:

3. Under **UC Booster Card - IP Address**, edit the IP address of the UC Booster Card. The IP address must conform to the IP address scheme of the internal network and must not have been assigned to any network client, since this would otherwise result in an IP address conflict. By default, the IP address 192.168.1.3 is entered here.
4. Click on **OK & Next**.
5. Keep clicking **OK & Next** until you receive a message that the feature has been installed.
6. Click on **Finish**. The hardware platform automatically performs a restart.

9.1.1.3 How to Check or Change the IP Address and Subnet Mask of the Softswitch

Step by Step

1. Click on **Computer** in the task bar.
2. In the menu tree, click on **System > YaST**.
3. Enter the password for the root user and click **Continue**. The YaST Control Center is opened.
4. Click on **Network Devices** in the menu tree.
5. In the **Network Devices** area, click on **Network Settings**.
6. Select the desired network card in the **Overview** window and click on **Edit**.
7. Enable the radio button **Statically assigned IP Address**.
8. Under **IP Address**, change the IP address of the Linux server on which the software of the softswitch is running. The IP address must conform to the IP address scheme of the internal network

and must not have been assigned to any network client, since this would otherwise result in an IP address conflict.

9. Under **Subnet mask**, edit the subnet mask of the Linux server. The subnet mask must conform to the IP address scheme of the internal network.
10. Click on **Next** followed by **OK**.
11. Close the **YaST Control Center**.

9.1.2 Internal IP Address Range of the LAN Interface

The internal IP address range of the LAN interface that is used by the hardware platform for the internal communication of its modules can be changed if necessary.

The hardware platform uses the internal IP address range 192.168.3.xxx by default. This address range can also be edited and set to a desired IP address range. The internal subnet mask is 255.255.255.0 and cannot be changed.

To activate the changes to the internal IP address range, a restart of the hardware platform is required.

The changes to the internal IP address range remain in effect with a software update, but will be reset to the default values in the event of a reload. These changes cannot be stored in a backup set.

9.1.2.1 How to Change the Internal IP Address Range of the Hardware Platform

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony Server > Payload**.
3. Click **Hardware Modules** in the menu tree.
4. Click on the **Edit DSP Settings** tab.

5. In the **General** area under **IP address**, enter an IP address for the communication system that is in the desired new internal range, e.g., 192.168.40.2. The entire IP address range (in this example 192.168.40.xxx) is now blocked for other clients on the LAN.

Integration into the Internal Data Network (LAN)

DHCP

- Click on **Apply** and confirm with **OK**.

9.1.2.2 How to Reset the Internal IP Address Range of the Hardware Platform

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

- In the navigation bar, click on **Expert Mode**.
- In the navigation tree, click **Telephony Server** > **Payload**.
- Click **Hardware Modules** in the menu tree.
- Click on the **Edit DSP Settings** tab.

- In the **General** area, enter the IP address 192.168.3.2 under **IP address**. The entire IP address range (192.168.3.xxx) is now blocked for other clients on the LAN.
- Click on **Apply** and confirm with **OK**.

9.2 DHCP

DHCP (Dynamic Host Configuration Protocol) is a protocol that enables the dynamic allocation of network-specific data to the IP stations of a network (e.g., a LAN) with the aid of a DHCP server.

DHCP thus makes it possible to automatically integrate IP stations (e.g., IP phones or PCs) in an existing LAN. The IP station must be configured to automatically receive the network-specific data and is thus a DHCP client. The DHCP server provides the IP stations with the network-specific data on request.

9.2.1 DHCP Relay Agent

When using the internal DHCP server of the hardware platform, the internal DHCP server and the DHCP clients must be on the same network segment. If this is not the case, the hardware platform must be configured as a DHCP relay agent. The DHCP requests of the IP stations are then forwarded from the hardware platform to the actual DHCP server.

9.2.1.1 How to Configure the Hardware Platform as a DHCP Relay Agent

If the hardware platform is configured as a DHCP relay agent, it relays DHCP requests on to the external DHCP server.

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click on **Telephony Server** > **Network Interfaces** in the navigation tree.
3. Click on **Mainboard** > **DHCP** in the menu tree.
4. Enable the **DHCP Relay Agent** radio button.
5. Click on **Apply** and confirm with **OK**.
6. Click **DHCP Relay Agent** in the menu tree.

7. Enter the **IP address of the first DHCP server**.
8. Enter the **IP address of the second DHCP server**.
9. Enter the **IP address of the third DHCP server**.

INFO: You can enter up to three DHCP servers. The entry of the first DHCP server is mandatory.

10. Click on **Apply**, followed by **OK**.

9.2.2 DHCP Server

The DHCP server assigns network-specific information such as the IP address and subnet mask of the IP station, the IP address of the default gateway, the IP address of the SNTP server, etc., dynamically to the IP stations (i.e., the IP phones, SIP phones, PCs, WLAN access points, and so on).

The internal DHCP server of the communication system or an external DHCP server can be used as DHCP server (e.g., the DHCP server of the Internet router).

In the hardware platform, the integrated DHCP server is enabled by default. If an external DHCP server is to be used, the internal DHCP server must be disabled. Otherwise, conflicts may arise with the external DHCP server.

For the softswitch, the Linux server can be configured as an internal DHCP server.

Integration into the Internal Data Network (LAN)

The decision as to whether the internal DHCP server of the communication system or an external DHCP server is to be used should be made during the initial startup. The internal DHCP server can also be enabled or disabled later. Even the network-specific data can be configured later.

Internal DHCP Server

If the internal DHCP server is used, the IP stations are automatically supplied with the following network-specific data:

- IP address and subnet mask of the IP station
- IP address of the communication system (default gateway)
- IP address of the SNTP server (to obtain the date and time)
- IP address of the DNS server (for name resolution)
- IP address of the SIP server (for the authentication of SIP stations)
- IP address of the internal DLI or the external DLS server (for the software update of the IP system phones)
- Routing rules

External DHCP Server

If an external DHCP server is used, it must support a vendor-specific option space to enable the provision of vendor-specific parameters. The following network-specific data should be entered in the external DHCP server:

- IP address and subnet mask of the IP station
- IP address of the default router = Option 3
- IP address of the communication system (default gateway) = Option 33
- IP address of DNS server (for name resolution) = Option 6
- IP address of the internal DLI or the external DLS server (for the software update of the IP system telephones) = Option 43
- Only for SIP phones: IP address of the SIP server (SIP registrar, for the authentication of SIP stations) = Option 120
- Only for SIP phones: IP address of the SNTP server (to supply the SIP phones with the date and time) = Option 42

NOTICE: Additional information on DHCP server in a Windows environment can be found here: http://wiki.unify.com/wiki/DHCP_Server_in_a_Windows_environment.

If no such entries can be made at the external DHCP server, this data must be entered directly at the IP system phones. Only then can the IP system phones be automatically supplied with the current date and time and the latest software updates, for example.

For further information please refer to the following Unify Experts Wiki page under: <http://wiki.unify.com/wiki/DHCP>

DHCP Address Pool (IP Address Ranges)

Whenever an IP station logs in at the DHCP server, it receives, among other things, a dynamically assigned IP address. The administrator

can optionally define an IP address range from which the DHCP server can assign IP addresses to the IP stations. In this case, for example, not all IP addresses from the range 192.168.1.xx are to be assigned, but only those from 192.168.1.50 to 192.168.1.254, since the lower IP addresses up to 192.168.1.49 are to be reserved for IP stations with static IP addresses.

In fact, even multiple IP address ranges can be set up for the internal DHCP server under **Network Interfaces** in expert mode.

9.2.2.1 How to Enable and Configure the DHCP Server of the Hardware Platform

The **Network Configuration** wizard can be used to enable and configure the DHCP server of the hardware platform.

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > Network/Internet**.
3. Click on **Edit** to start the **Network Configuration** wizard.

The screenshot shows the 'Setup - Wizards - Network / Internet - Network Configuration' window. The 'DHCP Global Settings' section is active. It contains a red warning message: 'In Expert Mode, DHCP was set to Relay Agent. If you now switch the DHCP server on, the IP addresses HiPath OpenOffice will be distributed. Network problems may occur as a result.' Below this, the 'Enable DHCP Server' checkbox is checked. The 'Netmask' field is set to '255.255.255.0'. The 'Broadcast Address' field is set to '0.0.0.0' with a note '(optional)'. The 'Preferred Gateway' field is set to '192.168.1.2'. The 'DNS Server' section is also visible, with 'Domain Name' and 'Preferred Server' fields set to '192.168.1.2'. The 'Lease time in hours (0 infinite)' field is set to '1'. The 'Enable Dynamic DNS Update' checkbox is unchecked.

4. Enable the **DHCP Server** check box.
5. Enter the subnet mask of your network in the **Subnet Mask** field (e.g., 255.255.255.0).
6. In the **Broadcast Address** field, enter the Broadcast address ("last" IP address of the net or subnet, default: 0.0.0.0) if required.
7. In the field **Preferred Gateway**, enter the IP address of the default gateway. As a rule, the IP address for the Internet router is usually 192.168.1.1.
8. If you need a fully qualified domain name for the DHCP server, enter this under **Domain Name** (max. 80 characters).
9. In the field **Preferred Server**, enter the IP address of an available DNS server, e.g., the IP address of the Internet router, 192.168.1.1.

Integration into the Internal Data Network (LAN)

10. If required, enter the maximum lease time in hours (default: 1 h, 0 = infinite lease time) in the field **Lease Time in hours (0 = infinite)**.
11. If you want to permit dynamic updates of the DNS server, enable the option **Enable Dynamic DNS Update** (default: disabled).

NOTICE: If Dynamic DNS Update option is enabled, it is mandatory to configure **Domain Name** in IP Address Pool respective Domain name field.

12. Click on **OK & Next**. The settings for the DHCP address pool are displayed.

The screenshot shows the 'DHCP Address Pool' configuration window. At the top, there is a blue header bar with the text 'Setup - Wizards - Network / Internet - Network Configuration'. Below this, the title 'DHCP Address Pool' is centered. The form contains three input fields: 'Subnet address' with the value '192.168.1.0', 'Subnet mask' with the value '255.255.255.0', and 'Address range 1' with the value '192.168.1.50 - 192.168.1.254'. The 'Address range 1' field is highlighted with a blue border.

13. In the **Subnet Address** field, enter the lowest IP address of the subnet in which the desired IP address range is located (in our example, 192.168.1.0).
14. Enter the subnet mask of the desired IP address range in the **Subnet Mask** field (e.g., 255.255.255.0).
15. Enter the upper and lower threshold for the desired IP address range in the **Address Range 1** field (e.g., 192.168.1.50 to 192.168.1.254).
16. Click on **OK & Next**. The **Routing Settings** window appears.
17. In the field **IP Address of DNS Server**, enter the IP address of an available DNS server, e.g., the IP address of the Internet router, 192.168.1.1.
18. Select the item **LAN** from the **Default Routing via** drop-down list.
19. If access to the Internet occurs via an Internet router, enter the IP address of the Internet router (e.g., 192.168.1.1) in the **IP address of Default Router** field.
20. Click on **OK & Next** followed by Finish.

9.2.2.2 How to Disable the DHCP Server of the Hardware Platform

The **Network Configuration** wizard can be used to deactivate the DHCP server of the hardware platform.

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > Network/Internet**.

3. Click on **Edit** to start the **Network Configuration** wizard.
4. Clear the **Enable DHCP Server** check box.
5. Keep clicking **OK & Next** until you receive a message that the feature has been installed.
6. Click on **Finish**.

9.2.2.3 How to Enable and Configure the DHCP Server of the Softswitch

Step by Step

1. Click on **Computer** in the task bar.
2. In the menu tree, click on **System > YaST**.
3. Enter the password for the root user and click **Continue**. The YaST Control Center is opened.
4. Click on **Network Services** in the menu tree.
5. In the **Network Services** area, click on **DHCP Server**.
6. Mark the desired network card and click **Select**.
7. Select the **Open Firewall for Selected Interfaces** check box.
8. Click on **Next**.
9. If you need a fully qualified domain name for the DHCP server, enter this under **Domain Name** (max. 80 characters).
10. In the field **Primary Name Server IP**, enter the IP address of an available DNS server, e.g., the IP address of the Internet router, 192.168.1.1.
11. In the field **Default Gateway (Router)**, enter the IP address of the default gateway. As a rule, the IP address for the Internet router is usually 192.168.1.1.
12. Enter the SNTP server configured during initial setup in the **NTP Time Server** field.
13. Click on **Next**.
14. Enter the lower limit of the desired IP address range in the field **First IP Address** and its upper limit in the field **Last IP Address** (e.g., 192.168.1.50 to 192.168.1.254).
15. Select the **Allow Dynamic BOOTP** check box.
16. Click on **Next**.
17. Enable the **When Booting** radio button.
18. Click on **Finish**.
19. Close the **YaST Control Center**.

9.2.2.4 How to Disable the DHCP Server of the Softswitch

Step by Step

1. Click on **Computer** in the task bar.
2. In the menu tree, click on **System > YaST**.
3. Enter the password for the root user and click **Continue**. The YaST Control Center is opened.
4. Click on **Network Services** in the menu tree.

5. In the **Network Services** area, click on **DHCP Server**.
6. Clear the **Start DHCP Server** check box.
7. Click on **Finish**.
8. Close the **YaST Control Center**.

9.3 DNS - Name Resolution

The Domain Name Service (DNS) serves to the translate names to numerical addresses. This enables host names or domain names to be converted to IP addresses, and vice versa.

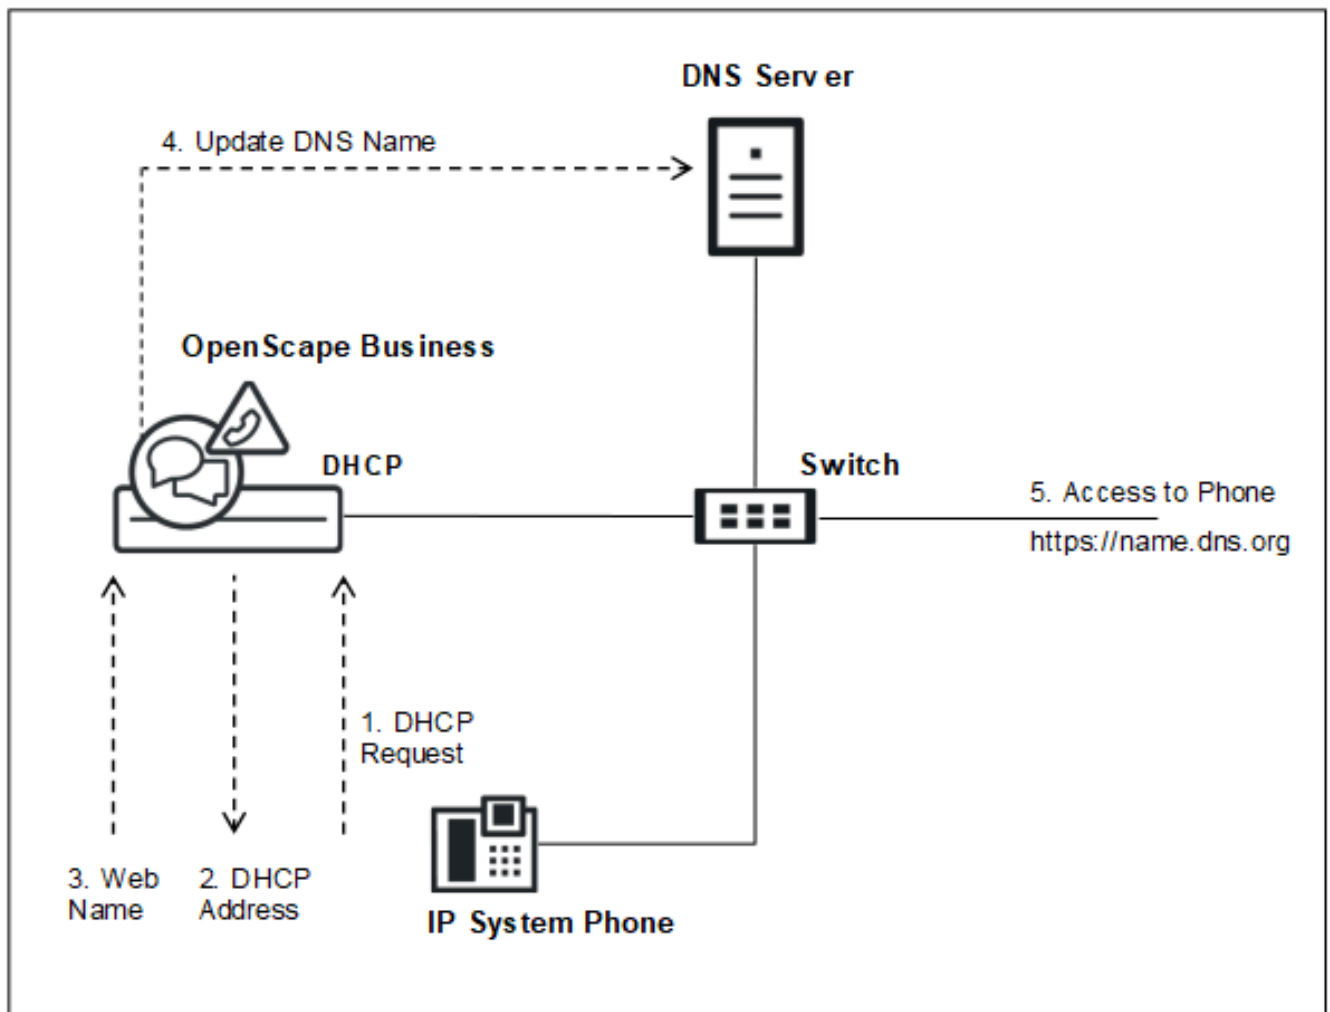

The DNS uses a hierarchical database that manages the Internet name space and is distributed over a collection of servers worldwide. This name space is divided into so-called zones (domains). Separate Internet-independent DNS servers are usually operated for local requirements – for example, within a corporate network.

Name Resolution for IP System Phones

The following prerequisites must be met:

- Windows 2008 DNS Server (with the current patch level and the "Allow unsafe update" setting enabled)
- The internal DHCP server is enabled
- The "Enable Dynamic DNS Update" functionality is activated in the internal DHCP server (see [DHCP Server](#))
- The web name is entered in the IP system telephone.

The IP system telephone sends a DHCP request (1) and receives a valid IP address and other network-specific data (2) from the internal DHCP server. After receiving this data, the IP system telephone sends the set web name to the internal DHCP server (3), which then forwards the name automatically to the configured DNS server (4). The DNS server now knows the name associated with the IP address of the IP system telephone. The IP system telephone can now be accessed via the WBM by using its web name (5).

DNS Server

The DNS server, also called a name server, is a program that responds to requests about domain names or computer names. Even the PC on which this program runs can be designated as a DNS server.

For requests about a domain name or a host name, the DNS server returns the corresponding IP address.

Example: for www.wikipedia.org, DNS server on the Internet will return the IP address 91.198.174.2.

If the preferred DNS server cannot answer a request, it forwards the request to another DNS server.

For a softswitch, the Linux server on which the communication software runs can be configured as a DNS server. The hardware platform cannot be used as a DNS server. An external DNS server can be specified for both the softswitch as well as the hardware platform.

9.3.1 How to Define an External DNS Server

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony Server > Routing**.
3. Navigate in the menu tree to **IP Routing > Mainboard > DNS Server**. The **Edit DNS Settings** window appears.

Expert mode - Telephony Server

Routing

- IP Routing
 - Mainboard
 - Static Routes
 - Default Router
 - DNS Server**
 - Application Board
 - NAT
 - PSTN

DNS Settings

Edit DNS Settings

IP Address of primary DNS Server: 192.168.186.22

IP Address of secondary DNS Server: 0.0.0.0

4. Enter the IP address of the relevant external DNS server in the field **IP Address of DNS Server**.
5. Click on **Apply** followed by **OK**.

NOTICE: In case of an OpenScape Business S system, a system reboot is necessary in order the changes to be applicable.

9.4 IP Routing

In data technology, IP routing describes the definition of paths (routes) for data streams within networks. IP routing is required when the sender and recipient are on different networks.

Default Router

To ensure that IP stations can also reach destinations outside their own networks that are not explicitly listed in a route table, a gateway must be specified for forwarding packets of this kind (default router). The default router will then redirect the data to the parent network.

You can enable or disable IP routing via a default router for both the mainboard and the Application Board.

Static Routes

Static routes are used to establish the path along which data will travel to a network that cannot be reached via the default router.

You can create static routes for both the mainboard and the Application Board.

9.4.1 How to Activate or Deactivate the Default Router

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony Server > Routing**.
3. Navigate in the menu tree to **IP Routing > Mainboard / Application Board > Default Router**. The **Edit Default Router** window appears.

4. If you want to enable IP routing over a default router, select the entry **LAN** in the **Default Routing via** list box and enter the IP address of the default router e.g., the IP address of the Internet router **192.168.1.1** under IP Address of Default Router.
5. If you want to disable IP routing over a default router, select the entry **No interface** in the **Default routing via** list box.
6. Click on **Apply** followed by **OK**.

9.4.2 How to Add a Static Route

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony Server > Routing**.
3. Navigate in the menu tree to **IP Routing > Mainboard / Application Board > Static Routes**. The **Static Routes** window is displayed.
4. Click on the **Add Static Route** tab. The **Route Index** shows which route is added.

Integration into the Internal Data Network (LAN)

Deployment Service (DLS and DLI)

5. Enter the required name for this route in the **Route Name** field.
6. Enter the IP address of the **Destination Network/Host**.
7. Enter the IP address of the **Destination Subnet Mask** (subnet mask).
8. Enter the IP address of the router you want to use to reach the destination network in the **Route Gateway** field.
9. If you have created one or more static routes for the mainboard, you can copy all static routes of the mainboard to the Application Board with the **Copy to OCAB** button.
10. Click on **Apply** followed by **OK**.

9.4.3 How to Delete Static Routes

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Routing**.
3. Navigate in the menu tree to **IP Routing > Mainboard / Application Board > Static Routes**.
4. Mark the route you want to delete.
5. Click the **Delete Static Route** tab.
6. Click on **Delete**.
7. Confirm the advisory message and then click **OK**.

9.5 Deployment Service (DLS and DLI)

DLI and DLS can be used to manage IP components centrally and to deploy their software. The DLI is integrated in the communication system. The DLS is a standalone application which must be installed on an external server PC.

DLI (Deployment Server Integrated)

The DLI is a component which is integrated in the communication system and provides limited DLS functionality. The internal DLI can be used to centrally configure all IP system phones connected to the communication system and to equip them with the latest phone software. For DeskPhone CP 400/600/600E/700/700X/710, when DLI is enabled, the following UC Server parameters are automatically configured: UC Protocol, UC Server address, UC Server port.

The internal DLI also works with the integrated FTP server on which the latest phone software is stored.

If the IP address of the DLI is known to the DHCP server, the DHCP server sends this data to the IP system telephone (HFA, SIP) as soon as the phone logs into the internal network. This enables the telephone to retrieve the current software from the FTP server of the communication system. The DLI is configured by default in the

internal DHCP server. If an external DLS server is to be used instead, its IP address must be configured in the internal DHCP server.

DLS (Deployment Service)

The DLS is a client/server application for the central administration of the IP components. The DLS server is not integrated in the communication system and must be installed on a server PC. The DLS client runs on the IP components. Administration occurs via a web browser.

IP components can be IP system phones, SIP phones, SIP clients and IP gateways.

NOTICE: The properties and features of the DLS can be found in the product description of the DLS and are not described in this documentation.

DLI or DLS with External DHCP Server

In order to ensure that the software of IP system telephones (HFA, SIP) can be updated automatically even when using an external DHCP server, you have the following alternatives:

- Configure the IP address of the DLI or DLS in the external DHCP server

When using an external DHCP server, the network-specific data and the IP address of the external deployment server (DLI or external DLS server) must be entered. In addition, the latest phone software must be stored on the external DLS server.

- Configure all system phones

The IP address of the deployment server must be entered as the DLS address for each IP system phone (IP address of the communication system for the internal DLI or IP address of the external DLS server).

Features and Restrictions

Function	DLI	DLS
Central configuration of the parameters of IP components The parameters of the IP components can be configured via customizable XML templates.	yes	yes
Plug&Play commissioning of the IP components Using a DHCP server, the IP components can log into the system automatically after being connected to the system for the first time or after an IP component is replaced, for example.	Yes	Yes

Integration into the Internal Data Network (LAN)

Function	DLI	DLS
<p>Central and automatic software update for IP components</p> <p>Whenever a new software version is available, the IP components are automatically supplied with the latest version of the software the first time the user logs on. The IP address of the DLI/DLS must be configured in the IP component.</p>	Yes	<p>Yes</p> <p>The latest phone software must be stored on the DLS.</p>
<p>Centralized inventory management of IP components</p> <p>The data on the hardware configurations of the IP components can be accessed and retrieved centrally.</p>	no	Yes
<p>Support for IP Mobility (Desk Sharing)</p> <p>The telephony data of a user (e.g., program keys, directory entries, journals) is stored centrally and can be retrieved at other phones).</p>	<p>Yes</p> <p>Not for SIP phones,</p> <p>Not possible in the internetwork.</p>	<p>Yes</p> <p>Not for SIP phones,</p> <p>In homogeneous networks (only OpenScape Business systems), only with closed numbering,</p> <p>Not in heterogeneous networks (with OpenScape 4000 or OpenScape Voice).</p>
SPE support in networks	SPE in networks is possible. DLS has to be used (no DLI).	<p>Yes</p> <p>The keys and certificates to be deployed must be available on the DLS.</p>
Central supply for several different platforms	no	Yes
<p>Activation of the 2nd LAN interface of IP system phones (PC Ethernet mode).</p> <p>See Basic Settings > Phone Parameter Deployment</p>	Yes	Yes

Deployment- und Licensing Client (DLSC)

To use DLS functions such as the element manager, for example, the communication system must allow the external DLS to access the configuration data. The communication system is then operated as Deployment and Licensing Client.

9.5.1 How to Configure the External DLS Server in the Internal DHCP Server

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click on **Telephony Server > Network Interfaces** in the navigation tree.
3. Navigate in the menu tree to **Mainboard > DHCP > DHCP Server > Global Settings**. The **Edit Global Parameters** window is displayed.

4. Clear the **Use Internal DLI** check box.
5. Enter the IP address at which the server can be reached in the **IP Address** field.
6. Enter the port used by the DLS server in the **Port** field. This port must be enabled in the firewall.
7. Click on **Apply**, followed by **OK**.

9.5.2 How to Enable the Internal DLI

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click on **Telephony Server > Network Interfaces** in the navigation tree.

Integration into the Internal Data Network (LAN)

3. Navigate in the menu tree to **Mainboard > DHCP > DHCP Server > Global Settings**. The **Edit Global Parameters** window is displayed.

4. Enable the **Use Internal DLI** check box. This check box is enabled by default.
5. Click on **Apply**, followed by **OK**.

9.5.3 How to Configure the Communication System as a Deployment and Licensing Client

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony Server > Security**.
3. Click **Deployment and Licensing Client (DLSC)** in the menu tree.

4. On the **DLSC Basic Configuration** tab in the **DLS Server** area, enter the IP address at which the external DLS server can be reached in the **IP Address of DLS Server** field.
5. Enter the port used by the DLS server in the **Port of DLS Server** field. The two displayed ports must be enabled in the firewall.
6. Click on **Apply** followed by **OK**.

10 Connection to Service Provider

The communication system supports connection to public communication networks. The connection to the IP network provides access to the Internet and Internet telephony, and the connection to the Central Office provides access to the ISDN network and the analog network.

Access to the Internet occurs via either an Internet modem or an Internet router.

ISDN trunk access for the hardware platforms occurs via the mainboard or additional plug-in boards. ISDN trunk access is not possible with the softswitch.

The analog trunk access for the hardware platforms requires an additional plug-in board. Analog trunk access is not possible with the softswitch.

10.1 Internet Access

A broadband connection (DSL or connection) is required for access to the Internet. This enables fast data transfers within the framework of the available bandwidth.

Internet Access via a DSL Connection

Conventional telephone lines are used for broadband Internet access via DSL (digital subscriber line). The Internet access can be used at the same time as the normal phone. Fax, analog phone or ISDN are also available during the DSL connection. This makes it possible to implement Internet access that is permanently available as in the case of a dedicated line (flat rate).

For Internet access via DSL, you need a modular jack (analog or ISDN) and an Internet Service Provider (ISP). The ISP provides a splitter and an Internet modem (DSL modem) or an Internet router with a built-in Internet modem. The splitter divides the signal into DSL and telephony parts and forwards the DSL signals to the Internet modem.

The communication system can be connected directly to the Internet modem or to the Internet router with an integrated Internet modem. In the first case, the access data of the ISP must be entered in the communication system; in the second, the Internet router must be made known to the communication system. The access data of the ISP is saved in the Internet router.

To use Internet telephony, you will also need an Internet Telephony Service Provider (ITSP, SIP provider).

Internet Access via a Cable Connection

The broadband connection to the Internet is implemented via the TV cable. In addition to transmitting TV signals, the TV cable connection can be used for accessing the Internet and making calls. This means you do not need a telephone line to surf and for telephony.

Connection to Service Provider

For Internet access via cable, you need a cable provider that offers this feature. The cable provider is also your Internet Service Provider (ISP). This cable provider supplies you with a cable port with a back channel and a cable modem that transmits the data over the TV cable network. The cable port and the communication system are connected to the cable modem over Ethernet. Internet data filtration takes place directly in the cable modem.

The communication system can be connected directly to the cable modem or to an Internet router that is connected to the cable modem. In both cases, the cable modem or the Internet router must be made known to the communication system.

To use Internet telephony, you will also need an Internet Telephony Service Provider (ITSP, SIP provider).

Configuring Internet Access

The configuration of Internet access in the WBM depends on whether the Internet connection has already been set up in an external router or whether it occurs via an Internet modem and thus needs to be set up in the WBM.

- **Internet access through an Internet modem (DSL at WAN port directly)**

You want to operate the communication system directly at an Internet modem (DSL, cable, UMTS ...). OpenScape Business has the Internet router integrated. Enter the access data of the Internet Service Provider (ISP) directly in the communication system and use the WAN port of the communication system. This option is not available with the softswitch.

You have the following options:

- Internet access via a preconfigured ISP
- Internet access via the standard ISP PPPoE
- Internet access via the standard ISP PPTP

If your ISP is not listed under the preconfigured ISPs, use the default ISP PPPoE or PPTP.

- **Internet access via an external Internet router**

You want to operate the communication system at an external Internet router. The Internet Service Provider is already configured in the Internet router.

You have the following options:

- **Internet access via an external Internet router at the WAN port**

(TCP/IP at WAN port via an external router)

To do this, you use the WAN port of the communication system. OpenScape Business either knows the Internet router or works as a DHCP client. This option can be used if the Internet router is located in another network segment and has its own DHCP server.

- **Internet access via an external Internet router at the LAN port**

(TCP/IP at LAN port via an external router)

To do this, you use the LAN port of the communication system. OpenScape Business knows only the default router and not the underlying infrastructure. To activate the connection to the Internet router, the IP address of the default router and that of the DNS server must be made known to the communication system.

- **Disable Internet access** (default setting)

You do not want to use the Internet. Then leave the Internet access disabled.

10.1.1 Internet Access via an External Internet Router

The **Internet Configuration** wizard helps you configure your Internet access via an additional Internet router.

To set up Internet access, you have the following options:

- **Internet access via an external Internet router at the LAN port**

To do this, you use the LAN port of the communication system. To activate the connection to the Internet router, the IP address of the default router and that of the DNS server must be made known to the communication system.

- **Internet access via an external Internet router at the WAN port**

Connection to Service Provider

To do this, you use the WAN port of the communication system. This option can be used if the Internet router is located in another network segment and has its own DHCP server.

10.1.1.1 How to Configure Internet Access via an External Internet Router over the LAN Port

The **Internet Configuration** wizard helps you configure the Internet access if the communication system is operated downstream of an additional Internet router. The communication system and the Internet router are in the same LAN segment. You must enter the IP address of the Internet router and the DNS server for this.

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

For OpenScope Business X: The communication system is connected to the customer network via the "LAN" port. The "WAN" interface must not be used for this purpose.

For OpenScope Business S: The Linux server is connected to the customer network via the LAN interface of the network card.

Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > Network / Internet**.
3. Click on **Edit** to start the **Internet Configuration** wizard.
4. Disable the **No Internet Access** check box.
5. Activate the radio button **TCP/IP at LAN Port via an external router** and click on **OK & Next**.

The screenshot shows the 'Setup - Wizards - Basic Installation - Basic Installation' window. The 'Routing Configuration' step is active. Below the wizard progress bar, there are two sections: 'DNS Server' and 'Default Router'. In the 'DNS Server' section, the 'IP Address of primary DNS Server' is set to '192.168.186.22'. In the 'Default Router' section, the 'IP Address of Default Router' is set to '192.168.186.22' and the 'Application Board - IP Address of Default Router' is also set to '192.168.186.22'.

6. Enter the IP address of the local DNS server (e.g., the Internet router) or the Internet DNS server (for Internet telephony, for example) in the **IP Address of DNS Server** field.
7. Enter the IP address of the external Internet router in the **IP Address of Default Router** field.
8. Click on **OK & Next** followed by **Finish**.

10.1.1.2 How to Configure Internet Access via an External Internet Router over the WAN Port

The **Internet Configuration** wizard helps you configure the Internet access if the communication system is operated downstream of

an additional Internet router. The communication system and the Internet router must not be located in the same LAN segment.

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

The communication system must be connected to the LAN segment of the customer network in which the Internet router is located via the "WAN" interface.

You are in the **Configure Internet Access** window.

Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > Network / Internet**.
3. Click on **Edit** to start the **Internet Configuration** wizard.
4. Disable the **No Internet Access** check box.
5. Activate the radio button **TCP/IP at WAN Port via an external router** and click **OK & Next**.

6. If the network-specific data for the WAN interface are to be obtained from an already active DHCP server:
 - a) Select the check box **Automatic Address Configuration (with DHCP)**.
 - b) Select the **Accept IP Address of the Default Router** check box if you want this IP address to be used.
 - c) Select the check box **Accept IP Address of the DNS Server** if required.
 - d) Select the check box **Accept IP Address of the SNTP Server** if required.
7. If a fixed IP address is to be assigned to the WAN interface:
 - a) Clear the check box **Automatic Address Configuration (with DHCP)**.
 - b) Enter the desired **IP address** and **Netmask** of the WAN interface.
8. Enable the **NAT** check box.
9. If you also want to use Internet Telephony, select the item **Upload only** or **Upload and Download** as needed from the **Bandwidth Control for Voice Connections** drop-down list. If the download bandwidth is high and the upload bandwidth is low, bandwidth control should only be activated for the upload

direction to ensure that the download bandwidth reserved for voice transmission is not unnecessarily high.

10. In the **Bandwidth for Downloads** and **Bandwidth for Uploads** fields, enter the bandwidth in Kbps for downloads and uploads, respectively, as provided by your Internet Service Provider.
11. Click on **OK & Next**, followed by **Finish**.

10.1.2 Internet Access via an Internet Modem

The **Internet Configuration** wizard helps you configure your Internet access via an Internet modem. An Internet modem is directly connected for this to the WAN port on your communication system. You can use an ISP that was preconfigured in the communication system or a standard ISP type (consult ISP for type).

To set up Internet access, you have the following options:

- **Setting up Internet Access via a Preconfigured ISP**
You are using an ISP preconfigured in the communication system. You can then select your preconfigured ISP from a list.
- **Setting up Internet Access via the Standard ISP PPPoE**
You are using the standard ISP type **Provider PPPoE**. Obtain the required settings from your ISP.
- **Setting up Internet Access via the Standard ISP PPTP**
You are using the standard ISP type **Provider PPTP**. Obtain the required settings from your ISP.

Connection Clear-down Depending on the Tariff Model

Depending on the tariff model, you can define whether or not the connection to the ISP should be maintained in the event of inactivity.

- With the flat-rate tariff model, the Internet connection does not have to time out on inactivity. Many ISPs require forced timeout every 24 hours. You can enter the time when the connection should time out.
- With the time-based tariff model, the Internet connection should time out on inactivity. You can specify the inactivity timeout for connection clear-down (for instance, 60 seconds). The connection is automatically reestablished the next time an Internet request is made. If VPN is configured, the connection should not be cleared due to inactivity; the flat rate tariff model should hence be selected here.

NOTICE: Network-based programs or services can automatically set up an Internet connection and thereby incur additional connection charges for you if your tariff is time-based.

Bandwidth

Different bandwidths for downloading and uploading are usually provided by the ISP. The bandwidth is specified in Kbps. If Internet

telephony is also used, the bandwidth is shared by voice and data transmission. We therefore recommend reserving sufficient bandwidth to guarantee good voice quality during voice transmission. However, this can lead to data transfer bottlenecks (for example, slower downloads) during periods with a high volume of voice transmissions.

You can choose whether bandwidth control for voice connections should be enabled only for uploading for both uploading and downloading. If the download bandwidth is high and the upload bandwidth is low, bandwidth control should be enabled only for uploading to prevent an unnecessarily high amount of download bandwidth from being reserved for voice transmissions.

NOTICE: About 128 Kbps of bandwidth is reserved for an Internet call.

10.1.2.1 How to Configure Internet Access via a Preconfigured ISP

You can use the **Internet Configuration** wizard to set up your Internet access via a preconfigured Internet Service Provider (ISP) in the communication system.

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Your ISP's Internet access data is available (for example, user account, password, etc.).

Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > Network / Internet**.
3. Click **Edit** to start the **Internet Configuration** wizard.
4. Disable the **No Internet Access** check box.
5. Activate the radio button **DSL at WAN Port directly** and click **OK & Next**.

6. Select your ISP from the **Internet Service Provider Selection** drop-down list.
7. Enter the access data that you received from your ISP in the **Internet Access Data for...** area. The fields in this area are

provider-specific. When entering your data, bear in mind that the input is case-sensitive!

8. Depending on your tariff model, select one of the following two options under **Full-Time Circuit** in the **Router Settings** area:
 - If you have a flat rate tariff model, enable the radio button **On**. In the **Forced Disconnect at (hour:min)** field, enter the time at which the Internet connection is to be deactivated (e.g., 04:59).
 - If you have a time-based tariff model, enable the radio button **Off**. In the **Disconnect automatically after (seconds)** field, enter the duration of inactivity after which the connection is to be dropped (e.g., 60 seconds).
9. Set the following values in the **QoS Parameters** area:
 - a) In the **Bandwidth for Downloads** and **Bandwidth for Uploads** fields, enter the bandwidth in Kbps for downloads and uploads, respectively, as provided by your ISP.
 - b) If you want to use Internet Telephony as well, open the drop-down list **Bandwidth Control for Voice Connections** and select the item **Upload only** or **Upload and Download**, as required. In the field **Bandwidth Used for Voice/Fax (%)**, enter how much bandwidth is to be reserved for voice and fax connections as a percentage value (default value: 80%).
10. Click **OK & Next**. You are taken to the **Configure DynDNS-Account** window.
11. If you want to use a VPN or remote access and do not have a public static IP address, you will need to have already applied for and set up a DynDNS account (at dyndns.org, for example).
 - a) If your desired DynDNS provider is included in the **Domain name** drop-down list, select it from that list (e.g., dyndns.org).
 - b) If your desired DynDNS provider is not included in the **Domain name** drop-down list, select the **User defined Domain** check box. Enter the desired DynDNS provider in the **Domain name** field and enter the update URL of the DynDNS provider in the **Update URL** field. The structure of this URL depends on the DynDNS provider. In addition, customer-specific parameters (shown in *italics* in the example) must be supplemented.

```
http://www.anydns.info/update.php?
user=<username>&password=<pass>&host=<domain>&ip=<ipaddr>
```
 - c) Enter the **User name** and the **Password** of your DynDNS account.
 - d) Enter the host name assigned to you by the DynDNS provider, omitting the domain name, for instance, myhost, in the **Hostname** field. Your complete domain name would then be myhost.dyndns.org, for example.
 - e) Test the DynDNS account with **Connection test**.
 - f) After the test succeeds, click **OK**.
 - g) Click **OK & Next**.
12. If you have a public static IP address or do not want to use a VPN or remote access, click **No DynDNS**.
13. Click **Finish**. The communication system performs a restart.

10.1.2.2 How to Configure Internet Access via a Standard ISP PPPoE

You can use the **Internet Configuration** wizard to set up your Internet access via the standard Internet Service Provider PPPoE.

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

The following ISP-specific Internet access data is available to you:

Field	Description	Value from ISP
IP Parameters (only for a fixed IP address)		
Remote IP Address of the PPP Connection	IP address of your ISP's server.	
Local IP Address of the PPP Connection	IP address that was assigned to you by your ISP for Internet access.	
Authentication (via PAP or CHAP). PAP is seldom used, since the authentication is unencrypted.		
PPP User Name	User name that was assigned to you by your ISP for the PPP connection.	
PAP Authentication Mode	Authentication mode for the PPP connection over PAP: PAP Client , PAP Host or Not used .	
PAP Password	Password assigned to you by the ISP for PAP authentication	
CHAP Authentication Mode	Authentication mode for PPP connection via CHAP: CHAP Client , CHAP Host , CHAP Client and Host or Not used .	
CHAP Password	Password assigned to you by the ISP for CHAP authentication	
QoS Parameters of Interface		
Bandwidth for Downloads	Value of the full download bandwidth in Kbps provided by the ISP.	
Bandwidth for Uploads	Value of the full upload bandwidth in Kbps provided by the ISP.	

Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > Network / Internet**.
3. Click **Edit** to start the **Internet Configuration** wizard.
4. Disable the **No Internet Access** check box.
5. Activate the radio button **DSL at WAN Port directly** and click **OK & Next**.

6. From the **Internet Service Provider Selection** drop-down list, select the standard ISP Type **Provider PPPoE**.
7. The **IP parameters** check box in the **IP Parameters** area should only be enabled if the ISP requires an adjustment of these parameters. In this case, enter the values that you have received from your ISP in the **Remote IP Address of the PPP Connection**, **Local IP Address of the PPP Connection** and **Max. Data Packet Size (bytes)** fields. From the **IP Address Negotiation** drop-down list, select the item **Use configured IP address**.
8. Depending on your tariff model, select one of the following two options under **Full-Time Circuit** in the **Router Settings** area:
 - If you have a flat rate tariff model, enable the radio button **On**. In the **Forced Disconnect at (hour:min)** field, enter the time at which the Internet connection is to be deactivated (e.g., 04:59).
 - If you have a time-based tariff model, enable the radio button **Off**. In the **Disconnect automatically after (seconds)** field, enter the duration of inactivity after which the connection is to be dropped (e.g., 60 seconds).
9. The settings in the **Authentication** area depend on whether or not the ISP requires authentication via PPP.
 - Authentication required by ISP: Make sure that the check box **PPP Authentication** is enabled. Enter the Internet access name of the ISP as the PPP user name. The customary standard is the **CHAP Client** authentication mode.
 - Authentication not required by ISP: Make sure that the check box **PPP Authentication** is disabled.
10. If you want to use NAT, enable the **NAT** check box (enabled by default) in the **Address Translation** area.
11. Set the following values in the **QoS Parameters of Interface** area:
 - a) In the **Bandwidth for Downloads** and **Bandwidth for Uploads** fields, enter the bandwidth in Kbps for downloads and uploads, respectively, as provided by your ISP.
 - b) If you want to use Internet Telephony as well, open the drop-down list **Bandwidth Control for Voice Connections** and select the item **Upload only** or **Upload and Download**, as required. In the field **Bandwidth Used for Voice/Fax (%)**, enter how much bandwidth is to be reserved for voice and fax connections as a percentage value (default value: 80%).
12. Click **OK & Next**. You are taken to the **Configure DynDNS-Account** window.
13. If you want to use a VPN or remote access and do not have a public static IP address, you will need to have already applied for and set up a DynDNS account (at dyndns.org, for example).
 - a) If your desired DynDNS provider is included in the **Domain name** drop-down list, select it from that list (e.g., dyndns.org).
 - b) If your desired DynDNS provider is not included in the **Domain name** drop-down list, select the **User defined Domain** check box. Enter the desired DynDNS provider in the

Domain name field and enter the update URL of the DynDNS provider in the **Update URL** field. The structure of this URL depends on the DynDNS provider. In addition, customer-specific parameters (shown in *italics* in the example) must be supplemented.

```
http://www.anydns.info/update.php?
user=<username>&password=<pass>&host=<domain>&ip=<ipaddr>
```

- c) Enter the **User name** and the **Password** of your DynDNS account.
- d) Enter the host name assigned to you by the DynDNS provider, omitting the domain name, for instance, myhost, in the **Hostname** field. Your complete domain name would then be myhost.dyndns.org, for example.
- e) Test the DynDNS account with **Connection test**.
- f) After the test succeeds, click **OK**.
- g) Click **OK & Next**.
- 14. If you have a static public IP address or do not want to use a VPN or remote access, click **No DynDNS**.
- 15. Click **Finish**.

10.1.2.3 How to Configure Internet Access via a Standard ISP PPTP

You can use the **Internet Configuration** wizard to set up your Internet access via the standard Internet Service Provider PPTP.

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

The following ISP-specific Internet access data is available to you:

Field	Description	Value from ISP
IP Parameters (only for a fixed IP address)		
Remote IP Address of the PPP Connection	IP address of your ISP's server.	
Local IP Address of the PPP Connection	IP address that was assigned to you by your ISP for Internet access.	
PPTP Parameter		
Local IP Address of the Control Connection	IP address that was assigned to you by your ISP for the PPTP connection. The default value is 10.0.0.140.	
Remote IP Address of the Control Connection	IP address of your ISP's server for the PPTP connection. The default value is 10.0.0.138.	
Remote Netmask for the Control Connection	Subnet mask that was assigned to you by your ISP for the PPTP connection. The default value is 255.255.255.248.	

Connection to Service Provider

Field	Description	Value from ISP
Authentication (via PAP or CHAP). PAP is seldom used, since the authentication is unencrypted.		
PPP User Name	User name that was assigned to you by your ISP for the PPP connection.	
PAP Authentication Mode	Authentication mode for the PPP connection over PAP: PAP Client , PAP Host or Not used .	
PAP Password	Password assigned to you by the ISP for PAP authentication	
CHAP Authentication Mode	Authentication mode for PPP connection via CHAP: CHAP Client , CHAP Host , CHAP Client and Host or Not used .	
CHAP Password	Password assigned to you by the ISP for CHAP authentication	
QoS Parameters of Interface		
Bandwidth for Downloads	Value of the full download bandwidth in Kbps provided by the ISP.	
Bandwidth for Uploads	Value of the full upload bandwidth in Kbps provided by the ISP.	

Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > Network / Internet**.
3. Click **Edit** to start the **Internet Configuration** wizard.
4. Disable the **No Internet Access** check box.
5. Activate the radio button **DSL at WAN Port directly** and click **OK & Next**.
6. From the **Internet Service Provider Selection** drop-down list, select the standard ISP Type **Provider PPTP**.
7. The **IP parameters** check box in the **IP Parameters** area should only be enabled if the ISP requires an adjustment of these parameters. In this case, enter the values that you have received from your ISP in the **Remote IP Address of the PPP Connection**, **Local IP Address of the PPP Connection** and **Max. Data Packet Size (bytes)** fields. From the **IP Address Negotiation** drop-down list, select the item **Use configured IP address**.
8. Enter the values that you received from your ISP in the **PPTP Parameter** area.
9. If you have a time-based tariff model, select the **Short Hold** check box. In the **Short Hold Time (sec)** field, enter the duration of inactivity after which the connection is to be dropped (e.g., 60 seconds).

10. The settings in the **Authentication** area depend on whether or not the ISP requires authentication via PPP.
 - Authentication required by ISP: Make sure that the check box **PPP Authentication** is enabled. Enter the Internet access name of the ISP as the PPP user name. Make the PAP and CHAP settings, as assigned to you by your ISP.
 - Authentication not required by ISP: Make sure that the check box **PPP Authentication** is disabled.
11. If you want to use NAT, enable the **NAT** check box (enabled by default) in the **Address Translation** area.
12. Set the following values in the **QoS Parameters of Interface** area:
 - a) In the **Bandwidth for Downloads** and **Bandwidth for Uploads** fields, enter the bandwidth in Kbps for downloads and uploads, respectively, as provided by your ISP.
 - b) If you want to use Internet Telephony as well, open the drop-down list **Bandwidth Control for Voice Connections** and select the item **Upload only** or **Upload and Download**, as required. In the field **Bandwidth Used for Voice/Fax (%)**, enter how much bandwidth is to be reserved for voice and fax connections as a percentage value (default value: 80%).
13. Click **OK & Next**. You are taken to the **Configure DynDNS-Account** window.
14. If you want to use a VPN or remote access and do not have a public static IP address, you will need to have already applied for and set up a DynDNS account (at dyndns.org, for example).
 - a) If your desired DynDNS provider is included in the **Domain name** drop-down list, select it from that list (e.g., dyndns.org).
 - b) If your desired DynDNS provider is not included in the **Domain name** drop-down list, select the **User defined Domain** check box. Enter the desired DynDNS provider in the **Domain name** field and enter the update URL of the DynDNS provider in the **Update URL** field. The structure of this URL depends on the DynDNS provider. In addition, customer-specific parameters (shown in *italics* in the example) must be supplemented.

```
http://www.anydns.info/update.php?
user=<username>&password=<pass>&host=<domain>&ip=<ipaddr>
```
 - c) Enter the **User name** and the **Password** of your DynDNS account.
 - d) Enter the host name assigned to you by the DynDNS provider, omitting the domain name, for instance, myhost, in the **Hostname** field. Your complete domain name would then be myhost.dyndns.org, for example.
 - e) Test the DynDNS account with **Connection test**.
 - f) After the test succeeds, click **OK**.
 - g) Click **OK & Next**.
15. If you have a public static IP address or do not want to use a VPN or remote access, click **No DynDNS**.
16. Click **Finish**. The communication system performs a restart.

10.1.3 WAN port

WANs (**W**ide **A**rea **N**etwork) are used to network different LANs (**L**ocal **A**rea **N**etwork) as well as individual PCs with one another. An Internet modem for access to the Internet can be connected to the WAN port.

The WAN port must not be used for the networking of network nodes and for connecting IP stations or IP clients.

10.1.4 DynDNS

DynDNS (Dynamic Domain Name Service) is an Internet service that assigns a fixed DNS name to an IP address that changes dynamically.

OpenScape Business X makes the DynDNS service available if an Internet modem is connected to the WAN port of OpenScape Business X and the communication system is used as an Internet router. If this is not the case, DynDNS is set up in the external Internet router in the infrastructure of the customer.

DNS Name

With DynDNS, a client who is connected to the Internet with a dynamic IP address can always be addressed with the same name, the DNS name. A DynDNS account with a DynDNS provider (such as www.dyndns.org) is needed for this. If the communication system is assigned a new IP address (for example, by the Internet Service Provider), this IP address is automatically sent to the DynDNS provider and saved in the DynDNS account. The refresh interval is adjustable. If a DNS name is addressed, a request is sent to the DynDNS provider to translate the name into the IP address currently valid. The entire DNS name (also known as the domain name) is composed of a host name of your choice (myhost, for instance) and the selected DynDNS provider (dyndns.org, for instance), producing, in this instance, myhost.dyndns.org. More information on this can, for example, be found at the Internet address:

<http://www.dyndns.org/services/dyndns>

DynDNS also lets you set up a virtual private network (VPN) over an Internet Service Provider that supplies dynamic IP addresses. This enables teleworkers, for example, to access the internal network via the Internet. More Information can be found under [Virtual Private Network \(VPN\)](#) .

Mail Exchanger

The Mail Exchange entry (MX record) in the Domain Name Service (DNS) specifies the IP address to which e-mails should be sent for the domain name configured (myhost.dyndns.org, for instance). The mail server (Mail Exchanger) must be located at the IP address specified. An e-mail address for this domain name could be as follows: mymail@myhost.dyndns.org.

The Backup MX function buffers e-mails that could not be delivered to the Mail Exchanger specified above (because of temporary unavailability, for instance) and delivers them as soon as Mail Exchanger availability is restored.

10.1.4.1 How to Configure the DynDNS Service

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony Server** > **Basic Settings** in the navigation tree.
3. Click on **DynDNS** in the menu tree.
4. Click **Update Timer for DNS Names**.

Setup - Wizards - Network / Internet - Internet Configuration

Routing Configuration

DNS Server

IP Address of primary DNS Server:

Default Router

IP Address of Default Router:

Application Board - IP Address of Default Router:

5. Activate the radio button **Update DNS Names**.
6. This timer value applies only to VPN: in the **Update Timer value for DNS Names** field, enter the time interval (in seconds) after which the VPN component checks whether any DNS names in the VPN configuration are resolved into new IP addresses (VPN with dynamic IP addresses). If this is the case, the VPN will be reconfigured with the new IP addresses.

The default value for this field is 180, which corresponds to an update interval of 3 minutes.

7. In the menu tree, click on **DynDNS Service**.
8. Click the **Edit DynDNS Configuration** tab.

Connection to Service Provider

9. Select the **Activate DynDNS** check box.
10. If your desired DynDNS provider is included in the **Domain name** drop-down list, select it from that list (e.g., dyndns.org).
11. If your desired DynDNS provider is not included in the **Domain name** drop-down list, select the **User defined Domain** check box. Enter the desired DynDNS provider in the **Domain name** field and enter the update URL of the DynDNS provider in the **Update URL** field. The structure of this URL depends on the DynDNS provider. In addition, customer-specific parameters (shown in *italics* in the example) must be supplemented.

`http://www.anydns.info/update.php?`

`user=<username>&password=<pass>&host=<domain>&ip=<ipaddr>`

Example of an update URL with base64-encoded authentication:

`https://<b64><username>:<pass></b64>`

`b64>@members.dyndns.org/nic/update?`

`hostname=<domain>&myip=<ipaddr>&wildcard=NOCHG&mx=NOCHG&backmx=NOCHG`

`<b64>...</b64>` for Base64-encoded parameters

12. Enter the user name for your DynDNS account with the DynDNS provider in the **Login Name** field.
13. Enter the password of your DynDNS account with the DynDNS provider in the **Password** and **Retype Password** fields.
14. Enter the host name assigned to you by the DynDNS provider, omitting the domain name, for instance, myhost, in the **Hostname** field. Your complete domain name would then be myhost.dyndns.org, for example.
15. Only visible for DynDNS providers included in the **Domain name** drop-down list: Activate the radio button **Enable Wildcard** if you want queries to a subordinate domain name such as any.myhost.dyndns.org to also be accepted.
16. Only visible for DynDNS providers included in the **Domain name** drop-down list: Activate the radio button **Use HTTPS for Update** if you want to use a secure connection to the DynDNS provider to update the IP address.
17. Click **Apply**, followed by **OK**.

10.1.4.2 How to Define the Mail Exchanger

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony** > **Basic Settings** in the navigation tree.
3. Click on **DynDNS** in the menu tree.
4. Click on **DynDNS Service**.
5. Click on the **Edit DynDNS Configuration** tab.

6. Enter the IP address of the mail server (Mail Exchange entry or MX record) in the **Mail Exchanger** field.
7. If necessary, activate the **Backup MX** radio button.
8. Click on **Apply**, followed by **OK**.

10.2 CO Access via ITSP

In order to make calls over the Internet, you will need access to an Internet Telephony Service Provider (ITSP, SIP Provider). To do this, an Internet telephony connection and a user account must be applied for from the ITSP.

Connection to the ITSP

The communication system uses the options described in the section on "Internet Access" to reach the ITSP (OpenScape Business X: via LAN or WAN / OpenScape Business S: exclusively via LAN).

The ITSP access based on SIP (Session Initiation Protocol) for signaling and RTP (Realtime Transport Protocol) for voice and data.

Internet Telephony Service Providers do not always offer the same range of SIP features. Consequently, only ITSPs certified for the communication system should be used. A list of certified ITSPs as well as the certification process can be found at the following link:

http://wiki.unify.com/wiki/Collaboration_with_VoIP_Providers

NOTICE: Special numbers and emergency numbers, which are not supported by the ITSP, should be routed over fixed network connections.

In the event of ITSP failure, fixed network connections via least cost routing (LCR) can be used as a fallback solution.

ITSP user account

The ITSP user account (SIP User Account) must be applied for from the ITSP. The ITSP provides a SIP Registrar server at which the communication system must first log in (provider-specific) for this purpose.

NOTICE: A registration is not necessary if static IP authentication or a VPN tunnel is used by the ITSP.

Mobile Extension (MEX)

This feature is offered by some mobile phone operators in connection with the MDA (mobile direct access) service. It enables mobile phones/smartphones to be integrated as internal subscribers in a communication system.

This feature can only be used only with an Internet telephony DID connection. To do this, the MEX number provided by the ITSP must be entered when configuring the ITSP. At the ITSP, the call number of the mobile phone is associated with the MEX number. In addition, the mobile phone or smartphone must be configured in the communication system as a Mobility station (see [Configuring myPortal to go and Mobility Entry](#)).

Short Description:

- The mobile phone operator offers a flat-rate for the mobile phone.
- One Number Service: the mobile phone can be reached under a single fixed network number, which is also communicated to the other party.
- The presence status and connection status of mobile phones are visible exactly as for normal internal subscribers.
- Every phone call from or to the mobile phone is performed exclusively via OpenScape Business in combination with a certified ITSP.
- The mobile phone number of the mobile phone is not known to the outside, i.e., the mobile phone cannot be called directly. It can also not make any direct outbound calls. All calls are conducted through OpenScape Business.
- The mobile phone can be integrated into system-internal teams.
- UC applications such as myPortal for Desktop and myPortal for Outlook can be used in the same way as for internal subscribers.
- myPortal to go is available on the road.

- Embedded mobile phones identify themselves by name when calling an internal subscriber.
- The digit analysis and call routing in the system or network occurs as for any other internal station (e.g., allowed numbers, denied numbers, LCR rules)
- The ITSP uses special call signaling from/to the OpenScape Business, which must be administered accordingly.
- Every integrated mobile phone requires a Mobility User license.
- To use UC applications, a UC Client license is additionally required.

10.2.1 Configuring an ITSP

It is possible to configure predefined and new Internet Telephony Service Providers (ITSPs). You can configure one or several accounts for each ITSP. Up to 8 ITSPs may be active simultaneously.

Additional information on ITSPs and their features can be found here:

http://wiki.unify.com/index.php/Collaboration_with_VoIP_Providers#Overview

NOTICE: Configuration examples can be found on the Internet at the **Unify Experts Wiki** under *OpenScape Business - SIP / ITSP Connectivity - PDF "OSBiz V2 Configuration for ITSP"*.

Assigning the ITSP Phone Numbers

- In the case of an **Internet Telephony Station Connection**, the ITSP provides individual numbers such as 70005555, 70005556, etc. These individual call numbers are then assigned manually as the internal call numbers of the subscribers.
- In the case of an **Internet telephony point-to-point connection**, the ITSP provides a call number range, e.g., (+49) 89 7007-100 to (+49) 89 7007-147. The call numbers from the range are then assigned manually as the internal call numbers of the subscribers.

These two connection types can be combined as appropriate.

Alternatively, the ITSP phone numbers can be entered as the DID call numbers of the subscriber for both connection types during the station configuration.

Internal call number	Name	DID
100	Andreas Richter	897007100
101	Susanne Mueller	897007101
102	Buddy Miller	897007102
104	Juan Martinez	70005555
105	Emilio Carrara	70005556

The ITSP call numbers thus result from the configured PABX number (e.g., country code 49) and the entered DID numbers in long format. This has advantages for the digit analysis and call management, even in an internetwork. The ITSP connection is thus DID-enabled for another node, for example.

A further CO trunk connection via ISDN is only possible to a limited extent in this case.

Multisite Management

The subscribers of the communication system can be assigned to different sites (with different area codes, for example). Each site is assigned a route, and each route is assigned an ITSP registration. A maximum of 8 ITSP registrations can be managed. One registration per ITSP is possible or even multiple registrations at one ITSP. Each ITSP registration can be assigned an area code, and multiple subscribers can then be assigned to it. The connection between the subscribers at the different sites and the communication system occurs via a VPN. All sites must be located within one country and use the same CO access code (see also *Networking OpenScape Business in Hosting Environments*, Scenario 1b).

Using ITSP Templates

The default is to use a preconfigured ITSP template. To do this, the own access data and phone numbers are entered in the template, and this is then activated.

In Expert mode, you can also edit a preconfigured ITSP template and save it as a new template.

Updating ITSP Templates

The preconfigured ITSP templates are automatically updated after a software update of the system if there are new preconfigured ITSP templates in that update or more recent default values for existing preconfigured templates.

If the ITSP of a template is already activated, the update is not done automatically, since important changes could otherwise be overwritten when updating the default values. Consequently, the update can be performed manually in the Expert mode if required. The default values will then need to be customized again to suit individual requirements.

Line Direction Mode

Individual lines of an ITSP trunk can be blocked for outgoing and/or incoming traffic. The following line direction modes are possible:

- outgoing only
- incoming only
- outgoing and incoming (default)

The line direction is evaluated when the communication system must reserve an ITSP line for an incoming or outgoing call.

10.2.1.1 How to Configure a Predefined ITSP

The **Internet Telephony** wizard can be used to configure and activate a predefined Internet Telephony Service Provider (ITSP). You can configure one or several accounts for each ITSP.

Prerequisites

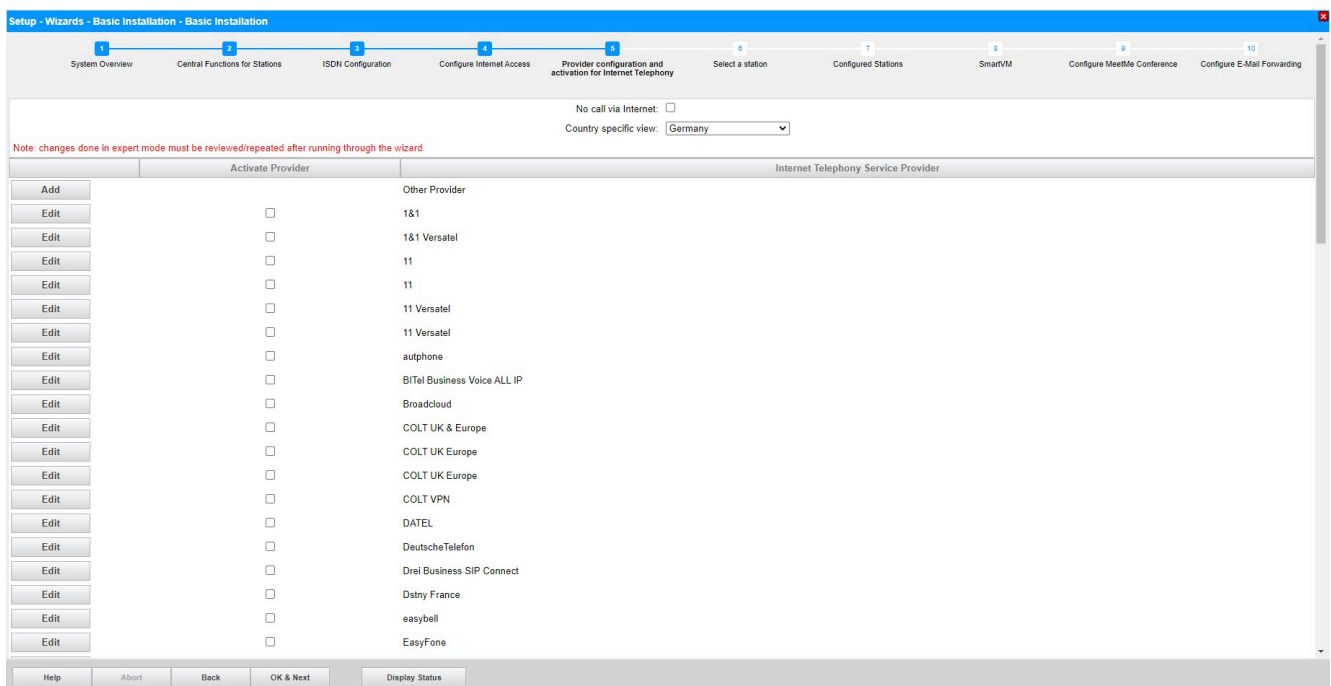

The Internet connection is operational.

Your ITSP's Internet telephony access data is available (for example, user account, password and Internet telephony number).

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click on **Wizards > Central Telephony**.
3. Click **Edit** to start the **Internet Telephony** wizard.
4. Clear the **No call via Internet** check box. A country-specific list of the possible ITSPs is displayed. The list contains the predefined ITSPs for the selected country and any already created ITSPs.

5. If you want to change the preset country, select the desired country from the **Country specific view** drop-down list to display the ITSPs that are available for this country.
6. If required, click **Display Status** to check which ITSPs have already been activated and which Internet telephony subscribers have already been configured under each ITSP. You can activate a maximum of 8 ITSPs. Click **OK** when finished.
7. To configure the predefined ITSP, click **Edit** in the line associated with the desired ITSP.
8. Activate the check box **Enable Provider**.

Connection to Service Provider

9. If the provider supports secure connection, the check box **Secure Trunk** can be activated.
10. The values for "**Provider Registrar**", "**Provider Proxy**", "**Provider Outbound Proxy**" and "**Provider Feature**" (if enabled) are predefined according to the needs of most ITSPs. For some ITSPs customer specific server addresses are used. In such a case the fields which are not greyed out needs to be filled according to the documentation received from the ITSP.
11. If the provider supports Call deflection the section Provider Feature is shown and you can activate the call deflection feature. When Call deflection is activated call forwarding is performed in the provider network, call management in the system is not effective.

Setup - Wizards - Central Telephony - Internet Telephony

Internet Telephony Service Provider

Provider Name: Siptate
Enable Provider: ☒
Secure Trunk: ☐
Domain Name: sipgate.de

Provider Registrar

Use Registrar: ☒
IP Address / Host name: sipgate.de
Port: 5060
Reregistration Interval at Provider (sec): 120

Provider Proxy

IP Address / Host name: sipgate.de
Port: 5060

Provider Outbound Proxy

Use Outbound Proxy: ☐
IP Address / Host name: 0.0.0.0
Port: 0

12. Click **OK & Next**.
13. Click **Add** to configure your ITSP accounts with the corresponding Internet telephony numbers. The fields that will then be displayed are provider-specific.

Setup - Wizards - Central Telephony - Internet Telephony

Internet Telephony Station for Siptate

Internet telephony station: 0186136
Authorization name: administrator@system
Password: ****
Confirm Password: ****

Internet Telephony Phone Numbers

Add	
Delete	75555555

Enter all call numbers supplied by your network provider here.
Assignment of call numbers to telephones takes place in a further configuration step.

14. Enter the credentials for your account in the **Internet Telephony Station** field. You received this data from your ITSP. Depending on the ITSP, different designations are used for this, for example: SIP User, SIP ID, etc.

More details can be found at http://wiki.unify.com/index.php/Collaboration_with_VoIP_Providers

15. Enter the authorization name in the **Authorization name** field. You received this data from your ITSP. If you have not received any authorization name, enter the same data you entered under **Internet Telephony Station**.

NOTICE: If no registration is used, **Authorization name** is grayed out and cannot be configured.

16. Enter the password you received from the ITSP in the **New Password** and **Confirm Password** fields. Depending on the ITSP, different designations are used for this, for example: Password, SIP Password, etc.

NOTICE: If no registration is used, **Password** is grayed out and cannot be configured.

17. Assignment of Internet telephony phone numbers - Option 1:

Use public number (DID): the Internet telephony phone numbers (DID) of your Internet telephony connection are configured in the stations setup (in the **DID** fields). No mapping configuration during the ITSP configuration is necessary.

- a) Select the option field **Use public number (DID)** in the **Call number assignment** area.
- b) Under **Default Number**, enter the phone number to be used for outgoing calls to subscribers who do not have their own phone number.
- c) If your ITSP supports the "Mobile Extension (MEX)" feature, enter the MEX number provided by the ITSP (8 positions, digits only) under **MEX Number**. If your ITSP does not support the "Mobile Extension (MEX)" feature, the **MEX Number** field is not displayed.
- d) If multiple routes need to be configured, activate the check box **ITSP-multiple route**.
- e) Enter the **ITSP route prefixes** assigned to the route and click on **Add**.

18. Assignment of Internet telephony phone numbers - Option 2:

Use internal number (Callno) / Single entries: You have an ITSP which needs SIP registration for each call number (e.g. 70005555, 70005556,...). For each call number an Internet Telephony Station must be created and a single call number

Connection to Service Provider

needs to be assigned. If your ITSP allows multiple call numbers with one registration Option 1 should be used.

- Select the option field **Use internal number (Callno) / Single entries** in the **Call number assignment** area.
- In the **Internet Telephony Phone Numbers** area, enter one of the Internet telephony phone numbers provided by the ITSP in the field next to the **Add** button and then click **Add**.
- To assign further Internet telephony numbers to the account, repeat step b).

19. Assignment of Internet telephony phone numbers - Option 3:

Use internal number (Callno) / Range entry: the use of this option is deprecated, for DID configuration option 1 should be used.

You have an Internet telephony point-to-point connection and have received a call number range as Internet telephony phone numbers (e.g., +49) 89 7007-100 to (+49) 89 7007-147. You then assign the call numbers from the call number range as the internal call numbers of the subscribers.

- Select the option field **Use internal number (Callno) / Range entry** in the **Call number assignment** area.
- Enter the system phone number under **System phone number (prefix)**.
- Enter the desired DID number range for the Internet telephony station in the 'from' and 'to' fields after Direct inward dialing band. The range entered by default is 100 - 147.

20. Click **OK & Next**.

21. If you want to configure additional accounts, repeat steps 13 through 20.
22. Click **OK & Next**. You will see an overview of which Internet telephony phone numbers are assigned to accounts.
23. Assign one internal station number each to every Internet telephony phone number.

This step is not required if you have selected option 1 for the assignment of the Internet telephony phone numbers. In this case, the assignment is made when the configuring the stations (i.e., the telephones and subscribers) in the **DID** field. The screen is also visible in this case but not editable.

Name of Internet Telephony Station	Internet Telephony Phone Number	Internal Call Number	Use as PABX number for outgoing calls
0186136	755555555	659995 Remote-Admin 659994 Licensing	<input type="radio"/>

- a) To do this, select an internal call number in the appropriate line from the **Internal Call Number** drop-down list.
- b) If subscribers without Internet telephony phone numbers or members of a call group are to be allowed to make external calls via the Internet, the radio button **Use as PABX number for outgoing calls** must be activated. The radio button can be activated for only one single Internet telephony phone number.
24. Click **OK & Next**. You will again see an overview of the possible ITSPs here. The enabled ITSPs are identified with a check mark in the **Enable Provider** column. With Display Status you can check the connection status. If you are having connection problems with an already activated ITSP, you can register it again with **Restart ITSP** on this page.
25. Click **OK & Next**.
26. Enter the upload speed of your Internet connection in the **Upstream up to (Kbps)** field. Please do not confuse this with the download speed!

NOTICE: The number of simultaneous Internet calls permitted is displayed in the **Number of Simultaneous Internet calls** field. If the voice quality deteriorates due to the network load, you will need to reduce the number.

For more information about the number of simultaneous Internet calls, please refer to [Limiting the Number of Simultaneous Calls via an ITSP](#) on page 797.

27. Click **OK & Next**.
28. Enter the special numbers you want in the **Dialed digits** column.

Connection to Service Provider

Special phone number	Dialed digits	Dial over Provider
1	@C112	Sipgate ▼
2	@C110	Sipgate ▼
3	@C0137Z	Sipgate ▼
4	@C0138Z	Sipgate ▼
5	@C0900Z	Sipgate ▼

7	@C116Z	Sipgate ▼
8	@C115	Sipgate ▼
9	@C010Z	Sipgate ▼

The following station number entries are valid:

- 0 to 9: allowed digits
- -: Field separator
- X: Any digit from 0 to 9
- N: Any digit from 2 to 9
- Z: One or more digits to follow up to the end of dialing
- C: Simulated dial tone (can be entered up to three times)

29. Use the **Dial over Provider** column to specify whether the special number should be dialed via ISDN or an ITSP. Only the active ITSP is displayed.

NOTICE: Ensure that emergency numbers can always be dialed. If you want to dial emergency numbers via an Internet Telephony Service Provider, you must make sure that the ITSP supports this feature.

30. Click **OK & Next**. The status of your ITSP will be displayed.

31. Click **Next** followed by **Finish**. Following this step, please run the **CO Trunk ISDN / Analog / ITSP** wizard to set the prioritization for the exchange line seizure (for example: Exchange Line Seizure First over ITSP and Next over ISDN).

10.2.1.2 How to Add a New ITSP

The **Internet Telephony** wizard can be used to configure and activate a new Internet Telephony Service Provider (ITSP). You can configure one or several accounts for each ITSP.

Prerequisites

The Internet connection is operational.

You are logged on to the WBM with the **Advanced** profile.

The following ITSP-specific Internet access data is available:

Field	Description	Value from ISP
Gateway Domain Name	Gateway Domain Name of the ITSP Usually identical to the host name (e.g., sip-voice.de)	

Field	Description	Value from ISP
Provider Registrar		
Use Registrar	Predefined by the ITSP and generally always set (not required for ITSPs which use static IP authentication).	
IP address/Host name	Host name or IP address of the Registrar server (e.g., sip-voice.de).	
Port	Port number of the Registrar server (e.g., 5060).	
Reregistration Interval at Provider (sec)	Interval (in seconds) at which ITSP registration is repeated. The value of the interval must not be 0 and must not be set too high because on repeating the registration at the ITSP, a dropped connection can also be detected, and an alternate route (via ISDN or an alternate Provider) may be selected if required. Default value: 120 seconds.	
Provider Proxy		
IP address/Host name	Host name or IP address of the proxy server (e.g., sip-voice.de). This is usually identical with the Provider Registrar entry.	
Port	Port number of the proxy server (e.g., 5060). This is usually identical with the Provider Registrar port number.	
Provider Feature		
Call deflection	Visible only if the selected Base template support Call deflection	
Provider Outbound Proxy		
Use Outbound Proxy	Only set if the ITSP uses an outbound proxy.	
IP address/Host name	Host name or IP address of the outbound proxy	
Port	Port number of the outbound proxy	
Provider Inbound Proxy		
Use Inbound Proxy	Only set if the ITSP uses a second proxy.	

Connection to Service Provider

Field	Description	Value from ISP
IP address/Host name	Host name or IP address of the second proxy	
Port	Port number of the second proxy	
Provider STUN		
Use STUN	Used only if STUN functionality is required. Also enables global STUN mode.	
IP address/Host name	STUN IP address if the ITSP is using a STUN server.	
Port	STUN port number if the ITSP is using a STUN server.	

Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > Central Telephony**.
3. Click **Edit** to start the **Internet Telephony** wizard.
4. Clear the **No call via Internet** check box. A country-specific list of the possible ITSPs is displayed. The list contains the predefined ITSPs for the selected country and any already created ITSPs.
5. If required, click **Display Status** to check which ITSPs have already been activated and which Internet telephony subscribers have already been configured under each ITSP. You can activate a maximum of 8 ITSPs. Click **OK** when finished.
6. Click **Add** to set up a new ITSP. A configuration window for the new ITSP appears.
7. Select a **Base Template** from the drop-down list. This option makes possible to have the same ITSP configured in several routes.
8. Assign a name of your choice for the ITSP in the **Provider Name** field.

NOTICE: The maximum limit of characters is 10.

9. Activate the check box **Enable Provider**.
10. Enter the values provided by your ITSP in the remaining areas (see table immediately after prerequisites).

NOTICE: The values under the "Extended SIP Provider Data" may only be changed by authorized service personnel, in collaboration with Development!

11. Click **OK & Next**.
12. Click **Add** to configure your ITSP accounts with the corresponding Internet telephony numbers. The fields that will then be displayed are provider-specific.

Setup - Wizards - Central Telephony - Internet Telephony

Internet Telephony Station for SIPgate

Internet telephony station:

Authorization name:

Password:

Confirm Password:

Call number assignment

Use public number (DID)

ITSP-multiple route: ☐

Default Number:

Default Number
 ITSP as primary CO access
 Enter one of the call numbers supplied by your network provider here. This will be used in outgoing calls as the calling party number in case no other number is available for the respective call.
 All call numbers supplied by your network provider are to be entered within the trunk and telephones configuration (DID field) primary CO access.

13. Enter the credentials for your account in the **Internet Telephony Station** field. You received this data from your ITSP. Depending on the ITSP, different designations are used for this, for example: SIP User, SIP ID, etc.

More details can be found at http://wiki.unify.com/index.php/Collaboration_with_VoIP_Providers

14. Enter the authorization name in the **Authorization name** field. You received this data from your ITSP. If you have not received any authorization name, enter the same data you entered under **Internet Telephony Station**.

15. Enter the password you received from the ITSP in the **New Password** and **Confirm Password** fields. Depending on the ITSP, different designations are used for this, for example: Password, SIP Password, etc.

16. Assignment of Internet telephony phone numbers - Option 1:

Use public number (DID): the Internet telephony phone numbers (DID) of your Internet telephony connection are configured in the stations setup (in the **DID** fields). No mapping configuration during the ITSP configuration is necessary.

Setup - Wizards - Central Telephony - Internet Telephony

Internet Telephony Station for SIPgate

Internet telephony station:

Authorization name:

Password:

Confirm Password:

Call number assignment

Use public number (DID)

ITSP-multiple route: ☐

Default Number:

Default Number
 ITSP as primary CO access
 Enter one of the call numbers supplied by your network provider here. This will be used in outgoing calls as the calling party number in case no other number is available for the respective call.
 All call numbers supplied by your network provider are to be entered within the trunk and telephones configuration (DID field) primary CO access.

- a) Select the option field **Use public number (DID)** in the **Call number assignment** area.
- b) Under **Default Number**, enter the phone number to be used for outgoing calls to subscribers who do not have their own phone number.

Connection to Service Provider

- c) If your ITSP supports the "Mobile Extension (MEX)" feature, enter the MEX number provided by the ITSP (8 positions, digits only) under **MEX Number**.
- d) Activate the check box **ITSP-multiple route**.
- e) Enter the **ITSP route prefixes** assigned to the route and click on **Add**.

NOTICE: In order to configure multiple routes the above steps have to be repeated. More information can be found in the Unify wiki at: http://wiki.unify.com/index.php/Collaboration_with_VoIP_Providers#General_Configuration_guides

17. Assignment of Internet telephony phone numbers - Option 2:

Use internal number (Callno) / Single entries: You have an ITSP which needs SIP registration for each call number (e.g. 70005555, 70005556,...). For each call number an Internet Telephony Station must be created and a single call number needs to be assigned. If your ITSP allows multiple call numbers with one registration Option 1 should be used.

- a) Select the option field **Use internal number (Callno) / Single entries** in the **Call number assignment** area.
- b) In the **Internet Telephony Phone Numbers** area, enter one of the Internet telephony phone numbers provided by the ITSP in the field next to the **Add** button and then click **Add**.
- c) To assign further Internet telephony numbers to the account, repeat step b).

18. Assignment of Internet telephony phone numbers - Option 3:

Use internal number (Callno) / Range entry: the use of this option is deprecated, for DID configuration option 1 should be used.

You have an Internet telephony point-to-point connection and have received a call number range as Internet telephony phone numbers (e.g., +49) 89 7007-100 to (+49) 89 7007-147. You then assign the call numbers from the call number range as the internal call numbers of the subscribers.

Setup - Wizards - Central Telephony - Internet Telephony

Internet Telephony Station for SIPGate

Internet telephony station:

Authorization name:

Password:

Confirm Password:

Call number assignment

Use internal number (Callno) / Range entry

Internet telephony system phone number

System phone number (Prefix):

Call numbers from up to

Here you may enter the call numbers supplied by your network provider by defining a range of numbers and a prefix, which is common to all numbers.
Assignment of call numbers to telephones takes place in a further configuration step.

- a) Select the option field **Use internal number (Callno) / Range entry** in the **Call number assignment** area.
- b) Enter the system phone number under **System phone number (prefix)**.
- c) Enter the desired DID number range for the Internet telephony station in the 'from' and 'to' fields after Direct inward dialing band. The range entered by default is 100 - 147.

19. Click OK & Next.

20. If you want to configure additional accounts, repeat steps 12 through 19.

21. Click OK & Next. You will see an overview of which Internet telephony phone numbers are assigned to accounts.

22. Assign one internal station number each to every Internet telephony phone number.

This step is not required if you have selected option 1 for the assignment of the Internet telephony phone numbers. In this case, the assignment is made when the configuring the stations (i.e., the telephones and subscribers) in the **DID** field. The screen is also visible in this case but not editable.

Setup - Wizards - Basic Installation - Basic Installation

Call Number Assignment for Sipgate

So that an internal participant or members of a call group can telephone via Internet without an "Internet Telephony Phone Number", the "Internet Telephony Phone Number" must be configured with "Use as PABX number for outgoing calls".

Name of Internet Telephony Station	Internet Telephony Phone Number	Internal Call Number	Use as PABX number for outgoing calls
0186136	755555555	<input type="button" value="v"/> <div> 659995 Remote-Admin 659994 Licensing </div>	<input type="radio"/>

- a) To do this, select an internal call number in the appropriate line from the **Internal Call Number** drop-down list.
- b) If subscribers without Internet telephony phone numbers or members of a call group are to be allowed to make external calls via the Internet, the radio button **Use as PABX number for outgoing calls** must be activated. The radio button can be activated for only one single Internet telephony phone number.

23. Click OK & Next. You will again see an overview of the possible ITSPs here. The enabled ITSPs are identified with a check mark in the **Enable Provider** column. With Display Status you can check the connection status. If you are having connection problems with an already activated ITSP, you can register it again with **Restart ITSP** on this page.

24. Click OK & Next.

- 25.** Enter the upload speed of your Internet connection in the **Upstream up to (Kbps)** field. Please do not confuse this with the download speed!

NOTICE: The number of simultaneous Internet calls permitted is displayed in the **Number of Simultaneous Internet calls** field. If the voice quality deteriorates due to the network load, you will need to reduce the number.

For more information about the number of simultaneous Internet calls, please refer to [Limiting the Number of Simultaneous Calls via an ITSP](#) on page 797.

- 26.** Click **OK & Next**.
- 27.** Enter the special numbers you want in the **Dialed digits** column.

The following station number entries are valid:

- 0 to 9: allowed digits
- -: Field separator
- X: Any digit from 0 to 9
- N: Any digit from 2 to 9
- Z: One or more digits to follow up to the end of dialing
- C: Simulated dial tone (can be entered up to three times)

- 28.** Use the **Dial over Provider** column to specify whether the special number should be dialed via ISDN or an ITSP. Only the active ITSP is displayed.

NOTICE: Ensure that emergency numbers can always be dialed. If you want to dial emergency numbers via an Internet Telephony Service Provider, you must make sure that the ITSP supports this feature.

- 29.** Click **OK & Next**. The status of your ITSP will be displayed.
- 30.** Click **Next** followed by **Finish**. Following this step, please run the **CO Trunk ISDN / Analog / ITSP** wizard to set the prioritization for the exchange line seizure (for example: Exchange Line Seizure First over ITSP and Next over ISDN).

10.2.1.3 How to Configure Multi-Sites over ITSPs

Using the **Multisite Management** wizard, you can define up to 8 sites for the communication system and then assign an ITSP registration and multiple stations to each of them.

Prerequisites

There are as many registrations set up at one or more ITSPs as the number of sites to be configured.

All sites are located within one country.

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click on **Wizards > Central Telephony**.
3. Click on **Edit** to start the **Multisite Management** wizard.
4. Under **Area Code**, enter an area code for each site (incl. a leading zero, e.g., 069 for Frankfurt and 030 for Berlin). Different area codes or even the same area code may be entered.
5. Under **Area**, enter a name for each site a name (e.g., the cities matching the area codes, i.e., *Frankfurt* and *Berlin*, for example, or department designations such as *Service* and *Sales* if the area code is the same).
6. Assign a route to each site in the **Dedicated Route** selection list. For each ITSP registration, one route is automatically reserved (up to 8 are possible).
7. If you want to delete one or more sites, mark the sites in the **Delete** column and click **Save**.
8. Click **OK & Next**.
9. Assign the stations and groups to the sites:
 - a) Mark the desired stations and groups.

NOTICE: You can search for stations and groups by entering a search term in the **Call no**, **DID** or **Name** search fields and then clicking on the magnifying glass icon. You can display all stations and groups by leaving all search fields empty and then clicking on the magnifying glass icon.

The **Type** option can be used to display all station types (e.g., **SIP Clients** or **System Clients**).

The found stations and groups can be optionally marked individually in the **Selection** column or collectively via the **Select all** check box.

- b) Select the desired site under **to Area**.
 - c) Click **Save**.
 - d) Repeat the preceding steps for other sites.
10. If required, you can also assign stations and groups of one site to another site:
 - a) To do this, first select the site from which you want to reassign stations and groups to a different site under **Move selection from area**. All stations and groups of the site are displayed.
 - b) Select the desired stations either individually in the **Selection** column or collectively via the **Select all** check box.
 - c) Select the new site under **to Area**.
 - d) Click **Save**.
 - e) Repeat the preceding steps for other sites.
11. Click **OK & Next**.

10.2.1.4 How to Save a Preconfigured ITSP Template as a New Template

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Telephony > Voice Gateway**.
3. In the menu tree, click on **Internet Telephony Service Provider**.
4. Click on the **Add Internet Telephony Service Provider** tab.
5. Select the desired ITSP template from the **Base Template** list.
6. Enter the desired name for the new ITSP template in the **Provider Name** field.
7. Edit the values of the template to suit your needs. An explanation of the values can be found under [Voice Gateway>Internet TelephonyService Provider](#).
8. Click on **Apply** followed by **OK**.

10.2.1.5 How to Customize a Preconfigured ITSP Template

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Telephony > Voice Gateway**.
3. In the menu tree, click **Internet Telephony Service Provider**.
4. Click on the desired ITSP template in the menu tree.
5. Click on the **Edit Internet Telephony Service Provider** tab.
6. Edit the values of the template to suit your needs. An explanation of the values can be found under [Voice Gateway>Internet TelephonyService Provider](#).

NOTICE: You can reset your edited values to the default values of the template with the **Reset Default Values** button. If the ITSP of the template has already been enabled, all accounts of the ITSP are immediately logged off and re-registered with the default values.

NOTICE: The **Update** button can be used to update the default values in cases where a software update containing more recent default values for this template was performed.

7. Click on **Apply** followed by **OK**.

10.2.1.6 How to Manually Update a Preconfigured ITSP Template

Prerequisites

The ITSP of this template is enabled.

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Telephony > Voice Gateway**.
3. In the menu tree, click **Internet Telephony Service Provider**.
4. Click on the desired ITSP template in the menu tree.
5. Click on the **Edit Internet Telephony Service Provider** tab.
6. Make a note of the template values that you have changed as compared to the default values (for example, using a screenshot).
7. Click on **Refresh**. The default values of the template are updated if a software update of the system was performed and if there are more recent default values for this template in that update.
8. Edit the values of the template again to suit your needs.
An explanation of the values can be found under [Voice Gateway>Internet TelephonyService Provider](#).

NOTICE: You can reset your edited values to the default values of the template with the **Reset Default Values** button. This causes all accounts of the ITSP to be immediately logged off and re-registered with the default values.

9. Click on **Apply** followed by **OK**.

10.2.2 STUN (Simple Traversal of UDP through NAT)

When operating the communication system behind a NAT router, STUN determines its own public IP address/port (which is required for some ITSPs). The functionality is made available on the Internet on STUN servers, whose addresses must be stored in the configuration of the communication system.

The required STUN mode depends on the ITSP infrastructure and the used Internet router. STUN is not required for ITSPs that resolve NAT traversal using infrastructure components in the provider network such as the session border controller.

The following STUN modes can be set at the communication system:

- **Automatic (Default)**

If no ITSP is active, STUN is fully disabled. With an active ITSP, STUN determines the used firewall type (NAT type) at system startup and detects IP address changes during runtime. Depending on the detected NAT type, STUN changes certain parameters in SIP messages (NAT traversal).

NOTICE: Symmetric NAT is not supported.

- **Always**

STUN is always active, for example. Depending on the detected NAT type, some parameters in SIP messages are adapted.

- **Use static IP**

The DSL modem or Internet router uses a static IP address (public IP address), and the ITSP requires a static IP authentication. The static IP address and port that is used by the modem or router must be specified in addition.

- **Port Preserving router**

The public IP address is determined using STUN. The port is entered in SIP messages unchanged.

10.2.2.1 How to Set the STUN Mode

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Telephony > Voice Gateway**.
3. In the menu tree, click **Internet Telephony Service Provider**.
4. Click on the **Edit STUN Configuration** tab.

5. Select the desired STUN mode from the **STUN Mode** drop-down list.
6. If you have selected the STUN mode **Use static IP**, enter the static IP address and the port of the DSL modem or Internet router under **Public IP Address** and **Public SIP Port**, respectively.
7. Click on **Apply**, followed by **OK**.

10.3 CO Access over Digital and Analog Lines

The CO Access over ISDN or analog lines connects the hardware platforms with the public network (PSTN).

Wizards are available to facilitate the configuration of an ISDN outside line or analog outside line.

10.3.1 Trunks

Trunks connect the hardware platforms with the public network (PSTN). Every trunk must be assigned a route through which different properties can be assigned to the trunk.

By default, all trunks are assigned a seizure code and a route. These assignments can be changed by the administrator.

In the case of an ISDN trunk connection, the trunks are also referred to as B-channels.

Trunk code

Using the trunk code, the communication system seizes the specific trunk assigned to that trunk code. The trunk code is also used to program a trunk key or to test a trunk.

MSN Allocation

The service provider assigns one or more MSN (Multiple Subscriber Number) to each ISDN point-to-multipoint (PMP) connection. These can be assigned directly to a line.

System Phone Numbers

System phone numbers include the international prefix, the country code and area code, and the PABX number or one or more MSNs.

ISDN Protocol

The ISDN protocol used depends on the country code. It should only be changed if the PSTN connection explicitly requires some other deviant protocol. Several protocol templates, which can be adapted to individual requirements, are available. The requisite information for this can be obtained from your Service Provider.

B Channel Seizure Mode

Individual B channels of an ISDN trunk can be blocked for outgoing and/or incoming traffic.

The following B channel seizure modes are possible:

- outgoing only
- incoming only
- outgoing and incoming (default)

The B channel seizure mode is only evaluated when the communication system must offer a B-channel. This applies in the following situations:

S ₂ outgoing:	The communication system must offer a B-channel.
S ₂ incoming:	The remote station must offer a B-channel. This B-channel is accepted by the communication system without checking the setting. It is thus of no direct significance.

S_0 outgoing:	Since the communication system does not pre-assign a B-channel (any channel), this setting is of no direct significance.
S_0 incoming:	When the remote station sets up a call without specifying a B-channel, the communication system offers a B-channel, while taking the set B channel seizure mode into account.

Dialing Method for Analog CO Trunks (MSI)

The dialing method is automatically detected by the communication system whenever the line is seized. For special cases, the dialing method can also be set directly to Dual Tone Multifrequency (DTMF) or Dial Pulsing (DP).

10.3.1.1 How to Configure an ISDN Outside Line

Use the **CO Trunk ISDN / Analog / ITSP** wizard to configure the ISDN outside line. Depending on which ports are present for CO trunks in the communication system (ISDN or analog), the wizard goes through different steps.

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

The communication system is connected to an ISDN trunk.

Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > Central Telephony**.
3. Click on **Edit** to start the **CO Trunk ISDN / Analog / ITSP** wizard. The wizard displays an overview of the box(es), slot(s) and S_0 ports.
4. In the **Country Code** field, enter the country code prefix, e.g., 49 for Germany or 1 for the U.S.
5. Enter the local area code, e.g., 89 for Munich, in the **Local area code** field.
6. For point-to-point connections, enter the system phone number of your trunk connection, e.g., 7007 (your connection number) in the **PABX number** field.
7. Change the **International Prefix** field only if required. The applicable values for Germany and the United States are 00 and 011, respectively.

For international calls, the phone number is preceded by the international prefix and the country code, e.g., 00-1 for calls from Germany to the USA and 011-49 for calls from the USA to Germany.

8. Click on **OK & Next**.
9. Select one of the following connection types for the relevant connection (box, slot and S_0 port):

- If you want to configure a point-to-point connection, select the **Point-to-point connection** radio button.
 - If you want to configure a point-to-multipoint connection, select the **Point-to-multipoint connection** radio button.
10. Click on **OK & Next**.
 11. If a point-to-multipoint connection is involved, enter the MSN for the relevant connection (box, slot and S₀ port) and click **OK & Next**.
 12. Leave the setting of the **No call via Internet** check box unchanged and click **Skip**.
 13. Select the preferred trunk (CO) access in the **First over** drop-down list and then click **OK & Next**.
 14. Click on **OK & Next** followed by **Finish**.

10.3.1.2 How to Configure an Analog Outside Line

Use the **CO Trunk ISDN / Analog / ITSP** wizard to configure the analog outside line.

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Your communication system is connected to an analog trunk.

Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > Central Telephony**.
3. Click on **Edit** to start the **CO Trunk ISDN / Analog / ITSP** wizard. The wizard displays an overview of the box(es), slot(s) and analog ports.
4. In the **Country Code** field, enter the country code prefix, e.g., 49 for Germany or 1 for the U.S.
5. Enter the local area code, e.g., 89 for Munich, in the **Local area code** field.
6. For point-to-point connections, enter the system phone number of your trunk connection, e.g., 7007 (your connection number) in the **PABX number** field.
7. Change the **International Prefix** field only if required. The applicable values for Germany and the United States are 00 and 011, respectively.

For international calls, the phone number is preceded by the international prefix and the country code, e.g., 00-1 for calls from Germany to the USA and 011-49 for calls from the USA to Germany.

8. Click on **OK & Next**.
9. Click on **Skip ISDN**.
10. Leave the setting of the **No call via Internet** check box unchanged and click **Skip**.

11. Select the protocol for displaying the phone number (service provider dependent) from the **Protocol** drop-down list:
 - If you want to use Frequency Shift Keying, select **FSK**.
 - If you want to use Dual Tone Multifrequency (DTMF), select **DTMF**.
 - If you do not want to use station number display (calling line ID), select **None**.
12. Click on **OK & Next**.
13. Click on **Edit** to configure the properties of the relevant trunk. If required, edit the values for the **Dialing method**, **CO call identification**, **Flash**, **Line Length** and **Flags** and then click **OK**.
14. Click on **OK & Next**.
15. Click on **Skip** and then, if necessary, on **OK & Next**.
16. Select the preferred trunk (CO) access in the **First over** drop-down list and then click **OK & Next**.
17. Click on **OK & Next** followed by **Finish**.

10.3.1.3 How to Display All Trunks

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Trunks/Routing**.
3. Click on **Trunks/Routing > Trunks** in the menu tree. Depending on the configuration of the communication system, all possible trunks, including the trunk code and route, will be displayed.

10.3.1.4 How to Display Individual Trunks

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Trunks/Routing**.
3. Navigate in the menu tree under **Trunks/Routing > Trunks > ...** to the desired line. The trunk connected to the communication system, including the trunk code and route, will be displayed.
4. Click on **OK**.

10.3.1.5 How to Change the Trunk Code

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Trunks/Routing**.
3. Navigate in the menu tree under **Trunks/Routing > Trunks > ...** to the desired line.
4. Click on the **Change Line** tab.
5. Enter the desired value in the **Code** field.

NOTICE: If no value is entered as the code, this trunk has no trunk code.

6. Click on **Apply** followed by **OK**.

10.3.1.6 How to Assign an MSN to a Trunk

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Trunks / Routing**.
3. Click **Trunks/Routing > MSN assign** in the menu tree.
4. Click on the entry that you want to edit under **MSN assign** in the menu tree.
5. Enter the **MSN**.
6. Select the route that you want to assign from the **Trunk** drop-down list.
7. Click on **Apply** followed by **OK**.

10.3.1.7 ISDN protocol, modify

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Trunks / Routing**.
3. Navigate in the menu tree under **Trunks/Routing > Trunks > ...** to the desired port.
4. Click on the **Change ISDN Flags** tab.

5. Select the desired protocol from the drop-down list in the **Protocol: Description** area.
6. Click on **Apply** followed by **OK**.

10.3.1.8 How to Change the B Channel Seizure Mode

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Trunks / Routing**.
3. Navigate in the menu tree under **Trunks/Routing > Trunks > ...** to the desired port.
4. Click on the **Change B-Channel** tab.
5. Clear the check boxes for each channel in the **outgoing** and **incoming** columns as desired.
6. Click on **Apply** followed by **OK**.

10.3.1.9 How to Change the Dialing Method

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Trunks / Routing**.
3. Navigate in the menu tree under **Trunks/Routing > Trunks > ...** to the desired port.
4. Click on the **Edit MSI Flags** tab.
5. Set the dialing method to Dual Tone Multifrequency (DTMF) or Dial Pulsing (DP).
6. Click on **Apply** followed by **OK**.

10.3.2 Routes

Routes enable trunks (B channels) to be grouped. Separate parameters can be configured for each trunk group (= route).

Each trunk can be assigned to exactly one route. By default, all trunks are assigned to route 1.

For each route, a name and a seizure code can be assigned.

INFO: Seizure codes only work for outgoing trunk seizures if LCR has not been activated.

B Channel Allocation

The allocation of B channels to different trunk groups is also called B-channel allocation. For ISDN trunk connections with multiple B-channels, e.g., S_{2M} ports, it may be useful to allocate B channels to different trunk groups (called B-channel allocation).

For outgoing calls, only B-channels that are included in the trunk group can be selected (e.g., trunk group selected via the seizure code, overflow trunk group or trunk group selected using LCR)

Incoming calls are always accepted, regardless of the trunk group. As a rule, the B-channel offered by the peer is seized. Consequently, the B-channel allocation configured in the system must also be supported on the peer side (system or public network). If this is not the case, the correct allocation of the call to the correct trunk group cannot be guaranteed.

Trunk group key

A subscriber can program a trunk group key on the telephone. One trunk group key is reserved for outbound calls. Calls placed via trunk group keys are subject to COS toll restriction levels and rules.

When a subscriber presses a trunk group key (or dials a seizure code), the communication system seizes an available trunk that is assigned to the appropriate route. The telephone shows the trunk number in the display. If all trunks of the route are seized, the corresponding LED lights up, even in the case of a successful overflow.

Overflow Route with LCR Disabled

For each route, the administrator can also define an overflow route. If all the trunks of a route are busy during a seizure attempt, the search for trunks continues among all trunks in the overflow route. If all the trunks in the overflow route are busy as well, no further overflow occurs.

Overflow Route with LCR Enabled

As part of the LCR configuration, the administrator configures up to 16 entries per route table that are then processed sequentially within the context of an overflow.

Type of Seizure

For an outgoing route seizure, the administrator can specify the criteria to be used by the communication system when searching for an available trunk in the required direction. This is done by defining the type of seizure as follows:

- cyclic:
after the last outbound seized trunk - search begins at the next higher trunk number, as of the last outgoing trunk reserved for that direction. Consequently, all trunks are used with similar frequency.
- linear:

always the first free trunk - search begins at the lowest trunk number assigned to that route.

Entering a PABX Number, Incoming and Outgoing

The administrator can configure the PABX number incoming and the PABX number outgoing separately. Thus, the own number for outgoing calls can be represented differently than is needed for accessibility by incoming calls. The portions for the country code, local area code and the PABX number must each be entered separately in this case. Different entries for the PABX number incoming and outgoing require the availability of the "CLIP no screening" feature at the Central Office. If no PABX number outgoing is configured, the communication system always uses the data of the PABX number incoming.

In the case of an incoming seizure on an ISDN line, the communication system truncates the PABX number portion (left-aligned) from the received phone number in accordance with the incoming phone number type (Type Of Number = TON, see table below Caller ID) and interprets the remaining portion as the Direct Inward Dialing number. For call number information to the PSTN, the communication system automatically inserts the outgoing PABX number portion as the leading portion of the call number in accordance with the configured type of number (TON). In Germany, the PABX number portion must be specified at the trunk connection without the local area code and the intercept code (0).

Station Number Transmission

The station number that is sent to the PSTN and to the receiver can be composed as follows:

Type Of Number (TON), outgoing	Station number transmitted to the PSTN
Unknown TON = Unknown	only DID number (default setting)
PABX number TON = Subscriber	PABX number + DID number
Local area code TON = National	+ Local area code + PABX number + DID number
Country code TON = International	Country code + Local area code + PABX number + DID number

Type Of Number (TON), outgoing	Station number transmitted to the PSTN
Internal TON=Internal	Only for networked system: number prefixes may not be added for closed numbering plans. Call number prefixes are suppressed here.

In addition, you can specify which call number information is to be transmitted from the dialing station to the destination station.

Call number type	Call number transmitted to the PSTN
Internal	In this case, only the internal call number is transmitted. If the destination is an external station, either no number is transmitted or only that of the Attendant Console. The internal call number can be displayed when the destination is an internal station.
Direct inward dialing	In this case, only the DID number is transmitted. The internal call number is not provided for display at internal destinations in other nodes. The call number information is sufficient for external destinations.
Internal / DID	This setting is useful for networking purposes. Both the internal call number and the DID call number are transmitted to the destination station. If an internal station is called within the network, the internal call number of the caller can be displayed for this station. If the internal destination station has activated call forwarding to an external destination, for example, a DID number can also be transmitted in this case.

In addition, the desired handling of the route prefix can be configured:

- Incoming call
The caller's number is supplemented with the seizure code (-> dialable format for callback) or passed through transparently when it is transmitted to the S0 bus. Default: enabled.
- Outgoing call
The display of the dialed phone number on the system telephone occurs with or without the route prefix. Default: enabled.

Second CO Code

A second trunk code (CO code) is defined if the communication system is a subsystem of another communication system or is networked with several other communication systems. It is only relevant for networking routes (route type = PABX). In this case, the second trunk code is the seizure code for the main system. Within a network, the codes for the trunk seizure, the route seizure code(s)

and the second CO code must be configured uniformly. The default in Germany is 0.

10.3.2.1 How to Change a Route Assignment

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Trunks/Routing**.
3. Navigate in the menu tree under **Trunks/Routing > Trunks > ...** to the desired line.
4. Click on the **Change Line** tab.
5. Select the route that you want to assign to the trunk from the **Routes** drop-down list.
6. Click on **Apply** followed by **OK**.

10.3.2.2 How to Change the Route Name

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Trunks/Routing**.
3. Click **Trunks/Routing > Route** in the menu tree.
4. Click on the entry that you want to edit under **Route** in the menu tree.
5. Enter the desired value in the **Route Name** field.
6. Click on **Apply** followed by **OK**.

10.3.2.3 How to Change the Seizure Code

Prerequisites

You are logged into the WBM with the **Expert** profile.

NOTICE: Seizure codes only work if LCR has not been activated.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Trunks/Routing**.

3. Click **Trunks/Routing > Route** in the menu tree.
4. Click on the entry that you want to edit under **Route** in the menu tree.
5. Enter the desired value in the **Seizure code** field.
6. Click on **Apply** followed by **OK**.

10.3.2.4 How to Configure an Overflow Route with LCR Disabled

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Trunks / Routing**.
3. Click **Trunks / Routing > Route** in the menu tree.
4. Click on the entry that you want to edit under **Route** in the menu tree.
5. Select the desired item from the **Overflow route** drop-down list.
6. Click on **Apply** followed by **OK**.

10.3.2.5 How to Configure an Overflow Route with LCR Enabled

When LCR is enabled, overflow treatment is performed by processing the individual entries of an LCR table successively in the context of the LCR configuration (see [LCR \(Least Cost Routing\)](#)).

10.3.2.6 How to Configure the Type of Seizure

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Trunks/Routing**.
3. Click **Trunks/Routing > Route** in the menu tree.
4. Click on the route that you want to edit under **Route** in the menu tree.
5. Click on the **Change Routing Parameters** tab.
6. In the **Type of seizure** drop-down list, select either **cyclic** or **linear**.
7. Click on **Apply** followed by **OK**.

10.3.2.7 How to Enter the PABX Number Incoming and Outgoing

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Trunks / Routing**.
3. Click **Trunks / Routing > Route** in the menu tree.
4. Click on the entry that you want to edit under **Route** in the menu tree.
5. In the **PABX number incoming** area, enter the appropriate values without leading zeros in the fields **Country Code**, **Local area code** and **PABX number**.
6. In the **PABX number Outgoing** area, enter the appropriate values without leading zeros in the fields **Country Code**, **Local area code** and **PABX number**.
7. Select one of the following options:
 - If you want to suppress the station number, enable the **Suppress station number** check box.
 - If you do not want to suppress the station number, leave the **Suppress station number** disabled.
8. Click on **Apply** followed by **OK**.

10.3.2.8 How to Configure the Format of the Transmitted Call Number

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Trunks/Routing**.
3. Click **Trunks/Routing > Route** in the menu tree.
4. Click on the route that you want to edit under **Route** in the menu tree.
5. Click on the **Change Routing Parameters** tab.
6. Select the desired format of the transmitted call number from the **No. and type, outgoing** drop-down list.
7. Click on **Apply** followed by **OK**.

10.3.2.9 How to Configure the Type of the Transmitted Call Number

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Trunks/Routing**.
3. Click **Trunks/Routing > Route** in the menu tree.
4. Click on the route that you want to edit under **Route** in the menu tree.
5. Click on the **Change Routing Parameters** tab.
6. In the **Call number type** drop-down list, select the item **Internal, Direct inward dialing** or **Internal/DID**.
7. Click on **Apply** followed by **OK**.

10.3.2.10 How to Configure the Direction Prefix

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Trunks/Routing**.
3. Click **Trunks/Routing > Route** in the menu tree.
4. Click on the route that you want to edit under **Route** in the menu tree.
5. Click on the **Change Routing Parameters** tab.
6. Select one of the following options:
 - If you want the seizure code to be added to the Calling Line ID for inbound calls, select the check box **Add direction prefix incoming** in the **Routing flags** area.
 - If you do not want the seizure code to be added to the Calling Line ID for inbound calls, clear the check box **Add direction prefix incoming** in the **Routing flags** area.
 - If you want the seizure code to be added to the Calling Line ID for outbound calls, select the check box **Add direction prefix outgoing** in the **Routing flags** area.
 - If you do not want the seizure code to be added to the Calling Line ID for outbound calls, clear the check box **Add direction prefix outgoing** in the **Routing flags** area.
7. Click on **Apply** followed by **OK**.

10.3.2.11 How to Define a Route for Networking and Enter a Second CO Code

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.

2. In the navigation tree, click **Telephony > Trunks/Routing**.
3. Click **Trunks/Routing > Route** in the menu tree.
4. Click on the entry that you want to edit under **Route** in the menu tree.
5. Enter the desired value in the field **CO code (2nd trunk code)**.
6. Click on the **Change Routing Parameters** tab.
7. Select the item **PABX** in the **Route type** drop-down list.
8. Click on **Apply** followed by **OK**.

10.3.3 Dial Tone Monitoring

When setting up a connection over an analog trunk line, the dialed digits can be sent to the Central Office only when a dial tone (audible signal) has been detected. Since the time until the arrival of the dial tone varies depending on the network provider and network state, the arrival of the dial tone can be monitored.

The dial tone monitoring time and the digit dialing time are configured using Manager E.

Delay Period for Dial Tone Monitoring

The monitoring of the dial tone can be done immediately or only after a pause. In some cases, additional tones may need to be played back to the subscriber after the line is seized, for example, to inform him or her that call forwarding has been enabled at the Central office. For such cases, a delay period for the dial tone monitoring (Analog trunk seizure, 1-9 seconds) can be programmed. The dialed digits will then be sent to the CO only after this pause.

NOTICE: Notes for Brazil:

If the DTMF dialing method is used from analog phone devices in conjunction with analog trunks (TLAx and TML8W) and pulse dialing after the dial tone monitoring, problems may arise with toll restriction when the country code is set to Brazil. In this case, the DTMF signals from the analog devices go directly to the analog trunk lines. All DTMF signals that were dialed before receiving the dial tone are lost. Consequently, for such cases, least cost routing (LCR) must be enabled for the dialing method and toll restriction to operate properly at the device.

Dial tone monitoring time

This parameter indicates how long the system will wait for the dial tone and is configurable. If no dial tone is detected during the configured dial tone monitoring time, the line is taken out of service. The system checks at cyclical intervals whether the dial tone is once again present. If this is the case, the line in question is put back into operation.

Digit dialing time

This parameter defines how many seconds after detection of the dial tone the first dialed digit is to be sent to the Central Office (default setting: 0 s).

Analysis of the Second Dial Tone

The communication system can recognize an additional dial tone (2nd dial tone). This is relevant for public network providers who transmit at a second dial tone for international calls, e.g., for Belgium after 00 and for France after 16 or 19. For Germany, this feature is not relevant.

10.3.3.1 How to Configure a Delay Period for Dial Tone Monitoring

Prerequisites

An analog port with the analog outside line is available.

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Trunks/Routing**.
3. Click **Trunks/Routing > Route** in the menu tree.
4. Click on the analog route that you want to edit under **Route** in the menu tree.
5. Click on the **Change Routing Parameters** tab.
6. If the dial tone monitoring is to take place immediately, enable the radio button **no pause** in the **Analog trunk seizure** area.
7. If the dial tone monitoring is to take place only after a delay period, select the delay period in seconds in the **Analog trunk seizure** area.
8. Click on **Apply** followed by **OK**.

10.3.3.2 How to Configure the Dial Tone Monitoring Time

Prerequisites

An analog trunk board is plugged in.

Step by Step

1. Log into Manager E at the admin PC.
2. Click on **File | Transmit** in the menu bar.
3. Select the **Communication** tab.
4. In the **Access** area, enable the appropriate radio button, depending on the type of connection from the admin PC to the communication system.
5. Enable the radio button **Read/write CDB** and click on **System - > PC**.

6. Click on **OK**. The CDB will be transferred from the communication system to Manager E.
7. After the successful transfer, click **OK** and then on **Close**.
8. Click in Manager E in the menu tree of the system view on **Settings > System Parameters > Time Parameters**.
9. In the list below **Dial tone monitoring time**, set the maximum time to wait for a dial tone under **Base** and **Factor** (default = base 1s, Factor = 10).
10. Click on **Apply**.
11. Click on **File | Transmit** in the menu bar.
12. Select the **Communication** tab.
13. Click on **PC > System** followed by **OK**. The settings are transferred to the communication system.
14. Then click **OK** and **Close**.

10.3.3.3 How to Configure the Digit Dial Time

Prerequisites

An analog trunk board is plugged in.

Step by Step

1. Log into Manager E at the admin PC.
2. Click on **File | Transmit** in the menu bar.
3. Select the **Communication** tab.
4. In the **Access** area, enable the appropriate radio button, depending on the type of connection from the admin PC to the communication system.
5. Enable the radio button **Read/write CDB** and click on **System - > PC**.
6. Click on **OK**. The CDB will be transferred from the communication system to Manager E.
7. After the successful transfer, click **OK** and then on **Close**.
8. Click in Manager E in the menu tree of the system view on **Settings > System Parameters > Time Parameters**.
9. In the list below **Time between HT analysis and dialing of trunk main station interface**, set the time under **Base** and **Factor** to specify how many seconds after the detection of the dial tone, the first dialed digit is to be sent to the Central Office (default: Base = 10 ms, Factor = 0).
10. Click on **Apply**.
11. Click on **File | Transmit** in the menu bar.
12. Select the **Communication** tab.
13. Click on **PC > System** followed by **OK**. The settings are transferred to the communication system.
14. Then click **OK** and **Close**.

10.3.3.4 How to Enable or Disable the Analysis of the Second Dial Tone

Prerequisites

An analog port with the analog outside line is available.

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Trunks/Routing**.
3. Click **Trunks/Routing > Route** in the menu tree.
4. Click on the analog route that you want to edit under **Route** in the menu tree.
5. Click on the **Change Routing Parameters** tab.
6. If you want to enable the analysis of the second dial tone, select the **Analysis of second dial tone** check box in the **Routing flags** area.
7. If you want to disable the analysis of the second dial tone, clear the **Analysis of second dial tone** check box in the **Routing flags** area.
8. Click on **Apply** followed by **OK**.

10.4 Prioritizing the Exchange Line Seizure with LCR Enabled

The prioritization for exchange line seizure defines in what order different network providers (ISDN/analog or ITSPs) are selected.

The exchange line seizure normally occurs by dialing the prefix "0". Within this code, different providers are prioritized (depending on what is preset). For example, an outbound call may be first routed via an ITSP and, if the exchange line seizure fails, be then sent via ISDN.

10.4.1 How to Prioritize the Seizure of Exchange Lines

The **CO Trunk ISDN / Analog / ITSP** wizard can be used to configure the order in which exchanges lines are seized over ISDN/ analog providers and ITSPs.

Prerequisites

You are logged on to the WBM with the **Advanced** profile. Different ITSPs have been set up.

Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > Central Telephony**.
3. Click on **Edit** to start the **CO Trunk ISDN / Analog / ITSP** wizard. The wizard displays an overview of the box(es), slot(s) and analog ports.

4. Click on **OK & Next**.
5. Continue clicking on **OK & Next** as often as needed until you reach the **Prioritization for Exchange Line Seizure** window.
6. In the **Try to get 'Outside line Seizure'** area, select the preferred network provider over which the communication system should first try to obtain a free CO trunk (i.e., an exchange line) from the **First over** drop-down list.
7. Then select a second network provider over which the next attempt to seize an exchange line should be made from the **Next over** drop-down list.
8. Finally, select a third network provider over which an attempt to seize an exchange line should be made from the following **Next over** drop-down list.
9. Click on **OK & Next** followed by **Finish**.

11 Stations

A subscriber or station is a communication partner connected to the communication system. In general, every station (apart from virtual stations) is assigned a terminal. A terminal is, for example, a telephone, a PC or fax device. The stations may also be users of the UC Clients.

The following types of stations exist:

- IP stations (also known as IP clients)
- SIP stations (a subset of IP stations)
- UP0 stations
- DECT stations
- ISDN stations
- Analog stations
- Mobility stations (mobile stations, see [Mobility](#))
- Virtual stations

The data of subscribers (name, station number, DID number, e-mail address, etc.) can be imported as an XML file during the initial installation (see [Individual Dial Plan](#)). In addition, the subscriber data can also be exported to an XML file (see [Exporting Subscriber Data](#)).

Licensing Procedure for Stations

All stations are subject to licensing. To begin with, stations can be set up during the initial installation or later by using the Station wizards. After a successful setup, the subscribers can make internal calls. In the next step, the station licenses must be activated and assigned to the stations. Once the licenses have been assigned successfully, the subscribers can also make external calls.

Related concepts

[Licensing](#) on page 275

[Mobility](#) on page 920

11.1 Dial Plan

A dial plan, which is also called a numbering plan, is a list of all phone numbers and codes available in the communication system. It includes, among other things, the internal call numbers, DID numbers and group call numbers. In the communication system, the call numbers and codes are preset with default values. However, these values can be adapted to suit individual requirements as needed.

When setting up call numbers or codes, error messages may be produced if the desired number is already being used. The dial plan can be used to check which call numbers can still be assigned.

11.1.1 Default Dial Plan

The default dial plan includes all call numbers and codes that are predefined in the communication system with default values.

These default values can be edited as necessary. Some numbers can be also deleted completely so that they no longer appear in a dial plan overview.

Default dial plan for the hardware platforms and the softswitch:

Type of call numbers	X1	X3/X5/ X8/S	Action
Internal station numbers	11-30	100-742	deletable
User direct inward dialing numbers	11 -30	100-742	deletable
Group call numbers 1-90	31-40	350-439	deletable
Group call numbers 91-800	-	not preset	
Trunk station number	700-703	from 7801 onward	deletable
Seizure codes (external codes):	0 = World / 9 = USA	0 = World / 9 = USA	only editable
Trk. Grp 1 (trunk: ISDN, analog)	-	851	
Rte. 8 (UC Suite)	not preset	855-858	
Trk. Grp 12-15 (trunk: ITSP)	not preset	859	
Rte. 16 (Networking)			
Attendant code (Intercept position), Internal	9 = World 0 = USA	9 = World 0 = USA	only editable
Attendant code (Intercept position), Direct inward dialing	0 = ROW - = USA	0 = ROW - = USA	only editable
Station numbers for online users	not preset	749	only editable
Call number for remote access	not preset	not preset	only editable
Call number for voicemail	351	351	only editable
UC Smart	-	not preset	only editable
UC Suite			
Conference call numbers	-	not preset	only editable
Call number for parking	-	not preset	only editable

Type of call numbers	X1	X3/X5/ X8/S	Action
AutoAttendant numbers	-	not preset	only editable
Station number for Attendant Console	9 = World 0 = USA	9 = World 0 = USA	only editable
Substitution for "#" (for service codes)	75	75	deletable
Substitution for "#" (for service codes)	76	76	deletable
Service codes			only editable

11.1.2 Individual Dial Plan

The communication system allows you to set up an individual dial plan by editing the default values of the call numbers and codes. A reload of the communication system resets the values to the defaults.

The following actions are useful for this purpose:

- Delete defaults: apart from some exceptions (special default numbers), default call numbers can be deleted. These call numbers are identified as "deletable" in the "Action" column of the default dial plan table.
- Edit special defaults: these call numbers must not be deleted. However, their values may be edited. These call numbers are identified as "only editable" in the "Action" column of the default dial plan table.
- Import call numbers and station data: station data can be imported via an XML file during the initial installation. The call numbers and DID numbers of the stations are imported as well. This is usually performed during the initial installation.

Importing Station Data via an XML File

An individual dial plan can be imported into the communication system via an XML file in UTF-8 format during the initial installation.

The OpenScape Business Assistant administration program makes the file `csv-templates.zip` available under **Service Center > Documents > CSV Templates**. This zip file contains, among other things, the following files, including descriptions:

- `portdata_xml_import_empty.xml`

This template contains registers without sample records. New records can be entered using Microsoft Excel, for example.

- `portdata_xml_import_example.xml`

This template contains registers with sample records. These records can be edited using Microsoft Excel, for example. Data records that are no longer needed should be deleted.

- portdata_xml_import_syntax.txt

Descriptions in German and English on how to create records correctly.

11.1.2.1 How to Delete or Edit Default Phone Numbers

You can delete some of the default call numbers and then redefine them via the wizards. For special default call numbers, you can edit and change the default values.

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. Click on **Edit** to start the **Basic Installation** wizard.
3. Click on **Next**.

NOTICE: You can have an overview of all configured station numbers displayed by enabling the radio button **Display station configuration** and then clicking **Execute function**.

4. Enable the radio button **Delete All station call numbers**.
5. Enable the check box **Delete all station call numbers** in the confirmation prompt.
6. Click on **Execute function**.

Setup - Wizards - Basic Installation - Basic Installation

Change preconfigured call and functional numbers

- The Internet Telephony numbers must be available; it is not possible to delete these numbers.
- Please keep in mind, that these numbers are not available for station or group dialing use.
- Automatic changes may be applied. Please check LCR dial plan and correct if necessary.

Preconfiguration for Internet Telephony	<input type="text"/>	<input type="text"/>	<input type="text"/>
Announcement Player	<input type="text"/>	<input type="text"/>	<input type="text"/>
Voicemail call number (Smart VM)	<input type="text"/>		
Autoattendant call number (Smart VM)	<input type="text"/>		
Attendant code	<input type="text"/>		
Remote Admin call number	<input type="text"/>		
Licensing call number	<input type="text"/>		
Functional numbers for Conferencing	<input type="text"/>	<input type="text"/>	<input type="text"/>
Functional number for MeetMe Conferencing	<input type="text"/>		

7. Edit the default values in the fields of the special default call numbers if required.
8. Click on **OK**. The call numbers are deleted, and any other changes made to the special default call numbers are applied.
9. Click on **Abort** to end the **Basic Installation** wizard.

11.1.2.2 How to Edit Special Default Call Numbers

You can change the predefined call numbers for special functions.

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. Click on **Edit** to start the **Basic Installation** wizard.
3. Click on **Next**.

NOTICE: You can have an overview of all configured station numbers displayed by enabling the radio button **Display station configuration** and then clicking **Execute function**.

4. Enable the radio button **Change pre-configured call and functional numbers**.
5. Click on **Execute function**.

Setup - Wizards - Basic Installation - Basic Installation

Change preconfigured call and functional numbers

- The Internet Telephony numbers must be available; it is not possible to delete these numbers.
- Please keep in mind, that these numbers are not available for station or group dialing use.
- Automatic changes may be applied. Please check LCR dial plan and correct if necessary.

Preconfiguration for Internet Telephony	<input type="text"/>	<input type="text"/>	<input type="text"/>
Announcement Player	<input type="text" value="659999"/>	<input type="text"/>	<input type="text"/>
Voicemail call number (Smart VM)	<input type="text"/>	<input type="text"/>	<input type="text"/>
Autoattendant call number (Smart VM)	<input type="text"/>	<input type="text"/>	<input type="text"/>
Attendant code	<input type="text"/>	<input type="text"/>	<input type="text"/>
Remote Admin call number	<input type="text" value="659995"/>	<input type="text"/>	<input type="text"/>
Licensing call number	<input type="text" value="659994"/>	<input type="text"/>	<input type="text"/>

Functional number for MeetMe Conferencing	<input type="text" value="-"/>	<input type="text"/>	<input type="text"/>

6. Enter the desired call numbers and codes in the fields and click **OK**. The new call numbers and codes are saved.

NOTICE: Note that the call numbers configured here cannot be assigned as station numbers, DID numbers or group call numbers.

7. Click on **Cancel** to end the **Basic Installation** wizard.

11.1.2.3 How to Import Call Numbers and Station Data

You can import predefined station data via an XML file you created earlier.

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

An XML file with the entered data is available in UTF-8 format. An XML template can be found under **Service Center > Documents > CSV Templates**.

Step by Step

1. In the navigation bar, click on **Setup**.
2. Click on **Edit** to start the **Basic Installation** wizard.
3. Click **Next**.

NOTICE: You can have an overview of all configured station numbers displayed by enabling the radio button **Display station configuration** and then clicking **Execute function**.

4. Enable the radio button **Import XML file with station data**.
5. Click on **Execute function**.
6. Use **Browse** to select the created XML file and click **Open**.
7. Click **OK** when finished. The station data is imported.
8. Click **Cancel** to end the **Basic Installation** wizard.

11.2 LAN Telephony Requirements

The term LAN telephony refers to the communication between IP stations in an internal network (LAN). To ensure the quality of the voice transmission in LAN telephony, the IP networks being used and the communication system must meet certain requirements. The voice quality and voice communication reliability always depend on the network technology in use.

To guarantee loss-free transmission and good voice quality, voice signals are digitized using audio codecs and marked using special procedures (Quality of Service) so that voice transmission has priority over data.

Requirements

- LAN with at least 100 Mbps and full duplex
- Every component in the IP network must be connected to a separate port on a switch or to a router; a hub should not be used.
- Not more than 50 msec delay in one direction (One Way Delay); not more than 150 msec total delay
- Max. 3% packet loss; if a fax/modem via G.711 is used, the packet loss must not exceed 0.05%.
- Not more than 20 msec jitter
- Support for Quality of Service (QoS): IEEE 802.p, DiffServ (RFC 2474) or ToS (RFC 791)
- Maximum 40% network load

11.2.1 Audio Codecs

An audio codec is a program that encodes and decodes voice in digital data packets (IP packets). The data compression rate can vary depending on the audio codec used. The bandwidth requirement for transferring an IP packet is lower if the packet is compressed. The decoding of data packets can, however, have a negative impact on voice quality and the playback continuity.

The recipient and sender must use the same codec to ensure that the data can be correctly decoded back into voice after transport.

Supported Audio Codecs

The following audio codecs are supported:

- G.729A, G.729AB: voice encoding at 8 Kbps - good voice quality.
- G.711 (A-law and μ -law): voice encoding at 56 or 64 Kbps - very high voice quality. G.711 is also used in fixed networks (ISDN).

The audio codecs can be assigned priorities between 1 (high) and 4 (low). The communication automatically tries to use the audio codec with the highest priority available for every connection. Using an audio codec with low voice compression (good voice quality) increases network load. In the case of intensive IP telephony, this can lead to diminished voice quality in a network already overloaded by data transfers.

The communication system can enable voice activity detection (VAD) for certain codecs. This can reduce network load during long voice pauses.

You can specify a frame size (IP packet size) of 10 to 90 msec for every codec. This specifies the sampling rate at which the audio codec splits the voice signal into IP packets. While a higher value (90 msec, for instance) results in a better relationship between payload and the IP packet overhead, it also increases the transfer delay.

It is possible to disable the resource-hungry G.729 codecs and to only use the G.711 codecs. This optimizes the number of possible simultaneous calls. If this function is enabled, the system must be restarted.

In OSBiz X systems, there is no end-to-end payload between Circuit and HFA users. Payload ends in the system, so the users talk with a codec, which is supported by the system. For example, HFA phone has firstly set G.722 codec and Circuit user supports G.722. The system does not support G.722 codec and G.711 codec has been set as its first option. In this case, the two users will talk with G.711 codec. Regarding OSBiz S systems, the users talk with G.722 codec, while there is end-to-end payload.

11.2.1.1 How to Configure Audio Codec Parameters

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony Server > Voice Gateway**.
3. In the menu tree, click **Codec Parameters**.

Codec	Priority	Voice Activity Detection	Frame Size
G.711 A-law	Priority 1	VAD: <input type="checkbox"/>	20 msec
G.711 µ-law	Priority 2	VAD: <input type="checkbox"/>	20 msec
G.729A	Priority 4	VAD: <input type="checkbox"/>	20 msec
G.729AB	Priority 3	VAD: <input checked="" type="checkbox"/>	20 msec

Enhanced DSP Channels

Use G.711 only ☐

T.38 Fax

T.38 Fax: ☒

Use FIMBIRemoval: ☒

Max. UDP Datagram Size for T.38 Fax (bytes): 1472

Error Correction Used for T.38 Fax (UDP): 138UDPRedundancy

T.30 Fax

Enable ECM: ☒

Misc

ClearChannel: ☒ Frame Size: 20 msec

RFC2833

Transmission of Fax/Modem Tones according to RFC2833: ☐

Transmission of DTMF Tones according to RFC2833: ☒

Payload Type for RFC2833: 98

Redundant Transmission of RFC2833 Tones according to RFC2198: ☐

4. Assign priority 1 (high) through 4 (low) to the required audio codecs via the **Priority** drop-down list.
5. Activate or deactivate the radio button **Voice Activity Detection (VAD)** for the desired audio codecs.
6. Use the **Frame Size** field for the desired audio codecs to define the frame size into which the audio codec splits the IP voice packets.

NOTICE: You must enter the same value for all codecs, e.g. 20 msec. It is not supported to configure different values for each codec.

7. If you want to use only the two G.711 audio codecs, select the **Use G.711 only** check box in the **Enhanced DSP Channels** area.
8. Click on **Apply**, followed by **OK**.

11.2.1.2 How to Assign Audio Codec Parameters to a Destination

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony Server > Voice Gateway**.
3. In the menu tree, click **Destination Codec Parameters**.

4. Assign priority 1 (high) through 4 (low) to the required audio codecs via the **Priority** drop-down list.
5. Under **IP address**, enter the IP address of the destination to which the previously set priorities of the audio codec are to be assigned (for example, 192.168.1.10).
6. Click on **Apply** followed by **OK**.

11.2.2 Transmission of Tones According to RFC 2833

The transmission of DTMF tones and fax/modem tones according to RFC 2833 can be enabled or disabled.

11.2.2.1 How to Enable or Disable Transmission of Fax/Modem Tones According to RFC2833

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Voice Gateway**.
3. In the menu tree, click **Codec Parameters**.

4. Select one of the following options:
 - If you want to enable the function, select the **Transmission of Fax/Modem Tones according to RFC2833** check box.

- If you want to disable the function, clear the **Transmission of Fax/Modem Tones according to RFC2833** check box.
5. Click on **Apply** followed by **OK**.

11.2.2.2 How to Enable or Disable Transmission of DTMF Tones According to RFC2833

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Voice Gateway**.
3. In the menu tree, click **Codec Parameters**.

4. Select one of the following options:
 - If you want to enable the function, select the **Transmission of DTMF Tones according to RFC2833** check box.
 - If you want to disable the function, clear the **Transmission of DTMF Tones according to RFC2833** check box.
5. Click on **Apply** followed by **OK**.

11.2.3 Quality of Service

Quality of Service (QoS) encompasses various procedures for guaranteeing the highest possible quality and integrity during the transmission of data packets (IP packets). For good voice quality during voice transmission, QoS is used in the IP network to give IP voice packets priority over IP data packets from other applications.

The IP packets are assigned a special marker (code point) for prioritization. Categorization in different classes is performed based on priority information. If the components available in the IP network (communication system, SIP stations, and Internet routers, for

instance) support QoS, you can assign different bandwidth to these classes and thus transport the IP voice packets first.

Priority Classes According to DiffServ

For DiffServ-based prioritization, different code points are defined for the Type of Service (ToS) field so that IP-packet transmission can be split into different classes.

- Expedited Forwarding (EF) Code point: guarantees constant bandwidth. The bandwidth is always the same for IP packets marked with this code point. Once the set value is reached, all IP packets that exceed this bandwidth are dropped.
- Assured Forwarding (AF) Code point: guarantees minimum bandwidth. IP packets that are marked with this code point have a lower priority than EF and must share the bandwidth not used by EF. Once the set value is reached, all IP packets that exceed this bandwidth are rejected.

Four classes are reserved for AF: AF1x (low priority), AF2x, AF3x and AF4x (high priority), where "x" stands for one of three dropping levels: low (1), medium (2) and high (3). In the case of "low", packets are buffered over an extended period, in the case of "high", packets are promptly rejected if they cannot be forwarded.

- Best Effort (BE): Unmarked IP packets (Type of Service (ToS) field=00) are handled in the same way as the lowest priority.

Priority Classes According to IP Precedence

In addition to the DiffServ method, there are several older definitions, which perform the prioritization based on the ToS field. To achieve the best possible adaptation of the communication system to any required settings in the customer network, classes 3 to 7 (CS3-CS7) can be selected for IP Precedence, for example.

Individual Priority Classes

If none of the preset options is used in the customer network, the ToS value can also be set directly and manually. The set value is set to decimal 0-63 and transferred to the upper 6 bits of the ToS byte (e.g., 41 = 101-001-00 = 0xA4).

Table of Possible Priority Classes

Priority class	ToS value, binary	ToS value, hexadecimal
AF (Assured Forwarding)		
AF11	001-010-00	28
AF12	001-100-00	30
AF13	001-110-00	38
AF21	010-010-00	48
AF22	010-100-00	50
AF23	010-110-00	58
AF31	011-010-00	68

Priority class	ToS value, binary	ToS value, hexadecimal
AF32	011-100-00	70
AF33	011-110-00	78
AF41	100-010-00	88
AF42	100-100-00	90
AF43	100-110-00	98
EF (Expedited Forwarding)		
EF	101-110-00	B8
Best Effort (BE)		
BE	000-000-00	00
CS (Class Selector)		
CS3	011-000-00	60
CS4	100-000-00	80
CS5	101-000-00	A0
CS6	110-000-00	C0
CS7	111-000-00	E0
Manual entry	xxx-xxx-00	0-63 (decimal)

11.2.3.1 How to Configure Quality of Service (QoS)

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony Server** > **Basic Settings** in the navigation tree.
3. In the menu tree, click **Quality of Service**.

Expert mode - Telephony Server

Basic Settings

Quality of Service

Edit Quality of Service Settings

Priority Class for Signaling Data: AF31

Priority Class for Fax/Modem Payload: EF

Priority Class for Network Control: CS7

Priority Class for Voice Payload: EF

4. Select the priority class you want in the **Priority Class for Signaling Data** drop-down list.
5. Select the priority class you want in the **Priority Class for Fax/Modem Payload** drop-down list.

6. Select the priority class you want in the **Priority Class for Network Control** drop-down list.
7. Select the priority class you want in the **Priority Class for Voice Payload** drop-down list.
8. Click on **Apply**, followed by **OK**.

11.3 IP Stations

IP stations are connected to the communication system via the LAN. An IP station is generally a LAN or WLAN phone.

The following IP protocols are supported:

- Vendor-specific communication system protocol
The communication system uses CorNet-IP (CorNet Internet Protocol) for LAN telephony within the internal network. CorNet-IP, which was developed on the basis of H.323, supports all telephone features of the communication system.
- SIP (Session Initiation Protocol)
SIP is usually used in Internet telephony but is not restricted to it. It can also be used for telephony in the internal network, for example. However, SIP does not support all telephony features associated with the communication system.

The following types of IP stations exist:

- **System Client:** A system client is an IP station that can use all the features of the communication system via CorNet-IP. This can be an IP system phone such as an OpenStage 60 HFA, for instance, or a PC with CTI software such as OpenScape Personal Edition.
- **SIP client:** A SIP client is an IP station that uses the SIP protocol. It can access only limited functionality of the communication system via SIP. A SIP client is a SIP phone such as the OpenStage 15 S, for example.
- **Deskshare User:** A Deskshare User is an IP user who can log in at another IP system telephone (mobile login) and then use this phone as his or her own phone (including the call number).
- **RAS User:** A RAS user (Remote Access Service user) is granted access to the IP network via the ISDN connection. This allows the communication system to be maintained remotely.

For each connected IP station, an "IP User" station license is required.

Two IP stations are reserved for the Online User and for remote access via ISDN. These IP stations do not require a station license. If one or several of these three reserved IP stations are not required, these stations can be converted to normal IP stations in Expert mode. However, station licenses are then required for these IP stations.

Configuring IP Stations

The following configurations can be performed for an IP station:

- Configuration of standard parameters with the **IP Telephones** wizard (see [How to Configure IP Stations](#)).

- Configuration of all parameters (standard and advanced parameters in Expert mode (see [Station>Station>IPClients](#)).

OpenScape Desk Phone IP system phones are supplied with the SIP software by default. As soon as an OpenScape Desk Phone IP system phone is configured in the WBM as a **System Client**, the HFA software stored in the communication system is automatically loaded onto the IP system phone.

11.4 SIP Stations

SIP stations are IP stations that use the Session Initiation Protocol (SIP) for communication. SIP stations can use this protocol to access a limited number of the communication system's functions. SIP stations, like IP stations, are connected to the communication system over the LAN.

A SIP station is a WLAN phone or a LAN phone such as the OpenStage 15 S, for example.

For each connected SIP station, an "IP User" station license is required.

SIP Authentication

In order to ensure the security of the internal network, it is important that SIP subscribers are authenticated at the communication system with the values described below. These values must be configured in the WBM of the communication system for each SIP subscriber and also at every SIP phone itself. To protect against SIP attacks, authentication is strongly recommended!

- Password

Password for authentication: assigned freely; at least 8 characters up to a maximum of 20 characters. The password should contain at least one uppercase letter, one lowercase letter, one digit and one special character. A separate password should be assigned for each SIP subscriber.

- SIP User ID / Username

User name for authentication: preassigned; can be changed if required, maximum 20 characters. Each SIP subscriber has a different preassigned SIP User ID.

- Realm

Zone or domain for authentication: assigned freely; can be changed if required, max. 20 characters. The realm for all SIP subscribers is preassigned with the same value. It can be changed as required, e.g., in the host name or domain name of the communication system.

Configuration of SIP Stations in the Communication System

The following configurations can be performed in the WBM of the communication system for an IP station:

- Configuration of standard parameters with the **IP Telephones** wizard (see [How to Configure SIP Stations](#)).

- Configuration of all parameters (standard and advanced parameters in Expert mode (see [Station>Station>IPClients](#)).

Configuration of the SIP phone

The data used to authenticate a SIP subscriber at the communication system must be additionally entered directly at the SIP phone.

Configuration of authentication data at the SIP phone (see [Configuring the Authentication Data at the SIP Phone](#)).

Features that can be used with SIP Telephones

The following features can be used with SIP telephones:

- Incoming and outgoing calls with display of call number and name
- Hold, Toggle/Connect, Consultation
- Call transfer (screened/unscreened)
- Take Call
- Immediate call forwarding, on busy and after timeout
- Three-party conference
- Call lists, message waiting indicator
- Ringer cutoff at phone, reject call, call forwarding
- Call waiting
- Membership in groups (without display of the group number)
- Different calls for internal, external and recall
- Mailbox LED - Message Waiting Indication
- DTMF dialing, e.g., for the operation of voicemail boxes
- Use of the UC clients
- Automatic software updates (when using the DLI)

NOTICE: Deployment with a multichannel Contact Center has not been released (e.g. transfer to UCD groups).

Depending on the telephone, there may be some restrictions on the available functions; see the wiki at: http://wiki.unify.com/wiki/SIP_devices_configuration_examples

The following features, which are activated using codes with * or #, can be used with SIP phones:

- Reset services: #0
- Join/Leave hunt group: *85/#85
- Station number suppression (CLIR) on/off: *86/#86
- Speed dial: * 7nnnn (nnnn = speed dial number)
- Door opener: *61

Features that can be used with SIP Telephones and myPortal/myAttendant

SIP phones to be used with myPortal and myAttendant must meet the following requirements:

- 3PCC as per RFC 3725 is supported.
- The "call waiting" feature is supported.

- The local Do Not Disturb is disabled.

The full functionality of the features depends on the SIP phone used and cannot be guaranteed. A successful test of the features listed below was performed with the OpenStage SIP telephones.

Connection-/call-oriented features:

- Making Call
- Redirect call
- Take Call
- Resume call
- Application-controlled conference
- Place call on hold
- Alternate (Toggle/Connect)
- Consultation
- Disconnect
- Transfer

Phone-oriented features:

- Do Not Disturb
- Call forwarding

11.5 UP0 stations

A UP0 station uses a $U_{P0/E}$ line to transmit digital signals. UP0 stations are connected to the communication system via UP0 interfaces and are system telephones such as an OpenStage 60T, for example. UP0 stations can therefore use the complete functional scope of the communication system.

The following connectivity options are available for UP0 stations:

- OpenScape Business X1
To the $U_{P0/E}$ interfaces on the mainboard.
- OpenScape Business X3/X5
To the $U_{P0/E}$ interfaces on the mainboard or, if several UP0 stations are involved, to an additionally inserted $U_{P0/E}$ board.
- OpenScape Business X8
To additionally inserted $U_{P0/E}$ boards.
- OpenScape Business S
No connection possible.

For each connected UP0 station, a "TDM User" station license is required. Even system telephones that are connected in slave mode require a station license.

Configuring the UP0 Stations

The following configurations can be performed for a UP0 station:

- Configuration of standard parameters with the **UP0 Devices** wizard (see [How to Configure UP0 Stations](#)).

- Configuration of all parameters (standard and advanced parameters in Expert mode (see [Station>Station>UP0Stations](#)).

11.6 DECT stations

A DECT station uses a Cordless base station to transmit digital signals. A DECT station is a DECT telephone.

The following connection options are available for DECT stations:

- OpenScape Business X1W/X3W/X3R/X5R
Cordless base station to a U_{P0/E} interface of the mainboard.
- OpenScape Business X8
Cordless base station to one or more SLMUC boards.
- OpenScape Business S
DECT IP base station on the LAN

The connection of a Cordless base station is called the integrated Cordless solution. This means that almost all functions of the communication system are available.

The integration of an IP DECT base station in the internal network is called Cordless IP. Since only the SIP protocol can be used in this case, not all communication system features are available.

For each connected DECT station, a "TDM User" station license is required.

For the description and configuration of the integrated Cordless solution, see [Integrated Cordless Solution](#).

Configuring DECT Stations

The following configurations can be performed for a DECT station:

- Configuration of standard parameters with the **DECT Devices** wizard (see [How to Configure DECT Stations](#)).
- Configuration of all parameters (standard and advanced parameters in Expert mode (see [Station>Station>DECTStations>DECT Stations](#)).

DECT IP stations are configured as normal SIP stations.

11.7 ISDN Stations

An ISDN station uses the S_0 bus for transmitting digital signals and is therefore often referred to an S_0 station. The ISDN station is connected to the communication system via the S_0 interfaces.

The following connection options are available for an S_0 station:

- OpenScape Business X1
To an S_0 interface of the mainboard.
- OpenScape Business X3/X5

To an S_0 interface of the mainboard or to an S_0 board.

- OpenScape Business X8

To one or more S_0 boards.

- OpenScape Business S

To additionally required gateways or adapters

The following ISDN stations can be connected:

- ISDN phone
- Fax Group 4
- ISDN modem
- PC with ISDN card

The following types of ISDN stations can be defined:

- Default: for ISDN phone, Fax Group 4, ISDN modem or PC with ISDN card
- Fax: prerequisites for setting up the "Info from Fax/Answering Machine" key. If a PC with an ISDN card and Fax software is attached to the S_0 bus and assigned the type "Fax", for example, then an "Info from Fax/Answering Machine" key could be set up on every device. When this key lights up, this indicates that a fax has been received.
- Answering machine: prerequisites for picking up a call when the answering machine has already accepted it. If a Gigaset ISDN phone with an answering machine is connected and assigned the type "Answering Machine", for example, a call that has already been accepted by the answering machine can be picked up at any terminal. To do this, the terminal must be programmed with the internal call number of the Gigaset.

For each connected ISDN station, a "TDM User" station license is required.

Connecting ISDN Stations to the S_0 Port

To be able to connect an ISDN station to the communication system, you must configure at least one of the S_0 ports that are used for the ISDN subscriber line or the ISDN point-to-point connection as an internal S_0 bus (S_0 EURO bus).

NOTICE: If there is more than one ISDN station connected to an S_0 port (up to 8 ISDN stations are possible) in an ISDN point-to-multipoint connection, each individual ISDN station must be assigned to a unique MSN. This assignment must be made in the configuration menu of the ISDN station.

Configuring ISDN stations

The following configurations can be performed for an ISDN station:

- Configuration of standard parameters with the **ISDN Devices** wizard (see [How to Configure ISDN Stations](#)).

- Configuration of all parameters (standard and advanced parameters via Expert mode (see [Station>Station>ISDNStations](#)).

Allowing only Configured Numbers for MSNs

The administrator can specify that further MSNs at an S0 bus may only be configured for call numbers that already exist there. This prevents subscribers from adding an MSN without authorization through an outgoing seizure of the S0 bus with a further MSN. Without this restriction, the communication system would normally assign a free internal call number to the S0 bus for that MSN.

Terminal Portability

The communication system supports Terminal Portability (TP), that is, it lets you park a call on the S₀ bus, unplug the terminal, and plug it back in at a new location to resume the call. The parked station receives a message indicating that the user is porting. Three minutes are available for the entire operation.

The feature is not supported for services such as telefax, teletex or data transfer.

11.7.1 How to Configure the S₀ Interface for ISDN Stations

You can use the **CO Trunk ISDN / Analog / ITSP** wizard to configure one or more S₀ ports so that ISDN phones can be connected to them.

Prerequisites

One or more free S₀ interfaces are available.

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > Central Telephony**.
3. Click **Edit** in the **CO Trunk ISDN / Analog / ITSP** wizard.
4. Click on **OK & Next**. The existing S₀ interfaces (S₀ ports) are displayed.

Setup - Wizards - Basic Installation - Basic Installation

System Overview | Central Functions for Stations | **ISDN Configuration** | Configure Internet Access | Provider configuration and activation for Internet Telephony | Select a station | Configured Stations | SmartVM | Configure MeetMe Conference | Configure E-Mail Forwarding

☒ No call via ISDN trunk line (S0)

Because you do not telephone over ISDN, you must make sure that emergency calls, special call numbers and FAX are supported by your Internet Telephony Service Provider. These settings can be configured via the Assistant 'Internet Telephony'.

Box	Slot	S0-Port	Board Type	Point-to-point connection	Point-to-multipoint connection	Internal S0 connection	Settings configured in expert mode
1	1	1	STLS2N	<input type="radio"/>	<input type="radio"/>	<input checked="" type="radio"/>	
1	1	2	STLS2N	<input type="radio"/>	<input type="radio"/>	<input checked="" type="radio"/>	

5. Do not alter the setting for the check box **No call via ISDN trunk line (S0)**.
6. Activate the **Internal S0 connection** radio button for the desired S0 ports.

NOTICE: These S₀ ports can no longer be used for ISDN trunk access.

7. Keep clicking **OK & Next** until you receive a message that the editing of the feature has been completed.
8. Click on **Finish**.

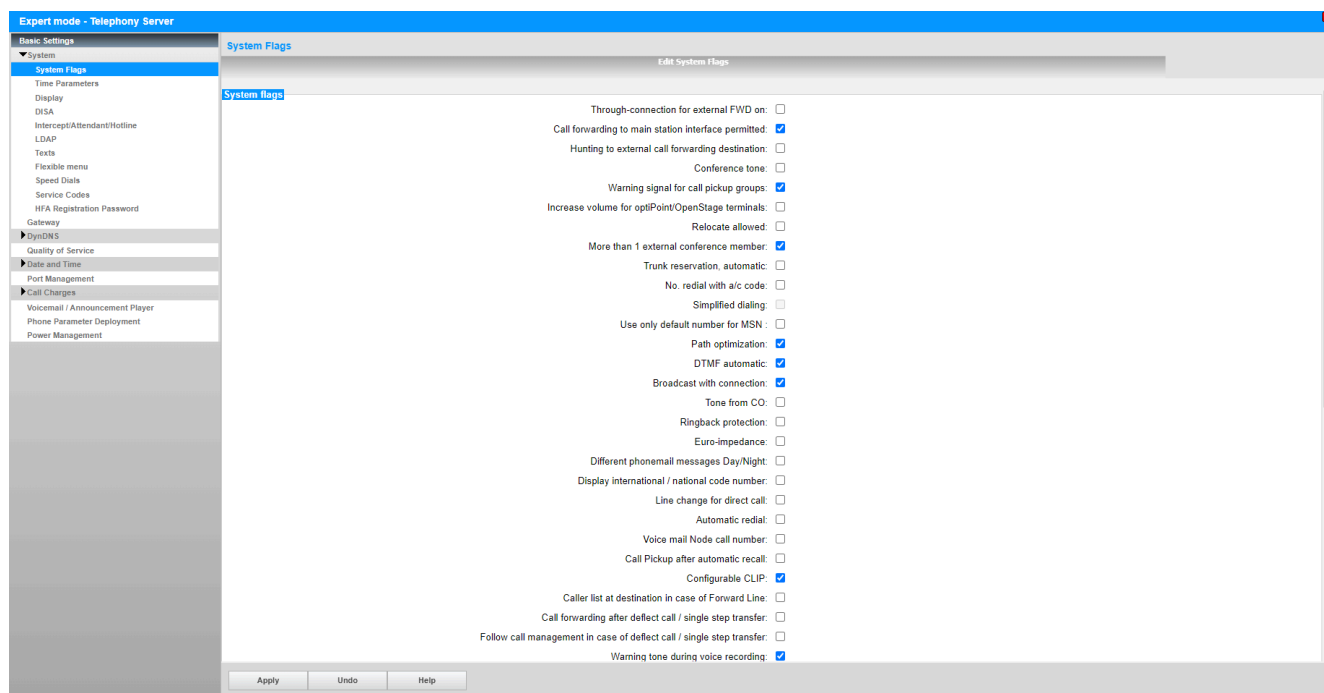

11.7.2 How to Allow only Configured Numbers for MSNs

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony Server > Basic Settings** in the navigation tree.
3. In the menu tree, click **Basic Settings > System > System Flags**.

4. If you want to allow only configured numbers for MSNs, enable the check box **Use only default number for MSN**.
5. If you do not want to allow only configured numbers for MSNs, clear the check box **Use only default number for MSN**.
6. Click on **Apply** followed by **OK**.

11.8 Analog Stations

An analog station uses a two-core analog cable to transmit analog signals. The communication system connects the analog station via the analog ports.

The following connectivity options are available for analog stations:

- OpenScape Business X1
To an analog interface of the mainboard.
- OpenScape Business X3/X5
To an analog interface of the mainboard or to an analog board.
- OpenScape Business X8
To one or more analog boards.
- OpenScape Business S
To additionally required gateways or adapters

The following analog stations can be connected:

- Analog telephone
- Analog Fax (Group 3)
- Answering Machine
- Modem, 9600 bps or higher
- Entrance Telephone (Door Opener)
- Loudspeaker

The following types of analog stations can be defined:

- Standard: for analog phone, Group 3 fax, answering machine or loudspeakers
- Fax: prerequisites for setting up the "Info from Fax/Answering Machine" key. If a Fax Group 3 device is connected and assigned the type "Fax", for example, then an "Info from Fax/Answering Machine" key could be set up on every device. When this key lights up, this indicates that a fax has been received.
- Answering machine: prerequisites for picking up a call when the answering machine has already accepted it. If a Gigaset phone with an answering machine is connected and assigned the type "Answering Machine", for example, a call that has already been accepted by the answering machine can be picked up at any terminal. To do this, the terminal must be programmed with the internal call number of the Gigaset.
- Modem: Analog modems with a fixed speed of 56 kbps or higher are not supported, since speeds of 56 kbps or higher cannot be processed.

For each connected analog station, a "TDM User" station license is required.

Availability of an Analog Fax Device in the System with Previous Fax Number

Since it is not possible to forward an analog fax device to a fax number in the system, the following workaround exists: The previous fax number is configured in the system and receives the incoming

fax messages. For the analog fax device, a port is configured with the previous number as the CLIP. The Configurable CLIP check box must be selected for this purpose. Outbound fax messages show the previous number as the sender; internal recipients see the internal number of the fax machine.

Configuring Analog Stations

The following configurations can be performed for an analog station:

- Configuration of standard parameters with the **Analog Devices** wizard (see [How to Configure Analog Stations](#)).
- Configuration of all parameters (standard and advanced parameters via Expert mode (see [Station>Station>AnalogStations](#)).

11.9 Virtual Stations

Virtual stations behave like real stations, but have no physical telephones assigned to them.

Virtual stations are required for mobile phone integration and call forwarding no answer (CFNA), for example. These stations must be configured like real stations so that they can be used for the signaling of calls, for example.

Configuring Virtual Stations

The parameters associated with a virtual station are configured in Expert mode (see [Station>Station>VirtualStations](#)).

11.10 Key programming

Every system phone comes with a certain number of function keys. A number of these function keys are programmed by default with functions. You can modify this default setting and program the remaining function keys that were not preprogrammed.

The individual keys can be programmed as follows:

- Key programming via WBM
The keys on connected system telephones can be programmed in the WBM via the **Key Programming** wizard.
This wizard can also be used to program a key assignment for a subscriber even though no system telephone has been connected for that subscriber.
- Key programming via the UC clients
Users of the UC clients **myPortal for Desktop**, **myPortal for Outlook** and **myAttendant** can also program the keys on their system telephone via these UC clients (see the respective User Guides for the UC clients).
- Key programming directly at the system telephone

System phones with display allow you to program certain function keys directly at the phone.

Programming Function Keys on Different Levels

The function keys of the system telephones can be programmed twice, that is, on the first and second levels. You can program all available functions on the first level. You can program external phone numbers on the second level. The Shift key must be programmed on the system phone before you can use the second level. The function key LEDs are always assigned to the first level.

NOTICE: In case of a **user it is not possible to copy key programming as the automatic key assignment feature is MULAP specific and should not be copied at any station. The prefix ** should be removed manually from these users in order the key copy to be enabled.

11.10.1 How to Program the Function Keys on the System Phones

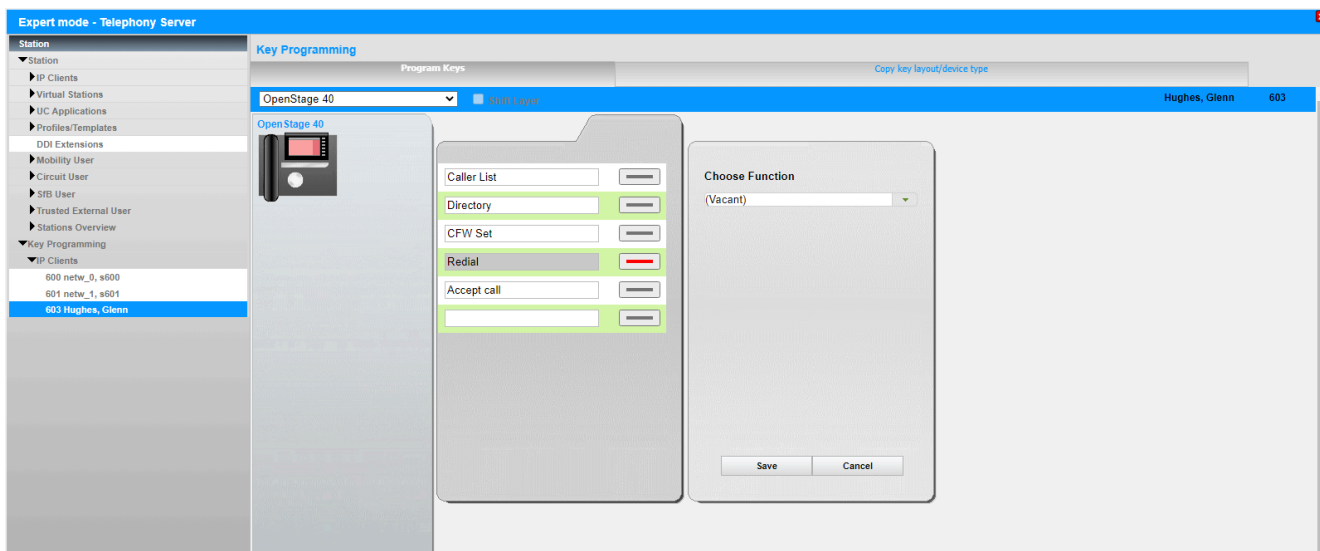

You can use the **Key Programming** wizard to configure the function keys on the system phones.

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > Telephones / Subscribers**.
3. Click **Edit** to start the **Key Programming** wizard. A list of all stations is displayed.
4. Click **Edit** in the row containing the station you want.
5. Assign the system phone to the station:
 - If a system telephone is already connected for the station, you will be presented with a simplified display of the system telephone.
 - If no system telephone is connected for the station as yet, select the system telephone to be connected from the drop-down list. You will then be presented with a simplified display of the system telephone.
6. Click in the simplified display of the system telephone on the desired key field. The function keys of the selected key field will be displayed with the currently assigned functions.

7. Assign functions to the function keys:
 - a) Click on the key symbol for the function key to be assigned. A drop-down list with the available functions appears.
 - b) Select one of the offered choices **Select Function** drop-down list.
 - c) Some functions require additional information. Select this as needed or enter the required data.
 - d) Click **Save**.
 - e) If required, edit the function key label in the **Change predefined label** field.

NOTICE: If you have a system telephone with automatic key labeling (such as an OpenStage 60 HFA, for example), this text will appear in the display of the system telephone.

- f) Click **Save**.
 - g) If you want to assign functions to further function keys, repeat step 7.
8. If you programmed a function key as the **Shift Key**, select the **Shift Key** check box. Program the second level of the function keys with the external call numbers as described below under step 7.
9. Click **Save Keypad**.
10. If you want to apply the key assignment just completed to several or all system telephones, enable the check box for the desired system phones and then click on **Apply**, **OK** and **OK & Next**.
11. If you want to apply the key assignment just completed to only the selected system telephone, first click on **Deselect all stations** to be on the safe side and then on **OK & Next**.
12. Click **Next** followed by **Finish**.

11.11 Station Profiles

The values and properties of subscribers are stored in profiles. One or more members can be assigned to a profile. The same values and properties then apply to all members of that profile.

Station profiles can be assigned to subscribers with system telephones. Up to 20 station profiles can be created. The station profiles can be exported or imported individually or collectively. The files are of type `xml`.

Every subscriber can be a member of exactly one profile. If the values and properties of a station that is a member of a profile are changed directly, i.e., not through the profile, the station is deleted from the profile.

11.12 Configuring Stations

You can define specific values (for example, phone number, name, and DID number) and properties (for example, type of call signaling) for the station.

Station configuration is split into standard configuration and advanced configuration. The default settings can be configured using wizards with the **Advanced** profile. The Advanced settings can only be configured in Expert mode with the **Expert** profile.

The default settings can be conveniently edited in a list for all stations of a station type (e.g., IP stations or analog stations). Additional settings (such as call signaling or the station flags, for example) can be changed individually for each subscriber.

Virtual stations are configured entirely in Expert mode (both the standard and the advanced settings).

Although the **Basic** profile cannot be used to configure stations, it can be used to edit the names of stations.

A dial plan (also called a numbering plan) should be available for the stations connected to the communication system. The station numbers, names and DID numbers of all configured subscribers can be displayed in Expert mode via **Stations > DDI Extensions**.

DID numbers which are not provided by the service provider and which are not used in the system should be deleted; otherwise, there may be conflicts with MSN or Internet telephony phone numbers. DID numbers that are provided by an Internet Telephony Service Provider (ITSP) must be assigned to the individual stations when configuring the ITSP (see [Configuring an ITSP](#)).

IMPORTANT: Whenever the phone number of a station is changed, the Smart VM (Voicemail) configured for that station is automatically reset. All personal voice messages, greetings and announcements are lost, and the password is reset.

Default Settings

The default settings should be verified for every station and adapted if required.

- **Station Number, Name, DID Number**

Every station is assigned a station number by default (such as 101). The station can be reached internally under this call number. In system phones, this phone number appears both on the actual display and the communication partner's display. If a station number other than the actual station number is to be displayed at the external station called, this number can be defined here.

You can also assign a DID number to each station. The station can be accessed directly from an external location with the DID number. The station can be reached internally via the call number 101, for example, and externally via the DID number 3654321 (MSN in a point-to-multipoint connection) or <PABX number>-101 (in a point-to-point connection). In the case of a point-to-point connection, you can configure whether the internal phone number should be automatically entered as a DID number during initial installation. The DID number may also differ from the phone number. If you are using Internet telephony, you can also define a DID number that can be used to reach the station via Internet telephony. This phone number is made available by the Internet Telephony Service Provider.

You can also assign a name to each station. This name appears on the communication partner's display (system phones only).

If a dial plan exists, the phone numbers, DID numbers, and names of the subscribers should be adjusted based on the dial plan.

- **Type**

The station type can be selected for every station. For example, an IP station could have a station type of **System Client** or **SIP Client**; an analog station may be an analog phone or an analog fax machine, and an ISDN station could be an ISDN phone or ISDN fax.

- **Fax call number; Fax DID number**

If the a fax box is to be set up for a subscriber (which can be used with the UC clients myPortal for Desktop or myPortal for Outlook, for example), assign a fax call number (for receiving internal faxes) and a fax DID number (for receiving external faxes).

- **Classes of Service**

A station can be assigned one out of 15 possible classes of service. This determines whether a station may accept and make external calls, for example, or which numbers may be dialed by the station and which are not allowed (see [Classes of Service \(Toll Restriction\)](#)).

- **Call pickup group**

Every station can be assigned to a call pickup group.

- **Language, call signaling**

The language used for the menu controls of the attached system telephones can be set.

The ring tone for an internal or external call can be selected.

- **Voicemail box (only with UC Smart)**

With the UC solution UC Smart, you can set up a voicemail box for each subscriber and choose between different greetings. For more detailed information on the voicemail box, see [Voicemail Box \(SmartVM\)](#)

With the UC solution UC Suite, a voicemail box is assigned automatically to each subscriber. Consequently, there are no voicemail box settings in this case.

- **Station flags**

The station flags of each subscriber can be changed. For a description of the station flags, see [Station>Station>StationParameters](#).

Advanced Settings

You can configure all settings for all types of stations in Expert mode. The advanced settings can be left unaltered for default operation and only have to be changed if required. For information on the advanced settings, see [Station](#) .

11.12.1 How to Configure IP Stations

You can use the **IP Telephones** wizard to configure the IP stations (LAN phones and WLAN phones).

Prerequisites

A functional wireless LAN network is needed to operate WLAN phones. You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > Telephones / Subscribers**.
3. Click on **Edit** to start the **IP Telephones** wizard. A list of all IP stations appears.

Setup - Wizards - Telephones / Subscribers - IP Telephones

Select a station -LAN Phones/WLAN Phones

☒ Take DID from changed call number

Box	Slot	Callno	First Name	Last Name	Display	DID	Type	Fax Callno	Fax DID	Class of service	Call pickup
1	0	ppc0	x651000	x651000	x651000.ppc0		System Client			International	
1	0	651001	hfa1	hfa1	hfa1.651001		System Client			International	
1	0	651002	hfa2	hfa2	hfa2.651002		System Client			International	
1	0	651003	hfa3	hfa3	hfa3.651003		System Client			International	
1	0	651004	hfa4	hfa4	hfa4.651004		System Client			International	
1	0	651005	hfa5	hfa5	hfa5.651005		System Client			International	
1	0	651007	hfa7	hfa7	hfa7.651007		System Client			International	
1	0	651009	hfa9	hfa9	hfa9.651009		System Client			International	
-	-	-	-	-	-		No Port			International	
-	-	-	-	-	-		No Port			International	

4. If you want the internal call number to be automatically assigned to the station as the direct inward dialing number, activate the radio button **Take DID from changed call number**.
5. If you want a different direct inward dialing number for the station than the call number, enter a DID number for the station under **DID** in the row of the desired station:
 - Only for a point-to-point connection:

Click in the desired field and type in the DID number using the keyboard. The DID number may also be identical to the internal station number.
 - Only for a point-to-multipoint connection:

Select an MSN in the desired field via the drop-down list. The station can be internally reached via the internal station number 101, for example, and externally via the MSN 654321.
 - For point-to-point and point-to-multipoint connections:

Select the entry **xxx - modifiable** (xxx is the internal station number) via the drop-down list in the desired field and type in the DID number using the keyboard or select an MSN from the drop-down list.
6. If you want an Internet telephony phone number to be assigned to the station as the direct inward dialing number, leave the radio button **Take DID from changed call number** unselected, and select the Internet Telephony Service Provider from the list next to the radio button instead. Then select the Internet Telephony phone number from the **DID** drop-down list in the row of the desired station.
7. Enter the internal station number for the subscriber under **Call No** in the appropriate row of the desired subscriber. You can use the preset phone number or assign some other free number.
8. In the row of the desired station, under **Name**, enter a name in the format **Last Name, First Name** or **First Name Last Name**.
9. Select the type of IP station (e.g., **System Client** or **DeskShare User**) from the **Type** drop-down list in the row of the desired station).
10. If you want to set up a fax box for the subscriber (which can be used with the UC clients **myPortal for Desktop** or **myPortal for Outlook**, for example), proceed as follows:
 - a) In the row of the desired station, in the **Fax No.** field, enter the desired internal fax number at which the user can receive internal fax messages.

- b) If you want to configure a DID number for the fax box, enter the desired external fax number under which the subscriber can receive external fax messages in the **Fax DID** field in the row of the desired subscriber.
11. Choose the desired Class of Service group in the row of the desired subscriber from the **Class of Service** drop-down list.
 12. To add the subscriber to a call pickup group, select a call pickup group from the **Call pickup group** drop-down list in the row of the desired subscriber.
 13. Make any further settings if required:
 - a) Click in the row of the desired station on the pencil icon **Edit**.

- b) Assign one **Mobile Call number** and select the **Web Feature ID** from the drop-down list in the **Mobility** area.
- c) In the **Clip/Lin** field, enter a phone number (DID number or MSN) to be displayed at the called party's extension instead of the own phone number in the case of an external call.

NOTICE: This feature must be released by the network provider.

NOTICE: At least one DID number should be configured. If not, the system does not take into account caller's CLIP number and the internal call number is formatted and sent as the Calling Party Number for the external call.

- d) Select the language for the menu controls on the phone from the **Language** drop-down list.
- e) From the **Call signaling internal** drop-down list, select and assign one of a total of eight possible acoustic call signals for internal calls. The station then will then send the modified

ringing tone to other internal stations, thus enabling its calls to be distinguished from other internal stations (default: Ring type 1).

- f) From the **Call signaling external** drop-down list, select and assign one of a total of three possible acoustic call signals for external calls (default: Ring type 1).
- g) In the **ITSP Loc-ID** field, enter the index number of the ITSP Location ID.
- h) Only with UC Smart: Select whether the subscriber is to receive a default mailbox or an attendant mailbox (AutoAttendant) in the **UC Smart Mailbox type** drop-down list.
- i) Only with UC Smart and default mailbox: If a caller may leave a message in the voicemail box, select the **Recording** check box.
- j) Only with UC Smart: Select a greeting from the **Greeting** drop-down list.
- k) Only with UC Smart: If the password of the voicemail box is to be reset, select the **Password Reset** check box.

NOTICE: The **Password Reset** check box must be cleared when setting up a new voicemail box. It is used to reset the password of the voicemail box. When a new voicemail box is created, the subscriber must change the initial password anyway when accessing his or her voicemail box for the first time.

- l) If the station is connected to the internet, Authentication MUST be activated and you MUST enter strong passwords for all IP stations. Check the **Authentication active** flag list and complete the **New password** and **Confirm password** fields.
 - m) Click on **OK & Next**.
 - n) Change the station flags as needed. For a description of the station flags, see [Station > Station > Station Parameters](#).
 - o) Click on **OK & Next**.
- 14.** If you want to configure another station, repeat steps [5](#) through [13](#).
- 15.** Click on **OK & Next**. A list of all configured IP stations appears. If required, you can print the list of IP stations with **Print**.
- 16.** Click on **OK & Next** followed by **Finish**.

11.12.2 How to Configure SIP Stations

You can use the **IP Telephones** wizard to configure the SIP stations (LAN phones and WLAN phones).

Prerequisites

A functional wireless LAN network is needed to operate WLAN phones. You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > Telephones / Subscribers**.
3. Click on **Edit** to start the **IP Telephones** wizard. A list of all IP stations appears. This list also includes all SIP stations.

Setup - Wizards - Telephones / Subscribers - IP Telephones

Select a station -LAN Phones/WLAN Phones

☒ Take DID from changed call number

Box	Slot	Callno	First Name	Last Name	Display	DID	Type	Fax Callno	Fax DID	Class of service	Call pickup
1	0		ppc0	x651000	x651000, ppc0		System Client			International	-
1	0		651001	hfa1	hfa1, 651001		System Client			International	-
1	0		651002	hfa2	hfa2, 651002		System Client			International	-
1	0		651003	hfa3	hfa3, 651003		System Client			International	-
1	0		651004	hfa4	hfa4, 651004		System Client			International	-
1	0		651005	hfa5	hfa5, 651005		System Client			International	-
1	0		651007	hfa7	hfa7, 651007		System Client			International	-
1	0		651009	hfa9	hfa9, 651009		System Client			International	-
-	-						No Port			International	-
-	-									International	-

4. If you want the internal call number to be automatically assigned to the station as the direct inward dialing number, activate the radio button **Take DID from changed call number**.
5. If you want a different direct inward dialing number for the station than the call number, enter a DID number for the station under **DID** in the row of the desired station:
 - Only for a point-to-point connection:
Click in the desired field and type in the DID number using the keyboard. The DID number may also be identical to the internal station number.
 - Only for a point-to-multipoint connection:
Select an MSN in the desired field via the drop-down list. The station can be internally reached via the internal station number 101, for example, and externally via the MSN 654321.
 - For point-to-point and point-to-multipoint connections:
Select the entry **xxx - modifiable** (xxx is the internal station number) via the drop-down list in the desired field and type in the DID number using the keyboard or select an MSN from the drop-down list.
6. If you want an Internet telephony phone number to be assigned to the station as the direct inward dialing number, leave the radio button **Take DID from changed call number** unselected, and select the Internet Telephony Service Provider from the list next to the radio button instead. Then select the Internet Telephony phone number from the **DID** drop-down list in the row of the desired station.
7. Enter the internal station number for the subscriber under **Call No** in the appropriate row of the desired subscriber. You can use the preset phone number or assign some other free number.
8. In the row of the desired station, under **Name**, enter a name in the format Last Name, First Name or First Name Last Name.
9. Select **SIP Client** from the **Type** drop-down list in the row of the desired station.

10. If you want to set up a fax box for the subscriber (which can be used with the UC clients **myPortal for Desktop** or **myPortal for Outlook**, for example), proceed as follows:
 - a) In the row of the desired station, in the **Fax No.** field, enter the desired internal fax number at which the user can receive internal fax messages.
 - b) If you want to configure a DID number for the fax box, enter the desired external fax number under which the subscriber can receive external fax messages in the **Fax DID** field in the row of the desired subscriber.
11. Choose the desired Class of Service group in the row of the desired subscriber from the **Class of Service** drop-down list.
12. To add the subscriber to a call pickup group, select a call pickup group from the **Call pickup group** drop-down list in the row of the desired subscriber.
13. Configure the data for SIP:
 - a) Click in the row of the desired station on the pencil icon **Edit**.

- b) In the **Security** area, enter the password for the authentication of the SIP station in the **Password** and **Confirm password** fields.
 - c) Assign a user name of your choice for the authentication of SIP station, e.g., SIP-120, in the **SIP User ID / Username** field.
 - d) Under **Realm**, assign a name of your choice for the associated zone, e.g., OSBIZ-SIP. This value should be the same for all SIP stations.

NOTICE: The values defined here for the password, SIP user ID and realm must also be entered at the SIP phone.

14. Make any further settings if required:
 - a) If this SIP phone is to be operated in conjunction with a dual-mode mobile phone, enter the dialout prefix followed by the

telephone number of the mobile phone (e.g., 0016012345678) in the **Mobility** area under **Mobile phone number**. In addition, select this SIP client from the **Web Feature ID** drop-down list. (see [Dual-Mode Telephony](#)).

- b) Assign one DID number each for Internet telephony to the station and, if desired, to its fax box in the **Direct inward dialing for Internet Telephony** area. To do this, select the DID numbers from the drop-down lists of the desired ITSPs. For every active ITSP, you will be presented with one drop-down list for the station and one drop-down list for its fax box.

NOTICE: The **DID for Internet Telephony** field is not visible if Internet telephony is not configured or if no Internet Telephony Service Provider has been activated.

- c) In the **Clip/Lin** field, enter a phone number (DID number or MSN) to be displayed at the called party's extension instead of the own phone number in the case of an external call.

NOTICE: This feature must be released by the network provider.

NOTICE: At least one DID number should be configured. If not, the system does not take into account caller's CLIP number and the internal call number is formatted and sent as the Calling Party Number for the external call.

- d) Select the language for the menu controls on the phone from the **Language** drop-down list.
- e) From the **Call signaling internal** drop-down list, select and assign one of a total of eight possible acoustic call signals for internal calls. The station then will then send the modified ringing tone to other internal stations, thus enabling its calls to be distinguished from other internal stations (default: Ring type 1).
- f) From the **Call signaling external** drop-down list, select and assign one of a total of three possible acoustic call signals for external calls (default: Ring type 1).
- g) Only with UC Smart: Select whether the subscriber is to receive a default mailbox or an attendant mailbox (AutoAttendant) in the **UC Smart Mailbox type** drop-down list.
- h) Only with UC Smart and default mailbox: If a caller may leave a message in the voicemail box, select the **Recording** check box.
- i) Only with UC Smart: Select a greeting from the **Greeting** drop-down list.
- j) Only with UC Smart: If the password of the voicemail box is to be reset, select the **Password Reset** check box.

NOTICE: The **Password Reset** check box must be cleared when setting up a new voicemail box. It is used to reset the password of the voicemail box. When a new voicemail box is created, the subscriber must change the initial password anyway when accessing his or her voicemail box for the first time.

- k) Click on **OK & Next**.
- l) Change the station flags as needed. For a description of the station flags, see [Station > Station > Station Parameters](#).
- m)Click on **OK & Next**.

- 15. If you want to configure another station, repeat steps 5 through 14.
- 16. Click on **OK & Next**. A list of all configured IP stations appears. If required, you can print the list of IP stations with **Print**.
- 17. Click on **OK & Next** followed by **Finish**.

11.12.3 How to Configure UP0 Stations

You can use the **UP0 Devices** wizard to configure the UP0 stations.

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

- 1. In the navigation bar, click on **Setup**.
- 2. In the navigation tree, click **Wizards > Telephones / Subscribers**.
- 3. Click on **Edit** to start the **UP0 Devices** wizard. A list of all UP0 stations appears.

Box	Slot	UP0-Port	Callno	First Name	Last Name	Display	DID	Fax Callno	Fax DID	Class of service	Call pickup
1	2	1 M	-	-	-	-	-	-	-	International	-
1	2	2 M	-	-	-	-	-	-	-	International	-
1	2	3 M	-	-	-	-	-	-	-	International	-
1	2	4 M	-	-	-	-	-	-	-	International	-
1	2	5 M	-	-	-	-	-	-	-	International	-
1	2	6 M	-	-	-	-	-	-	-	International	-
1	2	7 M	-	-	-	-	-	-	-	International	-
1	2	8 M	-	-	-	-	-	-	-	International	-
1	2	1 S	-	-	-	-	-	-	-	International	-
1	2	2 S	-	-	-	-	-	-	-	International	-

- 4. If you want the internal call number to be automatically assigned to the station as the direct inward dialing number, activate the radio button **Take DID from changed call number**.
- 5. If you want a different direct inward dialing number for the station than the call number, enter a DID number for the station under **DID** in the row of the desired station:
 - Only for a point-to-point connection:

Click in the desired field and type in the DID number using the keyboard. The DID number may also be identical to the internal station number.

- Only for a point-to-multipoint connection:

Select an MSN in the desired field via the drop-down list. The station can be internally reached via the internal station number 101, for example, and externally via the MSN 654321.

- For point-to-point and point-to-multipoint connections:

Select the entry **xxx - modifiable** (xxx is the internal station number) via the drop-down list in the desired field and type in the DID number using the keyboard or select an MSN from the drop-down list.

6. If you want an Internet telephony phone number to be assigned to the station as the direct inward dialing number, leave the radio button **Take DID from changed call number** unselected, and select the Internet Telephony Service Provider from the list next to the radio button instead. Then select the Internet Telephony phone number from the **DID** drop-down list in the row of the desired station.
7. Enter the internal station number for the subscriber under **Call No** in the appropriate row of the desired subscriber. You can use the preset phone number or assign some other free number.
8. In the row of the desired station, under **Name**, enter a name in the format *Last Name, First Name* or *First Name Last Name*.
9. If you want to set up a fax box for the subscriber (which can be used with the UC clients **myPortal for Desktop** or **myPortal for Outlook**, for example), proceed as follows:
 - a) In the row of the desired station, in the **Fax No.** field, enter the desired internal fax number at which the user can receive internal fax messages.
 - b) If you want to configure a DID number for the fax box, enter the desired external fax number under which the subscriber can receive external fax messages in the **Fax DID** field in the row of the desired subscriber.
10. Choose the desired Class of Service group in the row of the desired subscriber from the **Class of Service** drop-down list.
11. To add the subscriber to a call pickup group, select a call pickup group from the **Call pickup group** drop-down list in the row of the desired subscriber.
12. Make any further settings if required:
 - a) Click in the row of the desired station on the pencil icon **Edit**.

Setup - Wizards - Telephones / Subscribers - UP0 Telephones

- b) Select a DID number from the drop-down list in the **Direct inward dialing for Internet Telephony** area. A drop-down list is displayed for every active ITSP.

NOTICE: The **DID for Internet Telephony** field is not visible if Internet telephony is not configured or if no Internet Telephony Service Provider has been activated.

- c) In the **Clip/Lin** field, enter a phone number (DID number or MSN) to be displayed at the called party's extension instead of the own phone number in the case of an external call.

NOTICE: This feature must be released by the network provider.

NOTICE: At least one DID number should be configured. If not, the system does not take into account caller's CLIP number and the internal call number is formatted and sent as the Calling Party Number for the external call.

- d) Select the language for the menu controls on the phone from the **Language** drop-down list.
- e) From the **Call signaling internal** drop-down list, select and assign one of a total of eight possible acoustic call signals for internal calls. The station then will then send the modified ringing tone to other internal stations, thus enabling its calls to be distinguished from other internal stations (default: Ring type 1).
- f) From the **Call signaling external** drop-down list, select and assign one of a total of three possible acoustic call signals for external calls (default: Ring type 1).

- g) Only with UC Smart: Select whether the subscriber is to receive a default mailbox or an attendant mailbox (AutoAttendant) in the **UC Smart Mailbox type** drop-down list.
- h) Only with UC Smart and default mailbox: If a caller may leave a message in the voicemail box, select the **Recording** check box.
- i) Only with UC Smart: Select a greeting from the **Greeting** drop-down list.
- j) Only with UC Smart: If the password of the voicemail box is to be reset, select the **Password Reset** check box.

NOTICE: The **Password Reset** check box must be cleared when setting up a new voicemail box. It is used to reset the password of the voicemail box. When a new voicemail box is created, the subscriber must change the initial password anyway when accessing his or her voicemail box for the first time.

- k) Click on **OK & Next**.
 - l) Change the station flags as needed. For a description of the station flags, see [Station > Station > Station Parameters](#).
 - m) Click on **OK & Next**.
- 13.** If you want to configure another station, repeat steps [5](#) through [12](#).
 - 14.** Click on **OK & Next**. A list of all configured UP0 stations appears. If required, you can print the list of UP0 stations with **Print**.
 - 15.** Click on **OK & Next** followed by **Finish**.

11.12.4 How to Configure DECT Stations

You can use the **DECT Devices** wizard to configure the DECT stations (DECT phones).

Prerequisites

A base station is connected to a UP0 interface or to an installed SLC board.

You are logged on to the WBM with the **Advanced** profile.

Step by Step

- 1.** In the navigation bar, click on **Setup**.
- 2.** In the navigation tree, click **Wizards > Telephones / Subscribers**.
- 3.** Click on **Edit** to start the **DECT Phones** wizard. A list of all DECT stations appears.

Setup - Wizards - Telephones / Subscribers - DECT phones

Add Station - DECT Stations

CMI data

System ID: 00000000

System ID	Slot	SLC No	Number of Phones	Add	SLC Call number	Access

4. If you want the internal call number to be automatically assigned to the station as the direct inward dialing number, activate the radio button **Take DID from changed call number**.
5. If you want a different direct inward dialing number for the station than the call number, enter a DID number for the station under **DID** in the row of the desired station:
 - Only for a point-to-point connection:
Click in the desired field and type in the DID number using the keyboard. The DID number may also be identical to the internal station number.
 - Only for a point-to-multipoint connection:
Select an MSN in the desired field via the drop-down list. The station can be internally reached via the internal station number 101, for example, and externally via the MSN 654321.
 - For point-to-point and point-to-multipoint connections:
Select the entry **xxx - modifiable** (xxx is the internal station number) via the drop-down list in the desired field and type in the DID number using the keyboard or select an MSN from the drop-down list.
6. If you want an Internet telephony phone number to be assigned to the station as the direct inward dialing number, leave the radio button **Take DID from changed call number** unselected, and select the Internet Telephony Service Provider from the list next to the radio button instead. Then select the Internet Telephony phone number from the **DID** drop-down list in the row of the desired station.
7. Enter the internal station number for the subscriber under **Call No** in the appropriate row of the desired subscriber. You can use the preset phone number or assign some other free number.
8. In the row of the desired station, under **Name**, enter a name in the format `Last Name, First Name` or `First Name Last Name`.
9. If you want to set up a fax box for the subscriber (which can be used with the UC clients **myPortal for Desktop** or **myPortal for Outlook**, for example), proceed as follows:
 - a) In the row of the desired station, in the **Fax No.** field, enter the desired internal fax number at which the user can receive internal fax messages.
 - b) If you want to configure a DID number for the fax box, enter the desired external fax number under which the subscriber can receive external fax messages in the **Fax DID** field in the row of the desired subscriber.
10. Choose the desired Class of Service group in the row of the desired subscriber from the **Class of Service** drop-down list.

11. To add the subscriber to a call pickup group, select a call pickup group from the **Call pickup group** drop-down list in the row of the desired subscriber.
12. If you want to change the DECT phone code (PIN), enter the new code in the row of the desired subscriber under **Mobile code**. The DECT subscribers must log on at the base station again with this code.
13. Make any further settings if required:
 - a) Click in the row of the desired station on the pencil icon **Edit**.

- b) Select a DID number from the drop-down list in the **Direct inward dialing for Internet Telephony** area. A drop-down list is displayed for every active ITSP.

NOTICE: The **DID for Internet Telephony** field is not visible if Internet telephony is not configured or if no Internet Telephony Service Provider has been activated.

- c) In the **Clip/Lin** field, enter a phone number (DID number or MSN) to be displayed at the called party's extension instead of the own phone number in the case of an external call.

NOTICE: This feature must be released by the network provider.

NOTICE: At least one DID number should be configured. If not, the system does not take into account caller's CLIP number and the internal call number is formatted and sent as the Calling Party Number for the external call.

- d) Select the language for the menu controls on the phone from the **Language** drop-down list.
- e) From the **Call signaling internal** drop-down list, select and assign one of a total of eight possible acoustic call signals for internal calls. The station then will then send the modified ringing tone to other internal stations, thus enabling its calls to be distinguished from other internal stations (default: Ring type 1).
- f) From the **Call signaling external** drop-down list, select and assign one of a total of three possible acoustic call signals for external calls (default: Ring type 1).
- g) Only with UC Smart: Select whether the subscriber is to receive a default mailbox or an attendant mailbox (AutoAttendant) in the **UC Smart Mailbox type** drop-down list.
- h) Only with UC Smart and default mailbox: If a caller may leave a message in the voicemail box, select the **Recording** check box.
- i) Only with UC Smart: Select a greeting from the **Greeting** drop-down list.
- j) Only with UC Smart: If the password of the voicemail box is to be reset, select the **Password Reset** check box.

NOTICE: The **Password Reset** check box must be cleared when setting up a new voicemail box. It is used to reset the password of the voicemail box. When a new voicemail box is created, the subscriber must change the initial password anyway when accessing his or her voicemail box for the first time.

- k) Click on **OK & Next**.
 - l) Change the station flags as needed. For a description of the station flags, see [Station > Station > Station Parameters](#).
 - m) Click on **OK & Next**.
- 14.** If you want to configure another station, repeat steps [5](#) through [13](#).
- 15.** Click on **OK & Next**. A list of all configured DECT stations appears. If required, you can print the list of DECT stations with **Print**.
- 16.** Click on **OK & Next** followed by **Finish**.

11.12.5 How to Configure ISDN Stations

The **ISDN Devices** wizard can be used to configure the ISDN stations (e.g., ISDN phone or ISDN fax).

Prerequisites

At least one free S₀ interface is available. If one of the S₀ ports of a hardware platform is used, this must be set up as an internal S₀ port.

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > Telephones / Subscribers**.
3. Click on **Edit** to start the **ISDN Devices** wizard. A list of all ISDN stations appears.

Setup - Wizards - Telephones / Subscribers - ISDN Devices

Select a station -ISDN Devices

☒ Take DID from changed call number

	Box	Slot	S0-Port	Callno	First Name	Last Name	Display	DID	Fax Callno	Fax DID	Class of service	Call pickup
	1	1	1	-	-	-	-	-	-	-	International	-
	1	1	2	-	-	-	-	-	-	-	International	-

4. If you want the direct inward dialing number of the station to be automatically adapted to its call number, activate the radio button **Take DID from changed call number**.
5. If you want a different direct inward dialing number for the station than the call number, enter a DID number for the station under **DID** in the row of the desired station:
 - Only for a point-to-point connection:
Click in the desired field and type in the DID number using the keyboard. The DID number may also be identical to the internal station number.
 - Only for a point-to-multipoint connection:
Select an MSN in the desired field via the drop-down list. The station can be internally reached via the internal station number 101, for example, and externally via the MSN 654321.
 - For point-to-point and point-to-multipoint connections:
Select the entry **xxx - modifiable** (xxx is the internal station number) via the drop-down list in the desired field and type in the DID number using the keyboard or select an MSN from the drop-down list.
6. Enter the internal station number for the subscriber under **Call No** in the appropriate row of the desired subscriber. You can use the preset phone number or assign some other free number.
7. In the row of the desired station, under **Name**, enter a name in the format Last Name, First Name or First Name Last Name.
8. Choose one of the Class of Service groups in the row of the desired subscriber from the **Class of Service** drop-down list:
9. To add the subscriber to a call pickup group, select a call pickup group from the **Call pickup group** drop-down list in the row of the desired subscriber.
10. Make any further settings if required:
 - a) Click in the row of the desired station on the pencil icon **Edit**.

- n) Click on **OK & Next**.
- 11.** If you want to configure another station, repeat steps [5](#) through [10](#).
- 12.** Click on **OK & Next**. A list of all configured analog stations appears. If required, you can print the list of analog stations with **Print**.
- 13.** Click on **OK & Next** followed by **Finish**.

11.12.7 How to Edit Station Names

The **Station Name and Release** wizard can be used to edit the names of stations.

Prerequisites

You are logged in at the WBM.

Step by Step

- 1.** In the navigation bar, click on **Setup**.
- 2.** In the navigation tree, click **Wizards > User Telephony**.
- 3.** Click on **Edit** to start the **Station Name and Release** wizard.

Setup - Wizards - User Telephony - Station name and release		
Name Configuration and Unlock for Stations and Groups		
Call number	Display	System telephone lock reset
	VOICEMAIL	Function not available
	-	Function not available
	hfa4_651004	Function not available
	Group, test	Function not available
	test	Function not available
	Group, Panos	Function not available
	call_group	Function not available
659994	Licensing	<input type="checkbox"/>
659995	Remote-Admin	<input type="checkbox"/>

4. Click in the **Display** column in the field of the desired subscriber and edit a subscriber name in the format Last Name, First Name or First Name Last Name.
5. If you want to edit the names of further stations, repeat step 4.
6. Click on **OK & Next**, followed by **Finish**.

11.13 Configuring Station Profiles

The values and properties of IP stations are stored in station profiles.

Using the **Profiles** wizard, an administrator with the **Advanced** profile can perform the following configuration tasks:

- Create a new profile
- Display profiles and their members
- Add members to a profile
- Delete members from a profile
- Export or import a single profile

In Expert mode, an administrator with the **Expert** profile can also perform the following configuration tasks:

- Change values and settings of a station profile
- Export or import all profiles

Station profiles that have already been created cannot be deleted, but can be overwritten.

11.13.1 How to Create a New Station Profile

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > User Telephony**.
3. Click on **Edit** to start the **Station Profiles** wizard. All existing station profiles are displayed.

Stations

Setup - Wizards - User Telephony - Station Profiles

Station Profiles

		Profile	Display
Assign Stations	Import/Export Profile	Profile-1	<input type="text"/>
Assign Stations	Import/Export Profile	Profile-2	<input type="text"/>
Assign Stations	Import/Export Profile	Profile-3	<input type="text"/>
Assign Stations	Import/Export Profile	Profile-4	<input type="text"/>
Assign Stations	Import/Export Profile	Profile-5	<input type="text"/>

4. In the row of the desired station profile, in the **Display** column, enter a name of your choice for the profile (max. 16 characters).
5. Click **Assign Stations** in the row of the desired station profile.

Setup - Wizards - User Telephony - Station Profiles

Assign Stations to the Profile:asdasdasd

Profile Members

Selection

Members

Add >>
<< Delete

6. Select the desired members from the **Profile Members** table (multiple selections are allowed) and click on **Add**. These stations are now assigned to the station profile and cannot be assigned to any further station profile.
7. Click on **OK**.
8. Click on **OK & Next**. All existing station profiles and their members are displayed.
9. Click on **OK & Next** followed by **Finish**.

11.13.2 How to Display Station Profiles and their Members

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > User Telephony**.
3. Click on **Edit** to start the **Station Profiles** wizard. All existing station profiles are displayed.

4. Click on **OK & Next**. All existing station profiles and their members are displayed.

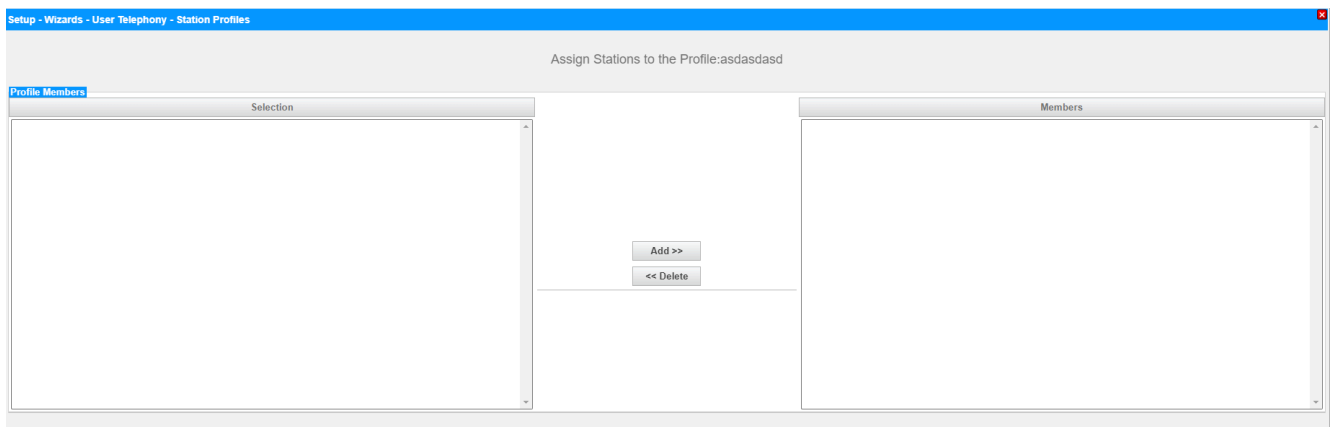

11.13.3 How to Add Members to a Station Profile

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > User Telephony**.
3. Click on **Edit** to start the **Station Profiles** wizard. All existing station profiles and their members are displayed.
4. Click **Assign Stations** in the row of the desired station profile.

5. Select the desired members from the **Profile Members** list (multiple selections are allowed) and click on **Add**. These stations are now assigned to the station profile and cannot be assigned to any further station profile.
6. Click on **OK**.
7. Click on **OK & Next**. All existing station profiles and their members are displayed.
8. Click on **OK & Next** followed by **Finish**.

11.13.4 How to Delete Members from a Station Profile

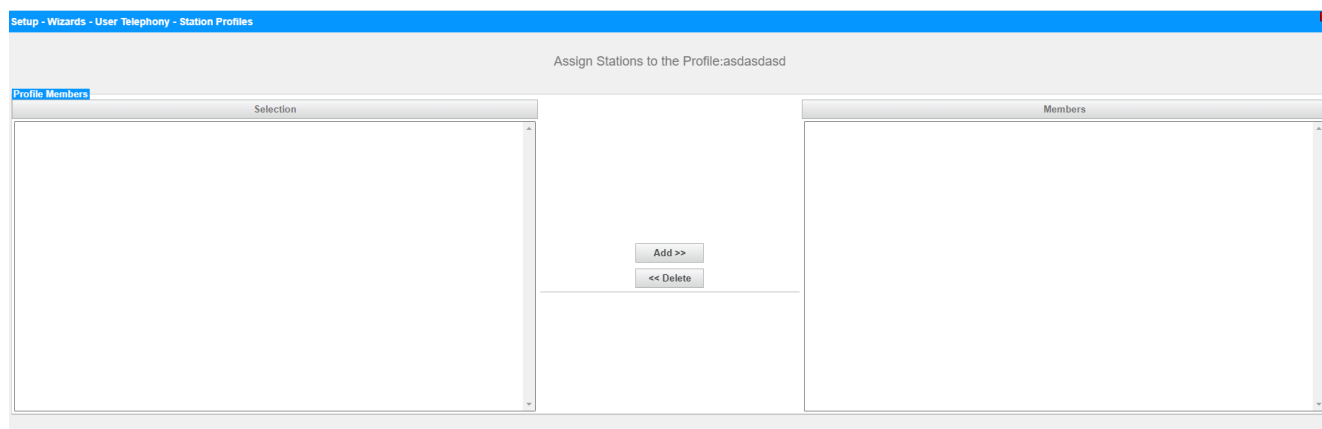

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > User Telephony**.

3. Click on **Edit** to start the **Station Profiles** wizard. All existing station profiles and their members are displayed.
4. Click **Assign Stations** in the row of the desired station profile.

5. Select the desired members from the **Members** list (multiple selections are allowed) and click on **Delete**. These subscribers can now be reassigned to another station profile.
6. Click on **OK**.
7. Click on **OK & Next**. All existing station profiles and their members are displayed.
8. Click on **OK & Next** followed by **Finish**.

11.13.5 How to Export or Import a Single Station Profile

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > User Telephony**.
3. Click on **Edit** to start the **Station Profiles** wizard. All existing station profiles and their members are displayed.
4. Click **Import/Export Profile** in the row of the desired station profile.
5. If you want to export the station profile to a file, click on **Download** and save the file in a directory of your choice.
6. If you want to import a station profile from a file, click **Browse**, navigate to the storage location of the file and load the file into the communication system.
7. Click on **OK**.
8. Click on **OK & Next**. All existing station profiles and their members are displayed.
9. Click on **OK & Next** followed by **Finish**.

11.13.6 How to Change Values and Settings of a Station Profile

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony Server > Stations**.
3. In the menu tree, click **Station > Profiles/Templates**.
4. In the menu tree, click on a station profile number.

5. If required, edit the name of the station profile (up to 16 characters are possible) on the **Station Parameters** tab in **Name** field and click **Apply**.
6. If required, edit the desired station parameters for the station profile on the **Station Parameters** tab and click **Apply**.

7. If required, edit the desired station flags for the station profile on the **Station Flags** tab and click **Apply**.

Stations

Configuring the Authentication Data at the SIP Phone

The screenshot shows the 'Expert mode - Telephony Server' interface. On the left is a navigation tree with categories like Station, UP0 Stations, IP Clients, Analog Stations, ISDN Stations, DECT Stations, IVMEVM Ports, Virtual Stations, UC Applications, and Profiles/Templates. The 'Profiles/Templates' category is expanded, showing a list of profiles from 1166 to 1184. Profile 1166, named 'asdasdasd', is selected. The main area displays the configuration for 'Profile - 1'. It has tabs for 'Edit station parameters', 'Edit station flags', 'Edit Group/CFW', and 'Add/Delete Profile member'. The 'Edit Group/CFW' tab is active. It shows a 'Call forwarding sequence' section with four targets: Target 1 is '* Called station', Target 2 is '** User defined', Target 3 is 'No entry', and Target 4 is 'No entry'. There is a checkbox 'The targets for day, night and internal are always the same:' which is checked. Below this, 'Call forwarding starts after:' is set to '15' seconds, and 'No call forwarding if busy:' is unchecked. The 'Class of service' section shows 'Day:' as 'International' and 'Night:' as 'International'. The 'Call pickup' section shows 'Group:' as '-'. The top right of the main area shows 'Display: asdasdasd'.

8. If required, edit the desired call forwardings for the station profile on the **Edit Group/CFW** tab and click **Apply**.

9. Click on **Apply**.

11.13.7 How to Export or Import all Station Profiles

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Stations**.
3. In the menu tree, click **Stations > Profiles/Templates**.
4. Click on the **Import/Export All Profiles** tab.
5. If you want to export all station profiles to a file, click on **Download** and save the file in a directory of your choice.
6. If you want to import all station profiles from a file, click **Browse**, navigate to the storage location of the file and load the file into the communication system.

11.14 Configuring the Authentication Data at the SIP Phone

The data used to authenticate a SIP subscriber at the communication system must also be entered directly at the SIP phone. The must be done by using the data that was entered in the WBM for each SIP subscriber.

The following data must be taken from the WBM and entered at the SIP phone (separately for each SIP phone):

- Password
Password for authentication.

- SIP User ID / Username
User name for authentication.
- Realm
Zone or domain for authentication.

The configuration can be performed via the WBM of the SIP phone or directly on the display of the SIP phone.

11.14.1 How to Configure the Authentication Data via the WBM of the SIP Phone

Prerequisites

The SIP phone is integrated in the LAN.

The admin PC has access to the WBM of the SIP telephone.

You know the IP address of the SIP phone.

The configuration uses an OpenStage 60 SIP as an example.

Step by Step

1. Start the web browser on the admin PC and open the login page of the WBM of the SIP telephone at the following address:

`https://<IP address of the SIP telephone>`

NOTICE: If the WBM cannot be started, check the LAN connection and repeat the call. If it still cannot be started, check whether the IP address has been blocked by your firewall. More detailed information can be found in the documentation of your firewall

2. If the browser reports a problem with a security certificate, install the certificate (using the example of Internet Explorer V10).

- a) Close the web browser.
- b) Open the web browser with administrator rights by clicking the right mouse button on the web browser icon and selecting the menu item **Run as administrator** from the context menu.
- c) Allow the User Account Control.
- d) Open the login page of the WBM of the SIP telephone at the following address:

`https://<IP address of the SIP telephone>`

- e) Click on **Continue to this website**.
- f) Click on the message **Certificate Error** in the navigation bar of the web browser.
- g) Click on **View Certificates**.
- h) Click on **Install Certificate** (only visible with administrator rights).
- i) Select the option **Local Computer** and confirm with **Next**.
- j) Select the option **Place all certificates in the following store**, click **Browse** and specify **Trusted Root Certification Authorities**.

- k) Confirm with **OK** and then with **Next** and **Finish**.
- l) Confirm the certificate import with **OK** and close the certificate window **OK**.
- m) Close the web browser.
- n) Start the web browser again (without administrator rights) and open the login page of the WBM of the SIP telephone at the following address:

`https://<IP address of the SIP telephone>`

- 3. When you log in for the first time, you are prompted to enter a password.
 - a) Enter a new password in the **New Password** and **Confirm Password** fields to protect the system against misuse. Note case usage and the status of the **Num** key. The password is displayed as a string of asterisks (*).

NOTICE: The password must be at least 6 characters long and include a digit. Make sure that you remember your new password.

- 4. Click on **OK**.
- 5. Click on the **Administrator Pages (Admin)** tab.
- 6. Enter the administrator password (default password: 123456) and click **Login**.
- 7. Navigate to **System > Registration**.

Registration

SIP Addresses

SIP server address	192.168.1.2
SIP registrar address	192.168.1.2
SIP gateway address	192.168.1.2

SIP Session

Session timer enabled ☐

Backup proxy address

Backup registration timer (seconds)

Backup transport

Backup OBP flag ☐

8. Select the entry **Genesys** from the **Server type** drop-down list in the **SIP Session** area.
9. In the **Realm** field, enter the realm entry that you specified when configuring SIP stations in the WBM of the communication system (e.g., SMART-SIP).
10. In the **User ID** field, enter the user ID that you specified when configuring SIP stations in the WBM of the communication system (e.g., SIP-120).
11. In the **Password** field, enter the password that you specified when configuring SIP stations in the WBM of the communication system.
12. Click on **Submit**. The changes are saved.
13. Log out from the WBM with the **Logoff** button.

11.14.2 How to Configure the Authentication Data on the Display of the SIP Phone

Prerequisites

The required authentication data (user ID, password, and realm) is known to you.

The configuration uses an OpenStage 80 SIP as an example.

Step by Step

1. To reach the administration mode of the system telephone, press the appropriate key for the Settings/Applications menu on the phone.
2. Scroll through the `Settings` options until `Admin` and confirm this with the OK key.
3. Enter administrator password (123456 by default) and confirm your selection with the OK key.
4. Scroll to `System` and confirm your selection with the OK key.
5. Scroll to `Registration` and confirm your selection with the OK key.
6. Scroll to `SIP Session` and confirm your selection with the OK key.
7. Scroll to `Server type` and confirm your selection with the OK key.
8. Scroll to the `Genesys` entry and confirm your selection with the OK key.
9. Scroll to `Realm` and confirm your selection with the OK key.
10. Enter the realm entry that you specified when configuring SIP stations in the WBM of the communication system (e.g., `SMART-SIP`). Click OK to confirm.
11. Scroll to `User ID` and confirm your selection with the OK key.
12. Enter the user ID that you specified when configuring SIP stations in the WBM of the communication system (e.g., `SIP-120`). Click OK to confirm.
13. Scroll to `Password` and confirm your selection with the OK key.
14. Enter the password that you specified when configuring SIP stations in the WBM of the communication system. Click OK to confirm.
15. After saving the changes, confirm the prompt by selecting `Save select` and confirming it with the OK button.
16. Use the Back key to go back to the `Admin` menu.
17. If the system telephone needs to be restarted due to the changes made, the menu item `Restart` will appear in the `Admin` menu. Confirm the `Restart` with the OK key and then also confirm `Yes` with the OK key. The system telephone performs a reboot and logs in to the communication system.

11.15 Exporting Subscriber Data

Important subscriber data can be exported to an XML file.

In addition to the user data, such as the names and phone numbers of the subscribers, e-mail addresses and phone types, for example, the XML file may also contain additional information such as group phone numbers and license assignments.

The XML file can be edited using a spreadsheet program such as Microsoft Office Excel, for example.

A template with sample data sets and a description thereof can be found in the file `csv-templates.zip` under **Service Center > Documents > CSV Templates**.

11.15.1 How to Export the Station Data

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance > Configuration** in the navigation tree.
3. Click on **Configuration > Port Configuration** in the menu tree.
4. Click on the **Export Configuration** tab.
5. Click on the **Download** button.
6. Confirm the prompt with **OK**.
7. Click on **Save** and select the storage location of the XML file.
8. Then click **Save**.

12 UC Smart

UC Smart is integrated in all OpenScape Business models (with and without the UC Booster) and offers unified communications features such as presence status and voice messages as well as conferencing, for example.

Clients for UC Smart

The UC Smart features can be used with the following clients:

- myPortal @work
- myPortal to go (as Mobile UC App or Web Edition)
- Application Launcher
- OpenScape Business Attendant / BLF
- 3rd Party WSI Clients

The capacity limits (for expansion) depend on the OpenScape Business model being used and any possibly installed OpenScape Business UC Booster variants.

Special Aspects of UC Smart with OpenScape Business S

Due to the system architecture, the following restrictions apply to OpenScape Business S:

- The number of voicemail messages is not shown on the phone's display (MWI).
- No fax, busy or idle detection is supported for the voicemail box (SmartVM). Incoming fax calls cannot be switched to a default fax device after being answered by the SmartVM. The SmartVM records for 2 minutes.
- When connections are switched by the Company AutoAttendant to busy subscribers, the caller receives a busy signal. There is no way to leave a voice message.
- If, when checking a voice message, you want to be redirected to the phone number stored in the SmartVM (calling party number), this number must be identical to the phone number of the user that was configured for the SmartVM.
- For connections to the voicemail box (SmartVM), SIPQ trunks are occupied at the UC Booster Server and OpenScape Business S. No trunk licenses are required for this.
- MEB channels are occupied for simultaneous announcements.
- Sixty MEB channels are available for voice connections to the voicemail box (SmartVM) or AutoAttendant.

NOTICE: After changes in configuration of Stations, Groups, Mobility or other system parameters like trunk access codes, the UC Data for either UC Smart or UC Suite need to be synchronized. Synchronization occurs five minutes after the last configuration change. If a later configuration change occurs before the 5 minutes timer, the timer is restarted. UC Data may outdated until synchronization starts.

Related concepts

[UC Features \(Overview\)](#) on page 81

12.1 Basic Settings for UC Smart

The basic settings for UC Smart can be customized.

UC Smart can be enabled or disabled. If UC Smart is used, UC Suite must be disabled.

Password Settings

The administrator must assign an initial password for all users of UC Smart and communicate this password to the users. The initial password may be the same for all users or different for each user. The initial password must be changed by the user when logging in at a UC Smart client for the first time. Without the assignment of an initial password, the user cannot log into to a UC Smart client.

The new password assigned by the user should meet stringent password policies.

Advanced Settings for Application-controlled Conferences (Optional)

During the basic installation, the administrator must set up the **Functional number for MeetMe Conferencing** (MeetMe dial-in number) and at least one **Functional number for Conferencing** (conference room) in the WBM.

For OpenScape Business X systems, the MeetMe dial-in number must be assigned a call destination list in which the first entry is empty and the second entry matches the call number of the voicemail box (SmartVM).

For OpenScape Business S systems, the MeetMe dial-in number must be assigned a call destination list in which the first entry matches the call number of the voicemail box (Route: Application Suite).

Finally, the MeetMe dial-in number must also be assigned a standard voicemail box.

The description of the configuration can be found here: [How to Configure Application-controlled Conferences](#) ,

License Assignments

The administrator must assign a UC User license to each UC Smart user.

Additional licenses can be optionally assigned for:

- Voicemail (also usable without UC Smart)
- Conference
- Application Launcher

12.1.1 How to Activate UC Smart

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click in the navigation tree on **Applications > Application Selection**.
3. If you want to use UC Smart without the UC Booster Server, click on **Package with UC Smart**,
4. If want to use UC Smart with the UC Booster Server, click on **Package with UC Smart on OSBiz UC Booster Server** and, in addition, enter the IP address of the external Linux server in the **IP address of the OSBiz UC Booster Server** field.
5. Click on **Apply**.

Next steps

How to Configure UC Smart

12.1.2 How to Configure UC Smart

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

The **Package with UC Smart** has been activated under **Application Selection** in Expert mode.

Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click on **Wizards > UC Smart**.
3. Click on **Edit** to start the **UC Smart** wizard.
4. Click on **Administration > Basic Settings** in the menu tree.
5. Under **Enable / Disable UC Smart**, select the check box **Active**.
6. Assign initial password under **Password Policy**:
 - a) Go to **System-wide initial UC Smart Password**, and click **Configure**.
 - b) Enter the initial password for all UC Smart users in the **System-wide initial UC Smart password** field..
 - c) Click on **Apply**.
7. Specify password policies under **Password Policy**:

NOTICE: For detailed information on the password policies, click on the icon **i**.

- If you want to enforce a strict password policy for user passwords (recommended), select the check box **Force user to choose secure password**.
 - If you do not want to enforce a strict password policy for user passwords (not recommended), clear the check box **Force user to choose secure password**.
8. Specify access to the system under **Access Rules**:
 - If you want to enable encrypted access from UC Smart clients to the system (recommended when using myPortal to go via the Internet), select the **HTTPS** check box.
 - If you want to enable unencrypted access from UC Smart clients to the system (not recommended when using myPortal to go via the Internet), select the **HTTP** check box.
 9. Select the check box **Save login data for devices** if the login credentials are to be additionally stored in the phone.
 10. Click on **Apply**.

12.1.3 How to Configure Application-controlled Conferences

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

The **Package with UC Smart** has been activated under **Application Selection** in Expert mode.

Step by Step

1. In the navigation bar, click on **Setup**.
2. Click on **Edit** to start the **Basic Installation** wizard.
3. Skip the **Overview** window with **OK & Next**. The **Central Functions for Stations** window appears.
4. Enable the radio button **Change pre-configured call and functional numbers**.
5. Click **Execute function**. The **Change preconfigured call and functional numbers** window appears.
6. If necessary, change the **Functional number for MeetMe Conferencing** to suit your requirements.
7. Assign at least one **Functional number for Conferencing** for the conference room.
8. Click **OK** when finished. You are taken back to the **Central Functions for Stations** window.
9. Click **OK & Next**.
10. Exit the wizard by skipping all other windows with **OK & Next**.
11. In the navigation bar, click on **Expert Mode**.
12. In the navigation tree, click **Telephony Server > Incoming Calls**.
13. Click **Incoming Calls > Call Forwarding** in the menu tree.
14. Click on the **Call dest. list - Definition** tab.

15. For OpenScape Business X, you define the call destination list for the MeetMe dial-in number as follows:
 - a) Under **Call dest. list**, select a free call destination list, e.g., 500.
 - b) Select **No entry** as the first destination and select the call number of the voicemail box (e.g., 351 VOICEMAIL Group) as the second destination.
16. For OpenScape Business S., you define the call destination list for the MeetMe dial-in number as follows:
 - a) Under **Call dest. list**, select a free call destination list, e.g., 500.
 - b) Select External Destination as First Destination (Route: Application Suite) and enter the call number of the voicemail box in "External Destination" field.
17. Click on **Apply** followed by **OK**.
18. Close the window.
19. In the navigation bar, click on **Expert Mode**.
20. Click on **Telephony > Auxiliary Equipment** in the navigation tree.
21. Click on **Auxiliary Equipment > SmartVM** in the menu tree.
22. Click on the **Edit SmartVM Mailboxes** tab.
23. In the **Mailbox call no.** column, enter the MeetMe dial-in number for which the mailbox is to be added in any free field.
24. Click on **Apply** followed by **OK**.

12.1.4 How to Determine the IP Addresses of the System Components

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click in the navigation tree on **Applications > Application Selection**.

Under **Application Selection**, the IP addresses of various components are shown, including, for example, **UC Smart**, **Application Launcher**, **CSTA Connector**, **Open Directory Service**, **UC Suite** and **Web Collaboration**.

Related concepts

[Basic Settings for UC Suite](#) on page 511

12.1.5 How to Determine the Status of C Smart

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

The **Package with UC Smart** has been activated under **Application Selection** in Expert mode.

Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click on **Wizards > UC Smart**.
3. Click on **Edit** to start the **UC Smart** wizard.
4. Click on **Administration > Status** in the menu tree.

Status information on UC Smart is displayed under **Application Server**, including, for example: **Status, Version, Telephone System, Database, EVM, Pending Monitors, Active Users, Active Connections, Active HTTPS Connections, Mobility Entry Users, Users Without Device** and **Blocked Users**.

12.2 UC Smart Clients

UC Smart clients provide subscribers with convenient user interfaces for unified communications.

The system offers the following UC Smart clients for the following devices:

Client type	Client	Device
Communications Client	myPortal @work	PC
Mobile Client	myPortal to go (UC Smart) (see Mobility on page 920)	Smartphone, Tablet PC
Communications Client	OpenScape Desk Phone CP 400/600/600E/700/700X/710 HFA(integrated Client to phone software)	OpenScape Desk Phone CP 400/600/600E/700/700X/710 HFA

12.2.1 myPortal @work

myPortal @work is a Unified Communication Application (Microsoft Windows and Mac OS X), which combines all needed features and services, like convenient dialing via phone directories, favorites, conversations and information on the presence status of colleagues, into a single solution designed to accelerate daily communication, improve teamwork and to get in quick contact with colleagues, customers and Partners.

myPortal @work can be used either in UC Smart or in UC Suite mode. Depending on the mode, the offered features in the user interface vary. You cannot change the operation mode, as this is set by the system administrator. In case of any doubt about the current operation mode of your myPortal @work client, ask your system administrator for details.

myPortal @work offers an embedded Voice over IP (VoIP) telephony client. If the VoIP option is activated, the voice call related features of the myPortal @work client use the VoIP functionality.

NOTICE: To use Voice over IP (VoIP) functionality, the user must be configured as system client.

For remote Voice over IP (VoIP) usage with Device@Home, please see [1 Configuration for System Device@Home](#)

VoIP functionality supports a set of features on top of UC features:

- Make a call
- Answer a call
- Terminate a call
- Consultation
- Transfer after answer
- Blind transfer
- Deflect
- Deflect to voicemail
- Automatic Recall (display notification for a recall is not yet supported)
- Toggle/Connect
- Mute/Unmute (only for VoIP functionality)
- System Conference
- Call waiting rejection
- Camp-on
- Do not disturb (DND)
- DTMF
- Call pick up

NOTICE: Since myPortal@Work client is not supporting the capability to send DTMF tones to another station, sending a DTMF tone via CSTA's command 'generateDigits' is respectively also not supported and such a request will be denied and rejected by the system.

Working in a team:

myPortal @work VoIP client can be also used in:

- Group (e.g. Linear, Call waiting)
- MULAP as a MULAP member

Signaling and Payload Encryption (SPE) is also supported for the communication system. VoIP client uses modern WebRTC security stack so it has also secure data transfer using DTLS.

NOTICE: ITSP SDES configuration is also supported.

Service codes can be initiated from the search bar but they are not supported in case of problems. Feedback regarding successful or unsuccessful execution of service codes is not provided and thus, it is strongly advised to utilize the input options provided by the myPortal @work user interface in order to control the respective features.

myPortal @work in UC Suite Mode can be used not only as stand-alone but also in combination with existing myPortal for Desktop/ Outlook, myAgent, myAttendant Client (CTI, Favorites and Conversations). The existing UC user licenses can also be used with myPortal @work.

The following description refers mainly to my Portal @work in UC Smart mode. Deviations for the UC Suite mode are pointed out in myPortal @work User Guide.

myPortal @work supports generally the following features:

- Presence status
- Status-based call forwarding
- Directories including search by name
- Favorites
- Conversations: up to 25 conversations are displayed in the client and each conversation has up to 50 entries
- Conferencing
- Hotkey Dialing / Hotkey Search / Telephony hyperlinks
- Call Functions either via:
 - 1) Associated telephone device
 - 2) Integrated Voice over IP telephony client
- Voicemail control
- Zoom In / Zoom Out
- Screen share via OpenScape Web Collaboration (optional)

Use of myPortal @work in Microsoft Terminal Server environment

myPortal @work is released for UC and CTI functionality in Microsoft Terminal Server environments with the following limitations:

- Telephony Hyperlinks and Click to Dial are not supported
- Start application on launch is not supported
- Upload of user image is not supported
- Functionality of dock/undock, pin/unpin and minimize to tray bar is limited
- VoIP functionality is not supported

12.2.1.1 Prerequisites for myPortal @work

In order to use the UC client, the client PC must be equipped with the appropriate hardware and software configurations. Depending on the configuration, administration rights are required for the installation and automatic updates. The available functionality depends on the licenses being used.

The following prerequisites are required for the installation of myPortal @work:

- Administrator rights
- myPortal @work software setup program
- IP addresses and ports of the communication system
- FQDN or IP address, port for WAN connectivity (device@home)
- Login Data (User and Password) for your UC user account in the communication system
- Voice-Mail account information (optional)
- MULAP call number in case of multiple number assignment (optional)
- Windows OS and Apple Mac OS X

NOTICE: Make sure that TLS 1.2 must be activated in Internet Options (in control panel) and the latest patches from Microsoft must be installed or activated manually.

If above actions are not performed then HTTPS access will be rejected.

Telephones

myPortal @work can be used in combination with the following telephones:

NOTICE: myPortal @work can also be used as stand-alone, using VoIP functionality, without the need of a physical device.

- OpenStage HFA
- OpenScape Desk Phone IP 35G/55G HFA
- OpenScape Desk Phone IP 35G Eco HFA
- OpenScape Desk Phone CP 100/200/205/400/600/600E/700/700X HFA
- OpenScape Desk Phone CP 110/210/710 HFA
- Analog telephones
- ISDN Phones
- OpenScape Personal Edition HFA
- OpenStage M3 (OpenScape Business Cordless)
- OpenScape DECT Phone S6/SL6/R6 (OpenScape Business Cordless)

Older devices (such as optiPoint 410/420/500 and Gigaset M2/SL3/S4/SL4/S5) are supported. Optiset E devices cannot be operated. For details on the tested and released devices, please refer to the Release Notice.

NOTICE: OpenScape Desk Phone CP 400/600/600E/700/700X/710 HFA integrated Client does not have any special prerequisites, apart from the standard client configuration and license.

"Favorites" in phone menu contains Free Programmable Keys and does not relate to UC Favorites. Details for those keys and how to, are available within the device documentation.

NOTICE: For analog and DECT telephones, the Message Waiting Indication (MWI) is not supported, and only limited support is available for displaying information on the phone.

Web Browsers

The following web browsers have been released for programming telephone keys via the UC client:

- Microsoft Internet Explorer Version 10 (or later)
- Mozilla Firefox Version 19 (or later)
- Google Chrome

Installation Files

The administrator can download the installation files from the **Service Center > Software** and make them available to users via a network drive, for example.

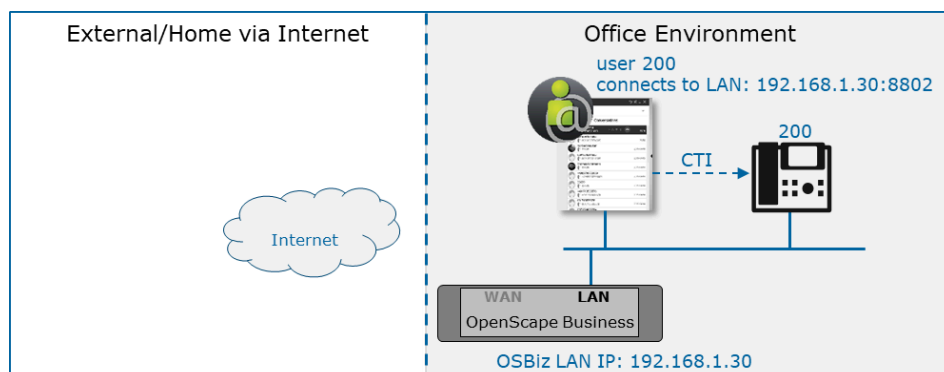

12.2.1.2 myPortal @work user configuration

myPortal @work is a combination of a UC client and a VoIP client and those two functionalities require the following configurations/licenses based on different UC modes (Smart/UC Suite) and use cases.

NOTICE: When a myPortal @work user account is locked after several incorrect log in attempts, in UC Suite mode, it is not visible in the UC Suite User Directory. You can view the locked myPortal @work users under **Expert Mode > Web Services > Web Services Assistant > User Management** but you can unlock these accounts under **Expert Mode > OpenScape Business UC Suite > User Directory**.

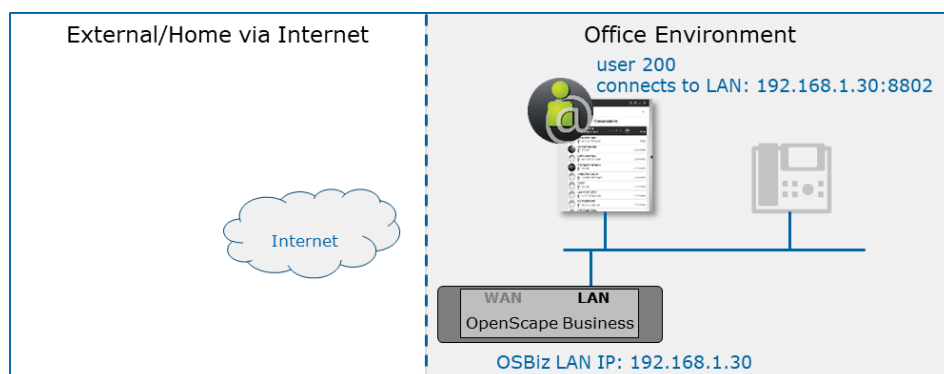

Local LAN configuration - UC and CTI client only

myPortal @work is used as UC and CTI client for an associated desk phone without VoIP.

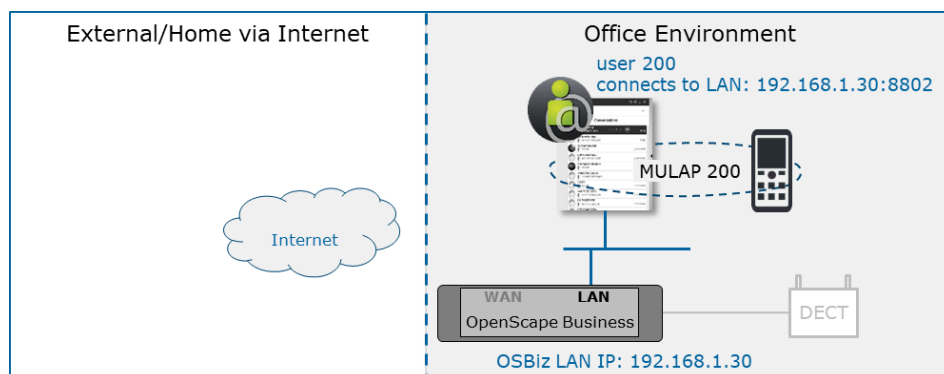

- Licenses: UC user or Groupware User
- myPortal @work login: in the login screen set your login username/password / LAN IP address:8802

Local LAN configuration - UC and VoIP client

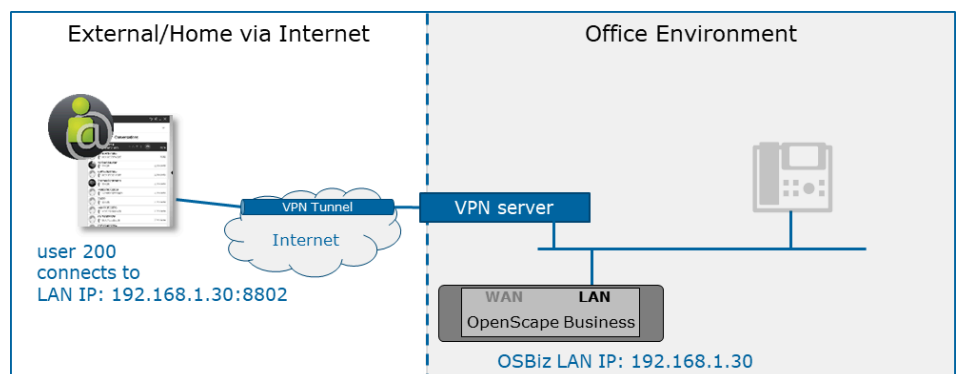

- Licenses: IP User and UC User or Groupware license
- myPortal @work login: in the login screen set your login username/password / LAN IP address:8802
- myPortal @work VoIP registration: After you have successfully logged in, you need to go to settings> VoIP> Enable VoIP
- STUN connectivity in the client is not needed for pure inhouse connections. Nevertheless, this is required in some hybrid scenarios with other users using myPortal @work VoIP via public internet. In order to check STUN connectivity, go to Settings > VoIP > Advanced ICE settings > Check ICE status.

MULAP user configuration (Local LAN)

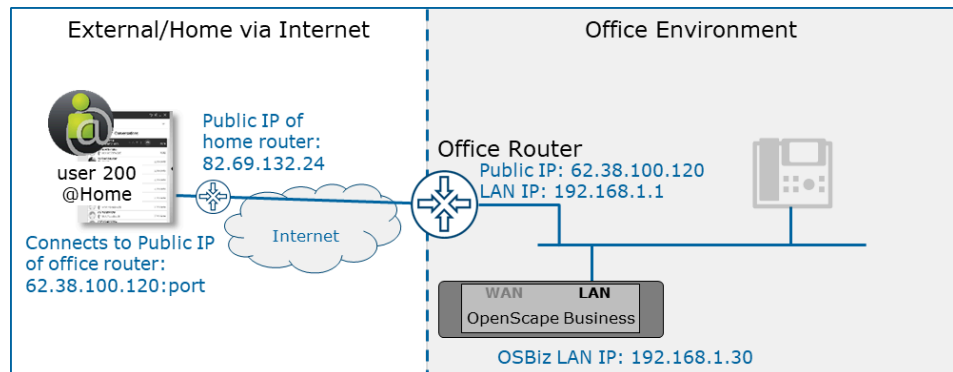

- Licenses:
 - myPortal @work: IP User and UC User or Groupware license
 - other Mulap device - in this example DECT: TDM User license or IP User (Mulap configuration is recommended for combination with TDM or DECT devices, but could also be used with an IP device. In case of an IP device see also section [Deskshare user via local LAN](#) on page 474 and [Remote Deskshare user via VPN](#) on page 474).
- myPortal @work login: in the login screen set your login username/password of the MULAP number / LAN IP address:8802
- myPortal @work VoIP registration: After you have successfully logged in, you need to go to settings> VoIP> choose the controlled device and then enable VoIP
- STUN connectivity in the client is not needed for pure inhouse connections. Nevertheless this is required in some hybrid scenarios with other users using myPortal @work VoIP via public internet. In order to check STUN connectivity, go to **Settings > VoIP > Advanced ICE settings > Check ICE status**.

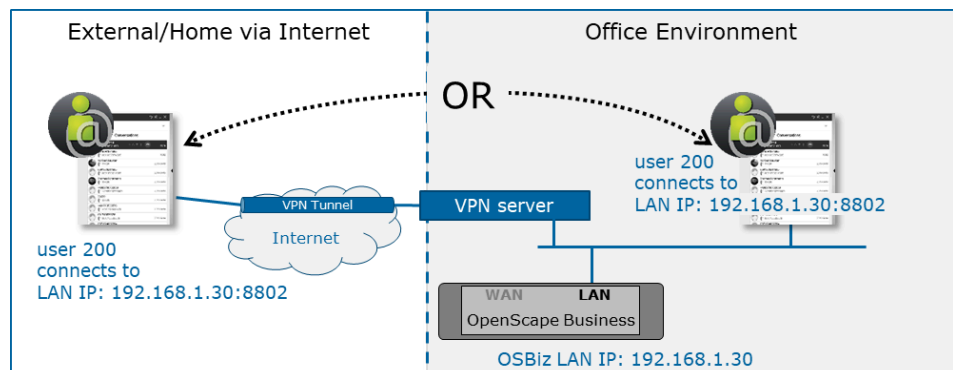

Home user with VPN connection configuration

- Licenses: IP User and UC User or Groupware license
- myPortal @work login: in the login screen set your login username/ password / LAN IP address:8802
- myPortal @work VoIP registration: After you have successfully logged in, you need to go to settings> VoIP> Enable VoIP
- STUN connectivity is mandatory. In order to check STUN connectivity go to Settings > VoIP > Advanced ICE settings > Check ICE status.

myPortal @work via public Internet

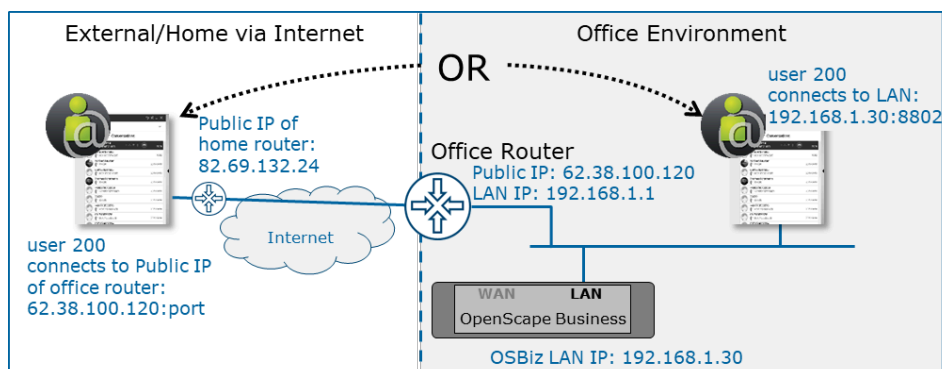

- Licenses: IP User and UC User or Groupware license
- myPortal @work login: in the login screen set your login username/password / Public IP address:port configured from the administrator.
- myPortal @work VoIP registration: After you have successfully logged in, you need to go to settings> VoIP> Enable VoIP
- Prepare the network environment as described in chapter [Configuration steps to use myPortal @work via the internet](#) on page 476
- SBC flag is not required for myPortal @work. It is only needed if you use a Hardware device.
- Please do not use the OSBiz WAN interface for connecting to the internet when using myPortal @work via Public IP. If this is done internal SBC will detect the Public IP address of the WAN interface and will use this in the communication between the client and the OSBiz which will lead to payload issues. Proposed configuration: Connect the ITSP via the LAN interface. This can be done via the normal ISP router or via a second router and static routes.
- STUN connectivity is needed. In order to check STUN connectivity go to Settings > VoIP > Advanced ICE settings > Check ICE status.

Home user with VPN and local LAN configuration (e.g. Moving from office to home and back)

- Licenses: IP User and UC User or Groupware license
- myPortal @work login: in the login screen set your login username/password/ LAN IP address:8802

- myPortal @work VoIP registration: After you have successfully logged in, you need to go to settings> VoIP> Enable VoIP
- myPortal @work can be used in both environments without changing the settings.
- STUN connectivity is mandatorily needed. In order to check STUN connectivity, go to Settings > VoIP > Advanced ICE settings > Check ICE status.

myPortal @work via public Internet and local LAN configuration (e.g. moving from office to home and back)

- Licenses: IP User and UC User or Groupware license
- myPortal @work login: in the login screen set your login username/password/ LAN IP address:8802 and Public IP address:port configured from the administrator. By configuring both addresses there is no need to use a second profile when moving from office to home and back.
- myPortal @work VoIP registration: After you have successfully logged in, you need to go to settings> VoIP> Enable VoIP
- Prepare the network environment as described in chapter [Configuration steps to use myPortal @work via the internet](#) on page 476
- SBC flag is not required for myPortal@work. It is only needed if you use a Hardware device.

For VoIP registration

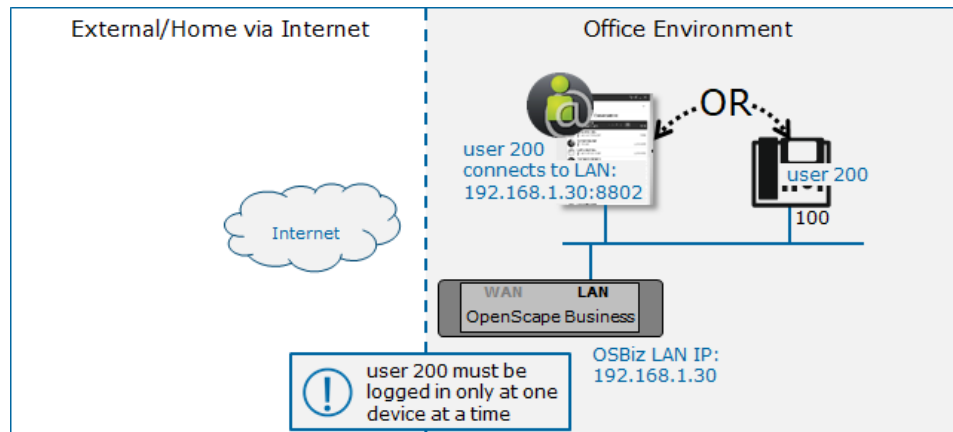

In case both local and home user are used, the user should have only one VoIP connection either in home or in office.

For UC

When the user wants to be connected in UC at the same time in more than one place:

- UC Smart mode: UC client can be connected at the same time from home and from office, but only one VoIP client is supported in this scenario and the VoIP functionality from the other client should be unregistered.
- UC Suite mode: Please check paragraph "Combination of myPortal @work with other UC Suite clients and license configuration" Only one myPortal @work client is allowed.

Deskshare user via local LAN

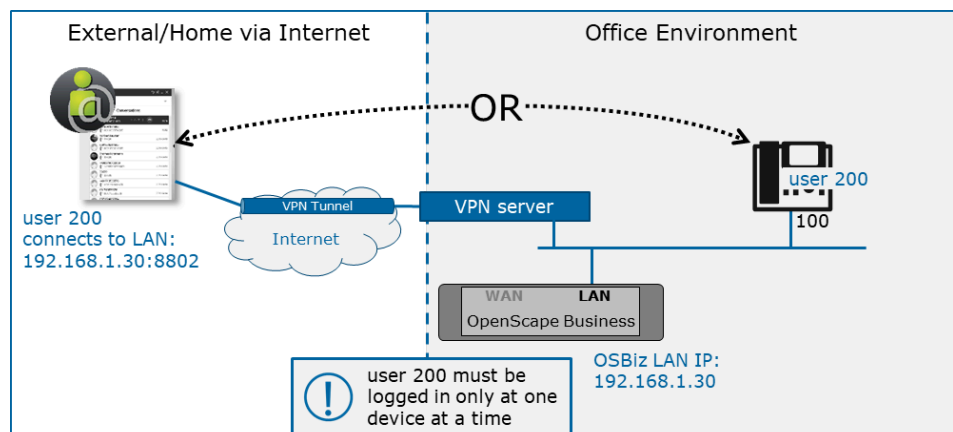

- Licenses: Deskshare license and UC User or Groupware license
- myPortal @work login: in the login screen set the login of the deskshare extension username/password/ LAN IP address:8802
- myPortal @work VoIP registration: After you have successfully logged in, you need to go to settings> VoIP> Enable VoIP

Example: Device uses dummy number = "100" Connect to "100" with your DeskPhone as deskshare e.g. 200 using service code *9419.

In order to use myPortal @work with user 200, the deskphone is automatically logged out and returns to the dummy number "100". When switching back to deskphone again please ensure that myPortal @work is unregistered (# user must exit the application or log out).

Remote Deskshare user via VPN

The same configuration as described in chapter [Deskshare user via local LAN](#) on page 474 is also supported for home user via VPN.

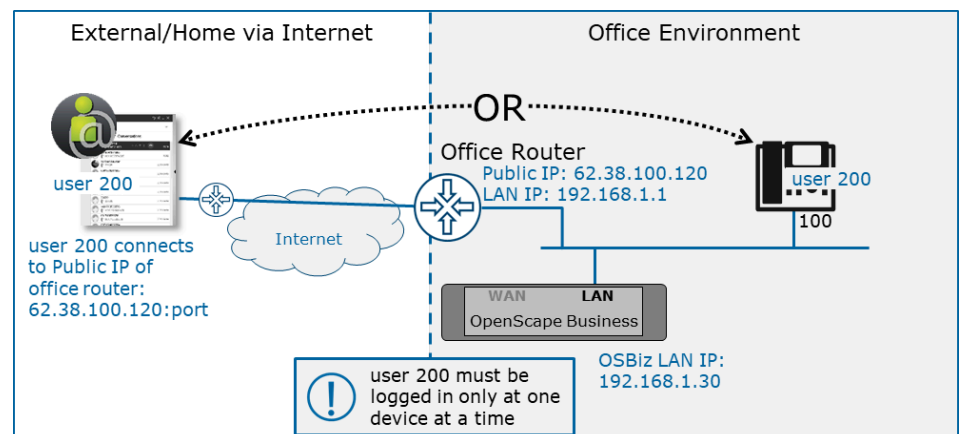

- Licenses: Deskshare license and UC User or Groupware license
- myPortal @work login: in the login screen set the login of the deskshare extension username/password/ LAN IP address:8802
- myPortal @work VoIP registration: After you have successfully logged in, you need to go to settings> VoIP> Enable VoIP

Example: Device uses dummy number = "100" Connect to "100" with your DeskPhone as deskshare e.g. 200 using service code *9419.

In order to use myPortal @work with user 200, the deskphone is automatically logged out and returns to the dummy number "100". When switching back to deskphone again please ensure that myPortal @work is unregistered (# user must exit the application or log out).

Remote Deskshare user via public Internet

The same configuration as described in chapter [Deskshare user via local LAN](#) on page 474 is technically also possible with home users via public Internet. Nevertheless, this is not yet completely tested and therefore described preliminary in this document version.

- Licenses: Deskshare license and UC User or Groupware license
- myPortal @work login: in the login screen set the login of the deskshare extension username/password/ LAN IP address:8802
- myPortal @work VoIP registration: After you have successfully logged in, you need to go to settings> VoIP> Enable VoIP

Example: Device uses dummy number = "100" Connect to "100" with your DeskPhone as deskshare e.g. 200 using service code *9419.

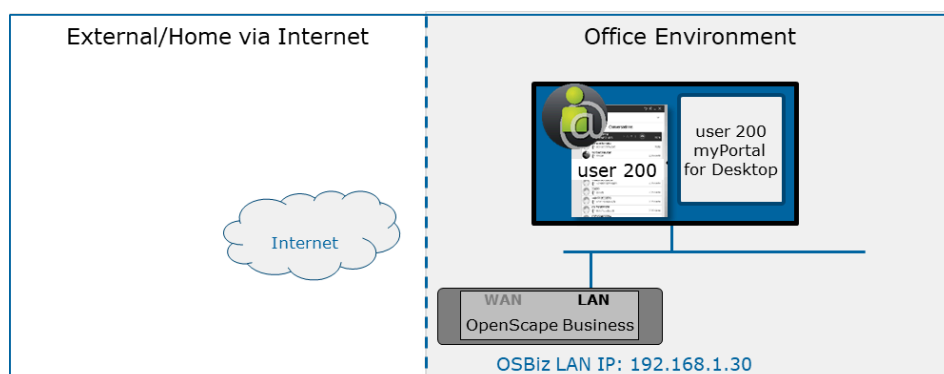

In order to use myPortal @work with user 200, the deskphone is automatically logged out and returns to the dummy number "100". When switching back to deskphone again please ensure that myPortal @work is unregistered (# user must exit the application or log out).

Combination of myPortal @work with other UC Suite clients and license configuration

NOTICE: The configurations described in this chapter are also supported for home user via VPN.

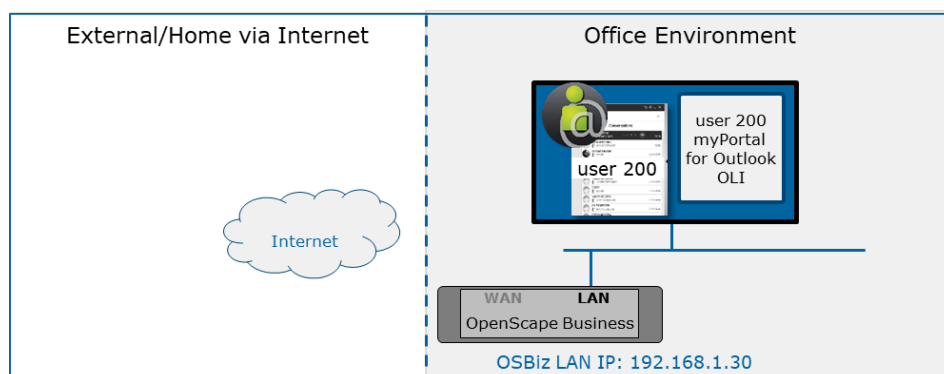

UC user license

The same user can be connected in parallel with myPortal @work and myPortal for Desktop.

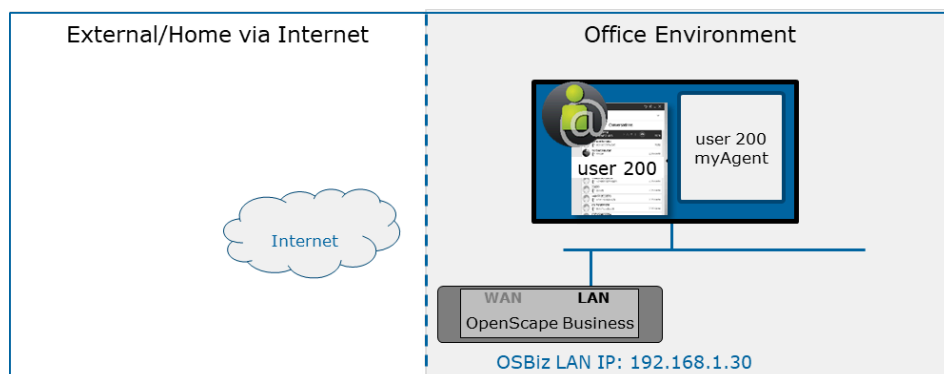

Groupware license

The same user can be connected in parallel with myPortal @work and OLI.

Combination of IP, UC user and myAgent license

myAgent and myPortal @work VoIP can be used as a softphone in parallel.

12.2.1.3 Configuration steps to use myPortal @work via the internet

In order to use myPortal @work from the internet the OpenScape Business therefore needs to be accessible from the internet as well. For all examples within this chapter, the following basic network scenario is assumed.

Network scenario description

The OpenScape Business is located within the office environment, which is connected to the internet via the office router. This router is accessible from the internet either via the public IP address of "62.38.100.120" or via a DNS name.

myPortal @work client is connected to the LAN within a home or external network, which is connected to the internet via a separated router. The external router is accessible from the internet with the public IP address "82.69.132.24".

Configuration steps

To use the myPortal @work client on the OpenScape Business via the internet the following components need to be configured accordingly.

OpenScape Business within the office

Active STUN support on the system if not already done for an ITSP.

Configure myPortal @work user (SBC flag is not needed for VoIP)

Office router

Since myPortal @work client must reach the OpenScape Business from the internet and vice versa, the following configuration must be done on the office router to accomplish this:

- HTTPS port forwarding from the external port (default is 8802) to the internal port 8802 of the system
 - External port (default is 8802) -> Office Router -> 192.168.1.30:8802

For more information, see also chapter [Ports and Firewall Settings](#) on page 478

myPortal @work/ external router

The myPortal @work client needs to connect to the public IP address or DNS of the office internet router on the external port, which is by default 8802 (due to the previously configured port forwarding this will point to the OpenScape Business within the office network).

In most cases nothing additional needs to be configured on the external router but in case of a problem, see chapter [Ports and Firewall Settings](#) on page 478.

12.2.1.4 Other Configuration Hints & Settings

STUN server settings

For more information on how to configure the STUN server, see chapter "Configuring STUN" in guide "[How to configure system device@home](#)" and OpenScape Business V3, my Portal @work, User Guide section "How to add a STUN server"

Headsets

Every detected sound device / microphone found in the operating system can be used.

Jabra/Plantronics headset integration

In case of problems with Jabra headset integration, run the application with administrator rights.

In order to use Jabra headset integration, the Jabra device needs to be set as the main microphone device in myPortal @work.

For Plantronics integration, Plantronics hub should be installed.

Ports and Firewall Settings

Basically, the following ports must be configured for myPortal@work signaling:

- UC functionality & WebRTC / VoIP signaling: 8802
- Default STUN server port: 3478. If a custom STUN server is configured, a different port may be required.

Configuration of ports for WebRTC / VoIP payload depends on the type of firewall used in the customer environment. In order to run myPortal @work in a customer network environment it is fundamental to understand and check the type of used firewall, either stateful or stateless, and configure the firewall settings together with the responsible IT admin.

To better understand the differences between both type of firewalls please read the following:

- Stateless firewalls are designed to protect networks based on static information such as source and destination.
- A stateful firewall is a firewall that monitors the full state of active network connections. This means that stateful firewalls are constantly analyzing the complete context of traffic and data packets.

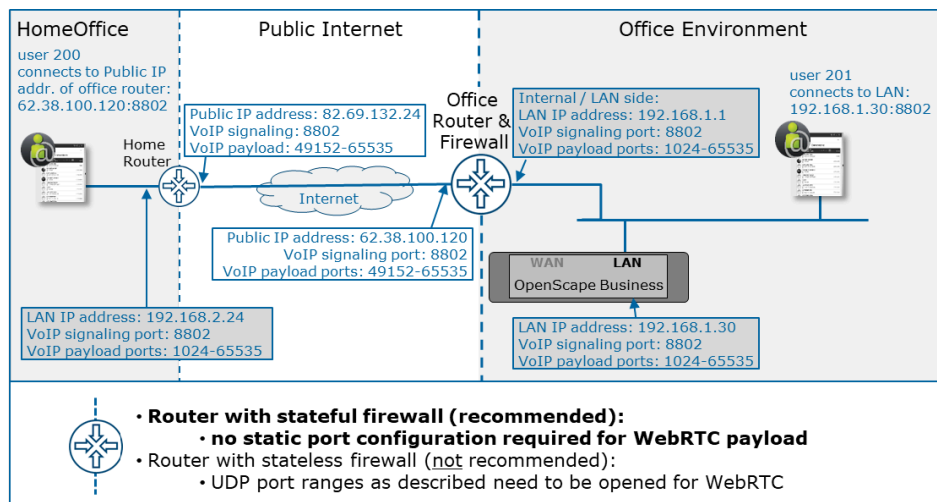

For further information on those firewall types please refer to the internet or relevant technical literature as a source of information.

Atos Unify assumes that a stateful firewall/NAT device is going to be used in order to better protect private customer networks means that this device needs to allow internal outbound connections towards their destination.

The firewall/NAT device will block any packets in the inbound direction, unless it belongs to an already established session (on an ephemeral/dynamic port) which was previously established outbound.

In terms of the port usage nothing needs to be configured within the firewall/NAT device since this will be handled and negotiated automatically when using a stateful firewall.

Using a stateful firewall is the recommended and more secured path to run WebRTC based VoIP solutions.

In terms of a stateless firewall (which is not going to be recommended for VoIP) the following range of UDP source ports for devices inside the customer network needs to be opened for internal payload traffic: 1024-65535.

For all payload traffic which is exchanged via the internet the WebRTC technology uses ports from the UDP port range of 49152-65535. For further information please refer to relevant technical literature as a source of information.

Each networking device on the path between the involved payload endpoints needs to be configured accordingly (e.g. router, firewall, NAT, proxy, etc).

Due to the broad port range which needs to be opened, stateless firewall cannot be recommend for VoIP.

Table 4:

	Stateful firewall	Stateless firewall to be opened statically
WebRTC / VoIP signaling port	8802	8802
WebRTC / VoIP payload	dynamic ⁴	1024-65535
UDP port range within local LAN i.e. within customer environment		

	Stateful firewall	Stateless firewall to be opened statically
WebRTC / VoIP payload UDP port range used over the public internet	dynamic ⁴	49152-65535

Restrictions on VoIP

- In scenarios with multiple calls (e.g transfer, conference, camp on) we recommend disabling the headset integration in case of an error. By deactivating the headset integration flag within myPortal @work only the headset's call control functionality cannot be used, but the headset can still be used as audio device.
- myAgent's "Free Seating" functionality (the agent can select the phone to be used via a drop-down menu during the logon process) i.e. free selection of a physical device by an agent is not supported in combination with myPortal @work.
- Symmetric NAT configuration is not supported.
- Strict firewalls are not supported.

12.2.1.5 Troubleshooting Guide

Connection Timeout

- As a home user with VPN connection, should ensure that the user can access the LAN address of the system and connect to the LAN address: 8802 port. Troubleshoot message: Error Message "connection time out", Action: check if the user when connected via VPN has a local IP from the VPN network.
- As a standalone user ensure that there is no other device or VoIP myPortal @work client registered with the same station number. Check also in **WBM > Expert Mode > Web Services Assistant** for the open connections.

No Payload

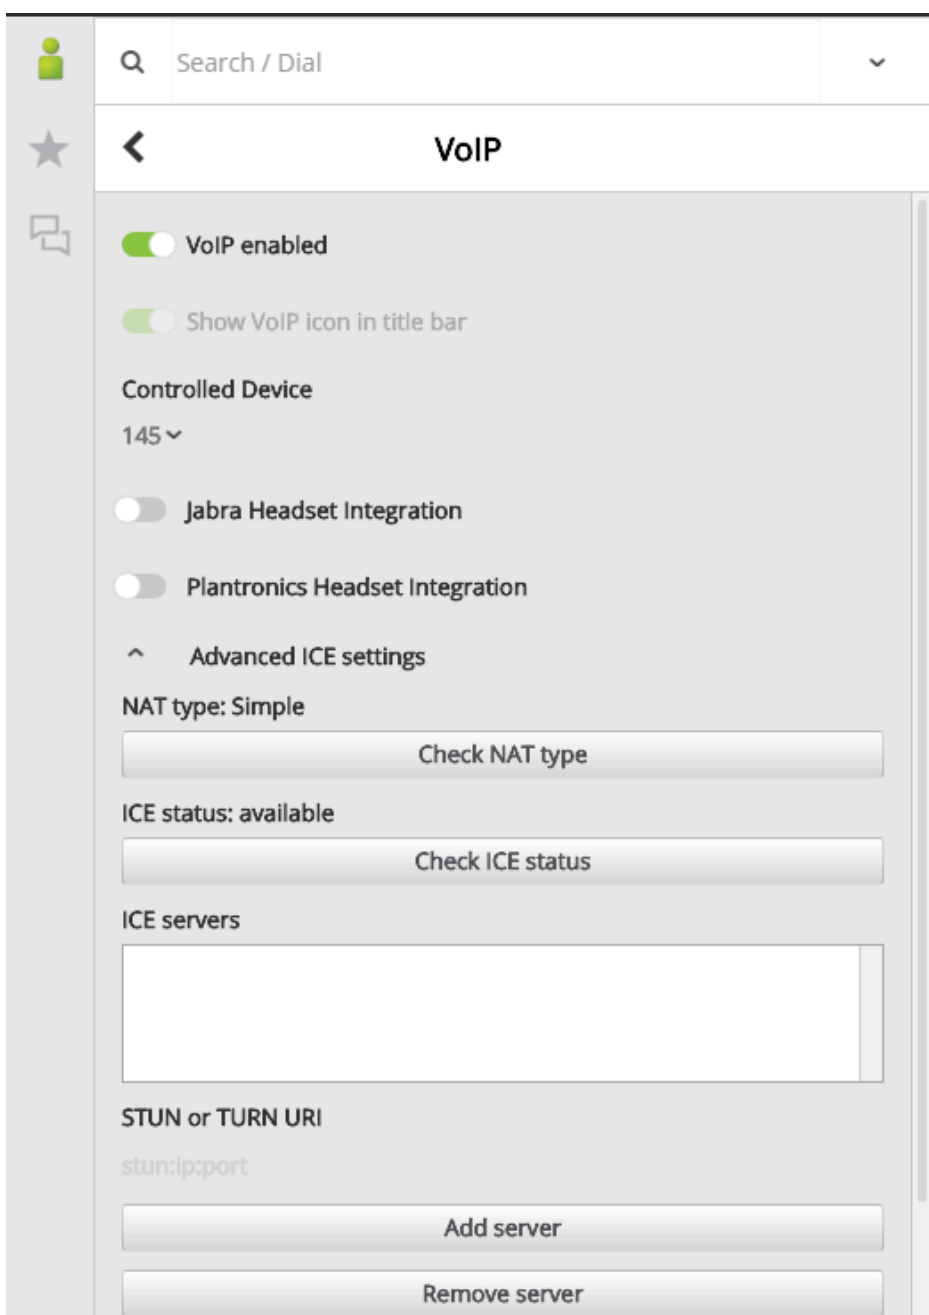

In case of no payload permanent issue:

- Check that allowed ports are open on the firewall. For more information, see chapter [Ports and Firewall Settings](#) on page 478.
- Check NAT firewall configuration. Symmetric NAT configuration is not supported.
- You may detect NAT type from the system in **WBM > Expert mode > Voice Gateway > Detect NAT type**.
- Check STUN server connectivity in the system.

⁴ No configuration action needed; ports will be taken dynamically from same UDP port range as listed for stateless firewall

- Check ICE connectivity in myPortal @work: **Settings > VoIP > Advanced ICE settings**. In case "NAT type" and/or "ICE Status" are not as seen below, network/firewall settings need to be checked by your administrator.

Run "Check NAT type" > NAT type: Simple

Run "Check ICE status" > ICE status: available

- Disable headset integration from myPortal @work and perform the scenario again.
- Select again audio devices from VoIP settings.

12.2.1.6 Further hints

SIP ALG (Application Layer Gateway)

If you experience one of the following issues, please check if a SIP ALG is activated on one of the involved routers. There are a few categories of symptoms SIP ALG could affect VoIP connections. It's not always apparent, especially since these issues often happen silently without users knowing.

- One-way audio (only one person can hear the other)
- Client does not ring when called
- Calls drop after being connected
- Calls going straight to voicemail for no known reason

12.3 Users of UC Smart

Users of UC Smart are subscribers who use the UC Clients of UC Smart.

The following settings for UC Smart clients are available in UC Smart Assistant:

Settings	Explanation
Settings	
Users	The setting is only displayed here.
Name	The setting is only displayed here.
Password	Password for UC Smart clients and UC Smart Assistant.
Language	Language of the user interface.
The user must assign a new password	The setting is only displayed here.
UC Smart Assistant access	User permission for the use of UC Smart Assistant in the web browser for configuration tasks.
Configured as Mobility stations	The setting is only displayed here.
Voicemail licence	The setting is only displayed here.
Associated Services	The setting is only displayed here.
Profile details	
Mobile phone number	Mobile phone number of the subscriber in canonical format (e.g., + 49 173 1234567).

Settings	Explanation
Private/External phone number	Additional phone number of the subscriber in canonical format (e.g., + 49 89 987654321).
E-mail Address	E-mail address of the subscriber.
Voicemail to e-mail	Enable/disable the e-mail notification when a new voice message is received.
Presence visibility	Setting that determines whether the presence status is visible to both internal and external subscribers or just to internal subscribers or not visible to any subscribers.
Licence information	
Display of licenses assigned to the user	

12.3.1 How to Configure UC Smart Users

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

The **Package with UC Smart** has been activated under **Application Selection** in Expert mode.

Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click on **Wizards > UC Smart**.
3. Click on **Edit** to start the **UC Smart** wizard.
4. Click on **Administration > User Management** in the menu tree.
5. Select the desired user in the **Users** list.
6. Enter the data of the user in the **Settings** area and the **Profile Details** area.
7. Click **Apply**.
8. If you want to configure another user, repeat steps 5 through 7.

12.3.2 How to Change the Password for a UC Smart User

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

The **Package with UC Smart** has been activated under **Application Selection** in Expert mode.

NOTICE: Please note that a UC Smart user must change his or her password again by default after the administrator has changed it. If this is not desired, the

flag "User must change the password" must be disabled after changing the password.

Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click on **Wizards > UC Smart**.
3. Click on **Edit** to start the **UC Smart** wizard.
4. Click on **Administration > User Management** in the menu tree.
5. Select the relevant user in the **Users** area.

NOTICE: A password, which consists of 5 stars (*****), will not be accepted by the system for security reasons.

6. Enter the new password under **Password** in the **Settings** area.
7. Click on **Apply**.
8. If you want to reset the password of another user, repeat steps 5 through 7.

Next steps

Notify the affected user(s) about the new password.

12.4 Presence Status (Presence)

The Presence status in the internal directory provides information on the availability of internal subscribers (including Mobility Entry stations). The Presence status also controls the availability of internal subscribers using status-based call forwarding.

As a subscriber, you can change your Presence status in myPortal @work or myPortal to go. For every change in the presence status (except for **Office**), you can also define the scheduled time of your return to the **Office** status if required.

As a subscriber, you can select the following statuses:

- **Office**
- **Meeting**
- **Sick**
- **Break**
- **Gone Out**
- **Vacation**
- **Lunch**
- **Gone Home**
- **Do Not Disturb**

NOTICE: The system administrator can enable/disable the visibility of status "sick" within the system administration. See [OpenScape Business UC Suite > Server](#)

Using the status-based call forwarding, calls can be forwarded to the personal voicemail box, for example. Subscribers who have no personal voicemail boxes can forward calls to a group mailbox or a system mailbox.

12.5 Directories and Journal

Directories and the Journal organize contacts and calls.

12.5.1 Directories

Directories are used to organize the contacts of subscribers. Subscribers can access these contacts with UC Smart clients.

The system provides the following directories, which support the following functions and with the below priority for lookup number (lookup number will be supported only for external call and in case that CO/ITSP does not provide the name):

Directory	UC Smart Clients	System telephone with a display
Personal directory	Outlook contacts imported via the Personal Assistant.	
Internal directory	Contains all internal subscribers and groups (with their phone numbers) for which the display has been activated in the system. Internal subscribers with system telephones are shown with presence status. The Presence status of a subscriber can only be shown if allowed by that subscriber.	Contains all internal subscribers and groups for which the display has been activated in the system.
Favorites list	Contains the contacts selected by the subscriber from his or her personal contacts and the internal directory. Internal subscribers with system telephones are shown with their respective presence statuses. The Presence status of a subscriber can only be shown if allowed by that subscriber.	
System Directory	Contains all central speed-dial numbers.	

NOTICE: Phone numbers in directories should always be entered in canonical format wherever possible.

NOTICE: When adding or removing a UC contact, it may take several minutes (**and** up to 30') until changes are applied on all clients and devices due to caching mechanisms that are used. Alternatively a system restart can be performed for the changes to take **immediate** effect.

12.5.1.1 How to Configure Directories for System Telephones

Prerequisites

You are logged into the WBM with the **Expert** profile.

You can select which directories are to be made available on system telephones with displays.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony Server > Basic Settings** in the navigation tree.
3. In the menu tree, click on **System > Display**.
4. Select one of the following options in the **Directory (phone book)** drop-down list:
 - If all the personal contacts, the internal, external and networking directory and the LDAP directory are to be made available, select **All**.
 - If only the personal contacts, the internal, external and networking directory is to be made available, select **Internal**.
 - If only the LDAP directory is to be made available, select **LDAP**.
 - If no directory is to be made available, select **No**.

NOTICE: The user can activated the search/lookup requests to be handled as requests to the Unified directory, by selecting the **Internal Phonebook via Unified Directory**. When the flag is deactivated and there is no access to Unified Directory, the list view at the phone-book menu, implemented for the OpenScape Desk Phone CP 200/205/210, is not available.

5. Click **Apply**.

Next steps

If you have selected **All** or **LDAP**, make sure that an appropriate LDAP directory (e.g., Open Directory Service) is available for the system telephones.

12.5.2 Internal Directory

The internal directory contains the contact details of the internal subscribers and MULAP groups of the communication system. UC Smart clients can access the internal directory.

As an administrator, you have unrestricted access to all data in the internal directory. As a subscriber, you can dial from the internal directory.

The station parameter **Entry in telephone directory** (which can be set in the WBM via the Stations wizard) determines whether or not internal subscribers and groups are displayed in the internal directory.

In an internetwork, the internal directory applies across all nodes.

Related concepts

[Group Call](#) on page 662

12.5.2.1 How to Enable or Disable the Display of Stations in the Internal Directory

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Stations**.
3. Navigate in the menu tree under **Stations > Station > ...** down to the desired station (Index - Station Number - Name).
4. Click on the **Edit Station Flags** tab.
5. Select one of the following options:
 - If you want the name of the subscriber to be displayed in the internal directory, enable the check box **Entry in telephone directory**.
 - If you do not want the name of the subscriber to be displayed in the internal directory, clear the **Entry in telephone directory** check box.
6. Click on **Apply**, followed by **OK**.

12.5.3 Favorites List

The Favorites list contains the contacts selected by the subscriber from the personal contacts and the internal directory. UC Smart clients have access to the Favorites list.

A UC Smart user can call a contact directly from the Favorites list. When an internal subscriber receives a call, the ringing state of the subscriber is displayed. The UC Smart user can then accept this call. In addition, the presence status for internal subscribers is displayed.

12.5.4 System Directory

The system directory contains all central speed-dial numbers for which a name was assigned. UC Smart clients can access the system directory.

The administrator individually disable the display for every subscriber and every speed-dial number with a name.

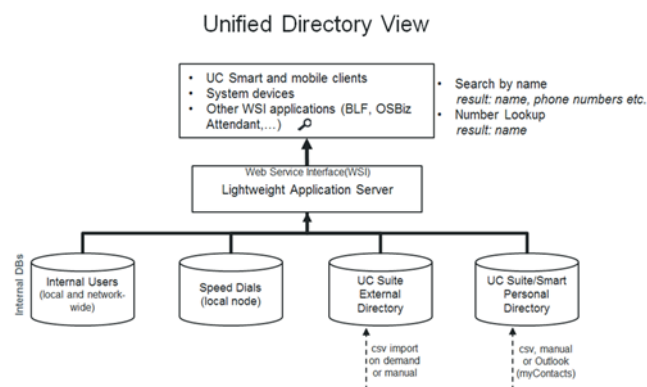

12.5.5 Unified Directory

OpenScape Business provides different data sources to store and to retrieve user or contact related data, starting with the internal user data in the internal user configuration, via the internal speed dial list, up to the different directories of the UC applications.

Each data source within OpenScape Business is used by a specific client application either located within the system SW itself in the phone devices or within a UC client application. Depending on the used data sources and the used clients, the retrieved data and their presentation is different.

The "Unified Directory" service within OpenScape Business comprises the existing OpenScape Business data sources for common search and name resolution functions. It provides the same search result or name resolution information to all system devices and OpenScape Business clients.

The Unified Directory service can either be accessed via the Web Service Interface (WSI) from externally located clients like myPortal to go or internally via the call processing mechanisms (e.g. from OpenStage Phones).

Unified Directory uses following internal databases and directories of OpenScape Business:

- Internal user directory (network wide)
- Speed dial lists
- UC Smart Personal Directory (optional)
- UC Suite External Directory (optional)
- Personal Outlook Contacts (if imported via myContacts)

The Unified Directory service is available within every OpenScape Business system from V2R2 on. It does not require specific HW-SW or license prerequisites.

In order to get best results when using the Unified Directory some rules regarding phone number formats and writing of names have to be followed.

12.5.5.1 Features

Supported Devices / Clients

Unified Directory Service provides:

- Directory Search in several internal data sources of OpenScape Business
- Unified offering of the search result to all supported clients
- Phone number Look-Up / Name Resolution in several internal data sources
- Unified offering of name resolution results for all supported clients
- External data access via the WebServices Interface (WSI)

The features are available for single node systems as described in the following. Within OpenScape Business networks, the availability of the features depends mainly on the kind of connection of the trunks, devices and clients within the network.

Unified Directory supports following clients / system devices of Unify using the indicated interfaces:

Device/Client	Used Interface/ Protocol	Remarks
OpenStage phones	Call Processing / HFA protocol	WSI / HTTP(S) is optional on OpenStage 60/80 for caller images
OpenScape Deskphone IP	Call Processing / HFA protocol	WSI / HTTP(S) is optional on DeskPhone IP 55 for caller images
Cordless (CMI) devices	Call Processing / CMI protocol	
CP 100/110/200/210	Call Processing / HFA protocol	
DeskPhone CP400/ 600/600E/ 700/700X/710	WSI / HTTP(S)	
myPortal @work	WSI / HTTP(S)	
myPortal to go	WSI / HTTPS	
Openscape Business Attendant/BLF	Call Processing / CorNet protocol	WSI / HTTP(S) is optional

NOTICE: The UC Suite myPortal, myAttendant and myAgent clients use their own mechanisms for directory search and name resolution.

Search function

The Unified Directory search is always performed by using the specific device / client user interface. The search criteria and the used character set could be restricted, depending on the used clients.

After the search criterion is entered the search is performed within subsequent directories

- Internal user directory (network wide)
- Speed dial lists
- UC Smart Personal Directory (optional)
- UC Suite External Directory (optional)
- Personal Outlook Contacts (if imported via myContacts)

All matches within the directories above are shown as search results together with their origin. The matches contain either the full contact data set or only parts of it. The information depth of the results depends on the data source.

NOTICE: Group name search in myportal@work is not supported at UC Suite mode. Only licensed users (basic license) and licensed MULAP groups (UC Entries) search is supported.

The matches are presented at the devices or clients depending on display capabilities.

	Internal User Directory	Speed Dials	UC Smart Personal Directory	UC Suite External Directory	Personal Outlook Contacts (via my Contacts)
Last Name	X	---	X	X	X
First Name	X	---	X	X	X
Short/ Displayname	X	X	---	---	---
Office Phone No.	---	---	X	X	X
Home/ Ext. PhoneNo.	---	---	X	---	X
Mobile Phone No.	---	---	X	X	X
Email-Adr.	---	---	X	X	X

	Internal User Directory	Speed Dials	UC Smart Personal Directory	UC Suite External Directory	Personal Outlook Contacts (via my Contacts)
Company name	---	---	X	X	X
City	---	---	---	---	---
Contact Picture	---	---	X	---	X
Contact Picturepreview	---	---	X	---	X

Phone Number Look-Up

Unified Directory Phone number Look-Up resolves the transferred calling party (CLI) by a number search in all supported internal data sources . The search is performed within following phone number fields:

- Office number
- Mobile number
- Home number

The Phone number Look-Up is triggered in case of incoming or outgoing calls in general, whereas specific routing and forwarding features are considered in addition.

A fixed prioritization of the data sources that are used for Phone number Look-Up is implemented in order to get the result as fast as possible. The result contains either only lastname, firstname, displayname or ,if available, the full related contact data.

Table 5: Supported Data Sources and Prioritization

Priority	Data Sources	Remark
1	CO/ITSP name (as sent by provider)	Prerequisite is to enable flag "Name in CO".
2	Speed dial list	
3	Personal Contacts	
4	UC User detail	

The retrieved data are presented on the user's device and/or in the UC client. The information depth depends on the display capabilities.

• Incoming calls

Supported scenario for single node systems:

- Basic call
- Group call/ MULAP call
- Ringing Group
- Single Step Call Transfer (SSCT)

- Attended/Supervised/Consultation Transfer
- Call Forwarding Unconditional (CFU)
- Call Forwarding No Reply (CFNR)
- Call Forwarding Busy (CFB)
- Blind transfer
- Call Pickup

NOTICE: Call Pickup is different from Call Pickup Group. In Call Pickup Group, when an external number is saved to the Unified Directory, the name of the caller is not shown from the members of the group.

Supported scenario for multi node (network) scenarios is a Gateway Call.

- **Outgoing call**

In case of an Outgoing Call the Phone number Look-Up of the called partynumber happens only once.

Supported scenario for single node systems is a Basic Call to externalnumber.

The presentation of the Phone number Look-Up result depends on display capabilities of the phones.

12.5.5.2 Rules and Conventions

Some conventions regarding number and name formats within the data sources have to be observed in order to get optimal results using the Unified Directory service.

Supported Number Format

All external phone numbers within the data sources must be entered in the canonical format including country and area code. e.g. +4989700712345

Speed Dial list supports only system dialable format e.g. 0089700712345 or 0004989700712345

When Speed Dial numbers are configured to be accessible through LDAP, you have to enable the Number conversion option to display the contact name when the number is in canonical format. For more information on how to enable Number conversion, see [How to Add an External Data Source for the Open Directory Service](#) on page 1158.

Supported Name Formats

The following conventions regarding name formats and character sets have to be observed:

- **Speed dial name format**

Name search within the Speed Dial List is supported only with specific configuration rules. The first and last names have to be entered within the existing name field using the following pattern:

<Last Name>, <First Name> (comma separated)

- **Internal Users in case of Migrations**

Migration to V2R1 and onwards with internal users that do not follow these configuration rules will not be supported in the expected way. This means the administrator should convert internal names to the following pattern before migration:

<Last Name>, <First Name> (comma separated)

Availability of directory changes

After creating, updating or deleting contacts in the various data sources it can take up to 10 minutes until all changes appear on Phone number Look-Up results.

12.5.5.3 Functional Boundaries

The following functional boundaries do exist regarding Unified Directories:

Name Search

- Group name support

Group names (not MULAP names) can not be searched in all kind of configurations

- Support of special characters

On most phone devices the user can search for standard characters "a-z". Special (diacritical) characters like German characters Ää, Öö, Üü, ß are not accessible via phone device user interface.

Therefore a plain character search result includes also special characters. A search for any of the characters "acdegilnorstuyz" matches with the corresponding special characters
"àáâãäåä#ăçċđďèéêëěē#ĩıİłłŕńňōóôõöőřśšşţţüúûũůųýÿžžź"

in the search result.

NOTICE: Phonebook search with the wildcard character at the beginning of the search string, e.g. `<*jo*>`, is only supported for internal users.

- Support of Speed Dial Name format

Name search within the Speed Dial List is supported only with specific configuration rules. The first- and last names have to be entered within the existing name field using one of the following patterns

- <Last Name>, <First Name> (comma separated)
- <First Name> <Last Name> (space separator on this case)

Name Presentation

Personal Contacts in UC Smart and from external offline directory,
with length of first name plus length of last name greater than 24

characters, will be truncated to 24 characters length to fit the display length of the devices.

Phone number Look-up

The Phone number Look-Up feature (retrieve contact name from calling party number) is not supported in Unified Directory for SIP and S0 devices.

12.5.5.4 Unified Directory in Networked Systems

The Unified Directory Service is active within every node of an OpenScape Business Network and uses the datasources of the own system. Phone Devices and Client use always the Unified Directory Service within their own node.

Therefore it depends on the kind of datasource content if netwide contacts are available.

Table 6: Local and Netwide Datasource

Data source	Local data	Netwide data
Internal user directory	X	X
Speed dial lists	X	---
UC Smart Personal Directory	X	---
Personal Outlook Contacts (via myContacts)	X	---

NOTICE: The unified directory is not fully supported in mixed UC Suite/ UC Smart environments.

Phone number Look-up

In Networking scenarios the Phone number Look-Up functionality is not used. In such scenarios the name is transported via normal networking mechanisms between the network nodes.

For internal users the configured Display Name is used so Lookup is not required.

12.5.6 Journal

The journal is the list of all incoming and outgoing calls of a subscriber. It enables subscribers to quickly and easily respond to missed calls and call back their contacts or call them again directly from within the journal.

A maximum of the last 100 calls are displayed to UC Smart users.

Folder for Call Types

The calls can be arranged in the following groups:

- **Open**
- **Missed**
- **Accepted**
- **All Calls**

Call Details

Every call is shown with the Date and Time and, if available, with the call number. If a directory contains further details on the call number such as the **Last Name** and **First Name**, then this information is also shown. In addition, the **direction** and **duration** of the calls are displayed, as well as any redirections and call pickups that may have occurred.

12.6 Calls

For calls, the call number format is of particular importance.

12.6.1 Call Number Formats

Call numbers can be specified in different formats.

Format	Description	Example
Canonical	Begins with + and always includes the country code, area code and the full remaining station number. Blanks and the special characters + () / - : ; are allowed.	+49 (89) 7007-98765
Dialable	Exactly as you would dial the call number on the system telephone in your office, always with the trunk access code.	<ul style="list-style-type: none">• 321 (internal)• 0700798765 (own local network)• 0089700798765 (external local network)• 0004989700798765 (international)

INFO: If possible, you should always use the canonical call number format. This ensures that a phone number is always complete, unique and consistent for networking and mobile stations in every situation.

When dialing an external station (dialable format) manually, the CO access code must always be dialed as well.

When dialing an external phone number in dialable format from a directory (and when using the Desktop Dialer and Clipboard Dialer for certain UC clients), the communication system automatically adds the CO access code (route 1).

NOTICE: For calls within the USA via CSTA to a number in canonical format, phone numbers are converted to the dialable format.

12.6.2 Prerequisites for receiving VoIP calls on myPortal to go using CallKit on your iPhone

The iOS VoIP call notifications are based on Apple's APNS mechanism. This service requires the following:

- A configured DNS server which resolves public domain names from the internet.
- Internet access for OpenScape Business system (port TCP/443 outbound) to send APNS call notifications.
- The system software needs to be up to date with the latest released major/minor/fix release. The latest system version is important because the APNS service requires specific certificates which expire when running older system software.

12.7 Conferences

In a conference, multiple participants (including external parties) can communicate with one another at the same time. The Conference Management function enables you to quickly and easily host conferences and also to schedule them in advance.

Phone-controlled and Application-controlled Conferences

As a subscriber, you can initiate conferences both via the phone and via the UC Smart applications.

You can initiate a phone-controlled conference in the following ways, and then control that conference via the phone:

- Call the desired conference participant and connect him or her to the conference
- Extend a consultation call into a conference
- Extend a second call into a conference

You can initiate, control and manage application-controlled conferences via the Conference Management. A Conference license is required for the use of Conference Management.

Differences between the conference types:

	Phone-controlled conference	Application-controlled conference
Direction of connection setup from the viewpoint of the system	<ul style="list-style-type: none"> Outbound 	<ul style="list-style-type: none"> Inbound (dial-in by the participant)
Authentication of conference participants	-	<ul style="list-style-type: none"> Personal PIN (conference ID) Guest PIN (optional)
Predefined invitation to the conference participants	-	<ul style="list-style-type: none"> Conference Name Dial-in number (MeetMe) Personal PIN (conference ID) Guest PIN (optional)
Max. number of participants per conference	8	16

Scheduled Conference

Scheduled conferences are created as permanent conferences. The conference can be used as needed at any time without further scheduling. Scheduled conferences do not occupy any conference channel so long as no participant has dialed into the conference. The order of dialing in determines the assignment of the conference channels.

Administrators can change the specified dial-in number (MeetMe) for conferences via the WBM during the initial setup. The dial-in number with which the participants can dial into the conference is shown to the participants. They are then required to authenticate themselves with their personal PIN or with the general guest PIN if allowed.

Moderators

The initiator of a conference is automatically the moderator and can:

- Create, edit and delete scheduled conferences.
- Add and remove conference participants.
Removed participants do not remain in the conference.
- Disconnect conference participants.
Disconnected participants can dial back into the conference.
- Specify another internal participant on the same node as the moderator
- Leave the conference without ending it immediately.
If the last moderator leaves the conference, it ends after 5 minutes.
- End active conferences.
- Start a web collaboration session in an active conference.
- Send predefined invitations to all or individual conference participants.

All internal participants within a node can be moderators. However, a conference license is required for this.

Conference participants whose contact details were entered manually are treated as external participants and cannot be set as moderators.

Conference Participants

Conference participants can leave the conference and dial-in again. In addition, they can participate in a web collaboration session has already been started. As long as a conference has only one participant, the participant hears music on hold. The maximum number of external conference participants is limited, inter alia, by the number of available trunks.

Automatic Termination without a Moderator

If the last moderator leaves the conference, the other participants are notified with an info text that the conference will end after about 5 minutes.

Notification of Conference Participants

The moderator can send all or some conference participants an invitation by email. This requires an email program to have been installed on the client PC. Known email addresses are automatically added to the distribution list. In an invitation to all conference participants, only the general guest PIN (if allowed) is included; for individual invitations, the personal PIN is also sent.

Alternatively, a predefined invitation text can be copied to the clipboard for further use in other programs (e.g., a chat program).

12.8 Web Collaboration

myPortal supports the integration of the separate product Web Collaboration for simultaneous multi-media collaboration during phone calls and conferences. This provides quick access to functions such as desktop and application sharing, file sharing, co-browsing, whiteboarding, URL push, IM chat and video chat with multiple participants.

Web collaboration can be started by a subscriber during a phone call via the Call window of the UC PC client or by the moderator of an active conference from within the conference. A Web page from which the download of the web collaboration client can be initiated is opened. A local installation of Web Collaboration on the UC PC client is not required. If an email program is available on the UC PC client, an email with the link to the web collaboration client can be sent to the communication partners. Detailed information on web collaboration can be found in the Web Collaboration product documentation.

On deleting or ending a conference, the associated web collaboration session is automatically deleted as well.

Integration of Web Collaboration

In order to integrate web collaboration, the license number and password for the hosted web collaboration connection must be

entered by the administrator in the WBM. The vendor offers the web collaboration server as a service on the Internet (Public Server). The license number and password are transmitted over a secure https connection. By default, TCP port 5100 is used for this purpose. Local web collaboration servers are not supported.

NOTICE: In order to use web collaboration, the UC PC clients and the communication system require an Internet connection. Connections via a proxy are not supported by the communication system.

Instant Messaging and Web Collaboration

Note that Instant Messaging of the system and Instant Messaging of a web collaboration session are mutually independent, i.e., the instant messages from a UC PC client do not appear in a web collaboration session of the same participant, and vice versa.

12.8.1 How to Configure the Connection to the Web Collaboration Server (Public Server)

Prerequisites

You are logged into the WBM with the **Expert** profile.

Internet access is available.

You need a license number and a password for the secure connection to the web collaboration server (public server).

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Applications > Web Services**.
3. Navigate in the menu tree down to **Web Services > Web Collaboration**.
4. Select the **Public Server** radio button.
5. Enter the license number for the secure connection to the web collaboration server (public server) in the **Licence Number** field.
6. Enter the password for the secure connection to the web collaboration server (public server) in the **Password** field.

NOTICE: If you want to test the Web Collaboration for 5 minutes, you can select the radio button **Public Server (Demo Mode/Evaluation Mode)**. No license number and password are required for this purpose.

7. Click on **Apply** followed by **OK**.

12.8.2 How to Disable the Connection to the Web Collaboration Server

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Applications > Web Services**.
3. Navigate in the menu tree down to **Web Services > Web Collaboration**.
4. Select the radio button **No Web Collaboration Server**.
5. Click on **Apply** followed by **OK**. The option to start a web collaboration session is disabled in the UC client.

12.9 Instant Messaging

Instant Messaging refers to communicating with instant messages (usually called a chat).

12.9.1 Instant Messaging

Using instant messaging, you can chat with other users of UC Smart.

The sent and received instant messages are presented to the communication partners as an interactive dialog. On selecting a recipient, the client shows whether the communication partner is currently online. If a communication partner is offline, no instant message can be transmitted to him or her. The IM overview page displays the most recent streams. The system stores a limited number of instant messages. A maximum of up to 100 of the last instant messages of a user are displayed.

12.10 Voicemail Box (SmartVM)

The voicemail box (also called SmartVM) plays a greeting to callers and offers them the option of recording a message or being routed to another number. Internal subscribers can access the voicemail box via a telephone and with the UC Smart client. Subscribers who want to use a voicemail box require a voicemail license.

Voicemail Box Types

The following different voicemail box types exist:

- Standard voicemail box:

The standard voicemail box is the personal voicemail box of a subscriber. It accepts the call, greets the caller with a personal or standard announcement and offers the caller the option to leave

a message. The standard voicemail box can be configured by the subscriber (by recording a personal greeting, for example) via the telephone or via UC Smart client.

- Group voicemail box:

The group voicemail box has the same features as the standard voicemail box, except that it is not assigned to a single user, but a group of users. Messages can be recorded for a group voicemail box only if at least one member of the group has a voicemail license. The info of the voicemail box is displayed to all group members with a voicemail license. Message playback is possible through the phone menu of the personal voicemail box of the group members.

- Attendant voicemail boxes (AutoAttendant / Company AutoAttendant):

The Attendant voicemail box offers callers a greeting with or without subsequent routing options. A special form of the AutoAttendant voicemail box is the Company AutoAttendant. Here, the caller can be optionally forwarded automatically (to the switchboard, for example) or selectively to another station (e.g., to the service or hotline) by dialing an internal call number or speed dial number (digits 0-9). These dialing options must, of course, be explained with a corresponding announcement. It is also possible to configure an intercept destination to which the caller will be redirected if he or she fails to enter a digit or enters an invalid (i.e., unassigned) digit. The administrator can configure up to 100 Attendant voicemail boxes.

- Announcement voicemail box:

The announcement function is configured by assigning an announcement index to an announcement port and configuring a voicemail box with the call number of the announcement port. The greeting of the mailbox is used as the announcement. Depending on the type of announcement, the playback may occur once (outgoing message) or cyclically (music). The phone menu of an announcement voicemail box can only be used from a different phone, since there is no associated phone. Consequently, a different PIN must be used for the announcement voicemail box than for the voicemail box of the used telephone.

- System voicemail box:

The voicemail box with the call number of the hunt group of the SmartVM is used as a system voicemail box. The system voicemail box must be a standard voicemail box (not an AutoAttendant) with voice recording enabled. The info of the voicemail box is displayed to the owner of the voicemail box with index 1 and can also be checked from there. This first voicemail box should not be a Group, Attendant or Announcement voicemail box. If the system voicemail box is not to be used, then no voicemail box should be configured with the call number of the SmartVM hunt group.

Features of the Voicemail Box

- Checking and control via a telephone
(from external location: own telephone number required)
- Manual or automatic selection of different greetings

- Phone menu (Telephone User Interface, TUI) with a system-wide switchable menu structure:
 - Phone menu, UC Smart: **SmartVM** (similar to Xpressions Compact / EVM)
 - Phone menu, UC Suite: **OSO** (similar to UC Suite)
- Up to 320 voicemail boxes can be set up per system
- Up to 32 hours of voice recording capacity per system
- Up to 100 stored messages per voicemail box
- Up to 2 minutes of recording time for a voicemail per voicemail box
- Up to 10 simultaneously possible switching and call answering operations
- Announcement/music before answering
- Playback of individual announcements
- Forwarding of fax calls through automatic fax tone recognition to a preconfigured fax destination

NOTICE: Details on the phone menu can be found in the two Quick Reference Guides, UC Smart Telephone User Interface (TUI) and UC Suite Telephone User Interface (TUI).

Code Number Settings

Before the first use of the voicemail box, every subscriber must change the preassigned code number (default: 123456).

The code number consists of a six digit sequence. Repeated digits (e.g., 333333) and digit sequences in ascending or descending order (e.g., 987654) are not allowed. After an invalid code number has been entered six times, access to the corresponding voicemail box is locked until the password is reset by the administrator. After two incorrect entries of the password via the phone menu, the connection is dropped.

Ports

The voicemail box uses the S_0 ports 500 to 509, which are assigned the call numbers 739 to 748, respectively. The ports 504 and 505 are assigned by default to the Company AutoAttendant (call number 352), and the remaining 8 ports are assigned to the voicemail box of the hunt group (call number 351). The call number 351 is the general call number of the voicemail box via which the phone menu is accessible.

Toll restriction

For security reasons, the ports of the voicemail box only have outward-restricted trunk access by default. The following features require the assignment of a COS group with direct trunk access:

- Call sender of a voice message
- Mobility users can listen to voice messages via callback
- Messages are transferred to an external destination using the Company AutoAttendant

Greetings / Announcements

Custom greetings (= announcements) can be either recorded from a phone or loaded into the system with the WBM. The configuration of a custom greeting via the phone occurs by dialing the voicemail box number and then using the user prompts of the voicemail box to record a new greeting over the phone.

Greetings can, however, also be loaded into the system separately for each voicemail box and subsequently saved or deleted in Expert mode.

NOTICE: For voicemail playback via external phone numbers (e.g. playback via mobile phone triggered by myPortal to go), the class-of-service of the Smart VM ports has to be adjusted. It is recommended to use an "allowed list" for such well-known numbers.

12.10.1 Configuring the Voicemail Box (SmartVM)

Configuring the voicemail box (SmartVM) includes the configuration of standard/group voicemail boxes and the Attendant voicemail boxes.

The general settings for the voicemail box (SmartVM) such as the adaptation of the voicemail box call number to a 4-digit dial plan, for example, are made via the **SmartVM** wizard.

The special settings for the voicemail box (SmartVM) and the setup of standard/group voicemail boxes and Attendant voicemail boxes are performed in Expert mode.

NOTICE: Changing a call number resets the voicemail box of the corresponding subscriber. All personal voice messages, greetings and announcements are lost, and the password is reset.

You can also load individual greetings into the SmartVM, save and delete them, as well as back up and restore the greetings and messages of individual or all voicemail boxes. In addition you can check the loaded languages of the user prompts and display the 10 voicemail boxes with the most messages as well as the amount of storage space used by the messages and greetings.

The setup of Attendant voicemail boxes can be found in the section Attendants - AutoAttendants - Company AutoAttendant (UC Smart).

Assigning the Mailbox to Subscribers

Once the voicemail box (SmartVM) has been configured, the subscribers can be assigned their default mailboxes. This is possible through

- call forwarding for the subscriber with the aid of a call destination list (set up by the administrator). In this case, the call is forwarded sequentially to the selected call destinations (e.g., first to the

subscriber and then - after a definable time period - to the mailbox).

- Call forwarding set up at the phone of the subscriber (which can be done by the subscribers themselves). In this case, the call goes immediately to the mailbox.

If the subscriber is a member of a hunt group and the hunt group is called, the call is not redirected to the voicemail box of the hunt group.

12.10.1.1 How to Disable or Enable the Voicemail Box

Prerequisites

You are logged into the WBM with the **Expert** profile.

UC Smart has been activated.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click on **Telephony > Auxiliary Equipment** in the navigation tree.
3. Click on **Auxiliary Equipment > SmartVM** in the menu tree.
4. Click on the **Edit SmartVM Parameters** tab.
5. If you want to deactivate the voicemail box, select the **EVM Deactivation** check box.
6. If you want to activate the voicemail box, clear the **EVM Deactivation** check box.
7. Click on **Apply** followed by **OK**.

12.10.1.2 How to Configure the Voicemail Box (SmartVM)

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click on **Wizards > Central Telephony**.
3. Click on **Edit** to start the **SmartVM** wizard.
4. Select the **Activate SmartVM** check box.
5. If required, change the general settings for the system mailbox under the **Voicemail** column:
 - a) If required, change the call number of the voicemail box in the **Call number** field (default: 351) to adapt it to a 4-digit dial plan, for example.
 - b) If required, change the direct inward dialing number of the voicemail box in the **DID** field (default: 351) to adapt it to a 4-digit dial plan, for example.
 - c) If required, change the name of the voicemail box in the **Name** field (default: VOICEMAIL).

6. If required, change the general settings for the Attendant mailbox under the **AutoAttendant** column:
 - a) If required, change the call number of the voicemail box in the **Call number** field (default: 352) to adapt it to a 4-digit dial plan, for example.
 - b) If required, change the direct inward dialing number of the voicemail box in the **DID** field (default: 352) to adapt it to a 4-digit dial plan, for example.
 - c) If required, change the name of the AutoAttendant box in the **Name** field (default: AutoAttendant).
7. Click on **OK & Next**.
8. If required, change the call number of the port in the **Call no** field in the row of the desired port (default: 739-748) to adapt to a 4-digit dial plan, for example.
9. If required, change the port name in the row of the desired port in the **Name** field (default: SmartVM 1-10).
10. If required, change the type of the port in the **Type** drop-down list in the row of the desired port.
 - **Phone mail (Callno. 5 digits)**: The port is assigned to the standard voicemail boxes and the Attendant voicemail boxes of type AutoAttendant. Ports of this type are automatically included in the hunt group 351.
 - **Standard**: The port is assigned to the Attendant voicemail boxes of type Company AutoAttendant and the announcement mailboxes. Ports of this type are automatically included in the hunt group 352.
11. If required, change the mode of the port in the **Mode** drop-down list in the row of the desired port.
 - **Announcement**: A greeting/announcement is played once.
 - **Music On Hold**: The greeting/announcement/music is played in a loop.
 - **Company AutoAttendant**: After playing a greeting/announcement, further switching is possible.
12. Click on **OK & Next**.
13. Select the desired mailbox in the **Mailbox selection** drop-down list. The fields for configuring the greetings will then appear.
14. If you want to use your own greetings for the selected mailbox, click on **Browse**, navigate to the storage location of the files (format: wave, PCM, 16 bit, 8 kHz, mono) and click on **Load**. The selected greetings are loaded into the system.

NOTICE: Previously loaded greetings can be saved or deleted.

15. If you want to set up greetings for further mailboxes, repeat steps 13 through 14.
16. Click on **OK & Next**.
17. You should change the general parameters only if required. For a description of the general parameters, see [Auxiliary Equipment>SmartVM](#).
18. Click on **OK & Next** and then on **Finish**.

12.10.1.3 How to Add a Standard Voicemail Box for a Subscriber

Prerequisites

You are logged into the WBM with the **Expert** profile.

The corresponding subscriber has been assigned a voicemail license.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click on **Telephony > Auxiliary Equipment** in the navigation tree.
3. Click on **Auxiliary Equipment > SmartVM** in the menu tree.
4. Click on the **Edit SmartVM Mailboxes** tab.
5. In the **Mailbox call no.** field, enter the call number of the subscriber for whom the voicemail box is to be added.
6. Select a greeting from the **Greeting** drop-down list.
7. If a caller may leave a message in the voicemail box, select the **Recording** check box.
8. Make sure that the **AutoAttendant** check box is selected.
9. The **Password Reset** check box must be cleared when setting up a new voicemail box. It is used to reset the password of the voicemail box. When a new voicemail box is created, the subscriber must change the initial password anyway when accessing his or her voicemail box for the first time.
10. Click on **Apply** followed by **OK**.

12.10.1.4 How to Change the COS Group for a Voicemail Box Port

Prerequisites

You are logged into the WBM with the **Expert** profile.

UC Smart has been activated.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click on **Telephony > Classes of Service** in the navigation tree.
3. Click in the menu tree on **Classes of Service > Stations > IVM/ EVM Ports > EVM** and then on the desired voicemail box port.
4. Select the the desired COS groups for the day and night service on the **Edit COS Group** tab from the **Class of Service Group Day** and **Class of Service Group Night** drop-down lists, respectively.
5. Click on **Apply**, followed by **OK**.

12.10.1.5 How to Change the Structure of the Phone Menu for the Voicemail Box

Prerequisites

You are logged into the WBM with the **Expert** profile.

UC Smart has been activated.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click on **Telephony > Auxiliary Equipment** in the navigation tree.
3. Click on **Auxiliary Equipment > SmartVM** in the menu tree.
4. Click on the **Edit SmartVM Parameters** tab.
5. If you want the structure of the phone menu to be similar to Xpressions Compact, select the entry **SmartVM** in the **Telephone User Interface** drop-down list.
6. If you want the structure of the phone menu to be similar to OpenScape Office, select the entry **OSO** in the **Telephone User Interface** drop-down list.
7. Click on **Apply** followed by **OK**.

12.10.1.6 How to Load, Save and Delete Individual Greetings

Prerequisites

You are logged into the WBM with the **Expert** profile.

UC Smart has been activated.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance > Configuration** in the navigation tree.
3. Click in the menu tree on **Configuration > SmartVM Configuration > File Operations**.
4. Click on the **Greetings** tab.
5. Select the desired voicemail box from the **Mailbox selection** drop-down list.
6. If you want to load a previously saved greeting or a wave file into the SmartVM, click at the desired greeting on **Browse** and navigate to the storage location of the greeting. Then click **Load**.

NOTICE: The wave file to be loaded must have the following format: PCM, 8 kHz, 16 bit, mono. The wave file is converted on loading. Depending on the size of the wave file, this may take some time to complete.

7. If you want to save an existing greeting, click at the desired greeting on **Save** and save the vma file to a location of your choice.
8. If you want to delete an existing greeting, click at the desired greeting on **Delete** and confirm this with **OK**.

12.10.1.7 How to Back up and Restore Greetings and Messages

Prerequisites

You are logged into the WBM with the **Expert** profile.

UC Smart has been activated.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance > Configuration** in the navigation tree.
3. Click in the menu tree on **Configuration > SmartVM Configuration > File Operations**.
4. If you want to back up greetings and messages:
 - a) Click on the **Backup** tab.
 - b) Select the **Messages** check box if the messages are to be backed up in addition to the greetings.
 - c) Transfer the voicemail boxes to be backed up from the **Available Mailboxes** list to the **Mailboxes for backup** list.
 - d) Click on **Apply**. The greetings (and messages if the **Messages** flag was enabled) of the voicemail boxes to be backed up are saved in a backup file (*.tar). Save the file to a location of your choice.
5. If you want to restore greetings and messages:
 - a) Click on the **Restore** tab.
 - b) Click on **Browse**, navigate to the storage location of your backup file (*.tar) and click on **Open**.
 - c) Click on **Load** followed by **OK**. The voicemail boxes contained in the backup file are displayed.
 - d) Transfer the voicemail boxes to be restored from the **Available Mailboxes** list to the **Mailboxes for restore** list.
 - e) Select the **Messages** check box if not only the greetings of the selected voicemail boxes, but also the messages are to be restored.
 - f) If the **Override** check box is cleared, only the greetings of the selected voicemail boxes that are present in the backup data will be overwritten. If the **Messages** check box is also selected, the messages contained in the backup data are included as well. The existing messages are retained
 - g) If the **Override** check box is selected, all the greetings and messages of the selected voicemail boxes in the SmartVM will be deleted before the restore. If voicemail boxes which are not contained in the backup data are selected, these will also be deleted! The greetings contained in the backup data are transferred. If the **Messages** check box is also selected, the messages contained in the backup data are transferred as well.

- h) Click on **Load** followed by **OK**. The greetings and messages of the selected voicemail boxes are restored.

12.10.2 Notification Service for Messages

The system can optionally notify a UC Smart user about a new voicemail by e-mail.

Prerequisites for the Notification Service

- The delivery of e-mails (e-mail forwarding) has been configured by the administrator in the system.
- The user's e-mail address must be known to the system. The administrator can import all e-mail addresses in the WBM during the initial installation via an XML file or enter an e-mail address for each user in the UC Smart Assistant (see [How to Configure UC Smart Users](#)). Alternatively, users can specify their own e-mail addresses in their UC Smart client.
- A Voicemail licence is assigned to the user.
- The **Voicemail to e-mail** feature is enabled. The administrator can activate the feature for each user in the UC Smart Assistant ([How to Enable or Disable E-mail Notifications](#)). Alternatively, users can activate the feature themselves in their UC Smart client.

The UC Smart user receives an e-mail with the voicemail as an attached WAV file (16 bit, mono), together with the date and time of receipt, duration of the voicemail and, if available, the phone number and name of the sender.

12.10.2.1 How to Enable or Disable E-mail Notifications

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

The **Package with UC Smart** has been activated under **Application Selection** in Expert mode.

The e-mail address of the user is entered in his or her profile details.

Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click on **Wizards > UC Smart**.
3. Click on **Edit** to start the **UC Smart** wizard.
4. Click on **Administration > User Management** in the menu tree.
5. Select the desired user in the **Users** list.
6. Select one of the following options:
 - a) If you want to enable the notification service for new messages, select the **Voicemail to e-mail** check box in the **profile details** area.

- b) If you want to enable the notification service for new messages, clear the **Voicemail to e-mail** check box in the **profile details** area.

7. Click **Apply**.

8. If you want to configure another user, repeat steps [5](#) through [7](#).

13 UC Suite

The UC Suite provides unified communications features such as the Presence status and CallMe, conferencing, as well as voicemail, fax functionality and Attendant Console functions.

NOTICE: For the OpenScape Business hardware models X3/X5/X8, the UC solution UC Suite requires the UC Booster hardware (UC Booster Card or UC Booster Server). With OpenScape Business S (softswitch), the UC solution UC Suite is already integrated.

NOTICE: After changes in configuration of Stations, Groups, Mobility or other system parameters like trunk access codes, the UC Data for either UC Smart or UC Suite need to be synchronized. Synchronization occurs five minutes after the last configuration change. If a later configuration change occurs before the 5 minutes timer, the timer is restarted. UC Data may outdated until synchronization starts.

13.1 Basic Settings for UC Suite

The basic settings for UC Suite can be customized.

UC Suite can be enabled or disabled. If UC Suite is used, UC Smart must be disabled.

In addition, for all UC calls initiated by the system (e.g., via the Call-Me service), a check can be performed before dialing to determine whether the requesting UC user has the requisite class of service for that call. If the UC user does not have the required class of service, the call is not executed.

NOTICE: If CSTA applications are used, the code parameter for all active trunks should be set.

Related tasks

[How to Determine the IP Addresses of the System Components](#) on page 464

13.1.1 How to Activate UC Suite

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.

2. Click in the navigation tree on **Applications > Web Services**.
3. In the menu tree, click on **Application Selection > Application Selection**.
4. Select one of the following options:
 - If you want to use the UC Suite with the UC Booster Card, click on **Package with UC Suite**.
 - If want to use the UC Suite with the UC Booster Server, click on **Package with UC Suite on OSBiz UC Booster Server** and, in addition, enter the IP address of the external Linux server in the **IP address of the OSBiz UC Booster Server** field.
5. Click on **Apply**.

13.1.2 How to Restrict the Authorization for UC Calls Initiated by the System

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click in the navigation tree on **Telephony Server > Basic Settings**.
3. In the menu tree, click **Basic Settings > System > System Flags**.
4. If an authorization check before dialing is to be performed for system-initiated UC calls to verify whether the requesting UC Suite user has the required class of service for that call, select the **Restriction for UC calls** check box in the **Restriction for UC calls** area.
5. If no authorization check before dialing is to be performed for system-initiated UC calls to verify whether the requesting UC Suite user has the required class of service for that call, clear the **Restriction for UC calls** check box in the **Restriction for UC calls** area.
6. Click on **Apply**.

13.2 UC Suite Clients

UC Suite clients provide subscribers with convenient user interfaces for comprehensive unified communications functions.

The system offers the following UC Suite clients for the following devices:

Client type	Client	Device
Communications Client	myPortal for Desktop	PC
	myPortal for Outlook	

Client type	Client	Device
	myPortal @work	
	Fax Printer	
	myAttendant	
Mobile Client	myPortal to go (UC Suite) (see Mobility)	Smartphone, Tablet PC
Contact Center Client	myAgent (see Multimedia Contact Center)	PC
	myReports (see Multimedia Contact Center)	

Subscribers with a configured e-mail address receive a welcome e-mail with Getting Started instructions.

Custom Settings

The custom (i.e., subscriber-specific) settings for myPortal for Desktop are stored in ini files on the PC. A separate ini file is created for every user. The custom settings for myPortal for Outlook, myAttendant and Fax Printer are stored in the registry of the PC. This enables different users to use the myPortal for Desktop, myPortal for Outlook, myAttendant and Fax Printer applications on a single PC (Desk Sharing) and also the deployment in Windows Terminal Server and Citrix Server environments. This allows different users to access the applications from their PCs without a local installation.

13.2.1 myPortal for Desktop

myPortal for Desktop is a client for unified communications on your PC. Besides convenient dialing aids via phone directories and favorites and information on the presence status of other subscribers, users can, for example, also access their voicemails and fax messages.

myPortal for Desktop provides the following features:

- Directories
- Favorites List
- Journal
- Desktop Dialer
- Screen Pops
- Presence status
- CallMe service with ONS (One Number Service)
- Status-based call forwarding
- Personal AutoAttendant
- Conference management

- Recording conferences
- Record calls
- Instant Messaging
- Voice and fax messages

13.2.1.1 How to Customize an an Alternative Modern User Interface for myPortal for Desktop

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

You can customize the appearance of the alternative modern user interface for myPortal for Desktop by performing the following steps:

Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **Skin Settings** wizard.
4. Select one of the following options for the skin to be used:
 - If you want to use the default skin, select the **Unify Default** from the drop-down list.
 - If you want to use the dark skin, select the **Unify Dark** from the drop-down list.
5. Click on **Save**.

13.2.2 myPortal @work

myPortal @work is a Unified Communication Application, which combines all needed features and services, like convenient dialing via phone directories, favorites, conversations and information on the presence status of colleagues, into a single solution design to accelerate daily communication, improve teamwork and to get in quick contact with colleagues, customers and Partners.

NOTICE: When myportal@work VoIP client is used in combination with other UC Suite clients it is recommended to use consultation hold from myportal@work instead of common hold from UC Suite clients.

myPortal @work can be used with both UC Smart and UC Suite solutions. For more information, see [myPortal @work](#).

13.2.3 myPortal for Outlook

myPortal for Outlook is the client for unified communications in Microsoft Outlook (plug-in) and is analogous to myPortal for Desktop.

myPortal for Outlook provides the following features in addition to those of myPortal for Desktop:

- How to Call an Outlook Contact
- How to Create an Outlook Contact from the Sender of a Voice Message
- How to Send a Voice Message as an E-mail
- How to Send a Fax Message as an E-mail

13.2.4 Fax Printer

Fax Printer is a Windows application for sending fax messages with individually created cover sheets from other Windows applications such as Microsoft Word, for example.

Fax Printer consists of the following components:

- Fax Printer Cover Editor
- Fax Printer Driver - with the following features:
 - Sending faxes to individual recipients
 - Directories
 - Use of central cover sheets
 - Using predefined headers
 - Merge fax
 - Control via the user interface
 - Control via the command line

13.2.5 myAttendant

myAttendant is a unified communications solution for Attendant functions. Besides convenient Attendant functions, dialing aids via phone directories and information on the presence status of other subscribers, myAttendant can, for example, also be used to access voicemails and faxes. Instant Messaging supports the communication with internal subscribers.

myAttendant provides the following features:

- Attendant functions
- Directories
- Journal
- Pop-up windows
- Change the presence status of subscribers
- Record calls
- Message Center
- User Buttons
- Manage voice and fax messages
- Instant Messaging
- Team functions
- Conference management

13.2.6 Prerequisites for UC Suite PC Clients

In order to use UC Suite PC clients, the client PC must be equipped with the appropriate hardware and software configurations. Depending on the configuration, administrator rights are required for the installation and automatic updates. The available functionality depends on the licenses being used.

NOTICE: Please make sure that you refer to the current notes in the `ReadMe first` file, which is located in the storage directory of the install files.

Telephones

The UC clients can be used in combination with the following telephones:

- OpenStage HFA and SIP
- OpenScape Desk Phone IP 35G/55G HFA and SIP
- OpenScape Desk Phone IP 35G Eco HFA and SIP
- OpenScape Desk Phone CP 100/200/205/400/600/600E/700/700X HFA and SIP
- OpenScape Desk Phone CP 110/210/710 HFA and SIP
- SIP phones with 3PCC support
- Analog telephones
- ISDN Phones
- OpenScape Personal Edition HFA and SIP
- OpenStage M3 (OpenScape Business Cordless)
- OpenScape DECT Phone S6/SL6/R6 (OpenScape Business Cordless)
- optiPoint WL3 professional SIP

Older devices (such as optiPoint 410/420/500, Gigaset M2/SL3/S4/SL4/S5 and optiPoint WL2 SIP) are supported. Optiset E devices cannot be operated. For details on the tested and released devices, please refer to the Release Notice.

NOTICE: OpenScape Desk Phone CP 400/600/600E/700/700X/710 HFA integrated Client does not have any special prerequisites, apart from the standard client configuration and license.

"Favorites" in phone menu contains Free Programmable Keys and does not relate to UC Favorites. Details for those keys and how to, are available within the device documentation.

NOTICE: For analog and DECT telephones, the Message Waiting Indication (MWI) is not supported, and only limited support is available for displaying information on the phone.

Operating Systems

The UC Suite PC clients can be used in conjunction with the following operating systems:

- Apple Mac OS X 10.10 / 10.9 / 10.8 / 10.7
- Microsoft Windows 10 / 8.1 / 8 / 7 (both 32-bit or 64-bit are possible)
- Microsoft Windows Vista (32 bit)
- Office 365 (local installation = Office 2013)

INFO: The used operating system always requires the latest version of all available updates (Service Packs and patches).

Support for the UC Suite PC clients for Microsoft Office 2003, Microsoft Windows XP and Microsoft Windows Server 2003 will end at the same time as the end of support for these products by Microsoft. The product will still be supported, but will no longer be tested in detail.

Local administrator rights on a client PC are required for the installation under Windows, but not for automatic updates. The Russian and Chinese user interfaces of myPortal for Outlook require a corresponding Russian or Chinese Windows installation.

myPortal for desktop for Apple MAC is available with same interface as under Microsoft Windows. However, due to the Apple MAC OS system architecture, the following functions are currently not supported:

- Sending faxes
- Outlook, Entourage Integration

myPortal for Outlook is supported in Microsoft Office 365 environments. Microsoft Office 365 is a cloud application. It includes, among other things, an Exchange server for the centralized distribution of e-mails as well as the traditional Microsoft Office products. OpenScape Business supports Microsoft Office 365.

The following functions can be used under Microsoft Office 365:

- Exchange Calendar Integration
- E-Mail Forwarding

Web Browsers

The following web browsers have been released for programming telephone keys via the UC clients:

- Microsoft Internet Explorer Version 10 (or later)
- Microsoft Edge
- Mozilla Firefox Version 19 (or later)
- Google Chrome

Additional Software

Additional Software	myPortal for Desktop	myAttendant	myPortal for Outlook
Oracle Java 8 or higher (32 bit / 64 bit) or alternatively OpenJDK 8 (32 bit / 64 bit)	X	X	
Microsoft Office 16, including Outlook (32 bit / 64 bit) or Microsoft Office 2013 / 2010 (32 bit / 64 bit) or Microsoft Office 365			X
Access to Microsoft Exchange Server (for Outlook contacts and appointments) Exchange 2015 / 2013 / 2010 (64 Bit)	X		X
Microsoft .NET Framework >= 4.0 (as of Outlook 2010)			X

NOTICE: In order to use the Exchange Calendar integration with Microsoft Small Business Server, FBA (Form Based Authentication) may need to be disabled there under some circumstances.

Note about Java 32 bit or 64 bit

In order to use the myPortal for Desktop function "Import Outlook Contacts at Startup" in conjunction with the 64-bit version of Microsoft Office 2013, an installation of the 64-bit variant of Java is required. If this function is not used, the Java 32 bit version is recommended, since the memory requirements for it are significantly lower. For this reason, the 32-bit version of Oracle Java or OpenJDK is generally recommended for all other installations as well.

NOTICE: Continuous use of the existing Oracle Java with OpenScape Business does not require any change. If a change of the Java version is required (for example upgrade from Oracle Java 7 to Oracle Java 8 or to Open JDK V8) then a reinstallation of the communication client is required.

Minimum Hardware Requirements

- 2 GHz CPU
- RAM: 2 GB
- 100 Mbps LAN (1 Gbps LAN recommended)
- XGA (1024x768) screen resolution, myPortal for Outlook: SVGA (800x600) screen resolution

NOTICE: 4K monitors are not supported for myPortal and myAttendant.

Microsoft Terminal Server, Citrix XenApp Server

The UC Suite PC clients can be used in Microsoft Terminal Server and Citrix Server environments under the following preconditions:

INFO: Terminal Server and Citrix Server environments, including hosted services and virtual environments are the responsibility of the customer.

INFO: Citrix server environments can decode some regional characters (e.g., German umlauts) correctly.

Operating systems:

- Microsoft Windows Server 2015 (32 bit / 64 bit) as Microsoft Terminal Server
- Microsoft Windows Server 2012 (32 bit / 64 bit) as Microsoft Terminal Server
- Microsoft Windows Server 2008 R2 (64 bit) as Microsoft Terminal Server
- Microsoft Windows Server 2008 R2 (64 bit) with Citrix XenApp 6.5 Server (Desktop Mode)

Office applications:

- Microsoft Office 16, including Outlook (32 bit / 64 bit)
- Microsoft Office 2013 (32 bit / 64 bit)
- Microsoft Office 2010 (32 bit / 64 bit)

Hardware Prerequisites: The number of installable clients depends on the server performance and on the amount of available memory. If the server is also being used for other applications, their memory requirements must also be taken into account.

More information on the configuration of Citrix XenApp Server can be found under:

http://wiki.unify.com/wiki/OpenScape_Business.

Installation Files

The following options are available for providing installation files to users:

- The administrator downloads the installation files from the Service Center. The administrator can download the installation files from the **Service Center** and provide them to the users via a network drive, for example.
- The administrator downloads also the offline installer repository from example.
- The administrator can also download the offline installer repository from the **Service Center** and the clients can be installed offline.

13.2.7 Silent Installation/Uninstallation for UC Suite PC Clients

Silent installation/uninstallation is a command-line based method to automatically install, uninstall or modify UC Suite PC clients on a PC without requiring any further user inputs.

NOTICE: Please make sure that you refer to the notes in the `ReadMe first.rtf` file.

The silent installation/uninstallation requires local administration rights on the relevant PC. The silent installation/uninstallation process can also be logged in a file.

The following parameters are available for silent installations / uninstallations:

Parameters	Components
<code>/quiet</code>	Starts the installation procedure without user intervention and without a user interface. This parameter requires that the repository is already found.
<code>/repository</code>	Sets the IP address or the hostname to use during installation. For example, <code>/repository=192.168.50.50</code>
<code>/installpath</code>	Sets the path of the installed clients. The default value is: <code>C:\Program Files(x86)\communicationsclients\</code>
<code>/autostart</code>	Starts the installation procedure without user intervention. This parameter requires that the repository is already found.
<code>/i</code>	Selects a product to be installed. Available values are <code>OLI</code> , <code>myPortal</code> , <code>myAgent</code> , <code>FPD</code> , <code>myReports</code> and <code>all</code> . For example: <code>/i="OLI, FPD"</code>
<code>/u</code>	Selects a product to be removed. For example: <code>/u="OLI, FPD"</code>

Parameters	Components
/set	<p>Selects the products that should be installed in the system. This switch will install the selected products, or modify them if they are already installed. It will also remove installed products that are not listed in the provided set. For example:</p> <pre>/set="OLI,FPD"</pre>
/repair	<p>Repairs the specified products. For example:</p> <pre>/repair="OLI,FPD"</pre>

13.2.7.1 How to Perform a Silent Installation

Prerequisites

Your PC meets the requirements described under [Prerequisites for UC Suite PC Clients](#).

You have local administration rights on the client PC.

The file `CommunicationsClients.exe` is available on the client PC.

NOTICE: Please make sure that you refer to the notes in the `ReadMe` first file.

Use the command line in accordance with the following patterns in a batch file or in a window with the DOS command prompt.

Step by Step

1. If you do not want to log the process, execute the following command:

```
CommunicationsClients.exe /repository=<IP-address> /i=all /quiet
```

Where `<IP-address>` must be replaced with the IP of UC Clients.

2. If you want to log the process in a file, for example, in `C:\ccinstall.log`, execute the following command:

```
CommunicationsClients.exe /repository=<IP-address> /i="myPortal,FPD" /quiet /l="C:\ccinstall.log"
```

Where `<IP-address>` must be replaced with the IP of UC Clients. The above command installs only myPortal for Desktop and FaxPrinter. You can modify it to install the clients you want.

13.2.7.2 How to Perform a Silent Uninstallation

Prerequisites

Your PC meets the requirements described under [Prerequisites for UC Suite PC Clients](#).

You have local administration rights on the client PC.

The file `CommunicationsClients.exe` is available on the client PC.

NOTICE: Please make sure that you refer to the notes in the `ReadMe` first file.

Use the command line in accordance with the following patterns in a batch file or in a window with the DOS command prompt.

Step by Step

1. If a system update was performed after the last silent installation, repeat exactly the same command line with the new `CommunicationsClients.exe` file as was done with the earlier `CommunicationsClients.exe` file (i.e., as if you wanted to reinstall the components installed earlier with the new `CommunicationsClients.exe` file. It is only then that a silent uninstallation will be possible.
2. If you do not want to log the process, select one of the following command lines:

- If you want to uninstall all the components:

```
CommunicationsClients.exe /quiet /u=all
```

- If you want to uninstall multiple components, specify their corresponding parameters as a comma-separated list after `/u=`, for example, `myPortal` for Desktop / `myAttendant` and Fax Printer:

```
CommunicationsClients.exe /quiet /u="myPortal,FPD"
```

- If you want to uninstall only one component, enter the appropriate parameter after `/u=`, for example, `myPortal` for Desktop / `myAttendant`:

```
CommunicationsClients.exe /quiet /u=myPortal
```

3. If you want to log the process in a file, e.g., in `C:\ccuninstall.log`, select one of the following command lines:

- If you want to uninstall all the components:

```
CommunicationsClients.exe /quiet /l="C:\ccuninstall.log" /u=all
```

- If you want to uninstall multiple components, specify their corresponding parameters as a comma-separated list after `/u=`, for example, `myPortal` for Desktop / `myAttendant` and Fax Printer:

```
CommunicationsClients.exe /quiet /l="C:\ccuninstall.log" /u="myPortal,FPD"
```

- If you want to uninstall only one component, enter the appropriate parameter after /u=, for example, myPortal for Desktop / myAttendant:

```
CommunicationsClients.exe /quiet /l="C:\ccuninstall.log" /u=myPortal
```

13.2.8 Automatic Updates

Automatic updates ensure that the UC clients are always kept up-to-date with the latest version.

If a new version is available, the update will either be installed automatically or you will be notified that an update is available. If necessary, a message is displayed indicating that one or more applications must be closed to perform the update.

NOTICE: We recommend that you always perform the updates offered. This also applies to software that is required for certain UC clients.

NOTICE: Automatic update of myPortal @work is not supported in MacOS.

13.3 Users and User Profiles of the UC Suite

Users of UC Suite are the subscribers who use the UC clients of UC Suite. User profiles store the settings of the users of UC Suite.

13.3.1 Users of UC Suite

UC Suite users use the UC clients of UC Suite. The settings of the UC Suite users are configurable in the user directory.

The user directory contains all the subscribers in the system. In order to use the UC clients, additional user data must be configured in the user directory.

NOTICE: Circuit users are not visible to the user directory as no license per user is assigned.

The following information is displayed in the user directory for every user:

- Symbol for presence status
The administrator can change the presence status for every user.
- **Extension**
- **User name**

NOTICE: While UCSuite does allow and support the change of usernames for its own clients, nevertheless such changes could affect the login of non-UCSuite clients like myPortalToGo/myPortal@Work (where applicable), hence not recommended in such situations.

- **Name**

First and last name, as configured for the subscriber.

- **Department**

If a department is assigned to the user.

- **E-mail**

E-mail address

- **Is Agent**

Agent level for Multimedia Contact Center.

- **Voicemail**

The user can receive voicemail.

- **Call Forwarding**

Call forwarding is configured for the user.

Search functionality is also available for the user directory fields.

The following settings can be configured:

Values and settings	Keywords
Personal details	
My Personal Details	Own name, user name, password, e-mail address, department, additional phone number
My Picture	My Picture Supported file formats: BMP, JPG/JPEG/JFIF, PNG. Maximum file size: 10MB
User Level	Receiving voicemails: see Stations User as Attendant Console: see Stations User as agent: see Stations
My Preferences	
Presentation	Skin colors, language of the user interface
Notifications	Screen Pops
Calendar connectivity	Automatic creation of Outlook appointments when absent, automatic update of presence status via Outlook/iCal appointments
Hotkeys	Hotkey for functions

Values and settings	Keywords
Miscellaneous	Automatic reset of the presence status, transfer method, retention period for Journal entries, server address, function keys of the telephone
Call Rules	
Forwarding destinations	Status-based Call Forwarding
Rules Engine	Rule-Based Call Forwarding
Communications	
Voicemail settings	Recording or announcement mode, language of the voicemail box
VM Notification	Notification Service for Messages
Fax Notification	Notification Service for Messages
Profiles	
Busy, No Answer, Meeting, Sick, Break, Away, Vacation, Lunch, Home Ph.	profile for personal AutoAttendant
Sensitivity	
Security and Access	Retrieval of your voice and fax messages by the Attendant; password check for the voicemail box
Presence Visibility	Visibility of your Presence Status for Others
VoiceMail Presence	Announcement of your presence status for external callers; announcement of your presence status for specific callers
Allow other users to copy my BLF layout	Allow other users to copy the BLF groups and buttons This option is not available for the profiles that have already been created.
myAttendant	
LAN Messages	Text module for Instant Messaging
DIDs	MSN
Communications	Call forwardings

Additional information on user settings can be found in the User Guides of the UC clients and under the keywords listed in the table.

The password for UC clients consists of six digits by default. The password length can be adapted as required (6-10 characters). The maximum number of repeated characters is two and the maximum number of sequential characters is three. The account name (reversed or not) cannot be part of the password and the password change requires knowledge of the old password. The user is forced to change the default password after the first use.

The maximum number of erroneous login attempts is five. An administrator with the **Advanced** profile can change the password of a user (if the user has forgotten it, for example).

NOTICE: The First Name and Last Name of a user are overwritten in the User Directory when they are changed by using a wizard or in Expert mode. By contrast, if the First Name and Last Name of a user are changed in the User Directory, the user data displayed when using a wizard or in Expert mode are not overwritten. This results in the existence of two different user names for the same user. Additionally, if the length of first name and the length of last name is greater than 16 characters in total, then it will be truncated to 16 in order to fit to display of the device.

Subscribers for whom an e-mail address has been configured and who use myPortal for Desktop receive a welcome e-mail with Getting Started Instructions.

Resetting User Data

The settings of a user can be reset to default values. Resetting user data will delete all user's data, including First Name, Last Name and Login Name.

Whether or not the user has First or Last Name set via **WBM > Expert Mode > Telephony Server > Station**, resetting this user via UC Suite will eventually assign the number that is stored as Extension also in the **Name** field.

13.3.1.1 How to Configure UC Suite Users

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **User Directory** wizard. All users are displayed.
4. Mark the desired user and click **Edit**.
5. Edit the data of the user.
6. Click on **Save**. The window is automatically closed. All users are displayed.
7. If you want to configure another user, repeat steps 4 through 6.

13.3.1.2 How to Reset UC Suite Users

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **User Directory** wizard. All users are displayed.
4. Mark the desired user and click **Reset User**.
5. Click on **Save**. The window is automatically closed. All users are displayed.
6. If you want to reset another user, repeat steps 4 through 5.

13.3.1.3 How to Configure UC Suite Users as Agents (myAgent)

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **User Directory** wizard. All users are displayed.
4. Click in the row with the relevant user.
5. Click **Edit**.
6. Click on **Personal Details > User Level**.
7. Select one of the following options:

If the agent is to be permanently available, select the **Permanently available agent** check box. The agent will then remain available for calls, faxes and e-mails even when he or she does not accept a call, fax or e-mail.

If the agent is not to be permanently available, clear the **Permanently available agent** check box. The agent will then be assigned the status Unavailable when he or she does not accept a call, fax or e-mail.
8. In the **Level** drop-down list, select the desired role for this agent: **Agent**, **Supervisor** or **Administrator**.
9. Click **Save**.
10. If you want to configure another user as an agent, repeat steps 4 through 9.

13.3.1.4 How to Change the Presence Status for a UC Suite User

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **User Directory** wizard. All users are displayed.
4. Select the desired user.
5. Select the relevant presence status from the drop-down list and, if necessary, enter the time of return in the format `yyyy/mm/dd hh:mm`, e.g., 2012/12/12 12:00.
6. Click on **Save**.
7. If you want to change the presence status for another user, repeat steps 4 through 6.
8. Close the window.

13.3.1.5 How to Change the Password for a UC Suite User

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **User Directory** wizard. All users are displayed.
4. Mark the corresponding user and click **Edit > Personal Details > My Personal Details**.
5. Under **Password**, click on **Change**.
6. Enter the new password under **New**.
7. Enter the new password under **Confirm**.
8. Click on **OK**. The window is automatically closed. All users are displayed.
9. If you want to change the password of another user, repeat steps 4 through 8.

Next steps

Notify the affected user(s) about the new password.

13.3.1.6 How to Change the Password Length for UC Suite Users

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Applications > OpenScape Business UC Suite**.
3. Click on **Server**.
4. Click on **General Settings**.
5. Enter the minimum required password length (6-10) for the future in the **Lengths** field, under the **Length of Password** area.
6. Click on **Save**.

13.3.2 User Profiles for the UC Suite

User profiles of the UC Suite store the settings of the UC Suite users. One or more users (members) can be assigned to a user profile. All members of this profile have the same settings.

Every user can be a member of no more than one user profile. Direct changes to the settings of a user - i.e., not via the assigned profile - automatically delete the user from the profile.

If a user is unassigned from a profile they retain the settings that are represented by this profile.

When a user is already assigned to a profile, only changes in the locked profile items will be applied to that user. If the lock symbol is unlocked, then the changes will not apply.

If an entire profile is deleted, users that were assigned to this profile also retain profile's settings.

The following values and settings can be configured:

Menu items	Values and settings for
Personal details	
My Personal Details	Visibility of phone numbers
My Preferences	
Appearance	Skin colors, language of the user interface
Notifications	Screen pops
Outlook connectivity	Automatic creation of Outlook appointments when absent, automatic update of presence status via Outlook/iCal appointments

Menu items	Values and settings for
Hot Keys	Activation and set up of key combinations for access to various commonly used functions through the keyboard. The lock symbol determines whether users can change these settings themselves.
Miscellaneous	Automatic reset of the presence status, transfer method, retention period for Journal entries, server address
Call Rules	
Forwarding destinations	Status-based call forwarding
Communications	
Voicemail settings	Recording or announcement mode, language of the voicemail box
VM Notification	Notification Service for Messages
Fax Notification	Notification Service for Messages
Missed Call Notifications	Notification Service for Missed Calls
VoiceMail Profiles	
VoiceMail Profiles	Profile for personal AutoAttendant. Available status: Busy, No Answer, Meeting, Sick, Break, Out of Office, Holiday, Lunch, Home
Sensitivity	
Security and Access	Retrieval of your voice and fax messages by the Attendant; password check for the voicemail box
Presence Visibility	Visibility of your Presence Status for Others
VoiceMail Presence	Announcement of your presence status for external callers; announcement of your presence status for specific callers
Favorites	
Favorites	Favorite groups with a list of contacts that can be assigned to the user.

Additional information on user profile settings can be found in the User Guides of the UC clients and under the keywords listed in the table.

13.3.2.1 How to Add a UC Suite User Profile

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **Profiles** wizard. All user profiles and their members are displayed.
4. Click on **Add**.
5. Enter the desired name for the profile under **Name**.
6. Click on **Save**.
7. Configure the desired settings for the user profile.
8. Click on **Save** and close the window.

13.3.2.2 How to Edit a User Profile of the UC Suite

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **Profiles** wizard. All profiles and their users are displayed.
4. Select the desired profile.
5. Click on **Edit**.
6. Change the desired values and settings.

NOTICE: Click on **Save** before you switch to a different menu item so that your changes are applied.

7. Then click **Save** and close the window.

13.3.2.3 How to Display the User Profiles of the UC Suite

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **Profiles** wizard. All user profiles and their members are displayed.

13.3.2.4 How to Add Members to a UC Suite User Profile

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **Profiles** wizard. All user profiles and their members are displayed.
4. Select the desired user profile and click **Assign Users**.
5. Select the desired members from the **Available Users** list.
6. Click on **<-** to transfer them to the **Assigned Users** list.
All station profiles and their members are displayed.
7. Close the window.

13.3.2.5 How to Delete Members from a UC Suite User Profile

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **Profiles** wizard. All user profiles and their members are displayed.
4. Select the desired user profile and click **Assign Users**.
5. Select the relevant members from the **Assigned Users** list.
6. Click on **->** transfer them to the **Available Users** list.
All station profiles and their members are displayed.
7. Close the window.

13.3.2.6 How to Delete a UC Suite User Profile

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **Profiles** wizard. All user profiles and their members are displayed.
4. Select the desired user profile.
5. Click on **Remove**.

6. Click **OK** to confirm your selection. All station profiles and their members are displayed.
7. Close the window.

13.4 Presence Status and CallMe Service

The Presence status and CallMe service display and optimize the availability of subscribers. The Presence status enables simple status-based call forwarding as well as rule-based call forwarding, which can be flexibly configured with myPortal for Desktop or myPortal for Outlook.

13.4.1 Presence Status (Presence)

The Presence status indicates the availability of internal subscribers (including mobile stations) in the Favorites list, the internal directory, the virtual conference room and via voicemail announcements. In addition, the Presence status controls the availability of internal subscribers with status-based call forwarding, rule-based call forwarding and the personal AutoAttendant.

As a subscriber, you can change your Presence status in myPortal for Desktop and myPortal for Outlook or via the menu controls of the voicemail box. Deactivating call forwarding at the telephone returns you to the **Office** presence status. For every change in the Presence status (except for **Office** and **CallMe**), you also define the scheduled time of your return to the **Office** or **CallMe** status.

As a subscriber, you can select the following statuses:

- **Office**
- **Meeting**
- **Sick**
- **Break**
- **Out of Office**
- **Holiday**
- **Lunch**
- **Home**
- **Do Not Disturb**

NOTICE: The system administrator can enable/disable the visibility of status "sick" within the system administration. See [OpenScape Business UC Suite > Server](#)

Call Forwarding to the Voicemail Box

If Presence status of a subscriber is not **Office** or **CallMe**, the communication system redirects calls for him or her to the voicemail box by default and notifies the callers via status-based announcements about the nature of absence and the scheduled time for return.

Info Text

You can enter any info text for your current presence status, e.g., "I am in Room No. ..." when attending a meeting. The info text is displayed in the Favorites list, in the internal directory and in the virtual conference room. The info text is deleted when you change your presence status.

Automatic Reset of the Presence Status

As a subscriber, you can have your Presence status automatically reset to **Office** at the end of your scheduled absence. Otherwise, the system extends the current Presence status in increments of 15 minutes until you change it yourself.

Visibility of your Presence Status

As a subscriber, you can specify for each subscriber in the internal directory whether or not that subscriber can see your Presence status other than **Office** and **CalMe** as well as the scheduled time of your return and any info text you may have entered.

NOTICE: Visibility settings are not applied for myAttendant users, as they can always see the presence status of other users.

Automatic Update of Presence Status via Outlook / iCal Appointments

As a subscriber, you can automatically control your Presence status via appointments (but not for those that have been proposed or declined) by using the specific keywords in the Subject line. You can choose between the following calendars:

- Exchange calendar (on the Microsoft Exchange Server)
The automatic update of the presence status via Outlook appointments occurs independently, regardless of whether or not your PC is running. The administrator must configure the Exchange Calendar Integration for this function.

NOTICE: Information on the usage of the various Microsoft Exchange servers can be found in the Unify Experts wiki at http://wiki.unify.com/wiki/OpenScape_Business#Microsoft_Exchange_Server.

- Outlook calendar
The automatic update of the presence status via Outlook appointments requires myPortal for Desktop or myPortal for Outlook to have been started on your PC.
- iCal calendar (myPortal for Desktop)

You can use the following keywords:

- **Meeting**
- **Sick**
- **Break**
- **Out of Office**

- **Holiday**
- **Lunch**
- **Home**

The keywords depend on the language set for the user interface. The keywords may be located anywhere in the Subject line. If the Subject line contains more than one such keyword, only the first takes effect. When this function is enabled, your Presence status changes automatically at the start and end time of the relevant appointment. The check for calendar appointments occurs at 30-second intervals.

NOTICE: When enabling this function, please bear in mind that any appointments with corresponding keywords in the Subject line could lead to undesirable changes in your Presence status. Consequently, you may need to change the Subject line if needed.

NOTICE: The "sick" presence status may not be available, depending on system settings by the administrator.

Automatic Creation of Outlook Appointments when Absent)

As a subscriber, you can have appropriate Outlook appointments created automatically when you are absent by a change in your Presence status. The Subject line of the corresponding Outlook appointment consists of your Presence status and the text "(Auto)", for example: "Meeting (Auto)". The start and end times for the appointment involved correspond to your entries in myPortal for Desktop or myPortal for Outlook. The end time of the Outlook appointment remains unchanged in the event of a possibly delayed return. You can define whether the Outlook appointments should be stored in the local PST file or on the Exchange server. If you are using a local PST file, your Outlook must be open when creating the Outlook appointments. If you are using a PST file on the Exchange server, the Outlook appointments are created, regardless of whether or not your Outlook is open. The administrator must configure the Exchange Calendar Integration for this function.

NOTICE: Information on the usage of the various Microsoft Exchange servers can be found in the Unify Experts wiki at http://wiki.unify.com/wiki/OpenScape_Business#Microsoft_Exchange_Server.

Screen Pops on Changing the Presence Status

As a subscriber, you can have changes to your Presence status indicated by a screen pop.

13.4.2 CallMe Service

The CallMe service enables subscribers to define any phone at an alternative workplace as the CallMe destination at which they can be

reached through their own internal phone numbers. The subscriber can use myPortal for Desktop or myPortal for Outlook at his or her alternative workplace exactly as in the office and thus also make outgoing calls from the CallMe destination.

Inbound Calls

Inbound calls to the internal phone number are forwarded to the CallMe destination. The internal phone number of the called subscriber is displayed to the caller. Unanswered calls are forwarded to the voicemail box after 60 seconds.

NOTICE: If an unconditional forwarding for the controlled device is configured, Application Launcher cannot receive call related events from the communication server and cannot therefore trigger any actions toward applications. This also applies when the UC Suite feature CallMe is activated.

Outbound Calls

For outbound calls with myPortal for Desktop or myPortal for Outlook, the communication system sets up two connections. It first calls the subscriber at the CallMe destination. If the call is answered, the communication system then calls the desired destination and connects the subscriber with it. The internal phone number of the caller is displayed at the destination (One Number Service).

Presence Status

When the CallMe service is enabled, the message "CallMe active" appears in the display of the relevant phone (not for analog and DECT phones). Other subscribers see the presence status **Office**.

Activation

As a subscriber, you can activate the CallMe service manually. In addition, the Call-Me service is also reActivated by an automatic reset of the Presence status following an absence, provided it was active earlier. Then following types of CallMe destinations are not supported:

- Group
- Redirected telephone

Displaying the CallMe Destination in the Favorites List

As a subscriber, you can have the number of your CallMe destination displayed in the Favorites list of other subscribers instead of your own phone number.

Deactivation

The CallMe service remains active until your Presence status changes.

NOTICE: CallMe function should not be used when dialing or caling in an open conference.

13.4.3 Status-based Call Forwarding

Status-based call forwarding enables subscribers to forward calls based on their Presence status to one of their additional phone numbers or their voicemail box.

As a subscriber, you can configure status-based call forwarding for every presence status except **Office**, **CallMe** and **Do Not Disturb**. When you change your Presence status, the communication system activates call forwarding to the destination defined by you for this purpose. For example, if you are away from the office, to your mobile phone or if you are on vacation, to your representative.

13.4.4 Rule-Based Call Forwarding

Rules-based call forwarding enables subscribers to forward calls based on numerous conditions and exceptions even more flexibly than with status-based call forwarding.

In addition, rule-based call forwarding also supports:

- Any destinations
- Presence status **Office**, **Meeting**, **Sick**, **Break**, **Out Of Office**, **Vacation**, **Lunch**, **Home**

NOTICE: **CallMe** and **DND** are not valid for rule-based call forwarding.

As a subscriber, you can define rules and activate or deactivate them at any time by using the Rules wizard. A rule can only be active if your phone has not been forwarded. Status-based call forwarding (except to the voicemail box) overrides rule-based call forwarding.

When a call forwarding rule is active, "**rule active**" appears on the display of your telephone.

When an inbound call is received, the communication system checks the applicability of the active rule in accordance with its sequential order in the Rules wizard. Only the first applicable rule is executed. In this case, your phone will ring once, and the communication system will then forward your call to the defined destination.

You can define several types of conditions and exceptions (except when ...) in one rule. However, you cannot define a condition with an exception of the same type. For example, it is not possible to define a condition of the type "On certain weekdays" together with an exception of the type "Except on certain weekdays".

Types of Conditions and Exceptions

- (except) for certain Presence status
- (except) from certain people (in the internal directory, external directory, personal directory or from any station number)

- (except) when transferred to you from certain people (in the internal directory, external directory, personal directory or from any station number)
- (except) from a certain type, i.e., **internal**, **external** or **Unknown Contact**
- (except) on a certain date (also on multiple dates)
- (except) on certain weekdays
- (except) between a certain Start and End date
- (except) between a certain Start and End time

13.5 Directories and Journal

Directories, the Favorites List and the Journal organize contacts and calls.

13.5.1 Directories

Directories are used to organize the contacts of subscribers. Subscribers can access these contacts with UC Suite clients and via system phones with displays.

The system provides the following directories, which support the following functions and with the below priority for lookup number (lookup number will be supported only for external call and in case that CO/ITSP does not provide the name):

Directory	myPortal for Desktop, my Attendant, myAgent, Fax Printer	myPortal for Outlook	System telephone with a display
Outlook Contacts MAC OS contacts (myPortal for Desktop)	If required, the subscriber can import Outlook/Mac OS contacts on starting myPortal for Desktop when using Microsoft Windows.	Contains the personal Outlook contacts of a subscriber. Only the subscriber involved has write access to this data.	Contains the personal Outlook contacts of a subscriber. Only the subscriber involved has write access to this data.
Personal directory	The subscriber can either import Outlook/Mac OS contacts on starting myPortal for Desktop or maintain personal contacts manually. Imported contacts cannot be edited.	-	Outlook contacts imported via the Personal Assistant.

Directory	myPortal for Desktop, my Attendant, myAgent, Fax Printer	myPortal for Outlook	System telephone with a display
Internal directory	<p>The internal directory of UC Smart offers additional features with the UC Suite. It contains:</p> <ul style="list-style-type: none"> • All internal subscribers • Groups for which the display has been activated in the system • Additional phone numbers, if the subscriber has made this information visible to other internal subscribers <p>Internal subscribers (with system telephones) are displayed with their Presence status and can be contacted through Instant Messaging. The Presence status of a subscriber can only be shown if allowed by that subscriber. If relevant, the scheduled time of return and any info text that may have been entered by the subscriber are also displayed. A subscriber has only read-access to this directory.</p> <p>Internal directory includes the System directory. But searches done in the Internal directory do not include System directory results, but only Internal directory entries.</p>		Contains all internal subscribers and groups for which the display has been activated in the system.
External directory	Contains contacts from a corporate directory and must be configured by the administrator. A subscriber is only provided read-access to this directory.		-
Public Exchange folder (not usable with Office 365)	<p>Contains contacts of the public Exchange folder if configured by the administrator. These are shown in the external directory.</p> <p>Information on the usage of the various Microsoft Exchange servers can be found in the Unify Experts wiki at http://wiki.unify.com/wiki/OpenScape_Business#Microsoft_Exchange_Server.</p>		-
External Offline Directory (LDAP)	Contains contacts from the LDAP corporate directory and must be configured by the administrator. The external offline directory can only be used for searches. The administrator can enable and disable the display of the external offline directory for system telephones.		
System Directory	<p>Contains all system numbers, UC and non UC users. Non UC users include stations with no UC licenses and virtual stations, like Fax, AutoAttendant.</p> <p>System Directory does not apply to the Fax Printer</p>		Includes all internal stations and all central speed-dial numbers. The administrator can enable and disable the display of a subscriber in the system directory.

NOTICE: Phone numbers stored in user settings and all directories (internal, external, personal, outlook,

exchange) should be in canonical format in order to be reachable both from UC and device.

Access code should not be in the number.

NOTICE: When adding or removing a UC contact, it may take several minutes (**and** up to 30') until changes are applied on all clients and devices due to caching mechanisms that are used. Alternatively a system restart can be performed for the changes to take **immediate** effect.

Simple Search

As a subscriber, you can search the directories by **First Name**, **Last Name** or a call number. The directories are searched in the order shown in the table above. The search can be conducted using whole words and also with partial search terms such as a part of a station number, for example. The set search options remain in effect for subsequent searches. All search terms used are saved. You can optionally delete the list of search terms used.

Advanced Search

You can selectively search in the **Title**, **First Name**, **Last Name**, **Company**, **Extension**, **Company Ph.**, **Business Ph. 1**, **Business Ph. 2**, **Home Ph. 1**, **Home Ph. 2**, **Mobile Number** and **Email** fields and limit the maximum number of hits. The modern interface of myPortal for Desktop does not support the advanced search. In a device only **Business Ph. 1**, **Home Ph. 1**, **Mobile Number** are supported.

Sorting

The contacts of a myPortal for Desktop and myPortal for Outlook directory can be sorted by any column in ascending or descending alphanumeric order. The modern interface of myPortal for Desktop does not support sorting.

13.5.1.1 How to Configure Directories for System Telephones

Prerequisites

You are logged into the WBM with the **Expert** profile.

You can select which directories are to be made available on system telephones with displays.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony Server > Basic Settings** in the navigation tree.
3. In the menu tree, click on **System > Display**.
4. Select one of the following options in the **Directory (phone book)** drop-down list:

- If all the personal contacts, the internal, external and networking directory and the LDAP directory are to be made available, select **All**.
- If only the personal contacts, the internal, external and networking directory is to be made available, select **Internal**.
- If only the LDAP directory is to be made available, select **LDAP**.
- If no directory is to be made available, select **No**.

NOTICE: The user can activate the search/lookup requests to be handled as requests to the Unified directory, by selecting the **Internal Phonebook via Unified Directory**. When the flag is deactivated and there is no access to Unified Directory, the list view at the phone-book menu, implemented for the OpenScape Desk Phone CP 200/205/210, is not available.

5. Click **Apply**.

Next steps

If you have selected **All** or **LDAP**, make sure that an appropriate LDAP directory (e.g., Open Directory Service) is available for the system telephones.

13.5.2 Internal Directory

The internal directory contains the contact details of the internal subscribers of the communication system. UC Suite clients can access the system directory.

As an administrator, you have unrestricted access to all data in the internal directory. As a subscriber, you can dial from the internal directory.

The administrator can disable the display for all analog stations or for analog stations without an associated name. Subscribers whose names begin with - are not displayed in the latter case.

13.5.2.1 How to Enable or Disable the Display of Analog Stations in the Internal Directory

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Applications > OpenScape Business UC Suite**.
3. Click **Servers** in the menu tree.
4. Click on the **General Settings** tab.

5. In the **Analog Extensions** area, select one of the following options from the **Analog User Mode** drop-down list.
 - If all the analog stations are to be displayed in the internal directory, select **Show all**.
 - If only analog stations with a name are to be displayed in the internal directory, select **Show named only**.

NOTICE: Analog stations with names beginning with '-' are not displayed in the latter case.

- If no analog stations are to be displayed in the internal directory, select **Not shown**.
6. Click **Save**.

13.5.2.2 How to Enable or Disable Searching the Internal Directory only

When dialing by name, you can configure either limiting the search only in the internal directory, or searching all directories in the network environment. The system is configured by default to search only in the internal directory.

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Applications> OpenScape Business UC Suite**.
3. Click **Servers** in the menu tree.
4. Click on the **General Settings** tab.
5. To enable searching only in the internal directory, select the check box **Dial by name search local extension only**, under the **Directory Server** area.

NOTICE: The check box **Dial by name search local extension only** is enabled by default.

The system now searches only the internal directory when dialing by name. When the local extension is reached, the system plays the receiver's name, as long as it has been previously recorded.

6. To disable searching only in the internal directory, clear the check box **Dial by name search local extension only**, under the **Directory Server** area.

The system now searches all directories in the network environment when dialing by name.

13.5.3 External Directory

The external directory includes contacts from outside the communication system.

The data of the external directory is available to all subscribers in all UC Suite clients and the phone display. Subscribers can dial from the external directory. Users with the UC Suite clients myAttendant and myAgent can also edit data in the external directory.

Importing a CSV File

As an administrator, you can import contacts from a CSV file in UTF-8 encoding from the local file system or a network share into the external directory.

A header in the CSV file allows the mapping of field names in the CSV file to fields in the system. A typical CSV file may be structured as follows:

- Header line:
"Customer ID","Last Name","First Name","Company Phone Number","Company Name":
- Data line:
"987654","Dubios","Natalie","+498977712345","Company"

You can map the data being imported from the CSV file to the following fields in the system:

- Customer ID
- Title
- First Name
- Last Name
- Company
- Business Ph.
- Business Ph2
- Mobile Ph.
- Home
- Fax Ph.
- E-mail
- City

NOTICE: The contact name will be displayed in the call history, only if you fill in both the First Name and Last Name fields.

After processing the CSV template, the file must be saved in UTF-8 format in order to ensure the correct import of any existing special characters.

If you want the import to overwrite data, the corresponding **Customer IDs** should be identical.

NOTICE: A CSV template and a description of the syntax required for importing data into the external

directory can be found under **Service Center > Documents > CSV Templates**.

13.5.3.1 How to Import a CSV File from the Local File System into the External Directory

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

A suitable CSV file in UTF-encoding with data for the external directory is available in the local file system.

NOTICE: CustomerID is the only key to determine if the record is duplicated. If CustomerID is not mapped, there is no way to avoid duplicates. As such, it is strongly advised that you rely on the provided Template and adapt the data over it, without omitting unique identifiers.

There are certain limitations to the length of the fields in the CSV templates. These length limitations are listed below:

- customer_business character varying(50)
- customer_business2 character varying(50)
- customer_home character varying(50)
- customer_mobile character varying(50)
- customer_title character varying(20)
- customer_firstname character varying(50)
- customer_surname character varying(50)
- customer_company character varying(255)
- customer_external_id character varying(255)
- customer_xmppid character varying(256)
- customer_fax character varying(50)
- customer_email character varying(255)
- customer_city character varying(255)
- customer_street_address character varying(2048)
- customer_import_source character varying(256)

Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click **Edit** to start the **External Directory** wizard.
4. Click on **Import External Directory** tab.
5. Select one of the following options:
 - If you want to load the CSV file from the local file system, select the **Local file** radio button and navigate to the CSV file in the **File Upload** area.
 - If you want to load the CSV file from a network share, select the **Public Windows Folder** radio button and enter the

network share access data (name of the CSV file, domain name as well as user name and password for the share) in the **Public Windows Folder** area.

Verify your input by clicking on **Test**.

6. Click in the **File Upload** area on **Choose File** and select the desired file.
7. Enter the number of header rows in the CSV file in the **Header Rows** field.
8. Enter the **Field separator** used in the CSV file.
9. Select one of the following options:
 - If you want to delete the existing data from the external directory, select the check box **Remove data before Import**.
 - If you do not want to delete the existing data from the external directory, clear the check box **Remove data before Import**.

NOTICE: The flag **Remove data before Import** will not remove records if they are already used in other functions such as a VIP caller, etc.

10. In the **Duplicate Customer ID** area, select how the system should respond when trying to import data with existing customer IDs:
 - If you want the existing contacts to be overwritten by the data from the CSV file, select **Update existing customer**.

NOTICE: The flag **Update existing customer** only works when CustomerID is mapped during import. Only the record with the same CustomerID will be considered as "existing customer" and will be updated.

- If you want to keep the existing contacts, select **Stop importing current record**.
11. Click **Next**.
 12. Select the fields of the CSV file to be mapped to corresponding fields in the system sequentially from the drop-down lists. If the appropriate fields do not exist or if you do not want to import the data, click on the blank option.
 13. Click **Next**.
 14. Click **Import**. Do not close this window while the data is still being imported. On completing the import, the number of imported records is displayed.

13.5.3.2 How to Add Access to an External Database for the External Directory

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

The required data for accessing the external database is available.

Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **External Directory** wizard.
4. Click on **Import External Directory** tab.
5. Click in the **File Upload** area on **Choose File** and select the desired file.

13.5.3.3 How to Export a CSV file from the External Directory

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on the **Export External Directory** tab.
4. Select one of the following options:
 - If you want to export a CSV file in the local file system, select the **Local file** radio button and click on the **Start** button.
 - If you want to export in a public Windows folder, select the **Public Windows Folder** radio button. Enter the requested values in the following fields:
 - **Filename**
 - **Username**
 - **Domain**
 - **Password**

And click on the **Start** button.

13.5.4 External Offline Directory (LDAP)

The external offline directory (LDAP) contains contacts from an LDAP server for myPortal for Desktop, myAgent, Fax Printer, myPortal for Outlook and for system telephones with displays.

The system supports LDAP Version 2 with authentication.

LDAP (Lightweight Directory Access Protocol) is a TCP/IP-based directory access protocol for accessing network directory services. LDAP has a unique format world-wide in which all names can be represented. It provides for different layouts and enables unique associations between names and their internal representation. This data is defined by the administrator together with the IT administrator of the customer when planning and setting up a project. LDAP can be used under the MS Windows and Linux operating systems.

In a Microsoft environment, the Active Directory Server (ADS) or the Exchange Server also serves as the LDAP server. Under Microsoft Windows, user data can be administered with the Active Directory (AD) application or ESTOS Metadir, for example. The administration of this data is generally performed by the IT administrator of the customer.

Under Linux, the user data can be administered with OpenLDAP, for example.

Setting up an LDAP directory service can be simplified with an LDAP browser (e.g., the freeware from Softerra).

Phone numbers on the LDAP server may only include "-" and blanks as delimiters. Other delimiters cannot be filtered out by the system.

As an administrator, you can adapt the mapping of fields to the names of the used LDAP server during the configuration of an external offline directory. Deleted fields are ignored when searching for names via phone numbers. The search always occurs with the last 4 positions of the phone number preceded by a wildcard. You can deactivate the search for names via phone numbers for incoming calls.

If the default port 389 is already being used, some other port must be configured

NOTICE: More information can be found on the Internet at <http://wiki.unify.com>.

The data of the external directory is available to subscribers in myPortal for Desktop, myAttendant, Fax Printer and myPortal for Outlook during the search.

System Telephones with Displays

As a subscriber, you can select between the internal directory and the LDAP directory via the menu., provided these have been configured for system telephones. The LDAP directory supports searches in the appropriate contacts and the subsequent calling of a contact.

The name information provided by the LDAP server is not displayed in ringing or call status. The call numbers for incoming calls are also not replaced by the name information provided by the LDAP server (as when call numbers are replaced by SSD names).

A system subscriber can only be reached from the LDAP directory if a DID number was configured for him or her and if this entry corresponds to the entry in the LDAP database. Call numbers provided by the LDAP server can only be routed within the network if the internal call number and the DID number are identical.

13.5.4.1 How to Add the External Offline Directory (LDAP) for PC Clients

Prerequisites

You are logged into the WBM with the **Expert** profile.

You know the required access data for LDAP server.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Applications > OpenScape Business UC Suite**.
3. Click the **External Providers Config** tab.
4. Select one of the following options:
 - If you want to enable the resolution of phone numbers into names in the journal for external incoming calls, select the **Search by phone number** check box.
 - If you want to disable the resolution of phone numbers into names in the journal for external incoming calls, clear the **Search by phone number** check box.
5. Click **Add**.
6. Enter the access data of the LDAP server.
 - a) Enter a name for this external offline directory under **Name**.
 - b) Enter the name or the IP address of the LDAP server under **Server**.
 - c) Enter the port number of the LDAP server under **Port**.
 - d) Under **LDAP Basic DN**, enter the LDAP Base Distinguished Name, e.g., `dc=example-for-a-domain, dc=net`.
 - e) Enter the **User Name**.
 - f) Enter the **Password**.
7. Enter the corresponding field designation of the LDAP server for the following fields: **Title, First Name, Last Name, Business Ph. 1, Business Ph. 2, Home, Mobile, Company, Company Ph., Postal Address, State, province or county, Country, Postal Code, E-mail, Pager, Fax Number** and **City**.
8. Click **Save**.

13.5.4.2 How to Delete the External Offline Directory (LDAP) for PC Clients

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Applications > OpenScape Business UC Suite**.
3. Click the **External Providers Config** tab.
4. Click on the external offline directory to be deleted.
5. Click **Remove**.

13.5.4.3 How to Add an External Offline Directory (LDAP) for System Telephones

Prerequisites

You are logged into the WBM with the **Expert** profile.

You know the required access data for LDAP server.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony Server** > **Basic Settings** in the navigation tree.
3. In the menu tree, click on **System** > **LDAP**.
4. Enter the **IP address of the LDAP server**.
5. Enter the **Port number for LDAP access**.
6. Enter the **User Name**.
7. Enter the **Password**.
8. Enter the password again in the **Confirm password** field.
9. Under **Basic DN**, enter the LDAP Base Distinguished Name of the LDAP server, e.g., `dc=example-for-a-domain, dc=net`.
10. Under **Search query**, enter the search string for the LDAP server, e.g.: `cn=$*`.
11. Enter the **Result attribute, Name** for the LDAP server, e.g.: `cn`.
12. Enter the **Result attribute, Station number** for the LDAP server, e.g.: `telephoneNumber`.
13. Select one of the following options for sorting the search results:
 - If you want to have the search results sorted, select the **Sort search results** check box.
 - If you do not want to have the search results sorted, clear the **Sort search results** check box.
14. Enter the **LDAP seizure code**.
15. Enter the **LDAP station number prefix**.
16. Click on **Apply**.

13.5.5 System Directory

Regarding UC Suite clients, the system directory contains all system numbers, UC and non UC users. Non UC users include stations with no UC licenses and virtual stations, like Fax, AutoAttendant. Regarding devices, the system directory contains all internal stations and all central speed-dial numbers.

The administrator individually disable the display for every subscriber and every speed-dial number with a name.

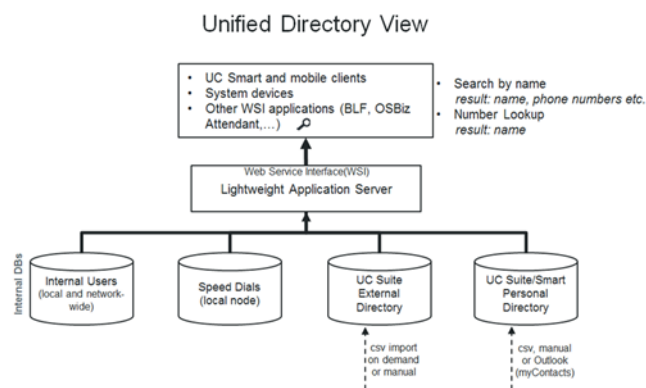

13.5.6 Unified Directory

OpenScape Business provides different data sources to store and to retrieve user or contact related data, starting with the internal user data in the internal user configuration, via the internal speed dial list, up to the different directories of the UC applications.

Each data source within OpenScape Business is used by a specific client application either located within the system SW itself in the phone devices or within a UC client application. Depending on the used data sources and the used clients, the retrieved data and their presentation is different.

The "Unified Directory" service within OpenScape Business comprises the existing OpenScape Business data sources for common search and name resolution functions. It provides the same search result or name resolution information to all system devices and OpenScape Business clients.

The Unified Directory service can either be accessed via the Web Service Interface (WSI) from externally located clients like myPortal to go or internally via the call processing mechanisms (e.g. from OpenStage Phones).

Unified Directory uses following internal databases and directories of OpenScape Business:

- Internal user directory (network wide)
- Speed dial lists
- UC Smart Personal Directory (optional)
- UC Suite External Directory (optional)
- Personal Outlook Contacts (if imported via myContacts)

The Unified Directory service is available within every OpenScape Business system from V2R2 on. It does not require specific HW-SW or license prerequisites.

In order to get best results when using the Unified Directory some rules regarding phone number formats and writing of names have to be followed.

13.5.6.1 Features

Supported Devices / Clients

Unified Directory Service provides:

- Directory Search in several internal data sources of OpenScape Business
- Unified offering of the search result to all supported clients
- Phone number Look-Up / Name Resolution in several internal data sources
- Unified offering of name resolution results for all supported clients
- External data access via the WebServices Interface (WSI)

The features are available for single node systems as described in the following. Within OpenScape Business networks, the availability of the features depends mainly on the kind of connection of the trunks, devices and clients within the network.

Unified Directory supports following clients / system devices of Unify using the indicated interfaces:

Device/Client	Used Interface/Protocol	Remarks
OpenStage phones	Call Processing / HFA protocol	WSI / HTTP(S) is optional on OpenStage 60/80 for caller images
OpenScape Deskphone IP	Call Processing / HFA protocol	WSI / HTTP(S) is optional on DeskPhone IP 55 for caller images
Cordless (CMI) devices	Call Processing / CMI protocol	
CP 100/110/200/210	Call Processing / HFA protocol	
DeskPhone CP400/ 600/600E/ 700/700X/710	WSI / HTTP(S)	
myPortal @work	WSI / HTTP(S)	
myPortal to go	WSI / HTTPS	
Openscape Business Attendant/BLF	Call Processing / CorNet protocol	WSI / HTTP(S) is optional

NOTICE: The UC Suite myPortal, myAttendant and myAgent clients use their own mechanisms for directory search and name resolution.

Search function

The Unified Directory search is always performed by using the specific device / client user interface. The search criteria and the used character set could be restricted, depending on the used clients.

After the search criterion is entered the search is performed within subsequent directories

- Internal user directory (network wide)
- Speed dial lists
- UC Smart Personal Directory (optional)
- UC Suite External Directory (optional)
- Personal Outlook Contacts (if imported via myContacts)

All matches within the directories above are shown as search results together with their origin. The matches contain either the full contact data set or only parts of it. The information depth of the results depends on the data source.

NOTICE: Group name search in myportal@work is not supported at UC Suite mode. Only licensed users (basic license) and licensed MULAP groups (UC Entries) search is supported.

The matches are presented at the devices or clients depending on display capabilities.

	Internal User Directory	Speed Dials	UC Smart Personal Directory	UC Suite External Directory	Personal Outlook Contacts (via my Contacts)
Last Name	X	---	X	X	X
First Name	X	---	X	X	X
Short/ Displayname	X	X	---	---	---
Office Phone No.	---	---	X	X	X
Home/ Ext. PhoneNo.	---	---	X	---	X
Mobile Phone No.	---	---	X	X	X
Email-Adr.	---	---	X	X	X
Company name	---	---	X	X	X
City	---	---	---	---	---

	Internal User Directory	Speed Dials	UC Smart Personal Directory	UC Suite External Directory	Personal Outlook Contacts (via my Contacts)
Contact Picture	---	---	X	---	X
Contact Picturepreview	---	---	X	---	X

Phone Number Look-Up

Unified Directory Phone number Look-Up resolves the transferred calling party (CLI) by a number search in all supported internal data sources . The search is performed within following phone number fields:

- Office number
- Mobile number
- Home number

The Phone number Look-Up is triggered in case of incoming or outgoing calls in general, whereas specific routing and forwarding features are considered in addition.

A fixed prioritization of the data sources that are used for Phone number Look-Up is implemented in order to get the result as fast as possible. The result contains either only lastname, firstname, displayname or ,if available, the full related contact data.

Table 7: Supported Data Sources and Prioritization

Priority	Data Sources	Remark
1	CO/ITSP name (as sent by provider)	Prerequisite is to enable flag "Name in CO".
2	Speed dial list	
3	Personal Contacts	
4	UC User detail	

The retrieved data are presented on the user's device and/or in the UC client. The information depth depends on the display capabilities.

• Incoming calls

Supported scenario for single node systems:

- Basic call
- Group call/ MULAP call
- Ringing Group
- Single Step Call Transfer (SSCT)
- Attended/Supervised/Consultation Transfer
- Call Forwarding Unconditional (CFU)
- Call Forwarding No Reply (CFNR)
- Call Forwarding Busy (CFB)

- Blind transfer
- Call Pickup

NOTICE: Call Pickup is different from Call Pickup Group. In Call Pickup Group, when an external number is saved to the Unified Directory, the name of the caller is not shown from the members of the group.

Supported scenario for multi node (network) scenarios is a Gateway Call.

- **Outgoing call**

In case of an Outgoing Call the Phone number Look-Up of the called partynumber happens only once.

Supported scenario for single node systems is a Basic Call to externalnumber.

The presentation of the Phone number Look-Up result depends on display capabilities of the phones.

13.5.6.2 Rules and Conventions

Some conventions regarding number and name formats within the data sources have to be observed in order to get optimal results using the Unified Directory service.

Supported Number Format

All external phone numbers within the data sources must be entered in the canonical format including country and area code. e.g.
+4989700712345

Speed Dial list supports only system dialable format e.g.
0089700712345 or 0004989700712345

When Speed Dial numbers are configured to be accessible through LDAP, you have to enable the Number conversion option to display the contact name when the number is in canonical format. For more information on how to enable Number conversion, see [How to Add an External Data Source for the Open Directory Service](#) on page 1158.

Supported Name Formats

The following conventions regarding name formats and character sets have to be observed:

- **Speed dial name format**

Name search within the Speed Dial List is supported only with specific configuration rules. The first and last names have to be entered within the existing name field using the following pattern:

<Last Name>, <First Name> (comma separated)

- **Internal Users in case of Migrations**

Migration to V2R1 and onwards with internal users that do not follow these configuration rules will not be supported in the expected way. This means the administrator should convert internal names to the following pattern before migration:

<Last Name>, <First Name> (comma separated)

Availability of directory changes

After creating, updating or deleting contacts in the various data sources it can take up to 10 minutes until all changes appear on Phone number Look-Up results.

13.5.6.3 Functional Boundaries

The following functional boundaries do exist regarding Unified Directories:

Name Search

- Group name support

Group names (not MULAP names) can not be searched in all kind of configurations

- Support of special characters

On most phone devices the user can search for standard characters "a-z". Special (diacritical) characters like German characters Ää, Öö, Üü, ß are not accessible via phone device user interface.

Therefore a plain character search result includes also special characters. A search for any of the characters "acdegilnorstuyz" matches with the corresponding special characters

"àáâãäåäq#äçčċđèéêëëë#ìíîïłñńňòóôõöőřśšţùúûüÿÿžžž"

in the search result.

NOTICE: Phonebook search with the wildcard character at the beginning of the search string, e.g. <*jo*>, is only supported for internal users.

- Support of Speed Dial Name format

Name search within the Speed Dial List is supported only with specific configuration rules. The first- and last names have to be entered within the existing name field using one of the following patterns

- <Last Name>, <First Name> (comma separated)
- <First Name> <Last Name> (space separator on this case)

Name Presentation

Personal Contacts in UC Smart and from external offline directory, with length of first name plus length of last name greater than 24 characters, will be truncated to 24 characters length to fit the display length of the devices.

Phone number Look-up

The Phone number Look-Up feature (retrieve contact name from calling party number) is not supported in Unified Directory for SIP and S0 devices.

13.5.6.4 Unified Directory in Networked Systems

The Unified Directory Service is active within every node of an OpenScape Business Network and uses the datasources of the own system. Phone Devices and Client use always the Unified Directory Service within their own node.

Therefore it depends on the kind of datasource content if netwide contacts are available.

Table 8: Local and Netwide Datasource

Data source	Local data	Netwide data
Internal user directory	X	X
Speed dial lists	X	---
UC Smart Personal Directory	X	---
Personal Outlook Contacts (via myContacts)	X	---

NOTICE: The unified directory is not fully supported in mixed UC Suite/ UC Smart environments.

Phone number Look-up

In Networking scenarios the Phone number Look-Up functionality is not used. In such scenarios the name is transported via normal networking mechanisms between the network nodes.

For internal users the configured Display Name is used so Lookup is not required.

13.5.6.5 How to Import Contacts to Unified Directory

Import contacts wizard offers the functionality to import directory contacts from a csv file.

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Setup**.

2. In the navigation tree, click **Wizards > Unified Directory**.
3. Click on **Edit** next to **Import Contacts**, to proceed with the importing of the contacts to the Global Directory.
4. Under **File Upload** section, click on **Choose File** and select the desired csv file to upload.

NOTICE: The maximum amount of entries per import is 100,000 (30,000 for embedded systems).

5. Under **Options** section, enter the **File separator**. ';' or ',' are valid entries.
6. Click **OK & Next**.
7. Backend processes the file, reads the headers and presents the headers together with the predefined categories of the Master Directory into the **CSV Header Mapping** page. Then the user can match the entries of the csv files in order to import the relative data to desired categories other than the predefined.
8. Click **OK & Next**.
9. Into the **Overview of Import** page:
 - a) Select one of the following options about the imported csv file:
 - Append global directory contacts
 - Delete all global directory contacts imported via CSV
 - Delete all global directory contacts
 - b) Regarding **Duplicated Customer ID** select one of the following options:
 - Update existing customer
 - Stop importing current record

The entries which will be added and the entries which failed to be validated are presented into two corresponding tables.

NOTICE: Duplicate records are identified by combination of First Name, Last Name, Business Phone and Email fields. These fields cannot be automatically updated by choosing "**Update existing customer**". In order to update these fields, choose to delete first older records in step 9a.

The flag "**Update existing customer**" only works when Customer ID is mapped during import.

Only record with the same **Customer ID** will be considered as "existing customer" and will be updated.

Flag "**Remove data before import**" will not remove records if they are already used in other functions such as used as a VIP caller, etc.

Customer ID is the only key to determine if the record is duplicated. If Customer ID is not mapped, there is no way to avoid duplicates.

Therefore, it is strongly advised that customers rely on the provided template and adapt their data over it without omitting unique identifiers.

10. Click **OK & Next**. Several minutes may be required for this process.
11. **Import Finished** page informs regarding the number of the entries which were imported.
12. Click on **Finish**.

13.5.6.6 How to Edit or Add new Unified Directory Contacts

Edit contacts wizard offers the functionality to edit the already imported contacts or add a new one.

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > Unified Directory**.
3. Click on **Edit** next to **Edit Contacts**, to proceed with the editing of the contacts of the Global Directory.
4. Edit the desired fields of the contacts. Only when an entry is edited then **Apply** button becomes available.
5. Click on **Add** to manually add a new contact.
6. Fill the desired fields of the new contact and click on the **Apply** button.

13.5.7 Departments

Departments classify subscribers in the internal directory into groups based on their organizational affiliation. The internal directory allows you to search and sort by department.

13.5.7.1 How to Add a Department

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **Departments** wizard.
4. Click on **Add**.

5. Enter the **Department Name** of the Department.
6. Enter the **Hunt Group** identifier.
7. Click on **Save**.

13.5.7.2 How to Assign Stations to a Department

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **User Directory** wizard.
4. Select the relevant station.
5. Click on **Edit > Personal Details > My Personal Details**.
6. Select the desired department from the list box in the **Department** field.
7. Then click **Save**.

13.5.7.3 How to Edit a Department

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **Departments** wizard.
4. Click in the list of departments on the appropriate department.
5. Click on **Edit**.
6. Enter the **Department Name** of the Department.
7. Enter the **Hunt Group** identifier.
8. Click on **Save**.

13.5.7.4 How to Remove a Department

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **Departments** wizard.
4. Click in the list of departments on the appropriate department.

5. Click on **Remove**.
6. Click on **OK**.

13.5.8 Favorites List

The Favorites list provides you (as a subscriber) with a constant view of selected contacts. These contacts can also be called very easily directly from the Favorites list. All internal subscribers with system telephones and external communication partners are shown together with their Presence status and can be contacted via instant messaging.

As a subscriber, you can add contacts from all directories to the Favorites list. For favorites that do not come from the internal directory, instead of the symbol for the Presence status, the symbol for the source of the contact is displayed.

The Favorites list manages contacts in groups. The contacts in all groups can be sorted by First Name, Last Name or their original sorting order.

When an internal subscriber is absent, you can determine the scheduled time of his or her return by positioning the mouse pointer over the entry for that subscriber, provided the subscriber has allowed his or her Presence status to be visible to you.

For favorites with multiple phone numbers, you can specify a default number with which the contact is to be called. The default phone number of a favorite can be determined in the context menu from the symbol with the activated check box.

13.5.9 Journal

The journal is the list of all incoming and outgoing calls of a subscriber. It enables subscribers to quickly and easily respond to missed calls and call back their contacts or call them again directly from within the journal.

Folder for Call Types

The calls are arranged in the following groups:

- **Open**
Contains the unanswered missed calls for which a call number was transmitted. As soon as one of these calls is answered, all associated entries with that call number are dropped from the list.
- **All calls**
- **Missed**
- **Answered**
- **Internal**
- **External**
- **Inbound**
- **Outbound**

- **Scheduled**

Contains all the calls that you (as a subscriber) have scheduled for specific dates/times. The Scheduled Calls feature is not available to Contact Center agents. In order for the communication system to execute a scheduled call, myPortal for Desktop or myPortal for Outlook must be open at the scheduled time; your presence status must be **Office** or **CallMe**, and you must confirm the execution of the call in a dialog. If you are busy at the time the scheduled call is to be made, the system defers the scheduled call until you are free again. myPortal for Desktop or myPortal for Outlook informs you of any pending scheduled calls on exiting the program. On starting the application, myPortal for Desktop or myPortal for Outlook notifies you about any scheduled calls for which the scheduled time has elapsed. You can then either delete such calls or save them with a new scheduled time.

Not all folders for call types are available in the modern user interface myPortal for Desktop.

On starting the modern user interface myPortal for Desktop, only 100 journal entries are loaded. After that and when new calls come in, the number in call history will exceed 100 records.

Retention Period

The system saves a record of the calls in the Journal for a maximum period of time, which can be configured by the administrator. As a subscriber, you can reduce this time. After the retention period expires, the system automatically deletes all associated entries.

NOTICE: The retention period also determines the maximum time period for evaluations with myReports.

Grouped by time period

The calls in each group are arranged by time, e.g.: Today, Yesterday, etc., Last Week, Last Month and Older. Your administrator can set the duration for which calls should be saved in the Journal. After this set time period expires, the entries are automatically deleted. The grouping by time period is not available in the modern user interface of myPortal for Desktop.

Call Details

Every call is shown with the Date and Time and, if available, with the call number. If a directory contains further details on the call number such as the **Last Name**, **First Name** and **Company**, then this information is also shown. In addition, the **Direction**, **Duration** and **Call Complete** columns are also displayed in most folders. Not all call details are available in the modern user interface of myPortal for desktop.

Sorting

You can sort the calls in the Journal by any column in ascending or descending alphanumeric order.

You can jump within the Journal to the first call whose entry begins with a specific character in the sorted column, e.g., to the first Last Name beginning with "P". By entering subsequent characters, you can then narrow the search. Sorting is not available in the modern user interface of myPortal for Desktop.

Export

As a subscriber, you can export the journal as a CSV file using myPortal for Desktop or myPortal for Outlook:

13.5.9.1 How to Change the Maximum Retention Period for the Journal

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Applications > OpenScape Business UC Suite**.
3. Click on **Server**.
4. Click on **Maintenance**.
5. Enter the desired duration in days in the **Keep call history for** field, under the **Calls Information Maintenance** area.

NOTICE: The retention period also determines the maximum time period for evaluations with myReports.

6. Click on **Save**.

13.6 Calls

For calls, convenient features such as a desktop dialer, screen pops and the option to record calls and conferences are available to subscribers.

13.6.1 Desktop Dialer and Clipboard Dialer

The Desktop Dialer and Clipboard Dialer enable users with myPortal for Desktop (Windows) or myPortal for Outlook to call a selected destination or a destination copied to the Windows clipboard via a key combination from many Windows applications, e.g., from an Outlook e-mail.

Depending on the type of string used, the Dialer works as follows:

- A phone number in canonical format is dialed directly.
- A station number in dialable format is dialed directly if the communication system can decide whether an internal or external

destination is involved. Otherwise, the user is asked to make the appropriate selection.

- A string containing letters is searched in the directories as a first name or company.

The Desktop Dialer and Clipboard Dialer are executed after a definable time period. During this period, the dialing can still be canceled. If the preset value of 3s is changed to 0s, the dialing will be executed immediately. The value is changed in the settings of the UC Suite clients.

Windows applications that were implemented with standard Windows-compliant components usually support the Desktop Dialer and Clipboard Dialer, but 16-bit applications do not. The Desktop Dialer is only supported by 32-bit applications.

13.6.2 Screen Pops

Screen pops in the UC Suite clients offer you convenient ways to respond to incoming calls or new voicemails with a single mouse click, for example.

Screen pops appear in the lower right corner of the screen. There are different types of screen pops. Screen pops for calls and messages show phone number, name and image of the caller, if possible. The buttons in the screen pops change, depending on the situation.

Screen pops can be minimized to a tray icon. As soon as more than three screen pops are opened for calls, they are automatically minimized and shown as icons on the task bar.

13.6.3 Record calls

A subscriber can record calls. Recorded calls appear in the voicemail box.

INFO: Note that in most countries you are legally required to notify the other party that you are recording the call. In some countries (such as France, for example), the other party is automatically notified by the system.

As an administrator, you can allow or prevent the recording of calls and conferences on a system-wide basis. In addition, you can optionally configure the playback of an announcement or warning tone at the start of the recording.

As a subscriber, you can control the recording of calls via myPortal for Desktop or myPortal for Outlook. Recorded calls are identified in the voicemail box with a red dot and show the call number of the other party if available.

Ongoing recordings are automatically stopped by a consultation hold, placing a call on hold, transfers and the initiation of a conference.

NOTICE: DTMF is not supported during call recording.

13.6.3.1 How to Activate or Deactivate the Recording of Calls

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Applications > OpenScape Business UC Suite**.
3. Click on **Server**.
4. Click on **Live Record**.
5. Select one of the following options:
 - If you want to allow the recording of calls, select the **Live Record** check box.
 - If you want to prevent the recording of calls, clear the **Live Record** check box.
6. Click on **Save**.

NOTICE: Calls that have this functionality activated cannot be transferred or held.

13.6.3.2 How to Activate or Deactivate the Recording Announcement

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Applications > OpenScape Business UC Suite**.
3. Click on **Server**.
4. Click on **Live Record**.
5. Select one of the following options:
 - If you want to play an announcement at the start of a recording, select the **Play prompt before recording** check box.
 - If you do not want to play an announcement at the start of a recording, clear the **Play prompt before recording** check box.
6. Click on **Save**.

13.6.3.3 How to Activate or Deactivate the Warning Tone for Recording

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Applications > OpenScape Business UC Suite**.
3. Click on **Server**.
4. Click on **Live Record**.
5. Select one of the following options:
 - If you want to play a warning tone at the start of a recording, select the **Play pip tone before recording** check box.
 - If you do not want to play a warning tone at the start of a recording, clear the **Play pip tone before recording** check box.
6. Click on **Save**.

NOTICE: Please note that this process applies only to **Openscape Business S**. The activation of the Recording warning tone in **Openscape Business X** is controlled by the flag **Warning tone during voice recording** which can be found in **Expert Mode > Basic Settings > System Flags**.

13.7 Conferences

In a conference, multiple participants (including external parties) can communicate with one another at the same time.

13.7.1 Conference Management

Conference management enables subscribers to use different types of conferences.

Types of Conferences

The different types of conferences offer the following features:

	Ad-hoc	Scheduled	Permanent	Open
Usage	<ul style="list-style-type: none"> • Phone-controlled • application-controlled 	<ul style="list-style-type: none"> • application-controlled 	<ul style="list-style-type: none"> • application-controlled 	<ul style="list-style-type: none"> • application-controlled

	Ad-hoc	Scheduled	Permanent	Open
Start	<ul style="list-style-type: none"> Manually 	<ul style="list-style-type: none"> Scheduled 	<ul style="list-style-type: none"> Manually 	<ul style="list-style-type: none"> Manually
End	<ul style="list-style-type: none"> Manually 	<ul style="list-style-type: none"> Scheduled Manually 	<ul style="list-style-type: none"> Manually 	<ul style="list-style-type: none"> Manually
Duration of the reservation of conference channels	<ul style="list-style-type: none"> 1 hour by default 	<ul style="list-style-type: none"> Scheduled 	<ul style="list-style-type: none"> Until the deactivation or deletion of the conference 	<ul style="list-style-type: none"> Until the deactivation or deletion of the conference
Extension	x	x	-	-
Recurrence	<ul style="list-style-type: none"> Manually 	<ul style="list-style-type: none"> Scheduled 	-	-
Direction of connection setup from the viewpoint of the system	<ul style="list-style-type: none"> Outbound 	<ul style="list-style-type: none"> Outbound Inbound 	<ul style="list-style-type: none"> Inbound 	<ul style="list-style-type: none"> Inbound
Set of participants	<ul style="list-style-type: none"> Fixed 	<ul style="list-style-type: none"> Fixed 	<ul style="list-style-type: none"> Fixed 	<ul style="list-style-type: none"> Open
Authentication of conference participants	-	<ul style="list-style-type: none"> Individual conference ID (optional) Password (optional) 	<ul style="list-style-type: none"> Individual conference ID (optional) Password (optional) 	<ul style="list-style-type: none"> Shared conference ID (optional)
Recording, if enabled in the system	<ul style="list-style-type: none"> Manually (On Demand Conference Recording) 	<ul style="list-style-type: none"> Automatically (Auto Conference Recording) Manually (On Demand Conference Recording) 	<ul style="list-style-type: none"> Automatically (Auto Conference Recording) Manually (On Demand Conference Recording) 	<ul style="list-style-type: none"> Automatically (Auto Conference Recording) Manually (On Demand Conference Recording)
Invitation by E-mail with:	<ul style="list-style-type: none"> Conference Name Link for Web Collaboration session 	<ul style="list-style-type: none"> Conference Name Dial-in number Conference ID Password Date and time of the start and end of the conference Link for Web Collaboration session 	<ul style="list-style-type: none"> Conference Name Dial-in number Conference ID Password Link for Web Collaboration session 	<ul style="list-style-type: none"> Conference Name Dial-in number Conference ID Password
Outlook appointment as an e-mail attachment (.ics)	-	x	-	-

Application-controlled Conference

As a subscriber, you can initiate, control and manage a conference with the Conference Management feature of myPortal for Desktop or myPortal for Outlook.

Phone-controlled Conference

As a subscriber, you can initiate a phone-controlled conference and then control it via the phone by the following methods:

- Call the desired conference participant and connect him or her to the conference
- Extend a consultation call into a conference
- Extend a second call into a conference

Virtual conference room

The virtual conference room enables you to follow a conference and its participants in a graphical environment (for application-controlled conferences) and to also manage the conference if you are the conference controller. The virtual conference room shows the phone number, name and presence status to the conference participants, where available.

Dial-in Number

As an administrator, you can change the conference dial-in numbers that were set up during basic installation. As a subscriber, you can display the dial-in number for a conference.

Conference Controller

The initiator of the conference is automatically the conference controller until this is explicitly changed. Depending on the type of conference, the controller can:

- Add or remove conference participants (for application-controlled conferences):

Removed participants do not remain in the conference.

- Disconnect or reconnect conference participants:

Disconnected participants remain in the conference. When the conference controller is connecting a conference participant, all other conference participants remain connected to one another. If there is only one participant connected, that participant will hear music on hold.

- Record a conference

Recorded conferences are identified in the voicemail box with a red dot and show the call number of the first conference participant, if available. Conferences in which a participant is on hold cannot be recorded.

- Set another internal participant on the same node as the conference controller
- Extend the conference
- Leave the conference without ending it:

The longest attending internal participant of the conference automatically becomes the conference controller.

- End the conference

Conference Participants

Conference participants can leave the conference and optionally dial-into it again (scheduled and permanent conferences). As long as a conference has only one participant, the participant hears music on hold. As an administrator, you can specify whether multiple external conference participants are allowed. The maximum number of external conference participants is determined, among other things, by the number of available trunks.

Conference tone

When connecting or disconnecting a conference participant, the other participants hear the conference tone. As an administrator, you can activate or deactivate the conference tone.

Automatic Termination without a Conference Controller

If there are only external subscribers left in a conference, the participants will hear an alert tone after a specified time period. Following a further timeout, the conference is automatically terminated by the system. As an administrator, you can edit these time values.

Notification by E-mail and Outlook Appointment

The system can automatically notify conference participants by e-mail and, for scheduled conferences, additionally through an Outlook appointment as an attachment (.ics):

Event	Notified conference participants	Outlook appointment
New conference	all	Automatic creation
Delete the conference		Automatic deletion
Reschedule the conference		Automatic update
Adding conference participants	Those affected	Automatic creation (those affected)
Remove conference participants		Automatic deletion (those affected)

This requires the administrator to have configured the sending of e-mails. In addition, an internal conference participant must have specified his or her e-mail address. For external conference participants, the initiator of the conference must enter their individual e-mail addresses.

NOTICE: For e-mail notifications, no return acknowledgments are obtained for failed deliveries or absence messages, since the e-mails are sent

directly from the system due to the integration of Web Collaboration.

Further Calls

While participating in a conference, making a call or accepting another call disconnects the participant from the conference.

Park, Toggle/Connect

The Park and Toggle/Connect features are not available in a conference.

Call Charges

Toll charges are assigned to the party who set up the toll call. When a conference is transferred to another conference controller, all further charges are assigned to that controller.

System Load

As an administrator, you can display both active and saved conferences. Inactive conferences can be deleted.

INFO: Permanent conferences occupy system resources permanently. Since every subscriber can configure permanent conferences with myPortal for Desktop or myPortal for Outlook, you should, as the administrator, review the saved conferences regularly to avoid resource bottlenecks.

Video Monitoring

Any ongoing video transmission must be terminated before participating in a conference.

13.7.1.1 How to Change the Dial-in Number for a Virtual Conference Room

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click on **Telephony > Stations** in the navigation tree.
3. Navigate in the menu tree to **Stations > UC Applications > Conference**.

The call numbers of the virtual conference room is displayed in the work area. The last of these is the one for scheduled and permanent conferences.

4. In the menu tree, click on the relevant entry (Index - Call number).

5. Click on the **Edit Station Parameters** tab.
6. Enter the new dial-in number in the **Phone Number** field. The dial-in number may only include the digits 0-9.
7. Click on **Apply** followed by **OK**.

13.7.1.2 Allowing or Preventing Multiple External Conference Participants

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony > Basic Settings** in the navigation tree.
3. Navigate in the menu tree to **System > System Flags**.
4. Select one of the following options:
 - If you want to allow multiple external conference participants, enable the check box **More than 1 external conference member**.
 - If you want to prevent multiple external conference participants, clear the check box **More than 1 external conference member**.
5. Click on **Apply** followed by **OK**.

13.7.1.3 How to Activate or Deactivate the Conference Tone

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony > Basic Settings** in the navigation tree.
3. Navigate in the menu tree to **System > System Flags**.
4. Select one of the following options:
 - If you want to activate the conference tone, enable the **Conference tone** check box.
 - If you want to deactivate the conference tone, clear the **Conference tone** check box.
5. Click on **Apply** followed by **OK**.

13.7.1.4 How to Change the Time Interval for the Automatic Termination of a Conference

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony > Basic Settings** in the navigation tree.
3. Navigate in the menu tree to **System > Time Parameters**.
4. In the **Time until warning tone in main station interface transit connections** row, under **Base** and **Factor**, select the desired time period between the time the last conference controller leaves the conference and the alert tone.
5. In the **Time from warning tone until release...** row, select the desired time from the alert tone till the automatic termination of the conference.
6. Click on **Apply** followed by **OK**.

13.7.1.5 How to Check the Details of a Saved Conference

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **Conferencing** wizard.
4. Click on the relevant user conference.
5. Click on **Display**.

13.7.1.6 How to Delete a Saved Conference

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **Conferencing** wizard.
4. Click on the relevant user conference.
5. Click on **Delete** and confirm the security prompt.

13.7.1.7 How to Configure the Recording of Conferences

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Applications > OpenScape Business UC Suite**.
3. Click on **Server**.
4. Click on **Live Record**.
5. Select one of the following options:
 - If you want to enable the recording of conferences, select the **Conference Live Recording availability** check box.
 - If you want to prevent the recording of conferences, clear the **Conference Live Recording availability** check box.
6. Click on **Save**.

NOTICE: Conferences that have this functionality activated cannot be transferred or held.

13.7.2 Ad-hoc Conference

An ad-hoc conference occurs spontaneously and is started manually by the conference controller. The conference controller can save ad-hoc conferences in order to set them up again at some later point in time.

Starting the Conference

The system opens the window with the virtual conference room automatically for all internal conference participants, provided they have started myPortal for Desktop with the classic user interface or myPortal for Outlook. The system calls all conference participants simultaneously. On joining the conference, each conference participant hears a greeting announcement with the name of the conference controller.

Recording the Conference

Conference controllers can record a conference manually for themselves or for all connected internal conference participants, provided the live recording of calls has been activated in the system. Participants located in the own node receive the recording in the voicemail box; participants in other nodes, via email. The duration of the recording is only limited by the available storage capacity of the system.

Ending the Conference

The conference controller can end the conference in the client or simply hang up. Alternatively, the conference ends when all conference participants have left the conference.

Expanding a Call to a Conference

An internal subscriber who is conducting a call can convert the call to an ad-hoc conference and add further subscribers. For this, the subscriber must have a UC Suite Conference license. This feature is not available for CallMe.

13.7.3 Scheduled Conference

A scheduled conference (Meet-Me conference) occurs at a pre-defined point in the future with a defined duration and may be set up to recur repeatedly at the same time.

A scheduled conference will run for the entire scheduled duration even if there are no connected participants. The conference controller saves a scheduled conference under a specified name.

Options for Configuring a Scheduled Conference

The initiator of the conference can define the following properties:

- Start time and End time
- Recurring conference
- Presence of conference controller required
- Authentication of conference participants on joining the conference required (by entering a conference ID and password via the phone keypad).

NOTICE: Mobility Entry users must enter the code for DTMF suffix dialing before their authentication.

The default password for conferences is 123456. The conference controller can change this for the conference participants individually.

- Language of announcements before the conference begins
- Direction for the connection setup for each conference participant (default: **outbound**).

Starting the Conference

The system opens the window with the virtual conference room at the scheduled time automatically for all internal conference participants, provided they have started myPortal for Desktop with the classic user interface or myPortal for Outlook. If the presence of the conference controller is required, the system first calls the controller. After the successful authentication of the controller, all the other conference participants are called simultaneously. Conference participants who have forwarded their calls to their voicemail boxes or who are determined to be absent by their presence status are not called.

Depending on how the connection setup has been configured, the system calls the conference participants or the participants can dial in themselves. The system announces every participant who joins the conference by name, as in: "... has joined the conference", provided the initiator has recorded his or her name announcement.

NOTICE: Conference participants of a scheduled conference without authentication can only hear the announcement with the name of the conference controller at the start of the conference, provided they have already initiated a conference with authentication earlier on one occasion.

Dialing In

Every conference participant can use the dial-in number to dial into the conference within the scheduled time period, regardless of which direction for the conference setup was set for that participant. Attempts to dial into the conference outside the scheduled time period result in a corresponding announcement. To dial in via an ITSP, the ITSP must support RFC 2833 (DTMF characters).

Forcing Authentication with the Star (*) Key

The conference controller can set the conference so that each conference participant is forced to provide authentication by at least by pressing the * key. This ensures that only the participants who are actually present are connected to the conference, as opposed to a voicemail box, for example.

Extending the Conference

Ten minutes before the scheduled end of the conference, the participants hear an announcement indicating that the conference is about to end and are offered the option of extending the conference by dialing a specific digit. Any conference participant can extend the conference by dialing that specific digit. The conference controller can extend the conference in myPortal for Outlook at any time.

Recording the Conference

Conference controllers can record a conference automatically or manually for themselves or for all connected internal conference participants, provided the live recording of calls has been activated in the system. Participants located in the own node receive the recording in the voicemail box; participants in other nodes, via e-mail. The duration of the recording is only limited by the available storage capacity of the system.

Ending the Conference

The conference ends at the time scheduled for the end of the conference or if the conference controller terminates the conference.

13.7.4 Permanent Conference

A permanent conference is not subject to time restrictions. The conference participants can dial in at any time.

The conference controller saves a permanent conference under a specified name. The conference is retained until it is explicitly deleted.

Options for Configuring a Scheduled Conference

The initiator of the conference can specify:

- whether the conference participants need to authenticate themselves by entering a conference ID and password via the phone keypad when joining the conference.

NOTICE: Mobility Entry users must enter the code for DTMF suffix dialing before their authentication.

The default password for conferences is 123456. The conference controller can change this for the conference participants individually.

- in which language the announcements before the start of then conference are to be made.

Starting the Conference

As soon as the first conference participant dials in, the system opens the window with the virtual conference room automatically for all internal conference participants, provided they have started myPortal for Desktop or myPortal for Outlook. All conference participants dial in themselves. The system announces every participant who joins the conference, as in: "... has joined the conference."

Dialing In

Every conference participant can use the dial-in number to dial into the conference at any time. To dial in via an ITSP, the ITSP must support RFC 2833 (DTMF characters).

Recording the Conference

Conference controllers can record a conference for themselves or for all connected internal conference participants, provided the live recording of calls has been activated in the system. Participants located in the own node receive the recording in the voicemail box; participants in other nodes, via e-mail. The duration of the recording is only limited by the available storage capacity of the system.

An automatic recording of a permanent conference starts when there are two or more conference participants and stops when there are less than two participants. After the end of recording, all participants get the same record file for the complete conference.

13.7.5 Open Conference

Open conferences are intended for a fixed number of arbitrary participants. Any participant who has the requisite access data can dial into them.

The conference controller saves an open conference under a specified name. The conference is retained until it is explicitly deleted.

Options for Configuring an Open Conference

The initiator of the conference can specify:

- The number of conference participants (max. 16).
- whether the conference participants need to authenticate themselves by entering a conference ID and password via the phone keypad when joining the conference.

NOTICE: Mobility Entry users must enter the code for DTMF suffix dialing before their authentication.

The default password for conferences is 123456. The conference controller can change this for the conference participants individually.

- what common conference ID is valid for all conference participants.
- in which language the announcements before the start of then conference are to be made.

Starting the Conference

All conference participants dial in themselves. The system announces every internal participant who joins the conference, as in: `"... has joined the conference."`

Dialing In

Every conference participant can use the dial-in number to dial into the conference at any time. To dial in via an ITSP, the ITSP must support RFC 2833 (DTMF characters).

Recording the Conference

Conference controllers can record a conference automatically or manually for themselves or for all connected internal conference participants, provided the live recording of calls has been activated in the system. Participants located in the own node receive the recording in the voicemail box; participants in other nodes, via e-mail. The duration of the recording is only limited by the available storage capacity of the system.

13.8 Web Collaboration

The UC PC clients myPortal for Desktop (Windows) and myPortal for Outlook support the convenient integration of the separate product OpenScape Web Collaboration for simultaneous multi-media

collaboration during phone calls and conferences. This provides quick access to functions such as desktop and application sharing, file sharing, co-browsing, whiteboarding, URL push, IM chat and video chat with multiple participants.

Web collaboration can be started by a subscriber during a phone call via the pop-up window of the UC PC client or by the conference controller of an active conference from within the conference. This opens the web collaboration session. A local installation of Web Collaboration on the UC PC client is not required. If an email program is available on the UC PC client, an email with the link to the web collaboration client can be sent to the communication partners. Detailed information on web collaboration can be found in the Web Collaboration product documentation.

When creating or editing a conference, the conference controller can also schedule a web collaboration session. On deleting or ending a conference, the associated web collaboration session is automatically deleted as well.

NOTICE: In order to enable UC PC clients to start web collaboration automatically, proxy authentication must be disabled whenever the UC PC clients access the Internet via a proxy server.

Supported Types of Connections

The web collaboration integration supports phone calls and phone-controlled conferences as well as the following types of application-controlled conferences:

- Ad-hoc conference
- Scheduled conference
- Permanent conference

Integration of Web Collaboration

For the integration of Web Collaboration, the address of the Web Collaboration server must be known to the communication system. The vendor offers the web collaboration server as a service on the Internet (Public Server). Alternatively, it may also be possible to use a Custom Server located on the customer's own network or with a partner. If the server is on the customer's own network, it is usually addressed by the communication system on TCP port 5004 using http. In the case of a hosted solution on the Internet (Public Server), a secure https connection is used instead, since the license number and password are transmitted over this connection. By default, TCP port 5100 is used for this purpose.

NOTICE: In order to use web collaboration, the communication system requires an Internet connection (default router and DNS server). Connections via proxy are not supported.

Internal conference participants with UC PC clients are automatically connected to the appropriate web collaboration session on starting the conference. To do this, FastViewer is automatically downloaded and opened in the background, which may take several seconds. External conference participants with known email addresses receive an email with an appropriate link to the Web Collaboration session.

NOTICE: Users working under a MAC OS must close the alert dialog for the terminated session manually after completion of a web collaboration session.

For a scheduled conference, it is possible to connect to the Web Collaboration session as early as 5 minutes before the start of the scheduled conference.

Instant Messaging and Web Collaboration

Note that Instant Messaging of the system and Instant Messaging of a Web Collaboration session are mutually independent, i.e.: the instant messages from a UC PC client do not appear in a web collaboration session of the same participant, and vice versa.

13.8.1 How to Configure the Connection to the Web Collaboration Server (Custom Server)

Prerequisites

You are logged into the WBM with the **Expert** profile.

Internet access is available.

You need a license number and a password for the secure connection to the web collaboration server (custom server).

Step by Step

- 1.** In the navigation bar, click on **Expert Mode**.
- 2.** In the navigation tree, click on **Applications > Web Services**.
- 3.** Navigate in the menu tree down to **Web Services > Web Collaboration**.
- 4.** Select the **Custom Server** radio button.
- 5.** If you want to set up a secure connection to the web collaboration server (custom server), proceed as follows:
 - a) In the **URL / IP address** field, enter the address of the web collaboration server (custom server) in accordance with the following pattern:

```
https://<URL Web Collaboration Server>:5100/  
xmlrpcsecure
```

or

```
https://<IP-Adresse Web Collaboration Server>:5100/  
xmlrpcsecure
```

- b) Enter the license number for the secure connection to the web collaboration server (custom server) in the **Licence Number** field.
- c) Enter the password for the secure connection to the web collaboration server (custom server) in the **Password** field.
- 6. If you want to set up an unsecured connection to the web collaboration server (custom server), proceed as follows:
 - a) In the **URL / IP address** field, enter the address of the web collaboration server (custom server) in accordance with the following pattern:

```
http://<URL Web Collaboration Server>:5004/OscInterface
```

or

```
http://<IP-Adresse Web Collaboration Server>:5004/OscInterface
```
- 7. Click on **Apply** followed by **OK**.

13.8.2 How to Configure the Connection to the Web Collaboration Server (Public Server)

Prerequisites

You are logged into the WBM with the **Expert** profile.

Internet access is available.

You need a license number and a password for the secure connection to the web collaboration server (public server).

Step by Step

- 1. In the navigation bar, click on **Expert Mode**.
- 2. In the navigation tree, click on **Applications > Web Services**.
- 3. Navigate in the menu tree down to **Web Services > Web Collaboration**.
- 4. Select the **Public Server** radio button.
- 5. Enter the license number for the secure connection to the web collaboration server (public server) in the **Licence Number** field.
- 6. Enter the password for the secure connection to the web collaboration server (public server) in the **Password** field.

NOTICE: If you want to test the Web Collaboration for 5 minutes, you can select the radio button **Public Server (Demo Mode/Evaluation Mode)**. No license number and password are required for this purpose.

- 7. Click on **Apply** followed by **OK**.

13.8.3 How to Disable the Connection to the Web Collaboration Server

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Applications > Web Services**.
3. Navigate in the menu tree down to **Web Services > Web Collaboration**.
4. Select the radio button **No Web Collaboration Server**.
5. Click on **Apply** followed by **OK**. The option to start a web collaboration session is disabled in the UC client.

13.9 Instant Messaging

Instant Messaging refers to communicating with instant messages (usually called a chat).

13.9.1 Instant Messaging

Instant Messaging enables you to chat with other peers. The system supports instant messaging with users of UC Smart, external communication partners and multi-user chats (or a combination of both).

Instant Messaging is possible with the following clients:

- myPortal for Desktop
- myPortal for Outlook
- myAgent
- myAttendant

As an administrator, you can enable or disable instant messaging on a system-wide basis. The sent and received instant messages are presented to the communication partners as an interactive dialog. On selecting a recipient, the client shows whether the communication partner is currently online. If one of the communication partners is offline, the following occurs with the instant message, depending on the type of the selected recipient:

Recipients	Behavior
Individual subscribers	The instant message is displayed at the next login.
Group in Favorites	The instant message is never displayed for the subscribers who are offline.

External Instant Messaging

As a subscriber, you can also chat with *one* external communication partner (e.g., a Google Talk user).

Multi-user chat

A multi-user chat is the exchange of instant messages with multiple communication partners. Here too, the system supports a maximum of one external communication partner.

Instant Messaging and Web Collaboration

Note that Instant Messaging of the system and Instant Messaging of a Web Collaboration session are mutually independent, i.e.: the instant messages from a UC client do not appear in a Web Collaboration session of the same participant, and vice versa.

13.9.1.1 How to Enable or Disable Instant Messaging

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Applications > OpenScape Business UC Suite**.
3. Click on **Server**.
4. Click on **General Settings**.
5. Select one of the following options, under the **Instant Message** area:
 - If you want to enable system-wide instant messaging, clear the **Disable instant messaging** check box.
 - If you want to disable system-wide instant messaging, select the **Disable instant messaging** check box.

NOTICE: Disabling instant messaging has no effect on currently existing IM windows.

6. Click on **Save**.

13.10 AutoAttendant

Depending on the presence status of the called party, the AutoAttendant offers callers options to route voice calls to fixed numbers or their voicemail box. Callers signal their choice by entering digits at the phone.

13.10.1 Personal AutoAttendant

The personal AutoAttendant is the customized AutoAttendant, which can be configured by subscribers.

Personal AutoAttendant

As a subscriber, you can do the following for your station number with myPortal for Desktop or with myPortal for Outlook:

- Record or import announcements for the personal AutoAttendant.
- Configure profiles for the personal AutoAttendant

The relevant calls are first handled by the central AutoAttendant.

13.11 Voice and fax messages

The Voicemail and Fax services integrated in the system enable subscribers to receive and manage voicemails and fax messages via myPortal for Desktop and myPortal for Outlook. Fax messages can be sent by subscribers using Fax Printer.

13.11.1 Voicemail Box

The voicemail box records central voicemail and recorded calls. Subscribers can access it by phone and via UC Smart clients.

NOTICE: The default voicemail password can only be changed via an internal phone number.

Only voice messages longer than two seconds are recorded.

Managing Voicemail Messages

As a subscriber, you can listen to your voicemails:

- via a PC with myPortal for Desktop or myPortal for Outlook
- via your phone if your Presence status is **Office** or **CallMe**
- via any external telephone

Using myAttendant, the Attendant can also listen to voicemails of other subscribers who have explicitly allowed this.

The subscriber uses folders such as Inbox, Played, Saved or Deleted to manage incoming voicemail messages.

Voice messages can also be played back, paused and forwarded to another subscriber. The subscriber can also save voicemail messages in .wav format and redirect them to any selected email account.

The voicemail box can also be used by subscribers to manage recorded calls. Recorded calls are identified in the voicemail box by an appropriate symbol.

NOTICE: Information on the Phone menu can be found in the Quick Reference Guide documentation of the UC Suite Telephone User Interface (TUI).

Calling Back the Sender of a Voice Message

When listening to a voicemail, the subscriber can directly call back the person who left a message.

As an administrator, you can configure on a system-wide basis whether or not callbacks can be executed from the voicemail box

- from any phone number
- only from the own phone numbers of a subscriber configured under My Personal Details in the myPortal for Desktop, myPortal for Outlook, myAttendant and/or myAgent clients (**Extension, Mobile number, External Number 1, External Number 2, Private Number and Assistant Number**).

Retention Period

As an administrator, you can configure the retention period for voice messages.

Prioritizing voicemail messages

Callers can flag their voicemail messages as normal, urgent or private.

In myPortal for Desktop and myPortal for Outlook, the prioritization of existing voicemail messages is represented by different colors.

Subscribers who listen to their voicemail messages through the phone are first notified how many messages are urgent, private and normal. Urgent messages are played back first.

If the voicemail messages are forwarded as emails, the voicemails identified as urgent are flagged as emails with high priority.

Functionality of the Voicemail Box

The administrator can define the scope of the voicemail box. He or she can choose between:

- **Full**
Full functionality of the voicemail box (default value)
- **Short Menu**
- After the status-based or personal announcement is made, a connection to the operator is offered.
- **No Menu**
- After the greeting announcement is played, the caller is directly taken to record a message.

Displaying New Messages at the Telephone

Voicemail messages are signaled at the telephone. As soon as the voicemail has been played, the indicators are deleted.

The type of signaling used for new voicemail messages depends on the phone

- For all telephones, acoustic signaling occurs using a special dial tone.
- For system telephones without a display, the Mailbox key also lights up (if configured).
- For system telephones with a display, the Mailbox key lights up (if configured), and a message appears on the display.

Notification Service

Subscribers who are using myPortal for Desktop or myPortal for Outlook can define whether the notification about the arrival of new voicemails should be forwarded and, if so, to what destination.

Subscribers can also define whether the message should be forwarded as an email. In addition, they can choose to be notified about the arrival of new voicemails by a phone call or an SMS.

Language of the Voicemail Box

As an administrator, you can select the default language of the voicemail box for the menu prompts and the internal system announcements on a system-wide basis.

Dependencies

Topic	Dependency
Playing a message over the phone	Subscribers can play back voicemails through the phone only in the Office or CallMe presence status. For all other settings, the message can only be played back via the PC.

13.11.1.1 How to Configure Station Numbers for Voicemail

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. Click on **Setup** in the navigation bar.
2. In the navigation tree, click **Wizards** > **Central Telephony**.
3. Click **Edit** to start the **Voicemail** wizard.
4. Enter the **VoiceMail Number**.
5. Click **OK & Next** followed by **Finish**.

13.11.1.2 How to Configure Call Forwarding to a Voicemail Box

You can use the **Call Forwarding** wizard to configure call forwarding for a subscriber to his or her voicemail box.

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > User Telephony**.
3. Click **Edit** to start the **Call Forwarding** wizard. The **Configure the 'Call Forwarding - No Answer' feature** window appears.
4. Select the desired station in the **Select Station / Group** area.
5. Drag the **Voicemail box** with the mouse and drop it into the **Edit Call Forwarding** area.
6. If required, edit the time until call forwarding occurs (default: 15 seconds).
7. Click **OK & Next** followed by **Finish**.

13.11.1.3 How to Configure the Parameters of the Voicemail Box**Prerequisites**

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Applications > OpenScape Business UC Suite**.
3. Click on **Server**.
4. Click on the **VoiceMail** tab.
5. Select the language for the menu controls and the predefined announcements of your voicemail box in the **VoiceMail Language** drop-down list.
6. In the field **Voicemail Message Play Order**, specify in which order the messages should be played.
7. Enter the duration in seconds in the **Voicemail Message Recording Time** field.
8. Specify the scope of the voicemail box in the **VoiceMail Mode** field.
9. If you want callbacks to be executed from the voicemail box only to the call numbers that are entered in the UC clients under **My Personal Details**, select the check box **Allow callback from VM to known number only**.
10. If you want to switch off the last announcement which is played from the system, select the check box **Skip "please leave a message after the tone" prompt**. The system announcement will not be heard even if a professional record announcement is used.
11. Click on **Save**.

13.11.1.4 How to Configure Retention Periods for Voicemail**Prerequisites**

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Applications > OpenScape Business UC Suite**.
3. Click on **Server**.
4. Click on **Maintenance**.
5. Enter the respective retention periods in days in the fields under **Message**.
6. Click on **Save**.

13.11.1.5 How to Activate or Deactivate the Password Prompt for the Voicemail Box

Prerequisites

You are logged into the WBM with the **Expert** profile

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Applications > OpenScape Business UC Suite**.
3. Click on **User Directory**.
4. Click on the relevant entry and then click on **Edit > Sensitivity**.
5. Click on **Security and Access**.
6. Select one of the following options:
 - If you want to activate the password prompt on calling your voicemail box, clear the **Bypass password when calling voicemail** check box.
 - If you want to deactivate the password prompt on calling your voicemail box, enable the **Bypass password when calling voicemail** check box.
7. Click on **Save**.

13.11.1.6 How to Configure an Info for Received Voicemails

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony Server > Basic Settings** in the navigation tree.
3. Click **System** in the menu tree.
4. Click **Display** in the menu tree.
5. Enable the **Status display for info message** check box in the **Switches** area.
6. Click **Apply** followed by **OK**.

13.11.1.7 How to Configure a Mailbox Key to Check Voicemail

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > Telephones / Subscribers**.
3. Click **Edit** to start the **Key Programming** wizard.
4. Select the relevant station.
5. Select the relevant key in the first column.
6. Select the **Mailbox** function in the **Key feature** column.
7. Click **Apply** followed by **OK**.

13.11.2 Voicemail Announcements

Voicemail announcements notify callers about the Presence status of a subscriber, for example.

Standard announcements are available in all languages. As a subscriber, you can also record or import personal announcements for your voicemail box. The corresponding standard announcement is overwritten by the personal announcement in the process. As an administrator, you can change the standard announcements by importing different announcements. The personal announcements of subscribers are overwritten in the process. The system performs the automatic level control and normalization needed to meet the "USA / TIA 968 Signal Power Limitations" requirements.

NOTICE: Before using announcements or music from other sources, make sure that you do not infringe on any copyrights.

System Language for Voicemail Announcements

The system language for the voicemail box is set at the country initialization. In addition, the subscriber can set the language of his or her own voicemail box. A caller will then hear the station-specific announcements in the language set by the subscriber and the system-specific announcements in the system language.

Announcements Depending on Presence Status and Profile

Depending on the Presence status, the announcements for the voicemail box change automatically; for example, if the Presence status is **Meeting**, then the announcement may be something like: The subscriber is in a meeting until 3.00 p.m. today. If the entered end of a meeting is reached, but the subscriber has not yet changed his or her status back to "In Office", then the voicemail announcement is adapted automatically or the

voicemail announcement reverts automatically to "In Office" (this is configurable by the subscriber).

The following table describes which greeting is heard by the caller, depending on the set Presence status and profile. The caller menu refers to the central AutoAttendant. The profile refers to the personal AutoAttendant of the subscriber here. The default greeting, name and custom greeting for profiles must be recorded by the subscriber. Depending on the configuration, the caller menu may vary in length or may not be available at all.

	Busy No answer Do Not Disturb	Meeting Sick Break Gone Out ...
Voicemail with Presence status	Default greeting + Caller menu	Name + Presence status + Caller menu
Voicemail box with blocked Presence status	Default greeting + Caller menu (if enabled)	
Profile with dynamic greeting	Custom Profile Greeting	Name + Presence status + Custom Profile Greeting
Profiles if dynamic greeting is to be skipped	Custom Profile Greeting	

If a subscriber has set his or her presence status to not be displayed to external callers, the external caller will always receive the "Busy" greeting for all presence states other than "Office" even if the called subscriber may not be actually busy in some cases. In this case, the subscriber should set up an announcement for the "Busy" greeting to indicate that he or she cannot accept the call.

13.11.2.1 How to Import Announcements for the Voicemail Box

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

The audio files to be loaded are available as PCM files with the following properties: 8 kHz, 16 bit, Mono. The maximum length for the audio file name is 30 characters.

NOTICE: You can use the Audio Wizard to create audio files in advance, while mixing two sources, e.g., background music and announcements.

INFO: Before using announcements or music, make sure that you do not infringe on any copyrights.

Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **File Upload** wizard.
4. On the **Audio File Manager** tab, select the entry **VoiceMail Greeting** as the **Upload Destination**.
5. If you want to import an audio file, proceed as follows:
 - a) Select the **Uploader** radio button and click on **Choose File** to select an appropriate audio file.
 - b) In the **Audio File Details** area, you will see the properties of the audio file such as the file name, file size, bit rate, etc.
 - c) Click **Upload**.
6. If you want to record an announcement using a phone, proceed as follows:
 - a) Select the **Recorder** radio button and under **Extension** field, select the phone with which the announcement is to be recorded.
 - b) Under the **Filename** field enter the name of the recording's file .
 - c) Click on **Make Call**. The selected phone rings.
 - d) Lift the telephone handset and click **Record**.
 - e) Speak into the handset to record your announcement and click **Finish** at the end.
 - f) You can then listen to your recording again with **Play**.

13.11.2.2 How to Change the Language for Voicemail Announcements

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Applications > OpenScape Business UC Suite**.
3. Click on **Server**.
4. Click on **VoiceMail**.
5. Select the **VoiceMail Language** from the drop-down list.
6. Click on **Save**.

13.11.3 Fax Box

The fax box enables subscribers to receive and send fax messages via myPortal for Desktop or myPortal for Outlook without a fax machine.

As an administrator, you can configure a fax box for licensed subscribers. In addition, you can connect fax devices or fax servers via the a/b or ISDN interface.

As a subscriber, you can access your fax messages via myPortal for Desktop or myPortal for Outlook. myAttendant can access the fax messages of subscribers who have explicitly allowed this.

Managing Fax Messages

The subscriber can manage received fax messages by moving them to different folders (Saved or Deleted, for instance). The fax messages can also be forwarded to another subscriber. The subscriber can also save fax messages as PDF or TIFF files and redirect them to any selected e-mail account.

The administrator can configure whether the fax message is to be stored as a TIFF file (default) or as a PDF file on a system-wide basis.

NOTICE: To convert a TIFF file to a PDF file, the page size must be A4.

Retention Period for Fax Messages

The system automatically deletes fax messages for which the following retention periods are exceeded:

Fax message	Retention period (days)
New	120
Read	365
Sent	365
Deleted	60

13.11.3.1 How to Add a Fax Box for Stations

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click on **Wizards > Telephones/ Subscribers**.
3. Click on **Edit** to start the **IP Telephones** wizard.

4. Click in the **Fax No.** field of the subscriber and enter the fax number under which the subscriber can receive fax messages (the preset hyphen must be deleted).
5. If a direct inward dialing number is to be configured for the fax box, click the **Fax Direct Inward Dialing** field and enter the Fax DID number (the preset hyphen must be deleted).
6. Click on **OK & Next**. If required, you can to print out a list of subscribers with the configured fax call numbers using **Print**.
7. Click on **OK & Next** and then **Finish** to complete the wizard.

13.11.3.2 How to Configure the File Type for Stored Fax Messages (UC Suite)

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Applications > OpenScape Business UC Suite**.
3. Click on **Server**.
4. Click on **General Settings**.
5. If you want to enable the saving of fax messages as PDF files, select the check box **Use PDF as fax format** in the **Fax Format** area.
6. If you want to enable the saving of fax messages as TIFF files, clear the check box **Use PDF as fax format** in the **Fax Format** area.
7. Click on **Save**.

13.11.4 Sending Fax Messages with Fax Printer

Fax Printer is an application for sending fax messages with centrally provided or individually created cover sheets from Windows applications such as Microsoft Word, for example.

Fax Printer consists of the following components:

- Fax Printer Cover Editor
- Fax Printer Driver

Fax Printer can be used from all the usual Windows programs. Fax groups make distribution easier. Fax messages are sent as an e-mail or directly to the Desktop. A screen pop notifies the subscriber when the fax is sent successfully.

Header Rows

As an administrator, you can configure different header lines for Fax Printer users. You can also define a header line as the default. Header lines may include the following elements:

Details	Placeholder
Date / Time	{{date_time}}
Company Name	{{company_name}}
User name	{{user_name}}
Company Ph.	{{company_number}}
Page number	{{page_number}}
Page count	{{page_count}}

The header lines of fax messages sent with Fax Printer may only include characters from the ANSI character set. In other words, no special or diacritical characters such as umlauts are allowed. Since the header line may basically include the sender's name, no special or diacritical characters should appear in the names of the subscribers as well.

13.11.4.1 How to Add a Central Cover Page

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

A fax cover page is available as a .opc file.

Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **File Upload** wizard.
4. Click on the **Central Fax Cover Page Upload** tab.
5. Click on **Choose File**.
6. Select a .opc file.
7. Click on **Open**.
8. Under **Name**, enter a name for the fax cover page.
9. Enter a **Description** for the fax cover page.
10. Click on **Upload**.
11. Click **OK** once the upload has been completed.
12. If you want to use this fax cover page as default, click on it in the list of fax cover pages and then click on **Set To Default**.
13. Click on **Save**.

13.11.4.2 How to Edit a Central Cover Page

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **File Upload** wizard.
4. Click on the **Central Fax Cover Page Upload** tab.
5. Click in the list of fax cover pages on the desired cover page.
6. Click on **Edit**.
7. Under **Name**, enter a name for the fax cover page.
8. Enter a **Description** for the fax cover page.
9. Click on **Save**.

13.11.4.3 How to Add a Header Line for the Fax Printer

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **Fax Headlines** wizard.
4. Click on **Add**.
5. Enter the **Template Name** for the fax headline.
6. To add details to the header line, click on the **Date / Time**, **Company Name**, **User name**, **Company Ph.**, **Page number** and **Page count** buttons in the desired sequence. For each detail, a corresponding placeholder appears in the **Text** field.
7. To remove a detail from the header line, select the appropriate placeholder in the **Text** field, e.g., {{page_count}} (**Page count**) and press the **Del** key.
8. If required, enter any additional text in the **Text** field, e.g., "from" between the placeholders {{page_number}} (**Page number**) and {{page_count}} (**Page count**).
9. Click on **Save**.

13.11.4.4 How to Edit a Header Line for Fax Printer

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click on **Applications > UC Suite**.
3. Click on **Fax Headlines**.
4. Click in the list of fax headlines on the desired headline.
5. Click on **Edit**.
6. Enter the **Template Name** for the fax headline.
7. To add details to the header line, click on the **Date / Time**, **Company Name**, **User name**, **Company Ph.**, **Page number** and **Page count** buttons in the desired sequence. For each detail, a corresponding placeholder appears in the **Text** field.
8. To remove a detail from the header line, select the appropriate placeholder in the **Text** field, e.g., `{{page_count}}` (**Page count**) and press the `Del` key.
9. If required, enter any additional text in the **Text** field, e.g., "from" between the placeholders `{{page_number}}` (**Page number**) and `{{page_count}}` (**Page count**).
10. Click on **Save**.

13.11.4.5 How to Delete a Header Line for Fax Printer

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **Fax Headlines** wizard.
4. Click in the list of fax headlines on the desired headline.
5. Click on **Remove**.

13.11.5 Notification Service for New Messages (UC Suite)

The system can optionally notify you (as a subscriber) about a new message by e-mail, by phone or with an SMS.

The Notification Service works as follows:

Notification	for voicemail	for fax message	Prerequisites
E-mail	You receive an e-mail with the message as a WAV file, the date and time it was received, the duration of the message and, if available, the phone number and name of the sender. If the size of the WAV file exceeds 10 MB (average 1MB/min), it is not attached to the e-mail. Voicemails with "urgent" priority are flagged as e-mails with "High" importance. E-mails with a voicemail have a separate symbol in Outlook. If you are using an IMAP mailbox that shows only the e-mail headers, the usual e-mail icon will appear instead.	You receive an e-mail with the message as a PDF or TIFF file, the date and time it was received, the number of pages and, if available, the phone number and name of the sender. If the size of the PDF or TIFF file exceeds 10 MB, it is not attached to the e-mail. E-mails with a Fax message have a separate symbol in Outlook. If you are using an IMAP mailbox that shows only the e-mail headers, the usual e-mail icon will appear instead.	The delivery of e-mails has been configured in the system. The corresponding address is used as the sender.
SMS	You receive an SMS about the received message at the phone number defined by you.		The SMS template has been configured.
by phone	Your voicemail box calls you at the number you have specified and plays back the message to you.	-	

As a subscriber, you can enable or disable every type of notification for each Presence status individually. The notification by phone can be restricted to the business hours configured by the administrator. You can define the number and intervals for the repeated attempts for the notification by phone.

13.11.6 Sending E-mails

The feature for sending e-mails enables e-mail notifications about new voice and fax messages to be sent to subscribers and system messages to be sent to administrators by e-mail.

13.11.6.1 How to Configure the Sending of E-mails

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

An e-mail account with a password exists with an e-mail provider, and you know the access data for this account.

Step by Step

1. Click on **Service Center** in the navigation bar.
2. Click **Service Center > E-mail Forwarding** in the navigation tree.
3. Enter the **Outgoing mail server (SMTP)** for the e-mail server to be used for sending e-mails, e.g., `smtp.web.de`. Ask your e-mail provider for the outgoing mail server if required.

NOTICE: In some cases, the sending of e-mails does not work because the name of the outgoing mail server cannot be resolved. To solve this problem, you must enter the IP address of the server instead of the name.

4. If a secure connection is required, enable the corresponding check box. If required, check with your e-mail provider whether this option needs to be enabled.
5. Enter the **User Name** of the e-mail account.
6. Enter the **Password** for the e-mail account and repeat it in the **Confirm Password** field.
7. Enter the **E-mail Address**, for example: `john.doe@web.de`.
8. If you want to now test the e-mail delivery, proceed as follows:
 - a) Click on **Test Connection**.
 - b) Under **Send to e-mail address**, enter the e-mail address of any e-mail box that you can access.
 - c) Enter the **Subject** in the e-mail.
 - d) Click on **Send Test E-mail**.
 - e) Check whether you have received the e-mail.
 - f) If the e-mail delivery failed, click **Back** and correct your e-mail settings (starting with step 3).
9. Enter the **E-mail Address 1** to get a notification email when ALI tolerance has been used. You may also enter a second email address.
10. Click on **OK & Next** followed by **Finish**.

Example

NOTICE: If you make configuration changes in the E-mail forwarding on an OpenScape Business X system with Booster Server you have to restart the Booster Server for the changes to take effect.

13.11.7 SMS Template

An SMS template enables subscribers to be notified about new voicemails with an SMS.

In order to receive SMS messages, a personal mobile e-mail address of the respective provider must be first activated. To do this, the

subscriber sends an activation SMS to a speed-dial number. The subscriber then receives an SMS with his or her personal e-mail address, which is usually composed of the call number and the gateway name. For example, the mobile e-mail address for a T-Mobile customer with the phone number 0171/1234 567 would be: 01711234567@t-mobile-sms.de. This applies analogously to other networks as well.

An SMS template consists of the Template Details and SMS Details areas. The administrator must enter the name of the template in the Template Details area. This is usually the name of the E-mail-to-SMS Provider.

The specifications in the SMS Details area depend on the Provider. Under Recipient, the administrator must enter the e-mail address to which the SMS is to be sent. The entry for the Subject line may be freely selectable or require the customer number to be entered by the administrator.

NOTICE: Every Provider requires a specific template. The required data can be obtained from the respective mobile service provider.

Placeholder

SMS templates may include the following placeholders in the **Recipient**, **Subject** or **Text** field:

Details	Placeholder
Mobile number to which the message is to be sent	{{MobileNumber}}
Name or call no. of the sender	{{Sender}}
Date and time of receiving a message	{{DateTime}}
Caller number	{{CallingNumber}}
Priority of message	{{Priority}}

System-Specific Information

The length of the message is reduced to the first 160 characters.

13.11.7.1 How to Add an SMS Template

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **Templates** wizard.
4. Click on **Add**.
5. Enter the **Template Name**.

NOTICE: The template name must not include any spaces.

6. Enter the name of the author under **Author Name**.
7. If you want to insert a placeholder, proceed in the following steps:
 - a) Click in the field in which you want to insert the placeholder: **Recipients, Subject** or **Text**.
 - b) Select the desired placeholder in the **VSL Fields** drop-down list.
 - c) Click on **Insert**.
 - d) If you want to insert additional placeholders, repeat step 7a-c accordingly.
8. Enter the **Recipient**.
9. Enter the **Subject**.
10. Enter the **Text**.
11. Click on **Create**.

13.11.7.2 How to Edit an SMS Template

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **Templates** wizard.
4. Select the desired SMS template from the **SMS Provider** table.
5. Click on **Edit**.
6. Enter the **Template Name**.

NOTICE: The template name must not include any spaces.

7. Enter the name of the author under **Author Name**.
8. If you want to insert a placeholder, proceed in the following steps:
 - a) Click in the field in which you want to insert the placeholder: **Recipients, Subject** or **Text**.
 - b) Select the desired placeholder in the **VSL Fields** drop-down list.
 - c) Click on **Insert**.
 - d) If you want to insert additional placeholders, repeat step 8a-c accordingly.
9. Enter the **Recipient**.
10. Enter the **Subject**.
11. Enter the **Text**.

12. Click on **Create**.

13.11.7.3 How to Remove an SMS Template

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **Templates** wizard.
4. Select the desired SMS template from the **SMS Provider** table.
5. Click on **Remove**.
6. Click on **OK**.

13.11.8 Fax over IP (T.38 / G.711 Fax)

Fax over IP enables the transmission of fax messages over the Internet in accordance with the G2 and G3 standards by using the network protocol IFP (Internet Facsimile Protocol).

UC Suite can generally handle up to 8 simultaneous fax connections. Depending on the DSP module, OpenScape Business X3/X5/X8 as an ISDN gateway can handle from 3 to 12 concurrent faxes. Both parameters determine the number of simultaneous T.38 or G.711 fax connections.

NOTICE: It is highly recommended to use T.38 fax, if possible.

The system supports the following scenarios for T.38 or G.711:

- A subscriber receives fax messages via an ITSP (Internet Telephony Service Provider) at his or her fax box and sends faxes to external locations with Fax Printer via the ITSP.
- A subscriber receives fax messages via a Mediatrix 4102S (SIP) at his or her fax box and sends faxes with Fax Printer via a Mediatrix 4102S (SIP).
- Stations can receive Fax messages via an ITSP (Internet Telephony Service Provider) on a fax device that is directly connected to an analog or ISDN interface and send faxes from this fax device via the ITSP to external destinations.
- Stations can receive fax messages via an ITSP on a fax device that is connected to a Mediatrix 4102S and send faxes from this fax device via the Mediatrix 4102S and ITSP to external destinations.
- Stations can receive fax messages via ISDN on a fax device that is connected to a Mediatrix 4102S and send faxes from this fax device via the Mediatrix 4102S and ISDN to external destinations.

- A station can send fax messages from a fax device that is connected to a Mediatrix 4102S to another fax device that is also connected to a Mediatrix 4102S.
- Internal fax message from a fax device at an ISDN port to a fax device at a Mediatrix 4102S and vice versa.
- Internal fax message from a fax device at an ISDN port to a fax box and vice versa.

NOTICE: T.38 must be activated in the system for the fax box. In order to send faxes from the communication system via an ITSP, the ITSP must support T.38. In case the ITSP cannot switch to T.38, then the fax will be handled as G.711.

13.11.8.1 How Enable or Disable Fax over IP (T.38 Fax)

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony Server > Voice Gateway**.
3. Click on **Voice Gateway** in the menu tree.
4. In the menu tree, click **Codec Parameters**.
5. Select one of the following options in the **T.38 Fax** area:
 - If you want to enable Fax over IP (T.38 Fax), select the **T.38 Fax** check box.
 - If you want to disable Fax over IP (T.38 Fax), clear the **T.38 Fax** check box.
6. Click on **Apply** followed by **OK**.

13.12 Microsoft Office 365 Integration Overview

You can work together easily with anywhere access to email, web conferencing, documents and calendars. It includes business-class security and is backed by Microsoft. Whether you are a small business or multinational enterprise, Office 365 offers plans designed to fit your organization's unique needs. For more details or a 30 day account, please visit

OpenScape Business with Microsoft Office 365

When a user sets an appointment in their Microsoft Outlook calendar, the OpenScape Business system automatically checks for keywords in the calendar appointment subjects like: "meeting", "sick", "break", "out of office". If such a keyword is found, the system sets the user's presence status automatically when the appointment time is reached, even if Microsoft Outlook session of this user is not active anymore.

The user configures the appointments with these keywords and OpenScape Business sets the user's telephone presence status automatically and forwards the calls to the voicemail or, for example, to the cellphone, depending on the settings. The user can also configure in a general client status, if the presence status should switch to back to Office presence status when the appointment time is ended.

This also works even if the user does not use the local Outlook client and will set up an appointment with the above named keywords directly from the Outlook webpage in the cloud.

Email forwarding:

OpenScape Business is able to send emails to Microsoft Office 365 included Microsoft Exchange Server.

This enables the users to receive emails for new voicemails, faxes or conference calls with the ability to perform automatically Web Collaboration session from OpenScape Business .

OpenScape Business generates emails for such actions and keeps users updated also via email, if such new notification arrives in the OpenScape Business message box.

13.12.1 How to connect OpenScape Business system to Microsoft Office 365 using Basic Authentication

You can connect OpenScape Business system to Microsoft Office 365 in the cloud using basic authentication to use OpenScape Business Exchange Calendar Integration and Email Forwarding the integrated Microsoft Exchange Server in the Microsoft Office 365.

Prerequisites

- Microsoft Office 365- Office 365 Enterprise E3 with the known local installed " Microsoft Office Professional Plus" suite and the Office Web Apps usage.
- Users are available in Microsoft Office 365 and connected with the local Microsoft Outlook with the assigned email; addressed in Microsoft Exchange of Microsoft Office 365.
- All available Microsoft Updates and Service Packs are installed.
- Check out the right needed Microsoft Enterprise licenses.
- Check out the OpenScape Business Release Note for released Microsoft Office versions.
- Microsoft Office and the Office Web Apps needs to be installed locally.

Important notes:

- The name of the Microsoft Office 365 domain is "mytestatos.onmicrosoft.com". You have to change this value to match your environment settings.
- The user "oso" is used in this example as Service Account with the role privilege for "ApplicationImpersonation" which is used to give the OpenScape Business access to the mailbox database of

the Microsoft Exchange Server. This user has to be added in the Microsoft Office 365 user directory as shown later. It requires also a configured email address.

- The known "Microsoft Exchange Public Folder Contacts search" of the Openscape Business Client is available, because Microsoft Office 365 offers this functionality.

Step by Step

1. Register for **Microsoft Office 365 Enterprise E3** at the official web page of [Microsoft](#).
 - a) Assign Global Administrator rights to user "oso".
2. Login to [Microsoft 365 admin center](#) and navigate to **Users > Active users** add the user "oso" and test users "user1- user3" and assign valid email addresses.

Follow the setup wizard to configure the users.

Add Global Administrator rights to user "oso".

The screenshot shows the 'Microsoft 365 admin center' interface. On the left, a sidebar lists the steps: Basics (selected), Product licenses, Optional settings, and Finish. The main area is titled 'Set up the basics' and contains the following fields and options:

- First name** and **Last name**: Text input fields.
- Display name**: Text input field with 'oso' entered.
- Username**: Text input field with 'oso' entered.
- Domain**: Dropdown menu showing 'oso25.onmicrosoft.com'.
- Automatically create a password**: Unchecked checkbox.
- Password**: Password input field with a strength indicator showing 'Strong'.
- Require this user to change their password when they first sign in**: Unchecked checkbox.
- Send password in email upon completion**: Unchecked checkbox.

At the bottom, there are 'Next' and 'Cancel' buttons.

3. Sign out from Microsoft 365 admin center and login with the new created user "oso" to change the temporary password.

Check that user "oso" has access to the Admin page: **Health > Service Health**. After Service Health check is completed without any major issues sign out and login again with Microsoft 365 administrator again.

Make sure that the users are available in the Microsoft Office 365 user directory and have already logged in to their profile once to change the temporary passwords and can login to their Microsoft Office 365 mailbox with the local installed Microsoft Outlook. This local Microsoft Office 365 installation has to be connected to Microsoft Office 365 portal and install and update it with all available Microsoft Updates for it.

4. Download [Microsoft Office](#) from Microsoft Office 365 portal, if not already done. Install and update it with the latest available Microsoft Updates.
5. Set the user "oso" as privilege user to be able to access the user calendars for the **Exchange Calendar Integration**.
 - a) On a Microsoft Windows 10 computer open the PowerShell in elevated mode:

- Open the start menu and type "Power" . The "Windows PowerShell" command is marked.
 - Press and hold the Shift + Ctrl keys and use the Enter key to start the PowerShell.
 - Apply the upcoming UAC message with Yes to start the PowerShell.
- b) Check if the local execution policy allows script usage in the computer: `Get-ExecutionPolicy`
- c) If the result is not "RemoteSigned", then run the command: `Set-ExecutionPolicy RemoteSigned`. If that fails, check that the privileges on this computer allow you to change this and have started the PowerShell in elevated mode.
- d) Run the command lines to login to the online Microsoft Exchange Server and login with your main Microsoft Office 365 administrator account:
- ```
$LiveCred=Get-Credential Import-PSSession $Session -AllowClobber

$Session = New-PSSession -ConfigurationName
Microsoft.Exchange -ConnexionUri https://
ps.outlook.com/powershell/-Credential $LiveCred -
Authentication Basic -AllowRedirection

6. Sign in to Microsoft Office 365 portal: [www.office.com](http://www.office.com) and log in with the user "oso" to get the information and select **Outlook** from the tree on the left. Then navigate to **Settings > View all Outlook settings > Mail > Sync email**.

Note down the server name and the port of the SMTP setting. For example, smtp.office365.com and 587. You will need this information for the next steps.

7. Navigate to **WBM > Setup > UC Suite > External Providers Config > Exchange Calendar Integration** and apply the following settings to connect with Microsoft Office 365 server:

- a) Click on the **Enable Exchange calendar integration** checkbox.
- b) From the **Authentication method** drop-down list, select **Basic**.
- c) Enter the **Server URL**. For example, <https://outlook.office365.com/ews/exchange.asmx>
- d) Enter the **Username** of the Privileged user set in Microsoft Office 365 directory.
- e) Enter the **Password** of the Privileged user password set in Microsoft Office 365 directory.
- f) Click **Save**.

These changes will grant access of OpenScape Business to the Microsoft Exchange Server within the Microsoft Office 365 for the Exchange Calendar Integration.

---

**NOTICE:** The fields for **Contact Providers > Exchange** must be filled with the online Exchange address: <https://outlook.office365.com/ews/exchange.asmx> and the email address of the global administrator (oso@osbiz5.onmicrosoft.com in this example), in order to be able to search contacts from public folders.

---

8. Navigate to **Service Center > E-mail Forwarding** to enable the mail access from OpenScape Business to Microsoft Office 365
  - a) Enter the Microsoft Office 365 server address in **Outgoing Mail Server (SMTP)** field, the **Outgoing mail server port** and enable **This server requires an encrypted connection (TLS/SSL)** on **Server Information** area.
  - b) From the **Authentication method** drop-down list, select **Basic**.
  - c) Enter the **User Name**, **Password** and **Confirm Password** of the Privileged user in Microsoft Office 365 on the **Login Information** area.
  - d) Enter the **E-mail Address** of the Privileged user in Microsoft Office 365 on the **User Information (Sender)** area.
  - e) Enter the **E-mail Address 1** and **E-mail Address 2** in ALI change notification recipients area.

f) Click **OK&Next**.

g) Click **Check e-mail forwarding** to check that the function works.

**9. Install the OpenScape Business client settings:**

As of February 2020, OAuth authentication is available for POP3, IMAP4, and SMTP AUTH connections to Exchange Online. So enabling authenticated client SMTP submission (SMTP AUTH) in exchange online is needed. Follow directions at: <https://docs.microsoft.com/en-us/exchange/clients-and-mobile-in-exchange-online/authenticated-client-smtp-submission>

Impersonation of the users is also needed. Log in with admin@osbiz5.onmicrosoft.com to office 365 and navigate to admin page on the left tree. New window tab will open. In the new window, under "Admin Centers" navigate to "Exchange". New window tab opens again and under "Roles" on the left tree again, go to "Admin roles" tab and click "Add role group". Give a name and press next. Click "ApplicationImpersonation" bullet and then "next". Finally add the users to the group and finalize.

Make sure that the Microsoft Office suite is installed to the user's computer and connected to Microsoft Office 365 and if not already done, install the CommunicationsClients with at least the option myPorta for Outlook.

a) Open the following path in Windows Explorer:

<\\198.6.127.12\\applications\\install-common\\CommunicationsClients.exe>

Syntax: \\<Openscape Business ip-address>\\applications\\install-common\\CommunicationsClients.exe

b) Login with WBM credentials and follow the setup wizard to install at least the option myPortal for Outlook.

**10. Open Microsoft Outlook and login with the user's credentials to the OpenScape Business system with the OpenScape Business clients. For more details, see myPortal for Outlook user guide.**

---

**NOTICE:** You can also use the **Silent Installation** option to install the CommunicationsClients unattended to the users computers. For more information, see [Silent Installation/Uninstallation for UC Suite PC Clients](#) on page 520.

---

**11. Navigate to **WBM > Setup > UC Suite > User Directory** to add the user's email address.**

OpenScapeBusiness will automatically send a "Welcome"-mail to all new entered mail-addresses with this configuration.

---

**NOTICE:** You can also perform this step in **WBM > Setup > UC Suite > User Directory**.

---

---

**NOTICE:** A configured valid mail-address is needed for the usage of the Exchange Calendar Integration

---

and also for the optional mail notification when the user receives a message from OpenScape Business.

---

Repeat this step for all users.

12. Navigate to **WBM > Setup > UC Suite > Profiles** to configure the **Exchange Calendar Integration** feature.
  - a) Select the user you want to enable the feature, click **Edit** and then click on **My preferences > Outlook connectivity**.
  - b) Select the **Exchange Calendar Integration** option in the **Calendar integration**
  - c) Click on the **Automatically generate calendar appointments form my presence changes** checkbox
  - d) Select **Exchange PST** form the drop-down list.

Repeat this step for all users.

13. Navigate to **WBM > Setup > UC Suite > Profiles**. Select the user you want to configure and click on **VM Notification**, to configure if mail notifications for voicemails will be sent in specific presence statuses, when a new voicemail is saved in the user's mailbox.

Repeat this step for all users. This step is optional.

14. Navigate to **WBM > Setup > UC Suite > Profiles**. Select the user you want to configure and click on **Fax Notification**, to configure if fax notifications for voicemails will be sent in specific presence statuses, when a new fax is saved in the user's mailbox

Repeat this step for all users. This step is optional.

## 13.12.2 How to connect OpenScape Business system to Microsoft Office 365 using Modern Authentication

You can connect your OpenScape Business system to Microsoft Exchange Online / Office 365 using modern authentication (Microsoft OAuth 2.0 token-based authorization) in order to use the E-mail forwarding, Exchange Calendar Integration, Exchange directory integration and E-mail Queues features.

Detailed instructions on how to setup the connection can be found in the Unify Experts Wiki at [https://wiki.unify.com/wiki/OpenScape\\_Business#Microsoft\\_Office\\_365](https://wiki.unify.com/wiki/OpenScape_Business#Microsoft_Office_365).

## 13.12.3 How to check that Microsoft Office 365 Integration features are configured

### E-Mail:

You can check the E-mail function with the button **Check e-mail forwarding** from the **Service Center > E-Mail forwarding** area in WBM. Enter a valid mail address as recipient and check receive of the test mail in the inbox of this mail account.

### Exchange Calendar Integration:

When users set appointments in their Microsoft Outlook calendar, the OpenScape Business system automatically checks for keywords in the calendar appointment subjects like: "Meeting", "Sick", "Break", "Out of Office", "Holiday", "Lunch" or "Home". If such a keyword is found, the system sets the user's presence status automatically when the appointment time is reached, even if the Microsoft Outlook session of this user is not active anymore. The user simply configures the appointments with these keywords and OpenScape Business will set the telephone presence status automatically and will forward calls to the voicemail, or for example, to the cellphone, depending on the set presence status and the from the user desired forwarding target. The user can also configure in a general client setting, if the presence status should be switched back to "Office" when the appointment time ends. This will also work, even if the user does not use the local Outlook client and sets up the appointment with the above named subject keywords directly in the Outlook webpage in the Outlook Web Access (OWA).

The user that uses the Exchange or local Outlook Calendar integration must have a valid e-mail address in their UC Suite client configuration as well as the set UC Suite client Outlook settings configuration named in the manual above. It is mandatory that the UC Suite-user to Exchange-user combination is done by the entered mail address,

The UC Suite users Voicemail language setting is used to combine the keywords like: "Meeting", "Sick", "Break", "Out of Office", "Holiday", "Lunch" or "Home" to the user's language setting, so for example if German language is selected in Voicemail, then German keywords will be checked in the appointments subject line like "Besprechung", "Krank", "Pause", "Außer Haus", "Urlaub", "Mittag" or "Zu Hause" only.

If "Auto back to office" option is not used, the user's presence status will be kept to the set status after the appointment time ends and the return time shown other users or callers will be raised every 15 minutes. If the "Auto back to office" option is used and the appointment time ends, the user's presence is automatically set to "Office" again.

Appointments set into the future with less than 3 minutes are ignored, because the system expects that the user is just creating a new appointment there everything can change within these 3 minutes. The communication system checks for appointments in the users calendars every 30 seconds. For this reason and for possible time delays between the communication system and the Exchange Server, try to use test appointments with more than 3,5 minutes. In tests appointments set in to the future with more than 5 minutes works perfectly to avoid the small time delays between communication system and the Exchange server and the 30 seconds read delay of the calendar read requests.

New appointments values are fully read within the minute the appointment start time is set to within the before named 30 seconds queries. So in case start time is just reached, keep in mind that the 30 seconds query has to be done within this minute and then the presence status is set. The query also sets the users return time according to the end time of the appointment.

If you want to test the functionality when myPortal for Outlook or myPortal for Desktop is closed for the user, simply use the Outlook web page in the Outlook Web Access (OWA). Login with the users credentials and add the appointment with the keyword to the calendar. Check in another UC Suite user's client that the presence changes when the appointment time is reached.

## **14 Functions at the Telephone**

The communication system offers a comprehensive set of telephony features extending from the usual features such as hold, toggle/connect and consultation hold, etc., through various call signaling mechanisms, down to call transfers, call deflections and call forwarding.

### **14.1 Making Call**

The communication system offers many ways to make calls, including, among other things, direct station selection and speed dialing.

#### **14.1.1 Digit Dialing**

In the case of digit dialing, every digit is transmitted as soon as it is dialed.

The call setup begins immediately after the input of the first digit. Consequently, the subscriber has no way to edit the dialed number.

#### **14.1.2 En-Bloc Dialing**

In en-bloc dialing, connections are only established after the complete phone number has been entered. The call number is transferred as a single block.

The transmission of the dialed number can be initiated by entering the end-of-dialing code (#).

En-bloc dialing is mandatory for:

- ITSP trunk connection
- ISDN Primary Rate Interface in the U.S.

After 5 seconds without the input of a digit, the last entered digit is interpreted as the final digit of the number block.

#### **14.1.3 Keypad dial**

In some countries, the services of digital trunk connections are controlled using keypad dialing instead of functional control. To activate these services in the PSTN, you can use the stimulus interface.

The feature must be configured in E Manager.

Subscribers acknowledge the message traffic using the display. As a result, keypad dialing can only be performed on telephones with a display (optiPoint, OpenStage), mobile telephones (Cordless) with optiPoint menu navigation and IP telephones with stimulus

interfaces. ISDN telephones are not supported. Each network provider determines which services can be used with keypad dialing.

An authorized station can activate keypad dialing using the service menu or using the \*503 code. This is possible only in the idle state. Then the station must select an ISDN trunk that the feature can use.

Depending on the messages sent by the central office (such as when connecting), keypad dialing can create CDR entries. The number of the station using keypad dialing, the line used, and the time period when the feature was used are logged.

---

**NOTICE:** Actions triggered by keypad dialing are not monitored by the system. The system cannot prevent improper use, such as call charges fraud or trunk blocking.

Customers must be informed that they are liable for damages resulting from the improper use of this feature.

---

### 14.1.4 End-of-Dialing Recognition

End-of-dialing is either recognized automatically after five seconds or indicated manually by the user with the end-of-dialing code "#".

### 14.1.5 Editing the Telephone Number

This option lets subscribers modify the digits entered for the station number. This function is common in mobile phones. A call number can only be corrected as it is being entered.

After entering a sequence of digits, the user can edit it from right to left by pressing a key; each time the key is pressed, one digit is deleted. Once the correct digit sequence is entered in full, the user can press the confirm key or lift the handset to start digit transmission.

It is not possible to edit a saved call number, for example, for number redial.

---

**INFO:** This feature can be individually activated for every station.

---

#### Dependencies

| Topic        | Dependency                                                                                                              |
|--------------|-------------------------------------------------------------------------------------------------------------------------|
| Call waiting | Call waiting is possible during editing because the telephone is in digit input state and is busy for incoming traffic. |

| Topic        | Dependency                                                                                                        |
|--------------|-------------------------------------------------------------------------------------------------------------------|
| Consultation | The telephone is in digit input state after a consultation. This makes it possible to edit station number digits. |

### 14.1.5.1 How to Activate or Deactivate Editing of the Telephone Number

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Telephony > Stations**.
3. In the menu tree, click **Stations**.
4. In the menu tree, click the station (Index - Call number - Name).
5. Click on the **Edit Station Flags** tab.
6. Select one of the following options:
  - If you want to activate the function, select the check box **Edit tel. number**.
  - If you want to deactivate the function, clear the check box **Edit tel. number**.
7. Click on **Apply** followed by **OK**.

### 14.1.6 Redialing

The phone number dialed is saved after an external call is set up. If the destination is busy or not reachable, a user can press the Redial key to redial the same number.

Speed dial numbers are also stored in the redial memory.

Dialing internal call numbers has no effect on the redial memory.

Post-dialed digits (also called DTMF characters), if any, are not seen as part of the dialing information and are therefore not saved (e.g., digits sent to a connected voicemail box).

The Redial function can only be activated via a key, not via an access code.

To retrieve a specific number and use it to set up another call, press the Redial key. Press the key once to dial the last number dialed. Press the key twice to dial the next-to-the-last number dialed. Press the key three times to dial the number that was stored the longest.

The station number saved is automatically dialed after 2 seconds when you press the Redial key. If you need more time to read the displayed station number, select "scroll" with the Confirm Key. Click "Next" to display the next phone number saved. This is phone number is dialed only on selecting the "Make Call" command. This

gives you much more time to check if the correct phone number was selected.

In the case of a call routed via LCR, only the number dialed by the station is stored.

Account codes are also stored in the redial memory. This is true only if the appropriate system-wide flags are set.

### 14.1.6.1 How to Enable or Disable Automatic Redialing

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony** > **Basic Settings** in the navigation tree.
3. Click **System** in the menu tree.
4. Click on **System Flags**.
5. Select one of the following options:
  - If you want to activate the function, select the check box **Automatic redial**.
  - If you want to deactivate the function, clear the check box **Automatic redial**.
6. Click on **Apply** followed by **OK**.

### 14.1.7 System Speed Dialing

You can save frequently needed external phone numbers in the communication system. Every number is then represented by a speed-dial number which is used instead of the full phone number.

Speed-dial numbers consist of 4-digit numbers.

All subscribers are members by default of a group that is assigned all SSD numbers. This means that every subscriber can use all SSD numbers.

SSD overrides toll restriction rules. Note that dialing a speed dial destination found during a search in the internal phonebook will not override toll restriction rules.

The numbers for system speed dialing are configured by the administrator in groups. The subscribers can each be assigned to one of these groups. A subscriber can only use the speed-dial numbers of his or her allocated group. A group can only be assigned a single SSD range.

Entries in speed dials are searchable by first and last name if name is configured in <Last Name>, <First Name> or <First Name>, <Last Name> format.

Used speed dial numbers are stored in the redial memory.

To program a "dial pause" and DTMF changeover for suffix dialing of DTMF characters (e.g., for controlling voicemail boxes), you can use the Repdial "P-key" or "#" (pound) key.

The repdial key for the customer must be set as:

<dial\_number><dtmf\_digit><pause\_digit><access\_code> e.g.  
008007728477#P2210344

### Translation of station numbers to names

You can assign a name to each speed-dialing destination. As soon as a call is received from a saved phone number, the system automatically enters the name and displays it instead of the phone number if CLIP is set.

### Suffix-dialing

Suffix-dialing is not supported for "en-bloc sending" Digit Transmission (e.g., an ITSP configuration). It is supported for "Digit-by-digit" Digit Transmission.

---

**NOTICE:** Digit transmission field can be changed in WBM via **Expert mode > Trunks/Routing > Route**

---

Suffix-dialing is also possible:

- Manual suffix-dialing

The user can select additional numbers by selecting the access code and entering the index number (speed-dial number). These are added to the station number saved in this index and dialed.

- Automatic suffix-dialing

When configuring an SSD, the number entered can be split into two parts. A dash "-" is used as the separator. The first part is always sent. A timer then starts. If the user does not dial any more digits before the timer expires, the second part of the number entered is automatically suffix-dialed, otherwise the manually dialed digits are transmitted.

For example: SSD = 7007-0

If the station does dial a DID (manual suffix-dialing) after selecting the SSD and before the specified time has expired, 0 is automatically dialed (automatic suffix-dialing).

### Importing Speed Dial Numbers

You can import speed-dial lists from an XML file in UTF-8 format. Existing speed dial numbers are deleted before the import.

An XML template with the appropriate explanations can be found in the WBM under **Service Center > Documents > CSV Templates**. You can enter your speed dial destinations in these templates by using Microsoft Excel, for example.

---

**NOTICE:** Import of speed-dial lists from CSV files is not recommended any more and it's only supported in special cases.

---

### Exporting Speed Dial Numbers

As an administrator with the **Expert** profile, you can export speed-dial numbers to an XML file in UTF-8 format in the **Expert mode**. The export always includes all the records.

#### 14.1.7.1 How to Add a Speed Dial

The **Phone Book/Speed Dialing** wizard can be used to add speed-dial destinations for system speed dialing.

##### Prerequisites

You are logged in at the WBM.

##### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > Central Telephony**.
3. Click on **Edit** to start the **Phone Book/Speed Dialing** wizard.
4. Enter the **Speed dial** number, the **Call number**, and the **Name** of the speed-dial destination in a free table row.
5. If you want to add further speed-dial destinations, click on **Store data** and repeat the previous step.
6. Click on **OK & Next**.
7. Click on **Finish**.

#### 14.1.7.2 How to Import Speed Dials from an XML File

The **Phone Book / Speed Dialing** wizard can be used to import speed-dial numbers and phone numbers from an XML file. Existing speed dial numbers are deleted before the import.

##### Prerequisites

You are logged in at the WBM.

An XML file with the entered speed dial numbers is available in UTF-8 format. An XML template for importing speed-dial numbers can be found under **Service Center > Documents > CSV Templates**.

---

**NOTICE:** Import of speed-dial lists from CSV files is not recommended any more and it's only supported in special cases.

---

##### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click on **Wizards > Central Telephony**.
3. Click on **Edit** to start the **Phone Book/Speed Dialing** wizard. The **Edit central phone book** window appears.
4. Click on **Import/Export CSV/XML Data**.

5. Click in the **Import CSV/XML file via HTTP** area on **Browse** to select the desired file.
6. Click on **OK**. Existing speed dial numbers are deleted, and the speed dial numbers entered in the XML file are imported into the system.
7. Click on **Finish**.

### 14.1.7.3 How to Export Speed Dials to an XML File

You can export speed dial numbers to an XML file. The export always includes all the data.

#### Prerequisites

You are logged in at the WBM.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click on **Wizards > Central Telephony**.
3. Click on **Edit** to start the **Phone Book/Speed Dialing** wizard. The **Edit central phone book** window appears.
4. Click on **Import/Export CSV/XML Data**.
5. Click in the **Export XML file via HTTP** area on **Download**. The list of speed dial numbers is prepared for downloading.
6. Select the storage location for the file and click **Save**.

### 14.1.7.4 How to Edit Speed Dials

The **Phone Book/Speed Dialing** wizard can be used to edit speed-dial destinations.

#### Prerequisites

You are logged in at the WBM.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click on **Wizards > Central Telephony**.
3. Click **Edit** to start the **Phone Book/Speed Dialing** wizard.
4. You can search for an entry by typing a search term in the **Speed dial**, **Call number** or **Name** search fields and then pressing the return key. All matches that contain the search term are displayed. For example, entering the call number 521 would display the matches +495213535 and +498967521, and entering the term co as the name would display Collins, Mcoin and Branco.

---

**NOTICE:** Pressing the return key with nothing entered in any of the search fields causes all entries to be displayed.

---

5. Edit the values for the desired table entry in the **Speed dial, Call number** or **Name** fields.
6. If you want to edit additional speed-dial destinations, click on **Store data** and repeat the previous step.
7. Click **OK & Next**.
8. Click **Finish**.

### 14.1.8 Individual Speed Dialing (ISD)

Individual Speed Dialing (ISD) enables every subscriber to save 10 external numbers as individual speed-dial numbers in addition to the system speed-dial numbers.

For telephones without a display, the station user must wait for the confirmation tone following station number entry.

External numbers can be programmed in the ISD pool. Access depends on the station's dial-up access rights. Before entering the station number, the subscriber must enter the CO access code (e.g., 0).

The Redial key or the pound (#) key is used to program a dial pause or DTMF changeover.

### 14.1.9 Direct station select

The function keys on a telephone or add-on device can be programmed as DSS keys. These are programmed with the phone number of an internal subscriber or a group for this. Press a key of this kind to initiate an immediate call to the programmed destination (DSS). The current status of the subscriber or of the group is indicated by the LED associated with the DSS key.

A DSS (direct station selection) key can also be used to transfer a call quickly to the programmed subscriber or group. Pressing a DSS key during a call with an external party places the ongoing call on consultation hold. The transferring subscriber can transfer the call to the transfer destination by replacing the handset (unscreened transfer). He or she can also wait until the transfer destination responds before transferring the call (screened transfer). If the transfer destination does not answer, an automatic recall is enabled.

#### Statutes of a DSS Key LED

The DSS key LED shows the current status of the programmed station:

- Off: the associated subscriber is not conducting a call.
- Lit: the associated subscriber is conducting a call or has activated Do Not Disturb.
- Flashing fast: the associated subscriber is conducting a call. The call can be accepted by pressing the Direct Station Select (DSS) key.

- Flashing slowly: the associated subscriber is being called and has not yet answered. The call can be accepted by pressing the Direct Station Select (DSS) key.

### 14.1.10 Speaker Calls / Direct Answering

The Speaker call function lets you set up an internal connection without the called subscriber lifting the handset. The loudspeaker on the called station is automatically activated.

On phones equipped with a speakerphone (microphone), direct answering of the called station is possible by switching on the microphone. On lifting the handset, the call becomes a normal two-party call.

Speaker calls can be used via a function key programmed for this purpose, the associated menu item or by entering the code and then dialing the station number of the destination station or group. A function key can also be programmed with a station number. A connection to the programmed destination is immediately set up when you press a function key of this kind.

Speaker calls also enable the broadcasting of announcements to all internal members of a group.

Direct answering can be activated via the menu item provided for this in the display or via a function key programmed for this purpose.

Speaker calls can be prevented for a subscriber by enabling an option to prevent voice calling. In this case, speaker calls are signaled like a normal call.

#### Dependencies

| Topic                                   | Dependency                                                                                                                                                                                                                                                                                              |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Do Not Disturb, Override Do Not Disturb | Speaker calls are not possible at stations where Do Not Disturb is active. If the subscriber who wants to use the "Speaker calls" feature is authorized to override Do Not Disturb, he or she hears the busy tone for five seconds. The destination station is then called, but not directly addressed. |
| Toggle, consultation hold, transfer     | The specified features cannot be used in a speaker calls/direct answering connection.                                                                                                                                                                                                                   |

| Topic                   | Dependency                                                                                     |
|-------------------------|------------------------------------------------------------------------------------------------|
| ISDN phones, SIP phones | The "Speaker call" and "Direct answering" features cannot be used with ISDN or SIP telephones. |

### 14.1.10.1 How to Enable or Disable the Prevention of Speaker Calls for Stations

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Telephony > Stations**.
3. Navigate in the menu tree under **Stations > Station > ...** down to the desired station (Index - Station Number - Name).
4. Click on the **Edit Station Flags** tab.
5. Select one of the following options:
  - If you want to enable the prevention of speaker calls for stations, clear the check box **Prevention of voice calling off**.
  - If you want to disable the prevention of speaker calls for stations, select the check box **Prevention of voice calling off**.
6. Click on **Apply** followed by **OK**.

### 14.1.11 Associated Dialing

Associated dialing enables an authorized subscriber to dial a phone number on behalf of any other subscriber. The effect is the same as when the other subscriber dials the phone number.

The user accesses the function by dialing a code and specifying the station for which a number should be dialed. The system then interprets this information as though the station specified earlier were dialing.

### 14.1.12 Trunk Queuing

A subscriber can reserve a trunk in advance if there are no free trunks available (busy signal). As soon as a trunk becomes free, it is offered to the subscriber through an automatic recall.

If the user is busy at the time of the recall, the trunk will camp on to the busy station. If the camp-on tone is not answered, the reservation is canceled, and the trunk is offered to the next station in the queue. If the user activated DND prior to receiving the recall from the queued trunk, the trunk reservation is canceled and the trunk is offered to the next station in the queue.

If a number of stations queue a trunk, the trunk is assigned in the order that the requests were received.

Only one queue/reservation request is accepted per telephone. If a second reservation is attempted, it overwrites the first.

It is not possible to invoke the Trunk Queuing feature if the attempted call was placed through LCR (least cost routing).

The Trunk Queuing feature ignores an existing call forwarding—no answer instruction. Trunk reservation is canceled if not answered within 20 seconds.

A recalling trunk cannot be picked up by either Call Pick up - group or Call pick up - Directed.

Trunks can be reserved in one of the following ways:

- Manual reservations only work in telephones with a display
- Automatic reservation (for all other telephones)

When this flag is activated and if a station is not assigned a free trunk after the usual simplified dialing procedures, the busy tone is signaled at the station. After five seconds, a positive acknowledgment tone is applied and the trunk is reserved, provided that the station has the appropriate CO call privilege.

---

**NOTICE:** Trunk queuing is not possible for S<sub>0</sub> phones.

---

### 14.1.12.1 How to Activate or Deactivate Trunk Queuing

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony** > **Basic Settings** in the navigation tree.
3. Click **System** in the menu tree.
4. Click on **System Flags**.
5. Select one of the following options:
  - If you want to activate the function, select the check box **Trunk reservation, automatic**.
  - If you want to deactivate the function, clear the check box **Trunk reservation, automatic**.
6. Click on **Apply** followed by **OK**.

### 14.1.13 Private Trunk

A private trunk is a CO trunk that is available exclusively to a specific subscriber.

## 14.2 Call Signaling, Calling Line ID

The communication system offers various options for call signaling and call number display such as CLIP, CLIR, COLP and COLR, for example.

### 14.2.1 Different Call Signaling

Different call signaling enables a distinction to be made between internal and external incoming calls.

Incoming calls are signaled visually and acoustically on the phone. The following displays appear on the screen:

- Caller number
- For internal call forwarding: additionally, the dialed call number

The incoming call can also be signaled via an LED. Different acoustic signals are used for internal and external calls.

#### Call signaling internal

Each subscriber can be assigned one of a total of eight possible acoustic call signals for internal calls. The station then uses the modified ringing tone to distinguish its calls at other internal stations. For example, a special internal ringing tone can be set for the manager so that every staff member knows when the manager is calling simply from the ringing tone.

#### Call signaling external

There are three different call types, each with different acoustics, that can be set for an external call. Different acoustic signals can be applied, for instance, to distinguish between calls from two different groups such as Sales and Warehouse.

- In Germany, the administrator can configure three different ring types for analog, ISDN and system phones.
- In other countries, the ring types for analog phones are the same.

### 14.2.2 Calling Line Identification Presentation (CLIP)

Calling Line Identification Presentation (CLIP) shows the caller's number at the called station.

The CLIP (Calling Line Identification Presentation) refers to incoming calls and must be supported by the network provider.

If the caller's name and phone number are programmed as a system speed dialing (SSD) number in the communication system, you will see the name on your display.

The Calling Line Identification Presentation (CLIP) and Calling Line Identification Restriction (CLIR) features are mutually exclusive, that is, as soon as CLIP is activated, CLIR is deactivated, and vice versa.

### Configurable CLIP

Configurable CLIP transmits a set call number (e.g., the call number of a hunt group) externally instead of the caller's number (e.g., the number of the hunt group member).

### System-Specific Information

| Country             | Enabled by default                                                                                   |
|---------------------|------------------------------------------------------------------------------------------------------|
| USA                 | LIN (Location Identification Number). If CLIP is enabled for the USA, LIN is automatically disabled. |
| Remaining countries | CLIP                                                                                                 |

#### 14.2.2.1 How to Enable or Disable Configurable CLIP

##### Prerequisites

You are logged into the WBM with the **Expert** profile.

##### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony** > **Basic Settings** in the navigation tree.
3. Click **System** in the menu tree.
4. Click on **System Flags**.
5. Select one of the following options:
  - If you want to enable Configurable CLIP, select the **Configurable CLIP** check box.
  - If you want to disable Configurable CLIP, clear the **Configurable CLIP** check box.
6. Click on **Apply** followed by **OK**.

#### 14.2.3 Calling Line Identification Restriction (CLIR)

Calling Line Identification Restriction (CLIR) suppresses the station number of the caller at the station of the called subscriber.

CLIR (Calling Line Identification Restriction) applies to outbound calls. The PSTN must support the feature. The Calling Line Identification Restriction (CLIR) has precedence over the Calling Line Identification Presentation (CLIP).

The Calling Line Identification Presentation (CLIP) and Calling Line Identification Restriction (CLIR) features are mutually exclusive, that is, as soon as CLIP is activated, CLIR is deactivated, and vice versa.

CLIR and COLR can only be enabled or disabled together.

Calling Line Identification Restriction (CLIR) has no effect for certain call destinations (e.g., emergency numbers of the police and fire departments).

### System-wide Station Number Suppression (CLIR)

As an administrator you can enable or disable the CLIR station number suppression on a system-wide basis.

---

**INFO:** The flag "System-wide station number display suppression" does not apply to the U.S.

---

### Temporary Station Number Suppression

As a subscriber, you can activate or deactivate the temporary station number suppression (CLIR). A temporary station number suppression is only possible if the system-wide station number suppression has been deactivated.

### Station Number Suppression (CLIR)

As an administrator, you can configure the CLIR for each route so that only the PABX number is transmitted instead of the subscriber's station number.

## 14.2.3.1 How to Enable or Disable Station Number Suppression

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Telephony > Trunks/Routing**.
3. In the menu tree, click **Route**.
4. Select the corresponding **Trk Grp..**
5. Select the check box **Suppress station number** under **System number - outgoing**.
6. Click on **Apply** followed by **OK**.

## 14.2.4 Connected Line Identification Presentation (COLP)

Connected Line Identification Presentation (COLP) transmits the call number of the called subscriber to the caller as soon as the two are connected.

Connected Line Identification Presentation (COLP) is an ISDN feature.

COLP makes sense with call forwarding, for example, so the caller can see the phone number of the actual communication partner instead of the originally dialed phone number.

The Connected Line Identification Presentation (COLP) and Connected Line Identification Restriction (COLR) features are mutually exclusive, that is, as soon as COLP is activated, COLR is deactivated, and vice versa.

#### 14.2.4.1 How to Enable or Disable Connected Line Identification Presentation (COLP)

##### Prerequisites

You are logged into the WBM with the **Expert** profile.

##### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Telephony > Trunks/Routing**.
3. In the menu tree, click **Route**.
4. Select the appropriate **Trk Grp..**
5. Click on the **Special Parameter change** tab.
6. Select the check box **COLP**.
7. Click on **Apply** followed by **OK**.

#### 14.2.5 Connected Line Identification Restriction (COLR)

Connected Line Identification Restriction (COLR) suppresses the display of the called station at the station of the caller.

The Connected Line Identification Restriction (COLR) applies to incoming calls.

The Connected Line Identification Restriction (COLR) has precedence over the Connected Line Identification Presentation (COLP).

The Connected Line Identification Presentation (COLP) and Connected Line Identification Restriction (COLR) features are mutually exclusive, that is, as soon as COLP is activated, COLR is deactivated, and vice versa.

CLIR and COLR can only be enabled or disabled together.

#### 14.2.6 CLIP No Screening (Transmission of Customer-Specific Phone Number Information)

CLIP No Screening transmits a call number specified by the caller instead of the caller's own number.

The outgoing system number does not have to be identical to the incoming system number.

The "Suppress station number" flag can be activated for special customer applications. This prevents the system from sending out the DID number of the station along with the outgoing system number.

**Example:** You want to prevent direct customer access to a service staff member who is reached centrally with a general service number. To conceal the staff member's own DID number, enter the general service number as the outgoing PABX number and activate the "CLIP no screening" flag. Then called subscribers see only the general service number on their display as the CLIP.

## Functions at the Telephone

Incoming and outgoing calls usually use the same system number. In this case, the entry under "System number - outgoing" is either empty or the same as the one under "System number- incoming". If this is not the case, you can

- enter a different number under "System number - outgoing".
- use the routing parameter "No. and type, outgoing" to define whether the "System number - outgoing" entered contains the station number without area code, with area code (national), or also with the international country code (international).

---

**INFO:** CLIP no screening must be supported by the Network Provider and be activated.

---

### 14.2.6.1 How to Configure CLIP No Screening

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Telephony > Trunks/Routing**.
3. In the menu tree, click **Route**.
4. Select the corresponding **Trk Grp..**
5. Enter the required **PABX number** under **System number - outgoing**.
6. Click on **Apply** followed by **OK**.

### 14.2.7 CLIP for Analog Telephones

CLIP for analog telephones transmits the call number of an analog device of the caller to the called party and displays the CLIP (Calling Line Identification Presentation) on suitable devices of the called party analogously.

The additional transmission of CNIP name information (Calling Name Identification Presentation) can be configured.

---

**INFO:** CNIP is device-independent. Please also refer to the vendor specifications.

---

### 14.2.8 Ringer Cutoff

The Ringer Cutoff feature signals incoming calls acoustically with only a brief alert tone (beep) and on the display.

Ringer Cutoff is only available on phones with displays and has no effect on the signaling of appointments.

## 14.2.9 Translating Station Numbers to Names for System Speed Dialing

For calls made using system speed-dials (SSD) and for incoming calls from system speed-dial numbers, the name associated with the speed-dial destination is displayed after dialing instead of the speed-dial number.

## 14.3 Functions During the Call

The communication system offers several functions during calls, e.g., holding, redirecting and transferring calls.

### 14.3.1 Placing a Call on Hold

Placing a call on hold causes the call to be held in a waiting state. During this period, the caller usually hears an announcement or music on hold.

The hold ends when the held call is retrieved (i.e., resumed).

The following types of holds are possible:

- Common hold:  
Any subscriber can retrieve the call again by pressing a trunk or call key
- Exclusive hold: (only for Team or Top function and at the Attendant Console)  
Only the initiating party can retrieve the call.

#### Placing a Call on Hold and Automatic Recall

A parked call results in an automatic recall when the **Time for parking + change to hold** timer expires (default: 160 s).

### 14.3.2 Parking

Parking a call causes that call to be placed in a waiting state. During this period, the caller usually hears an announcement or music on hold. A parked call can be retrieved from any telephone.

As a subscriber, you assign a park slot (0-9) for a call to be parked. If the park slot you select is already occupied, a negative confirmation tone sounds and the number does not appear on the screen. You can then select another park slot. To retrieve a parked call, you must specify its park slot.

A parked call can be retrieved (unparked) via a code or a correspondingly programmed key and can also be retrieved if another call is waiting at the same time.

### Parking and Automatic Recall

A parked call results in an automatic recall when the **Time for parking + change to hold** timer expires (default: 160 s).

### Parking and Call Forwarding

In the case of a recall, a parked call does not follow call forwarding.

### Parking and DISA

Parking cannot be enabled via DISA.

### Parking and Conference Calls

You cannot park a conference call.

### Parking and Networking

A parked call can only be retrieved in the same node. An incoming call over a network can only be parked at the destination node.

### Parking and Do Not Disturb

A station with DND enabled can place a call in a park slot; however, if a recall occurs from the parked call, and no other destination was defined in the call management, the call will be automatically disconnected after the recall timer expires.

---

**NOTICE:** Detailed instructions on how to park a call and how to retrieve a parked call can be found in the relevant chapter of the corresponding device's user guide (OpenStage X Hipath/ OpenScape 3000/ 4000 User Guide).

---

## 14.3.3 Consultation

In the case of a consultation hold, a subscriber initiates a second call from the same phone or accepts a waiting call. In the meantime, the first call is placed on hold.

A consultation hold is terminated on:

- retrieving the held call or
- Disconnect

This results in either:

- a transfer of the held call or
- an immediate automatic recall from the party on hold to the party that has just hung up

### Consultation Call using the Direct Station Select (DSS) Key

Pressing a Direct Station Select (DSS) key during a call initiates a consultation call to the corresponding destination.

### **Connecting two External Parties**

During an external call, a consultation call to another external destination followed by a transfer connects the two external parties. This may involve call charges.

## **14.3.4 Toggle/Connect**

The Toggle/Connect feature enables a subscriber to switch between two calls. When the subscriber is talking to one party, the other party is placed on hold.

The subscriber can toggle between the two calls by pressing the appropriate trunk key.

### **Toggle/Connect and Placing a Call on Hold**

The Toggle function is not available to an on-hold subscriber.

## **14.3.5 Transfer**

A transfer enables a subscriber to transfer his or her call to another destination. As soon as a subscriber initiates a transfer, the waiting party is placed on hold for the time being.

The following types of transfers are possible:

- **Blind transfer (also called an unscreened transfer):**  
You can transfer the call without an answer from the subscriber at the destination of the transfer. If the station at the transfer destination is busy, the call is camped on (i.e., call waiting is signaled). If a third party now tries to transfer a call to this busy station or if call waiting rejection has been turned on at the transfer destination, an immediate recall occurs. If the subscriber at the transfer destination does not accept the transferred call within a specified time period ("Dial time during transfer before answer" timer), an automatic recall occurs. A blind transfer (also called an unscreened transfer) to an agent in another Multimedia Contact Center queue is not possible.
- **Consultation transfer:**  
You can transfer the call only if the subscriber at the destination of the transfer answers. The transfer is completed by hanging up the handset.

### **Transfer with Call Forwarding**

Any call forwarding set at the transfer destination will be followed, i.e., the call will be forwarded accordingly. The display shows the final destination of the transfer.

### **Transfer with Do Not Disturb**

Transferring a call to a station at which Do Not Disturb is enabled results in an immediate recall to the transferring station even if the transferring station itself also has Do Not Disturb enabled.

### System-Specific Information

"Dial time during transfer before answer" timer: 45 seconds by default

Up to 5 calls can be transferred simultaneously to a busy station.

---

**NOTICE:** In a call transfer, the display information update through the ITSP/NATIVE-SIP interface is not supported.

---

## 14.3.6 Automatic Recall

An automatic recall is received by the originator of a call if his or her call was placed on hold or parked for too long or if an attempt to transfer that call was unsuccessful.

An automatic recall occurs in the following cases:

- A held or parked call is not picked up again within a specific time period ("Time for parking + change to hold" timer).
- In the case of unscreened transfers, under the following circumstances:
  - The call is not answered before a certain time period expires ("Dial time during transfer before answer" timer)
  - The destination does not exist
  - The destination is busy with a second call
  - The digital phone at the destination is defective
  - The transfer type is not allowed

If the originator (i.e., initiating party) is busy during the recall, the automatic recall will camp on the line. As soon as the originator is free again, the automatic recall is signaled. Either the caller's phone number or that of the destination can be shown on the display or the originator. If the recalled party does not answer the call before the "Intercept time for automatic recall" timer expires, an intercept to the intercept position occurs (if the "On unanswered recall" flag is set). If the intercept position does not answer the recall before the "Time for activation of automatic recall at attendant console" timer expires, the recall is automatically disconnected.

### Automatic Recall and Call Pickup

Every station in a call pickup group with the initiating party (originator) can pick up an automatic recall if the system-wide flag "Call Pickup after Automatic Recall" is set.

### Automatic Recall and Do Not Disturb

An automatic recall ignores the Do Not Disturb setting.

### System-Specific Information

"Intercept time for automatic recall" timer: 30 seconds by default

"Time for activation of automatic recall at attendant console" timer: 60 seconds by default

### 14.3.7 Call Supervision

Call Supervision allows authorized subscribers to listen in on a call conducted by any internal subscriber. The microphone of the party listening in is automatically muted. The participants in the supervised call are not advised of the supervision operation by any signal such as a tone or display.

The feature is disabled in the default configuration. It may only be enabled if the country-specific legislation permits this. In individual cases, the current country-specific legislation must always be checked before the feature is activated.

Authorized subscribers need a system phone and the Override class of service.

The subscriber you want to supervise must be actively conducting a call. When you start and end call supervision, you may encounter a lapse of up to two seconds of the conversation. The supervised connection is released as soon as one of the stations in the connection is put on hold, transferred or the call is ended. The supervised connection can only be resumed when the station to be supervised is again engaged in a call.

#### Dependencies

| Topic            | Dependency                                                                                                                                                                                                   |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cordless phones  | You cannot use call supervision at cordless telephones because they do not support automatic microphone muting.                                                                                              |
| Conferencing     | Call Supervision restricts the number of possible conferences. Maximum number of conferences possible in the system = maximum number of simultaneous call supervision stations.                              |
| Call Supervision | The call can be overridden only using code *944 + station number (not from a menu).                                                                                                                          |
| Call Supervision | To enable the use of features at a station, both the station flag <b>Call Supervision</b> and the flag <b>Override class of service</b> on must be activated. (Feature cannot be used with CSTA monitoring.) |

#### 14.3.7.1 How to Activate or Deactivate Call Supervision for a Station

##### Prerequisites

You are logged into the WBM with the **Expert** profile.

The Override class of service has been activated for the relevant station.

##### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Stations**.

3. In the menu tree, click **Stations**.
4. Navigate in the menu tree under **Stations > Station > ...** down to the desired station (Index - Station Number - Name).
5. Click on the **Edit Station Flags** tab.
6. Select one of the following options:
  - If you want to grant the authorization for this function to a station, select the **Call Supervision** check box.
  - If you want to revoke the authorization for this function from a station, clear the **Call Supervision** check box.
7. Click on **Apply** followed by **OK**.

### 14.3.8 Discreet Call (Whisper)

The Discreet Call (Whisper) feature enables a subscriber (e.g., at station C) to monitor a simple existing connection between two other stations (e.g., A and B) and to pass on information to station A that without being heard by station B. This feature is typically used in Contact Centers and Executive/Secretary systems.

The feature must be configured in E Manager.

---

**NOTICE:** Although there is no connection between station B and station C, user B may be able to hear the muffled tones of what user C is saying because of feedback on station A.

---

Destination terminals for the Whisper feature (station A) can only be system telephones with displays. Stations A and C must be in the same node.

In the idle/ready state, station C activates this feature by dialing a code. The telephone features a partially programmed key (only the code is programmed on the key, the station number must be suffix-dialed). A new menu item will be incorporated into the Service menu; the Idle/Call menu remains unchanged.

The option for activating the feature is linked to a user-specific class of service. A second class of service can be used to protect station A from a discreet call (whisper/off hook announcement).

The feature is disabled if this is initiated by the activating station C or by the impact of some other call-related feature.

---

**NOTICE:** If neither of the participants in the original call is a TDM station, the switching network is not involved at the time of activation, and changeover is impossible without briefly interrupting the existing connection.

---

**NOTICE:** Call transfer and conference functionalities are not available from UC Suite products while Discreet Call is activated.

If the Whisper/Off Hook Announcement feature is active, and station A or station B initiates another call-related feature, the Whisper feature will be deactivated. The table below provides further information on interaction with particular features:

| Feature                                         | Station A |                                          | Station B |                                          | Station C |                          |
|-------------------------------------------------|-----------|------------------------------------------|-----------|------------------------------------------|-----------|--------------------------|
|                                                 | Possible  | Action                                   | Possible  | Action                                   | Possible  | Action                   |
| Consultation Hold, Call Hold, Park, Common Hold | Yes       | Deactivate Whisper/Off Hook Announcement | Yes       | Deactivate Whisper/Off Hook Announcement | no        | Negative acknowledgement |
| Transfer                                        | --        | --                                       | --        | --                                       | --        | --                       |

### 14.3.9 Live Call Recording (Voice Recording)

This feature is used to record data from an active voice connection between two stations (one station must be internal, the other may be external), in other words, to record calls. A separate device is required for recording.

Recording can be started/stopped by pressing a function key or entering a code (analog telephones). Depending on the configuration, recording can also be stopped by the recording device.

The recording equipment can be used by all supported telephones within a CorNet-NQ network. Connections with CorNet-N and QSIG (ECMA, ISO) are not supported. The recording tone can be deactivated during recording.

TDM and CorNet-IP (HFA) telephones (incl. devices without a display) as well as OpenScape Personal Edition (HFA) and optiClient Attendant are supported. Standard H.323 telephones, SIP telephones and EDSS1 stations are not supported.

---

**NOTICE:** Activated voice recording is indicated by a LED or a recording tone during the call.

Authorization to use voice recording can be individually set for each station .

---

#### Dependencies/Restrictions

| Subject                                                 | Dependency/Restriction                                                                                                                                              |
|---------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Consultation hold, toggle/connect, transfer, conference | Initiating one of these features when recording a call automatically interrupts voice recording.                                                                    |
| Call Hold                                               | Ongoing recording is interrupted by activating "Call Hold". Recording cannot be activated when a station is on hold.                                                |
| Override                                                | Voice recording is not possible.<br>You cannot override a call that is being recorded. Similarly, you cannot activate recording after overriding a call.            |
| Call supervision                                        | Voice recording is not possible.<br>You cannot monitor a call that is being recorded. Similarly, you cannot initiate recording after activating "Call supervision". |

---

**NOTICE:** You can only record two-party calls, not conferences or calls involving a held party.

---

**NOTICE:** Additional remarks:

- ) The recording device can be addressed in a random node in a CorNet NQ network.
  - ) Only a limited number of stations in a node can be allocated voice recording authorization (currently limited to 50 stations).
  - ) Conference resources are allocated during recording.
  - ) The default service code for activating call recording is \*493.
- 

## 14.4 Controlling Availability

To control accessibility, the system offers features such as call forwarding, do not disturb and call rejection.

Call destination lists are used for various call forwarding types. Call destination lists define how incoming calls for the assigned station or assigned group are handled. The individual call destinations in a call destination list are processed sequentially. Different entries are possible for internal and external calls (day or night).

### 14.4.1 Call Forwarding

Call Forwarding—No Answer (CFNA) forwards calls that are not answered within a certain period of time.

This type of forwarding is also referred to as fixed call forwarding, since it is only configurable by the administrator.

For each call forwarding, there are one or more call destination lists, which can be assigned to the stations for the following types of calls:

- External calls during the day (when the night service is inactive )
- External calls at night (during active night service)
- Internal calls

For each call destination list, you can specify up to 4 call destinations to which the call is to be forwarded sequentially after a preset time has expired.

Under normal circumstances, the station number or name of the originally called subscriber and the station number or name of the caller are displayed at the call forwarding destination. As an administrator, you can disable the additional display of the station number or name of the caller.

#### Call Forwarding on Busy

Call forwarding on busy forwards an incoming call for a busy extension immediately to the next call destination.

If the call destination is also busy, the caller hears a busy signal. For an internal call, the call remains at the call destination, which is cyclically checked until the destination is free. The administrator defines the cycle.

If the call destination is not available and if no further call forwarding has been configured for it, then the call not forwarded.

#### Dependencies

| Topic             | Dependency                                                                                                                |
|-------------------|---------------------------------------------------------------------------------------------------------------------------|
| Analog telephones | There is no indication at these telephones that this call has been forwarded.                                             |
| Call waiting      | If a subscriber enabled call waiting, an incoming call is camped on if call forwarding—busy is configured for him or her. |
| DND               | A call destination which has activated DND, will be skipped.                                                              |

| Topic                                | Dependency                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Call forwarding                      | Call Forwarding - No Answer (CFNA) is only executed when the call forwarding destination has not responded after a timeout period defined by the administrator.                                                                                                                                                                                                                                                                                                                    |
| Night service                        | If the option "by day / by night" is enabled for a subscriber as the Call Forwarding - No Answer (CFNA) setting, external calls are forwarded in accordance with the settings for the night service. Internal calls are still handled as in the "by day" settings.                                                                                                                                                                                                                 |
| External Call Forwarding - No Answer | If external call forwarding - no answer is active, this has precedence over other call forwarding instructions.                                                                                                                                                                                                                                                                                                                                                                    |
| Hunt group / Group call              | <p>If you enter a group or hunt group as the destination of a call forwarding—no answer instruction, every subscriber in the entire group is called before the next call forwarding destination is evaluated. Group calls and hunt groups can be seen as a call forwarding configuration within a call forwarding configuration.</p> <p>A hunt group is busy if all members are busy or have left the hunt group. A group is always busy if all members of the group are busy.</p> |

### 14.4.1.1 How to Configure Call Forwarding

Call forwarding for internal subscribers can be configured for incoming calls by using the **Call Forwarding** wizard.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click on **Wizards > User Telephony**.
3. Click **Edit** to start the **Call Forwarding** wizard. The **Call dest. list - Definition** window appears.
4. First, define a call destination list by clicking on the **Edit** icon in the row of the call destination list to be processed.
5. Select the desired destinations in the **Target 1** to **Target 4** drop-down lists. You have the following options:
  - **No entry**: The destination is skipped
  - **External destination**: Route and external phone number with CO access code
  - **\* Called station**: The called subscriber

- **\*\* User defined:** Destination of call forwarding after timeout (if configured).
- **#9 = System search:** Next available station (except for Executive extensions)
- **#201 - #260:** Call Distribution (UCD Group)
- **#801 - #817:** Ann. device
- **100, 101, ...:** Phone number of an internal subscriber or a group (e.g., voicemail box)

---

**NOTICE:** To find a call destination faster, you can also enter one or more digits in the **Target 1 - Target 4** fields. This takes you directly to the list item that starts with the specified string of digits. It is also possible to enter a character string.

---

6. Select the time in seconds after which a call is be forwarded to the next destination from the **Call forwarding starts after:** drop-down list.
7. Select the **Call Forwarding** check box if the call is to be forwarded immediately to the next call destination "on busy".
8. If the call is to be signaled at an additional internal station or at a relay (actuator) for a common ringer (night bell), select the desired phone number from the **Second ringer** drop-down list. With **Sec. ringer type**, select whether the call is signaled at the station immediately or after the entire call forwarding time has expired.
9. Click **OK & Next**. This will return you to the **Basic Configuration** window.
10. If you want to define additional call destination lists, repeat the previous steps.
11. Click **OK & Next**.
12. Now assign the call destination lists to the stations.
13. You can search for a station by typing a search term in the **Call no** or **Name** search fields and then pressing the return key. All matches that contain the search term are displayed. For example, entering the call number 521 would display the matches +495213535 and +498967521, and entering the term co as the name would display Collins, Mcoin and Branco.

---

**NOTICE:** Pressing the return key with nothing entered in any of the search fields causes all entries to be displayed.

---

14. Select the call destination lists from the drop-down lists in the row of the desired station for the following cases:
  - **Day:** call destination list to be used for incoming external calls during business hours (day service)
  - **Night:** call destination list to be used for incoming external calls during night service
  - **Internal:** call destination list for incoming internal calls
15. Save your entries with **Save** before switching to a station on another page.

16. If you want to assign multiple stations conveniently to a call destination list, click **Copy**.
  - a) Under **Call dest. list**, select the call destination to which the stations should be assigned.
  - b) Mark one or more stations in the **Selection** window and transfer them with **Add** to the **Members** window.
  - c) Use the **Day**, **Night** and **Internal** check boxes to select whether the call destination list is to apply to incoming external calls during working hours (day service), when the night service is activated or only to internal calls.
  - d) Click **OK & Next**.
17. Click on **OK & Next** again.
18. You can have all stations of a call destination list displayed here. To do this, select the desired call destination list in **Show all members with call destination list**.
19. Click **OK & Next**. The setup of call forwarding for internal stations is now complete.
20. Click **Finish**.

### 14.4.2 Call Forwarding (CF)

Subscribers can use Call Forwarding (CF) to redirect incoming calls to a destination of their choice.

If trunk keys (incl. MULAP trunk keys) have been configured, users can also activate call forwarding individually for a specific trunk (or MULAP trunk).

The following calls can be diverted:

- All calls
- External calls only
- Internal calls only

The following destinations are possible for call forwarding:

- Other phone (internal or external)
- Attendant Console
- Voicemail
- Hunt Group
- UCD group (UCD Universal Call Distribution)

Outgoing calls can still be made when call forwarding is activated.

#### External destination

If the call forwarding destination is external, you must enter the trunk access code followed by the external phone number of the forwarding destination.

#### Call Forwarding to External Destinations

If a subscriber has entered an external call forwarding destination in his or her call destination list, forwarding ends at this destination, and

any further call forwarding destinations that may have been entered in call destinations list are ignored.

If call forwarding to additional destinations is to occur, the system flag **Hunting to external call forwarding destination** must be activated by the service technician.

If call forwarding to an external destination is to be followed even for a call over an analog trunk, the system flag **Call forwarding to main station interface permitted** must be activated by the service technician.

---

**NOTICE:** When a call is routed through Smart AA and this call is put through towards a user A with external forward activated (\*11) to user B, then user B will not be presented the calling party CLI, but user A's DID.

---

|------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Do Not Disturb                           | You cannot program call forwarding to a telephone where DND is active.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Appointment, automatic wake-up system    | If an appointment comes due, it is signaled at the forwarded telephone, irrespective of any active call forwarding settings.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| UCD group as call forwarding destination | <p>A call is not forwarded to a UCD group in the following cases:</p> <ul style="list-style-type: none"> <li>• If a hunt group is called and a subscriber with call forwarding to a UCD group is next, this call is not forwarded. In this case, the next station in the hunt group is immediately called.</li> <li>• A subscriber is a member of a group call with the property "Group" and has activated call forwarding to a UCD group.</li> <li>• A station is a member of a group call no answer. If the group is called, the call is not forwarded to the UCD group. Exception: The first subscriber entered has activated call forwarding to a UCD group. In this case, the call is forwarded.</li> </ul> |

### 14.4.2.1 How to Enable or Disable Call Forwarding over Analog Trunks

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony > Basic Settings** in the navigation tree.
3. Navigate in the menu tree to **System > System Flags**.

4. Select one of the following options:
  - If you want to enable call forwarding over analog trunks, select the **Call forwarding to main station interface permitted** check box.
  - If you want to disable call forwarding over analog trunks, clear the **Call forwarding to main station interface permitted** check box.
5. Click on **Apply** followed by **OK**.

### 14.4.2.2 How to Enable or Disable Call Forwarding to the External Destination

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony > Basic Settings** in the navigation tree.
3. Navigate in the menu tree to **System > System Flags**.
4. Select one of the following options:
  - If you want to enable call forwarding to the external destination, select the check box **Hunting to external call forwarding destination**.
  - If you want to disable call forwarding to the external destination, clear the check box **Hunting to external call forwarding destination**.
5. Click on **Apply** followed by **OK**.

### 14.4.3 Call Forwarding After Timeout

Call Forwarding after Timeout forwards unanswered calls after a specific period of time. Call Forwarding after Timeout is analogous to Call Forwarding No Answer, the only difference being that subscribers can set the call forwarding themselves.

The subscriber can set call forwarding after timeout for his or her own phone and can also enter external destinations and groups.

The call deflection destination is not permanently saved, but deleted after you deactivate the feature.

If a subscriber is busy, the rules of call forwarding - no answer apply, that is, the system proceeds to the next destination.

#### System-Specific Information

You can set three destinations for each station. In addition, there is also a special ID "User-defined", via which the administrator can release or lock the Call Forwarding after Timeout feature for a station. The feature is released by default.

If a call is not answered after the preset timeout, the system searches for and calls the call deflection destination saved. If the subscriber has not entered an individual call deflection destination, the system proceeds with the next destination in the call destination list.

The administrator must release the call forwarding after a timeout for the individual subscribers via the call destination lists.

#### 14.4.4 External Call Forwarding - No Answer (Not for U.S.)

Every station assigned an MSN (multiple subscriber number at the ISDN point-to-multipoint connection or ITSP connection) as a DID number can activate or deactivate call forwarding —no answer for this MSN, provided that the user is authorized to use external call forwarding—no answer.

If you have assigned an MSN to a subscriber group, any member of the group can activate and deactivate external call forwarding-no answer for this MSN.

There are three different versions of the feature:

- Call Forwarding Unconditional (CFU): The network provider forwards all calls to this MSN directly, regardless of the MSN status.
- Call Forwarding Busy (CFB): Calls are forwarded only if the MSN dialed is busy.
- Call Forwarding No Reply (CFNR): Calls are forwarded only if the destination does not answer the incoming call within a preset period of time.

---

**NOTICE:** For all the above call forwarding scenarios, users can enter only one forwarding destination per MSN. A total of 10 multiple subscriber numbers can be forwarded.

In case of ITSP or ISDN configured with DID, this number is 249.

---

##### Dependencies

| Topic         | Dependency                                                                   |
|---------------|------------------------------------------------------------------------------|
| Night service | External call forwarding—no answer has a higher priority than night service. |

#### 14.4.5 Ringing Assignment / Call Allocation

The ringing assignment enables incoming calls of an analog or  $S_0$  trunk to be forwarded to a station or group, depending on the dialed number and the activation state of the night service.

Different destinations are possible for the day and night service. An incoming call is not signaled at the called station, but according to the call destination lists for that station.

### 14.4.5.1 How to How to Configure a Ringing Assignment

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Trunks/Routing**.
3. Click on **Trunks/Routing > Trunks** in the menu tree.
4. Navigate in the menu tree under **Trunks > ...** (Box-Port code) to the desired analog or S<sub>0</sub> trunk.
5. Select the desired station number in the **Day Call no.** drop-down list.
6. Select the desired station number in the **Night Call no.** drop-down list.
7. Click on **Apply** followed by **OK**.

### 14.4.6 Ringing group on

The feature "Ringing group on" allows internal subscribers to manage a personal list of internal call numbers which are called whenever their own number is called.

Users can also enter their own station numbers. They might do this, for example, if a station number is permanently routed to another station (executive/secretary).

A button can be programmed on the IP system telephones, OpenStage TDM telephones and optiPoint 500 telephones to activate/deactivate this feature. More than one Ringing Group button can be programmed on one telephone to allow for different variations. More than one button can be activated at one time; however, the maximum number of telephones with call signaling cannot exceed five.

This feature can be activated/deactivated via a DISA connection by its own station user or for another user with the aid of the feature Associated Services.

The Forwarding screen is one of three screens in the System Status pathway in Manager E that provides station-specific (rather than system-specific) status information. You can use the Call Forwarding screen to see if a phone has a Ring Group activated or if it is part of a Ring Group.

If the feature is used frequently, the subscribed can assign the feature to a free button on the telephone. The name of the key is "Ringing group on" under Key Programming. When the feature is enabled, the LED is lit.

The station flag “no group ringing on busy” determines which stations in a call ringing group receive a call when the master telephone (the one activating the feature) is busy, and which ones do not. If the same station is in the ringing group of more than one master telephone, the flag applies to all calls signaled at this station.

If the flag is not set, group ringing always takes place, provided the station in the call ringing group is available (default behavior).

If the flag is set, group ringing depends on the availability of the master telephone:

- If the master telephone is available, group ringing takes place immediately

If the primary telephone has activated call waiting, group ringing takes place after a 5-second delay.

If the primary telephone cannot receive a call, or if call waiting is inactive, call ringing does not take place.

| Topic                                         | Dependency/Restriction                                                                                        |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------|
| Automatic recall<br>System search<br>Callback | Group ringing is not carried out with an immediate recall (operator error), system search or callback.        |
| Call forwarding                               | If the station that activated group ringing has also activated call forwarding, group ringing does not occur. |
| Do Not Disturb (DND)                          | If a station in the call ringing group has activated DND, group ringing is not carried out at that station.   |
| Timed reminder                                | An active timed reminder does not follow group ringing.                                                       |
| No group ringing on busy                      | If the flag is set, no group ringing will take place if the station is busy.                                  |

### 14.4.7 Rejecting Calls

The subscriber can reject internal and external incoming initial calls. These calls can be rejected by pressing the Disconnect key.

The rejected call is then forwarded in accordance with the CFNA instruction. If there is no other call forwarding destination, an external call is intercepted by the attendant console, provided the relevant intercept criteria were configured. If no destination can be called, the caller continues to receive a busy signal.

Transferred recalls, transferred calls, queued callbacks, held or parked calls cannot be rejected. An intercepted call sent to the Intercept position cannot be rejected.

### Dependencies

| Topic                              | Dependency                                                                                                                                                                         |
|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Group call, hunt group call, MULAP | In these cases, the entire group call is terminated and the call follows the call forwarding instruction configured. The call is terminated if there is no other call destination. |

## 14.4.8 Deferring a Call

Subscribers are provided the option of deferring an incoming call. The subscriber called can set up a connection without picking up the incoming call.

The waiting call is then signaled as a camped-on call.

If an incoming call is signaled, the subscriber can press a call or trunk key to conduct the external call. Two call keys and one trunk key must be programmed for this. One of the relevant keys must be free to execute the feature.

The calling party does not notice a change in signaling if call waiting is set for ringing on call waiting.

## 14.4.9 Do Not Disturb

Do Not Disturb prevents incoming calls from being put through.

A subscriber who has activated DND hears a special dial tone when he or she lifts the handset. When active, the Do Not Disturb feature is also indicated on display phones. In all other phones, the LED on the DSS key flashes with a brief interruption on stations where Do Not Disturb is active.

The Do Not Disturb feature, if set, can be overridden by the Attendant or an authorized subscriber. The call can also be immediately put through for a subscriber with an active Do Not Disturb feature.

A caller who dials a telephone with DND activated receives a busy signal and is not allowed to camp on.

### Dependencies

| Topic                       | Dependency                                                                                                                              |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| Attendant/night destination | The attendant and the current intercept position cannot activate the Do Not Disturb feature.                                            |
| Call forwarding             | You cannot specify DND if call forwarding is active on the same telephone. You cannot activate call forwarding to a telephone with DND. |

| Topic                                 | Dependency                                                                                                                                                                                                         |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Callback                              | If a callback is initiated to a station with DND activated, the callback is not executed until DND is deactivated. If the subscriber with DND activated initiates a callback, this will override the DND function. |
| Appointment, automatic wake-up system | If a station has set an appointment and activated DND, an audible signal is sent to the telephone when the appointment comes due.                                                                                  |
| DISA                                  | DISA can be activated by the subscriber for his or her own phone or by a user for another phone (associated services).                                                                                             |

## 14.5 Optimizing Communication

The communication system offers various options to conveniently and effectively handle calls, e.g., through callbacks or call waiting.

### 14.5.1 Callback

A callback can then be activated if the subscriber called does not answer or is busy. An active callback triggers a call as soon as the called subscriber is available.

#### **Automatic Callback When Free or Busy**

If a call cannot be set up because the subscriber called is busy or does not accept the call, the calling subscriber can activate a callback to set up the call at a later time. If the subscriber called was busy, the Callback function monitors the call to see when it ends. The calling subscriber receives a signal in the form of a call from the communication system when the other subscriber's line is free. If he or she accepts this call, the subscriber who was previously busy is redialed. If a call set up via the Callback function is not successful, this function remains active. The callback attempt is repeated once the required subscriber has conducted another call.

A telephone can initiate up to two Callback requests and be the destination for up to two requests. Any further outgoing requests are rejected.

Callback requests are deleted when

- the call is completed; if not, the callback remains in effect (for an internal callback),
- the callback was established without a call being completed (for an external callback),
- the initiator cancels the request,
- the system deletes all callbacks daily at 23:57.

Callback requests can be made for internal subscribers and groups. Callback requests for a group call are stored at the first subscriber. When a callback is made to a group, the ring is heard at all phones that are free.

### **Automatic Call Completion on No Reply (CCNR) on the Trunk Interface**

An internal subscriber who cannot reach an available external subscriber can activate a callback request at the central office. The system then monitors the connection of the called subscriber. As soon as the called subscriber initiates a connection setup and then ends this connection, the central office attempts to establish a connection between the two subscribers. This feature must be supported by the central office.

### **Callback on busy**

This feature sets enables a manual callback to be set on an external station that is busy. When the station becomes free, the trunk attempts to set up a connection between the two stations. The feature must be supported and enabled by the central office and peer.

## **14.5.2 Call Waiting**

Call waiting signals the arrival of a further incoming call to a subscriber who is on the phone.

The incoming call is visually signaled by a message on the display. It can also be signaled acoustically by a short call waiting tone. The call waiting tone can be heard every 5 seconds.

The subscriber called can accept this second call or ignore it. To answer the second caller, the subscriber can optionally end the first call and answer the second or select the **Call waiting** function offered in the display. In the latter case, the first call is placed on hold.

You cannot camp on to a subscriber if someone is already camped on (a maximum of 4 subscribers can camp on) or if the subscriber has activated call waiting rejection. The caller receives a busy signal if call forwarding—busy is not configured.

### **Enabling Call Waiting**

#### **Call Waiting (Camp On) by Attendant Console**

If the **Call waiting rejection** flag is set, the subscriber can use a menu or code to either enable or suppress call waiting. If a subscriber has enabled call waiting, an incoming call is camped on if call forwarding—busy is configured.

The default setting is always "call waiting after timeout". However, the Attendant Console can also camp on immediately.

**Dependencies**

| Topic             | Dependency                                                                                                                                                                                                               |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Call waiting tone | The subscriber can activate/deactivate the call waiting tone with a code. Call waiting is still visually signaled on the phone's display. The call waiting tone is active by default.                                    |
| Override          | If call waiting rejection is active, an ongoing call by this subscriber cannot be overridden.                                                                                                                            |
| Group Call        | If one or more stations in a group call are free, the call will be offered to them. If all stations are busy, all of them receive a call waiting signal, apart from any stations where call waiting rejection is active. |
| Speaker call      | Speaker calls to busy stations are not possible.                                                                                                                                                                         |

**14.5.2.1 How to Enable or Disable Call Waiting****Prerequisites**

You are logged into the WBM with the **Expert** profile.

**Step by Step**

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Telephony > Stations**.
3. In the menu tree, click **Stations**.
4. Click **IP Clients**, for example.
5. Click **System Clients**, for example.
6. Select the relevant station.
7. Click on the **Edit Station Flags** tab.
8. Select one of the following options:
  - If you want to enable call waiting, clear the Call waiting rejection on check box.
  - If you want to disable call waiting, select the check box **Call waiting rejection on**.
9. Click on **Apply** followed by **OK**.

**14.5.2.2 How to Enable or Disable Immediate Call Waiting (Camp On) by the Attendant Console****Prerequisites**

You are logged into the WBM with the **Expert** profile.

**Step by Step**

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony > Basic Settings** in the navigation tree.

3. Click **System** in the menu tree.
4. Click on **Intercept/Attendant/Hotline**.
5. Select one of the following options under **Other criteria**:
  - If you want to activate the function, enable the check box **Immediately camp on for attendant calls**.
  - If you want to deactivate the function, clear the check box **Immediately camp on for attendant calls**.
6. Click on **Apply** followed by **OK**.

---

**NOTICE:**

For CMI DECT - TDM deskphones, when a station that is busy is called and call waiting - camp on is allowed, the busy tone is active for 5 seconds, and then camp on takes place thus the ringback tone can be heard.

For IP DECT - SIP deskphones when a station that is busy is called and call waiting - camp on is allowed, the camp on is immediate thus the ringback tone can be heard from the beginning.

---

### 14.5.3 Override (Intrusion)

The Override feature enables an authorized subscriber to override (i.e., intrude into) a call of another internal subscriber.

The override (intrusion) occurs by means of a code or key, and the subscriber involved is notified by a warning tone (beep) and a visual signal on the display.

The feature can be invoked during the busy signal or during the camp on state.

During an override condition, the following applies:

- If the called party hangs up, he or she receives a call from the switching party.
- If the overriding party (who wants to switch the call and overrides) hangs up, the call is switched through to the destination station.
- If the party which was connected to the called party hangs up, the overridden and called parties remain connected.

An override can be performed by any internal subscriber and the intercept position (attendant console). However, in order to use this feature, the internal subscriber and even the intercept position must be authorized for this.

It is not possible to prevent an override to a particular telephone.

**Dependencies**

| Topic                            | Dependency                                                                                                                                                                                             |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Voice Channel Signaling Security | You cannot override a call if the called station or the internal party it is connected to is entered as a data station (voice channel signaling security), or if the called party is dialing a number. |
| Do Not Disturb                   | If the called station has activated Do Not Disturb, only one call can be overridden when the subscriber is conducting a call.                                                                          |
| Hunt group                       | Busy override is not possible if all stations are busy when a group or hunt group is called.                                                                                                           |
| S <sub>0</sub> station           | It is not possible to override an S <sub>0</sub> station.                                                                                                                                              |

**14.5.3.1 How to Authorize an Internal Station for the Override Feature****Prerequisites**

You are logged into the WBM with the **Expert** profile.

**Step by Step**

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Telephony > Stations**.
3. In the menu tree, click **Stations**.
4. In the menu tree, click the station (Index - Call number - Name).
5. Click on the **Edit Station Flags** tab.
6. Activate the check box **Override class of service on**.
7. Click on **Apply**, followed by **OK**.

**14.5.3.2 How to Authorize the Intercept Position for the Override Feature****Prerequisites**

You are logged into the WBM with the **Expert** profile.

**Step by Step**

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony > Basic Settings** in the navigation tree.
3. Click on **System > Intercept/Attendant/Hotline** in the menu tree.
4. Select the **Override by Attendant** check box in the **Other criteria** area.
5. Click on **Apply** followed by **OK**.

### 14.5.4 Advisory Messages

The advisory message of a subscriber appears in the caller's display.

Variable parameters can also be assigned in advisory messages (also referred to as absence texts). These parameters (for example, time) are entered in the course of activation. Users can use the numeric keypad on the telephone to enter additional characters. The advisory message can be activated/deactivated at a phone via a code or a preconfigured function key.

#### Call forwarding

When call forwarding is enabled, the called subscriber's advisory message is displayed and the call is forwarded.

#### 14.5.4.1 How to Edit Advisory Messages

##### Prerequisites

You are logged into the WBM with the **Expert** profile.

##### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony** > **Basic Settings** in the navigation tree.
3. Click **System** in the menu tree.
4. Click on **Texts**.
5. Click on the relevant field in the **Answer texts** column and enter your advisory message.
6. Click on **Apply** followed by **OK**.

### 14.5.5 Message Texts

Message texts are internal system texts that can be selected by a subscriber and sent to internal subscribers.

A message text (also called an Info text) can be sent to one or more recipients.

If you want to send the text to all members of an internal group or an internal hunt group, you must specify the phone number of the group or the hunt group - not an individual subscriber - as the recipient.

---

**NOTICE:** Only 100 phones can receive mass Message Waiting Indication (MWI) messages, any additional message will fail.

---

The message is sent by pressing the relevant button or via the Send Message menu.

The message can be sent in idle, ringing, talk or busy state. In ringing state it is not necessary to specify the recipient's station number.

### 14.5.5.1 How to Change a Message Text

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony** > **Basic Settings** in the navigation tree.
3. Click **System** in the menu tree.
4. Click on **Texts**.
5. Click on the relevant field in the **Info texts** column and enter the text.
6. Click on **Apply** followed by **OK**.

### 14.5.6 Associated Services

An authorized station can control certain features on behalf of any other station, e.g., call forwarding, turning the lock code or hunt group on/off, etc. The effect is the same as if the feature involved were activated or deactivated by the other station itself.

The following features can be controlled on behalf of other stations:

- Call forwarding on / off
- COS changeover on / off
- Ringing group on / off
- Advisory message on / off
- Hunt Group and Group Call on / off
- Night service on / off
- Timed reminder on / off
- Send message / Delete sent message
- Edit lock code password
- UCD agent log in / log out
- UCD agent Available/Not available
- UCD agent Wrapup on / off
- UCD agent Night service on / off
- Forward Line Key (MULAP) on / off
- Resetting Activated Features

This is operated via a procedure. The station must specify the following:

- the code for Associated Services
- the station number of the subscriber for whom the action is to be performed.
- the code of the feature to be controlled

Before any subscriber can use the Associated Services, he or she must first disable the lock code of the other subscriber (if enabled).

### 14.5.6.1 How to Activate or Deactivate Associated Services

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Telephony > Stations**.
3. In the menu tree, click **Stations**.
4. In the menu tree, click the station (Index - Call number - Name).
5. Click on the **Edit Station Flags** tab.
6. Select one of the following options:
  - If you want to activate the function, select the check box **Associated dialing/services**.
  - If you want to deactivate the function, clear the check box **Associated dialing/services**.
7. Click on **Apply** followed by **OK**.

### 14.5.7 DISA

DISA (Direct Inward System Access) allows authorized subscribers to use features of the communication system from outside, e.g., at the mobile phone using myPortal for Mobile (for mobile callback) and Mobility.

Using DISA, a subscriber can also set up outgoing connections, both internal and external. Whenever a subscriber uses DISA, he or she must enter the password for the lock code. Certain features are then available as for internal use.

DISA supports the following features:

| Feature                  | by the subscriber<br>him/herself | via associated<br>services |
|--------------------------|----------------------------------|----------------------------|
| Call forwarding on / off | x                                | x                          |
| Do not disturb on / off  | x                                | x                          |
| Hunt group on / off      | x                                | x                          |
| Advisory message on/off  | x                                | x                          |
| Ringing group on / off   | x                                | x                          |
| COS changeover on / off  | x                                | x                          |

| Feature                | by the subscriber<br>him/herself | via associated<br>services |
|------------------------|----------------------------------|----------------------------|
| Reset services         | x                                | x                          |
| System Speed Dialing   | x                                | –                          |
| Send message text      | x                                | –                          |
| Night service on / off | x                                | –                          |

The administrator specifies under which call number the stations can access DISA. The call number may be different for external and internal use. Internal means at some other "IP-networked" node.

The password to be entered by subscribers consists of the internal call number and the PIN for the lock code. After entering the password, subscribers must either press the # key or wait until the communication system has recognized their input, depending on the security mode that was set for DISA by the administrator.

The subscriber must log in again for further action via DISA.

---

**NOTICE:** In OpenScape Business X when a DISA number is called, you will hear a continuous tone. In OpenScape Business S when a DISA number is called, you will hear Music on Hold.

---

### 14.5.7.1 How to Activate or Deactivate a DISA Class of Service for a Station

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Telephony > Stations**.
3. In the menu tree, click **Stations**.
4. In the menu tree, click the station (Index - Call number - Name).
5. Click on the **Edit Station Flags** tab.
6. Select one of the following options:
  - If you want to activate the function, select the check box **DISA Class of Service**.
  - If you want to deactivate the function, clear the check box **DISA Class of Service**.
7. Click on **Apply** followed by **OK**.

### 14.5.7.2 How to Configure a DISA Number

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony** > **Basic Settings** in the navigation tree.
3. In the menu tree, click **Basic Settings** > **System** > **DISA**.
4. In the field **DID**, enter the call number via which the stations can use DISA externally.
5. In the field **Phone Number**, enter the call number via which the stations can use DISA internally.
6. Click on **Apply** followed by **OK**.

### 14.5.7.3 How to Configure the DISA Security Mode

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony** > **Basic Settings** in the navigation tree.
3. In the menu tree, click **Basic Settings** > **System** > **DISA**.
4. In the **Security Mode** drop-down list, select the item **After timeout** or **After input #**.
5. Click on **Apply**, followed by **OK**.

### 14.5.8 Flex Call/Mobile PIN

Flex Call (Mobile PIN) enables a system telephone to be temporarily used by other subscribers for the next outbound call as if that phone were their own phones.

Flex Call includes this subscriber's phone number, name, toll restriction, and call detail recording.

The phone being used cannot be reached at its own station number if Flex call is enabled. This status is reverted at the end of the call.

To enable Flex Call, an individual code lock must have been assigned for the mobile subscriber.

One of the following steps must be performed at the system phone to activate the feature:

- OpenStage: Service Menu > PIN and Class of Service > Flex Call + Mobile phone number + Lock code of mobile subscriber
- Code for Flex Call + Mobile phone number + Lock code of mobile subscriber

## 14.5.9 Relocate

The Relocate (Hoteling) feature allows an OpenStage TDM station to use a procedure to change the assignment between the physical telephone port and the logical station data (user profile).

The Relocate feature can be used if two users decide to swap their workplaces and both users share the same phone types. Relocate thus enables the implementation of DeskSharing for TDM users. The TDM users can perform the Relocate operation without the assistance of an administrator.

Only user profiles of the same phone type, i.e., with an identical key layout, may be exchanged. If you exchange user profiles from different phone types, individually programmed key functions on the basic device will be replaced by the default values. Executing the Relocate feature causes the TDM telephones involved to go out of service and restart. Enabled features are treated accordingly, i.e., current callbacks and sent infos are deleted, and all other features are preserved.

The use of Relocate requires a system-wide release of the feature. To enable the feature, select Relocate in the service menu of the phone to be exchanged and enter the internal number of the target station and the lock code PIN (the lock code PIN is not required if the default PIN 00000 is being used). After you have entered the destination call number, the Relocate feature is blocked for all other users until the procedure has completed. When executing the exchange, both telephones involved are reset. The successful exchange is indicated on both TDM phones by the display of the new number (display: New Call No.: XXXXX).

Relocate cannot be performed on system telephones with programming authorization (for Assistant T). In other words, Relocate is usually not possible on the first two active system telephones.

### 14.5.9.1 How to Unlock Relocate on a System-wide Basis

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Basic Settings > System**.
3. Click **System Flags** in the menu tree.
4. Select the **Relocate allowed** check box.
5. Click on **Apply** followed by **OK**.

## 14.5.10 Reset activated features

You can reset specific features collectively at your terminal using a code.

This is possible for the following features:

- Call forwarding
- Delete received infos
- Advisory message on / off
- Ringing group on / off
- Hunt group on / off
- Station number suppression on / off
- Silent camp-on on / off
- Do not disturb on / off
- Ringer cutoff on / off
- Appointment
- Cancel all callbacks

### 14.5.11 Procedures

The communication system lets the subscriber program a key with codes, phone numbers, and other dialing information. If a subscriber presses the Procedure key as a suffix or during a call, the communication system transmits the corresponding DTMF character (DTMF = dual tone multifrequency).

Sample applications:

- Code for callback
- Code for call waiting
- Code for override
- Digit string for voicemail or answering machine
- Trunk flash code + destination station number
- Code for controlling a service + destination phone number, for example, code for send/retrieve message (message waiting) + phone number + text number
- ACCT (account code) + trunk code + destination station number

Procedures that require PIN input cannot be saved.

Only the first key level supports Procedure keys.

Depending on the situation, a subscriber can use the following features in procedures:

| Feature                                                                                                  | Ready to dial | Busy | On the phone | Outgoing call | Incoming call |
|----------------------------------------------------------------------------------------------------------|---------------|------|--------------|---------------|---------------|
| Directed call pickup                                                                                     | x             | –    | x            | –             | –             |
| Call Forward on, (not for tenant systems; not for individual MSNs in an S <sub>0</sub> trunk connection) | x             | –    | x            | x             | –             |
| External call forwarding on / off; toggle function; (not for tenant services);                           | x             | –    | x            | x             | –             |
| Call forwarding, login/UCD (uniform call distribution), logout; toggle function                          | x             | –    | x            | x             | –             |
| Call forwarding, night destination on / off; toggle function                                             | x             | –    | x            | x             | –             |

| Feature                                                 | Ready to dial | Busy | On the phone | Outgoing call | Incoming call |
|---------------------------------------------------------|---------------|------|--------------|---------------|---------------|
| Call forwarding per team configuration                  | x             | x    | x            | x             | x             |
| Advisory message on / off; toggle function              | x             | –    | x            | x             | –             |
| Associated Dialing                                      | x             | x    | x            | x             | x             |
| Associated Services                                     | x             | –    | x            | x             | –             |
| Speaker call                                            | x             | –    | x            | –             | –             |
| Release trunk (emergency trunk access)                  | x             | –    | x            | x             | –             |
| Send message (message waiting)                          | x             | –    | x            | x             | –             |
| Dial station speed dialing                              | x             | –    | x            | x             | –             |
| Dial system speed dialing                               | x             | –    | x            | x             | –             |
| DTMF transmission                                       | –             | –    | x            | –             | –             |
| DTMF transmission in the talk state using procedure key | x             | x    | x            | x             | x             |
| Night service on / off; toggle function                 | x             | –    | x            | x             | –             |
| Retrieve call; toggle function                          | –             | x    | x            | x             | –             |
| Account code ACCT                                       | x             | –    | x            | –             | –             |
| Account code ACCT in prefix                             | x             | –    | x            | –             | –             |
| Callback requests - display or delete; toggle function  | x             | –    | –            | –             | –             |
| Ringing group on / off; toggle function                 | x             | –    | x            | x             | –             |
| Language selection                                      | x             | x    | x            | x             | x             |
| Telephone Data Service TDS                              | x             | –    | x            | x             | –             |
| Door opener via adapter cabinet                         | x             | x    | x            | x             | x             |
| Timed reminder; toggle function                         | x             | x    | x            | x             | x             |
| Retrieval of an external call from common hold          | x             | x    | x            | x             | x             |
| System Telephone Lock                                   | x             | –    | x            | –             | –             |

### System-Specific Information

A procedure key can store up to 32 characters.

## 14.5.12 Automatic Wake-up System and Timed Reminders

All users can program timed reminders (appointments). They will be reminded of the appointment at the set time. The appointment can be programmed for a single reminder (once within a 24-hour period) or for regularly scheduled daily reminders.

The time format is four-digits. The first two digits are the hour, and the second two digits are the minutes. A 12-hour clock mode is supported for the U.S.: users enter the four digits and then select "am" (key 2) or "pm" (key 7). If nothing is specified, "am" will be used as the default setting.

Analog telephones, optiPoint 500 and CMI telephones support only programming of non-repeating appointments.

The default timed reminder sounds for 20 seconds and will repeat a maximum of five repeats at one-minute intervals. The timed reminder is cleared automatically as soon as the user lifts the handset or presses the speaker button, or after the fifth repeat (number of repeats is configurable). Alternatively, a programmed timed reminder can be canceled using a procedure. Display telephones also support queries.

A timed reminder which is due but cannot be signaled (user busy, for example), is postponed until the next cycle.

## 14.6 Overview of functions and codes

| Service code | Description                             |
|--------------|-----------------------------------------|
| *0           | Return to held call                     |
| *1           | Call forwarding                         |
| *2           | Toggle/Connect                          |
| *3           | Conference                              |
| *44          | Night answer on                         |
| *51          | Trunk flash                             |

# 15 Working in a Team (Groups)

Several features are provided by the communication system to enable and facilitate working in a team. Besides call pickup groups, group calls and hunt groups, this also includes groups with team and executive/secretary functions as well as voicemail box and fax box groups. The "UCD (Uniform Call Distribution)" feature enables incoming calls to be uniformly distributed to a group of users (UCD group).

---

**INFO:** When configuring groups, it must be noted that the first three groups are reserved:

The first group is used by default as the hunt group for Xpressions Compact.

The second group is used by default as the hunt group for OpenScape Business Smart VoiceMail.

The third group is used by default as the hunt group for the Company AutoAttendant of OpenScape Business Smart VoiceMail.

---

## 15.1 Call Pickup Group, Group Call and Hunt Group

The communication system offers several methods of combining stations into groups so that multiple subscribers and phones can be reached under one call number, for example, or a call to one station can also be signaled at other stations.

In the case of a call pickup group, a call for one member of the group is also signaled at all other group members.

With a group call, by contrast, all members can be reached via a single phone number (group phone number). The first station to answer the call is connected to the calling party.

In the case of a hunt group, an incoming call is signaled at one of the group members. If this member does not answer the call, the call is assigned to the next member. All members of the hunt group can be reached at the same phone number.

### 15.1.1 Call Pickup Group

A call for a member of a call pickup group is also signaled at all other group members. The call can be accepted by all group members via a function key programmed for this purpose, via the associated phone menu item or by dialing the code.

The call is signaled acoustically and visually on the display of the call pickup group member originally called. If programmed, the call is also signaled via the function key LED.

The other group members are only notified of the call by a visual signal. The phone number or name of the subscriber originally called

and the phone number or name of the caller are shown on the phone's display. The display of the station number or name of the caller can be disabled by an administrator with the **Expert** profile in **Expert mode**. If programmed, the call is also signaled via the function key LED.

If the call is not accepted within four ring cycles (4 x 5 seconds), the other group members receive a warning tone (acoustic signaling). The time from the start of call signaling till the warning tone is not variable. The warning tone can be disabled for all group members by an administrator with the **Expert** profile in **Expert mode**.

If more than one call is received for a call pickup group, signaling occurs in the sequence in which the calls are received.

If recalls for members of a call pickup group are also to be picked up by other members in the group, this must be enabled by an administrator with **Expert** profile in **Expert mode**.

A station can belong to only one call pickup group.

Any call charges incurred for a picked-up call are accrued to the subscriber who picked up the call.

---

**NOTICE:** Double quotations (") are not supported for naming a Call Pickup Group.

---

### SIP Phones

SIP telephones can be integrated in a call pickup group.

---

**INFO:** In addition, a function key for the call pickup group can be programmed for SIP phones, and the specific messages of a call pickup group can be shown on the displays of the corresponding SIP phones. In order to use this feature, the "Call Pickup Group" feature must be enabled on the SIP phone (see the User Guide of the SIP phone for details).

---

### Call Pickup Outside a Call Pickup Group

Another version of the feature is the "call pickup outside a call pickup group". This permits the pickup of calls for internal subscribers that do not belong to the same call pickup group. The call can be picked up via a function key programmed for this purpose, the associated menu item or by dialing the specific call pickup code followed by the station number of the called station.

## 15.1.2 Group Call

A group call can be defined in cases where multiple subscribers need to be reached via a single phone number (group phone number). Incoming external and internal calls are signaled at the same time at all group member phones. The first station to answer the call is connected to the calling party.

Every member of a group call can also be reached at his or her own station number.

The group must be assigned one of the following properties:

- Group

Incoming calls are simultaneously signaled at all available group members. Available group members are subscribers who are not busy. If all group members are busy, a call is signaled by a camp-on tone. Call signaling continues at all group members (camp-on tone at busy group members) even if the subscriber hangs up.

A caller hears the busy tone if all group members are busy and all have activated the DND feature. If a call forwarding destination has been defined for this group, the caller does not hear a busy tone, but is forwarded directly to the next call forwarding destination.

- RNA

Incoming calls are simultaneously signaled at all group members. If a group member is busy, the entire group call is marked as busy. Other callers receive the busy tone.

---

**NOTICE:** The presence status of an external destination that belongs to the group cannot be detected.

---

- Call waiting

Incoming calls are simultaneously signaled at all available group members. Available group members are subscribers who are not busy. A call is signaled by a camp-on tone for busy group members.

This requires that all group members have the Do Not Disturb feature disabled.

Group calls are treated like stations by the Call forwarding—no answer function. In other words, if a call cannot be accepted by any of the members in a group call, it is redirected to a call forwarding destination in accordance with the call destination list. You can specify whether call forwarding should be performed on RNA (ring no answer) or busy.

When a call is not answered by any member of a group call, it appears as a missed call in the journal of the UC clients of all members. An accepted call appears only in the journal of the member who answered the call.

A single station can belong to several groups simultaneously. The following applies to groups of the type Group Call, Hunt Group, Team Configuration / Team Group and Executive/Secretary / Top Group: The sum of all the subscriber's memberships in these groups must not exceed 32.

The group name assigned is shown on the internal caller's display. After a call is accepted, the name of the subscriber who accepted the call is displayed.

If a member has defined rules using the AutoAttendant, e.g., to forward calls, these rules will apply only to calls to his or her own station number. The rules are ignored for group calls.

Up to 20 subscribers can be configured per group call.

Every group call can be assigned a name containing up to 16 characters.

### **Voicemail Box for Group Call**

When setting up a group call, a voicemail box is created automatically. The call number of this voicemail box for the group call always matches that of the group call. If a group call is not accepted by any member, the call is forwarded to the voicemail box for the group call. This requires the group call voicemail box to have been defined as the CFNA (call forwarding on no answer) destination of this group call.

If a member does not accept an incoming call to his or her own station number, this call is redirected to a call forwarding destination in accordance with the call destination list.

Example of a group call of type RNA (ring no answer) with the group call number 404 and the members A (call number 200), B (201) and C (202). Call Forwarding-No Answer after Timeout to the voicemail box of the group call was set up for the group call. Every member has defined Call Forwarding-No Answer (CFNA) after Timeout to his or her own voicemail box.

## Working in a Team (Groups)

|                                       |                                                                                                                     |                                                                                                                                                                                             |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Inbound call for Member A (200)       | All members are free.                                                                                               | Member A does not accept the call. Call Forwarding-No Answer after Timeout occurs to the voicemail box of member A.                                                                         |
|                                       | Member A has defined Call Forwarding Unconditional (CFU) to his or her own voicemail box. Members B and C are free. | The call is forwarded immediately (CFU) to the voicemail box of member A.                                                                                                                   |
| Inbound call for the group call (404) | All members are free.                                                                                               | The call is signaled at all other members. No member accepts the call. Call Forwarding-No Answer after Timeout occurs to the voicemail box of the group call.                               |
|                                       | Member A has defined Call Forwarding Unconditional (CFU) to his or her own voicemail box. Members B and C are free. | The call is signaled at members B and C. No member accepts the call. Call Forwarding-No Answer after Timeout occurs to the voicemail box of the group call.                                 |
|                                       | Member A has defined Call Forwarding Unconditional (CFU) to an external destination. Members B and C are free.      | The call is signaled at members B and C and at the external destination. No member accepts the call. Call Forwarding-No Answer after Timeout occurs to the voicemail box of the group call. |
|                                       | Member A has defined CFNA rules using the AutoAttendant. Members B and C are free.                                  | The call is signaled at all other members. No member accepts the call. Call Forwarding-No Answer after Timeout occurs to the voicemail box of the group call.                               |

### Activating/Deactivating a Group Call

If a subscriber is a member of a group call, he or she can use codes to leave and rejoin the group call.

If a subscriber is a member of both multiple group calls and multiple hunt groups, he or she can use codes to leave and rejoin all group calls and hunt groups. Subscribers are added to or removed from a specific group call or hunt group by entering codes and then making a selection from the group calls and hunt groups displayed.

You can also program function keys with a shift function for joining and leaving. You can program a function key here that applies for a specific group call and hunt group or all group calls and hunt groups. Variable programming is also possible. After you press a function key of this kind, you must select one of the group calls and hunt groups displayed to define the group call or hunt group you want to leave/join.

### Ring type

For every group call, an administrator with the **Expert** profile can define the acoustic signaling of incoming external calls via the ring type setting. You have the following options:

- Two rings (default setting)
- Three rings
- short-long-short ring

Only the default setting is possible for analog phones. Changes have no effect.

### SIP Phones

SIP telephones can be integrated in a group call.

---

**INFO:** No programming of function keys is possible for SIP phones. Furthermore, no features can be activated or deactivated via codes. Specific display messages of a group call are not supported.

---

### Dependencies

| Topic           | Dependency                                                                                                                                                                                             |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Call forwarding | If a group member activates call forwarding for all calls, all calls are signaled at the destination telephone.                                                                                        |
| Do Not Disturb  | If a group member activates the Do Not Disturb feature, incoming calls for his or her phone are not put through. This applies to calls via the group phone number and the member's own station number. |
| Override        | Override is not possible if all members of a group call are busy.                                                                                                                                      |
| ISDN Phones     | It is not possible to include ISDN telephones in a group call.                                                                                                                                         |

### 15.1.3 Hunt Group

Hunt groups permit the distribution of incoming calls to associated subscribers (members). If a subscriber is busy or does not accept an incoming call, the call is automatically forwarded to the next free member of the hunt group. All members of the hunt group can be reached at the same phone number.

Every member of a hunt group can also be reached at his or her own station number.

The hunt group must be assigned one of the following properties.

- Linear

An inbound call is always signaled first at the first member of a hunt group. Further signaling is performed on the basis of the sequence in which the members are entered in the group table.

- Cyclic

An inbound call is always signaled first at the member that follows the subscriber who answered the last call. Further signaling is performed on the basis of the sequence in which the members are entered in the group table.

The call is automatically forwarded to the next free hunt group member when the forwarding time expires, provided the call is not answered or a member is busy or DND is activated.

You can program a call forwarding destination (call destination list) if a call cannot be answered by any of the members of the hunt group.

A single station can belong to several groups simultaneously. The following applies to groups of the type Group Call, Hunt Group, Team Configuration / Team Group and Executive/Secretary / Top Group: The sum of all the subscriber's memberships in these groups must not exceed 32.

The name assigned to the hunt group is shown on the internal caller's display. After a call is accepted, the name of the subscriber who accepted the call is displayed.

If a member has defined rules using the AutoAttendant, e.g., to forward calls, these rules will apply only to calls to his or her own station number. The rules are ignored for hunt group calls.

Up to 20 subscribers can be configured per hunt group.

Every hunt group can be assigned a name containing up to 16 characters.

### Voicemail Box for Hunt Group

When setting up a hunt group, a voicemail box is automatically created for it. The call number of this voicemail box for the hunt group always matches that of the hunt group. If a call for a hunt group is not accepted by any member, the call is forwarded to the voicemail box for the hunt group. This requires the hunt group voicemail box to have been defined as the CFNA (call forwarding on no answer) destination of this hunt group.

If a member does not accept an incoming call to his or her own station number, this call is redirected to a call forwarding destination in accordance with the call destination list.

Example of a linear hunt group with the call number 404 and the members A (call number 200), B (201) and C (202). Call Forwarding-No Answer after Timeout to the voicemail box of the hunt group was set up for the hunt group. Every member has defined Call Forwarding-No Answer (CFNA) after Timeout to his or her own voicemail box.

|                                       |                                                                                                                     |                                                                                                                                                                                                   |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Inbound call for Member A (200)       | All members are free.                                                                                               | Member A does not accept the call. Call Forwarding-No Answer after Timeout occurs to the voicemail box of member A.                                                                               |
|                                       | Member A has defined Call Forwarding Unconditional (CFU) to his or her own voicemail box. Members B and C are free. | The call is forwarded immediately (CFU) to the voicemail box of member A.                                                                                                                         |
| Inbound call for the hunt group (404) | All members are free.                                                                                               | The call is signaled first at member A, then at member B and then at member C. No member accepts the call. Call Forwarding-No Answer after Timeout occurs to the voicemail box of the hunt group. |
|                                       | Member A has defined Call Forwarding Unconditional (CFU) to his or her own voicemail box. Members B and C are free. | The call is signaled first at member B and then at member C. No member accepts the call. Call Forwarding-No Answer after Timeout occurs to the voicemail box of the hunt group.                   |

## Working in a Team (Groups)

|  |                                                                                                                |                                                                                                                                                                                                   |
|--|----------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | Member A has defined Call Forwarding Unconditional (CFU) to an external destination. Members B and C are free. | The call is signaled first at member B and then at member C. No member accepts the call. Call Forwarding-No Answer after Timeout occurs to the voicemail box of the hunt group.                   |
|  | Member A has defined CFNA rules using the AutoAttendant. Members B and C are free.                             | The call is signaled first at member A, then at member B and then at member C. No member accepts the call. Call Forwarding-No Answer after Timeout occurs to the voicemail box of the hunt group. |

### Activating/Deactivating the Hunt Group

If a subscriber is a member of a hunt group, he or she can use codes to leave and rejoin the hunt group.

If a subscriber is a member of both multiple hunt groups and multiple group calls, he or she can use codes to leave and rejoin all hunt groups and group calls. Subscribers are added to or removed from a specific hunt group or group call by entering codes and then making a selection from the hunt groups and group calls displayed.

You can also program function keys with a shift function for joining and leaving. You can program a function key here that applies for a specific or all hunt groups and group calls. Variable programming is also possible. After you press a function key of this kind, you must select one of the hunt groups and group calls displayed to define the hunt group or group call you want to leave/join.

### Ring type

For every hunt group, an administrator with the **Expert** profile can define the acoustic signaling of incoming external calls via the ring type setting. You have the following options:

- Two rings (default setting)
- Three rings
- short-long-short ring

Only the default setting is possible for analog phones. Changes have no effect.

### SIP Phones

SIP telephones can be integrated in a hunt group.

---

**INFO:** No programming of function keys is possible for SIP phones. Furthermore, no features can be activated or deactivated via codes. Specific display messages of a hunt group are not supported.

---

**Dependencies**

| Topic           | Dependency                                                                                                                                                                                          |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Call forwarding | If a hunt group member activates call forwarding for all calls, all calls are signaled at the destination telephone.                                                                                |
| Do Not Disturb  | If a hunt group member activates the Do Not Disturb feature, incoming calls for his or her phone are not put through. This applies to calls for the hunt group and the member's own station number. |
| Queue           | For cyclical and linear hunt groups, it is not possible to set up a call queue.                                                                                                                     |
| ISDN Phones     | It is not possible to include ISDN telephones in hunt groups.                                                                                                                                       |

## 15.1.4 Configuring Call Pickup Groups, Group Calls and Hunt Groups using Wizards

Several different wizards are available to conveniently configure call pickup groups, group calls and hunt groups.

The **Call Pickup** wizard can be used to combine subscribers into a group to enable mutual call pickups. The following application cases, which can be configured using the wizard, are described here:

- [How to Configure a Call Pickup Group](#)
- [How to Add or Delete a Member to or from a Call Pickup Group](#)

The **Group Call / Hunt Group** wizard can be used to configure group calls of the type Group. The following application cases, which can be configured using the wizard, are described here:

- [How to Add a Group Call \(Group\)](#)
- [How to Edit a Group Call \(Group\)](#)
- [How to Delete a Group Call \(Group\)](#)
- [How to Add or Delete a Member to or from a Group Call \(Group\)](#)
- [How to Add a Hunt Group](#)
- [How to Change a Hunt Group](#)
- [How to Delete a Hunt Group](#)
- [How to Add or Delete a Member to or from a Hunt Group](#)

### 15.1.4.1 How to Configure a Call Pickup Group

The **Call Pickup** wizard enables you to combine subscribers into a group so that they can accept calls for one another.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > User Telephony**.
3. Click on **Edit** to start the **Call Pickup** wizard. The list of all possible call pickup groups is displayed.
4. To configure a call pickup group, click **Edit** in the row containing the required call pickup group.
5. If you want to add members to the call pickup group, enable the **Allocation Group <Number>** check boxes for the desired call numbers/names.
6. If you want to remove members from the call pickup group, clear the **Allocation Group <Number>** check boxes for the desired call numbers/names.
7. Click on **OK** to accept the entries.
8. Enter the name of the just configured call pickup group in the **Name** field.
9. If you want to configure further call pickup groups, repeat steps 4 through 8.
10. Click on **OK & Next** followed by **Finish**.

---

### 15.1.4.2 How to Add or Delete a Member to or from a Call Pickup Group

The **Group Pickup** wizard can be used to add or delete members to or from call pickup groups.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > User Telephony**.
3. Click on **Edit** to start the **Call Pickup** wizard.
4. Click **Edit** in row of the desired call pickup group.
5. Select one of the following options:
  - If you want to add members to the call pickup group, enable the **Allocation Group <Number>** check boxes for the desired call numbers/names.

- If you want to remove members from the call pickup group, clear the **Allocation Group <Number>** check boxes for the desired call numbers/names.
6. Click on **OK** to confirm the entries.
  7. Click on **OK & Next** followed by **Finish**.

---

### Related concepts

### 15.1.4.3 How to Add a Group Call (Group)

The **Group Call / Hunt Group** wizard can be used to configure group calls of the type Group.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > User Telephony**.
3. Click on **Edit** to start the **Group Call / Hunt Group** wizard.
4. Click on **Add** to set up a new group call.
5. Enter the call number of the new group call in the **Call number of the group** field.
6. Enter the DID number of the new group call in the **Direct inward dialing number** field.

---

**INFO:** If you want to use DID 879, 890 or 891, you must make the setting through ManagerE and not through WBM.

---

7. Enter the name of the new group call in the **Name of the group** field.
8. Select the item **Group** in the **Type** drop-down list.
9. Select one of the following options to transfer the call number for the group call into the internal directory:
  - If you do want the call number of the group call to appear in the internal directory, enable the **Tel. directory** check box.
  - If you do not want the call number of the group call to appear in the internal directory, clear the **Tel. directory** check box.
10. Select the call number of the desired subscriber from the **Call number of the subscriber to be added to the group** drop-down list.
11. Click on **OK & Next**.

---

**INFO:** If the phone number and/or DID number you have selected already exists, you can call up the current dial plan (also called a numbering plan)

---

to determine a free phone number and/or DID number.

12. Click **Edit** in the row containing the new group call to assign further subscribers to the group call.
13. Select the call number for the subscriber that you want to assign to the group call in the **Call No.** drop-down list.
14. Click on **Add**.
15. If you want to assign another subscriber to the group call, repeat steps 13 and 14.
16. Click on **OK** to accept the entries.
17. If you want to configure another group call, repeat steps 4 through 16.
18. Click on **OK & Next** followed by **Finish**.

---

### Related concepts

[Group Call](#) on page 662

#### 15.1.4.4 How to Edit a Group Call (Group)

The **Group Call / Hunt Group** wizard can be used to edit group calls of the type Group.

### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > User Telephony**.
3. Click **Edit** to start the **Group Call / Hunt Group** wizard.
4. Click **Edit** in the row containing the group call you want to change.
5. Change the required group parameters.
6. Only with UC Smart: Assign a mailbox to the group call if needed:
  - a) Select whether the group call is to receive a default mailbox or an attendant mailbox (AutoAttendant) in the **UC Smart Mailbox type** drop-down list.
  - b) Only with default mailbox: If a caller may leave a message in the voicemail box, select the **Recording** check box.
  - c) Select a greeting from the **Greeting** drop-down list.
  - d) If the password of the voicemail box is to be reset, select the **Password Reset** check box.

---

**NOTICE:** The **Password Reset** check box must be cleared when setting up a new voicemail box. It is used to reset the password of the voicemail box. When a new voicemail box is created, the subscriber must change the initial password

anyway when accessing his or her voicemail box for the first time.

7. If you want to add a member to the group call, select the call number of the desired subscriber from the **Call No.** drop-down list and then click **Add**.
8. If you want to remove a member from the group call, click on **Clear** in the row of the group member to be removed and then on **OK**.
9. Click **OK** to confirm the entries.
10. Click **OK & Next** followed by **Finish**.

#### 15.1.4.5 How to Delete a Group Call (Group)

The **Group Call / Hunt Group** wizard can be used to delete group calls of the type Group.

### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > User Telephony**.
3. Click on **Edit** to start the **Group Call / Hunt Group** wizard.
4. Click **Edit** in the row containing the group call you want to delete.
5. Click on **Delete Data**.
6. Click on **OK** to confirm the deletion.
7. Click on **OK & Next** followed by **Finish**.

---

#### 15.1.4.6 How to Add or Delete a Member to or from a Group Call (Group)

The **Group Call / Hunt Group** wizard can be used to add or delete members to or from group calls of the type Group.

### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > User Telephony**.
3. Click on **Edit** to start the **Group Call / Hunt Group** wizard.

4. Click on **Edit** in the row of the desired system telephone.
5. Select one of the following options:
  - If you want to add a member to the group call, select the call number of the desired subscriber from the **Call No.** drop-down list and then click **Add**.
  - If you want to remove a member from the group call, click on **Clear** in the row of the group member to be removed and then on **OK**.
6. Click on **OK** to confirm the entries.
7. Click on **OK & Next** followed by **Finish**.

### 15.1.4.7 How to Add a Hunt Group

The **Group Call / Hunt Group** wizard can be used to set up hunt groups.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > User Telephony**.
3. Click on **Edit** to start the **Group Call / Hunt Group** wizard.
4. Click on **Add** to set up a new hunt group.
5. Enter the call number of the new hunt group in the **Call number of the group** field.
6. Enter the DID number of the new hunt group in the **Direct inward dialing number** field.

---

**INFO:** If you want to use DID 879, 890 or 891, you must make the setting through ManagerE and not through WBM.

---

7. Enter the name of the new hunt group in the **Group Name** field.
8. Select the type of the new hunt group in the **Type** drop-down list. You have the following options:
  - If you want a call to always be signaled at the first member of the hunt group first, then select the item **linear hunt group**.
  - If you want a call to always be signaled first at the hunt group member who follows the one who accepted the last call, select the item **cyclic hunt group**.
9. Select one of the following options to transfer the call number for the hunt group into the internal directory:
  - If you do want the call number of the hunt group to appear in the internal directory, enable the **Tel. directory** check box.

- If you do not want the call number of the hunt group to appear in the internal directory, clear the **Tel. directory** check box.
10. Select the call number of the desired subscriber from the **Call number of the subscriber to be added to the group** drop-down list.
  11. Click on **OK & Next**.

---

**INFO:** If the phone number and/or DID number you have selected already exists, you can call up the current dial plan (also called a numbering plan) to determine a free phone number and/or DID number.

---

12. Click **Edit** in the row containing the new hunt group to assign further subscribers to the hunt group.
13. Select the call number of the subscriber that you want to assign to the hunt group in the **Call No.** drop-down list.
14. Click on **Add**.
15. If you want to assign another subscriber to the hunt group, repeat steps 13 and 14.
16. Click on **OK** to accept the entries.
17. If you want to configure another hunt group, repeat steps 4 through 16.
18. Click on **OK & Next** followed by **Finish**.

---

## 15.1.4.8 How to Change a Hunt Group

The **Group Call / Hunt Group** wizard can be used to edit hunt groups.

### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > User Telephony**.
3. Click **Edit** to start the **Group Call / Hunt Group** wizard.
4. Click **Edit** in the row containing the hunt group you want to change.
5. Change the required hunt group parameters.
6. Only with UC Smart: Assign a mailbox to the hunt group if needed:
  - a) Select whether the hunt group is to receive a default mailbox or an attendant mailbox (AutoAttendant) in the **UC Smart Mailbox type** drop-down list.

- b) Only with default mailbox: If a caller may leave a message in the voicemail box, select the **Recording** check box.
- c) Select a greeting from the **Greeting** drop-down list.
- d) If the password of the voicemail box is to be reset, select the **Password Reset** check box.

---

**NOTICE:** The **Password Reset** check box must be cleared when setting up a new voicemail box. It is used to reset the password of the voicemail box. When a new voicemail box is created, the subscriber must change the initial password anyway when accessing his or her voicemail box for the first time.

---

- 7. If you want to add a member to the hunt group, select the call number of the desired subscriber from the **Call No.** drop-down list and then click **Add**.
  - 8. If you want to remove a member from the hunt group, click on **Clear** in the row of the group member to be removed and then on **OK**.
  - 9. If you want to change the position of the members within the hunt group, click **Change Order**. Enter the desired position number for each member in the **Position** field. Click **OK & Next**.
  - 10. Click **OK** to confirm the entries.
  - 11. Click **OK & Next** followed by **Finish**.
-

### 15.1.5 Configuring Call Pickup Groups, Group Calls and Hunt Groups using Expert Mode

Besides the configuration options available through wizards, administrators with the **Expert** profile are also offered additional options to configure call pickup groups, group calls and hunt groups via the **Expert mode**.

The procedure for the following application cases, which can be configured using the **Expert mode** wizard, is described here:

- [How to Enable or Disable the Display of a Caller's Station Number and Name](#)
- [How to Activate or Deactivate the Warning Tone](#)
- [How to Enable or Disable Call Pickup for Recalls](#)
- [How to Add a Group Call \(RNA or Call Waiting\)](#)
- [How to Display or Edit a Group Call \(RNA or Call waiting\)](#)
- [How to Delete a Group Call \(RNA or Call Waiting\)](#)
- [How to Add or Delete a Member to or from a Group Call \(RNA or Call Waiting\)](#)
- [How to Enable or Disable Do Not Disturb for a Group Member](#)

### 15.1.5.1 How to Enable or Disable the Display of a Caller's Station Number and Name

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony > Basic Settings** in the navigation tree.
3. In the menu tree, click on **System > System Flags**.
4. Select one of the following options:
  - If you do want the call number and name of the caller to be displayed, enable the **Calling number in pick-up groups / ringing groups / CFN / RNA** check box.
  - If you do not want the call number and name of the caller to be displayed, clear the **Calling number in pick-up groups / ringing groups / CFN / RNA** check box.
5. Click on **Apply** followed by **OK**.

## 15.1.5.4 How to Add a Group Call (RNA or Call Waiting)

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Incoming Calls**.
3. Click **Incoming Calls > Groups/Hunt groups** in the menu tree.
4. Click on the **Add Group** tab.
5. Enter the call number of the new group call in the **Phone Number** field.
6. Enter the DID number of the new group call in the **Direct inward dialing number** field.

---

**INFO:** If you want to use DID 879, 890 or 891, you must make the setting through ManagerE and not through WBM.

---
7. Enter the name of the new group call in the **Name** field.
8. Select one of the following options in the **Type** drop-down list:
  - If you want to set up a group call of type RNA (ring no answer), select the **RNA** entry.
  - If you want to set up a group call of type Call Waiting, select the **Call waiting** entry.
9. Select the call number for the subscriber that you want to assign to the group call from the **Phone Number** drop-down list.
10. Click on **Apply** followed by **OK**.

---

## Working in a Team (Groups)

Team Configuration / Team Group and Executive/Secretary / Top Group

# 15.2 Team Configuration / Team Group and Executive/Secretary / Top Group

A Team Configuration / Team Group offers several convenient team functions. The station numbers of all team members are programmed on MULAP keys (trunk keys). Every team member can thus access all trunks (for instance, for call pickup) and can also conduct calls simultaneously via multiple trunks. An Executive/Secretary or Top Group offers convenient Executive and Secretary functions (Top function) for up to three executives and up to three secretaries.

---

**NOTICE:** When creating a MULAP from Team/Top options in WBM / Manager E it is not allowed to enter any number beginning with \*\* or \*\*\*.

---

## 15.2.1 Team Configuration / Team Group

MULAP (Multiple Line Appearance) keys (trunk keys) are programmed on a telephone with team functions with the individual telephone's number and the phone numbers of all other team members. Every team member can access all trunks (for instance, for call pickup) and can also conduct calls simultaneously via multiple trunks. In addition, DSS keys with which the team members can directly call one another are programmed automatically.

The MULAP keys give team members access to the phone numbers of all members. An incoming call for a team member can thus also be accepted by all other members by pressing the flashing MULAP key. Team members can also toggle between multiple trunks. By pressing a MULAP key, a team member can make an outbound call via the associated line. The station number of this line will then appear on the display of the called party.

Incoming calls are visually signaled at the same time on all team member phones via the MULAP key LED. You can also specify for each team member if incoming calls should also be signaled acoustically.

Every team member can use a group call key to activate or deactivate incoming call signaling for each individual trunk.

An administrator with the **Advanced** profile can configure up to 3 stations per Team configuration/Team group by using the **Team Configuration** wizard. An administrator with the **Expert** profile can configure up to ten stations per Team configuration or Team group in **Expert mode**.

An single subscriber may also simultaneously belong to several groups. The following applies to groups of the type Group Call, Hunt Group, Team Configuration / Team Group and Executive/Secretary / Top Group: The sum of all the subscriber's memberships in these groups must not exceed 32.

Every team configuration / team group can be assigned a name containing up to 16 characters.

When setting up a Team configuration or Team group, the following properties are assigned to its members (these settings can be changed by an administrator with the **Expert** profile in **Expert mode**.):

- **Master**

This parameter changes a member into a master of the Team configuration / Team group. If a master activates call forwarding, this applies to all members (phones) in the Team configuration / Team group.

Default setting: master is the first member of the Team configuration / Team group.

- **Acoustic ring**

If this parameter is activated, incoming calls are signaled acoustically.

Default setting: the parameter is activated.

- **Automatic seizure outgoing**

If this parameter is active, a call is automatically made via the MULAP trunk of this member on lifting the handset. If the parameter is not active, the subscriber must press the MULAP key before dialing is possible.

Default setting: the parameter is activated.

- **No automatic incoming call acceptance**

If this parameter is activated, you cannot answer an incoming call by lifting the handset. An incoming call must be accepted by pressing the MULAP key.

Default setting: the parameter is not activated.

- **Automatic conference release**

If the parameter is active, you can release the seized MULAP line for a conference by pressing the MULAP key. The release of this line is signaled to all other members by the flashing MULAP key. They can join the conference by pressing the MULAP key.

Default setting: the parameter is not activated.

- **MULAP key set up**

If the parameter is active, a MULAP key is programmed on the associated phone. Pressing the key sets up an outgoing call via the MULAP trunk of the master. The MULAP station number of the master appears on the called party's display.

Default setting: the parameter is not activated.

### Using MULAP Keys

Every team member is assigned a separate trunk (MULAP trunk). The member's own trunk and the trunks of all other members are programmed as MULAP keys (trunk keys) for every team member. This means that every team can use all available MULAP trunks.

The LED on a MULAP key (trunk key) can have different statuses with the following meaning:

- Off: the relevant trunk is free and can be used.

## Working in a Team (Groups)

- Lit: the relevant trunk is busy.
- Flashing fast: call on the relevant trunk.
- Flashing slow: an on-hold call is waiting on the relevant trunk.

### Using DSS Keys

Every team member has a DSS key for every other team member. This means that team members can reach each other directly at the push of a button.

A Direct Station Select (DSS) key can also be used to quickly transfer an existing call to the team member programmed on it.

The LED on a DSS key can have different statuses with the following meanings:

- Off: the associated Team member is not conducting a call.
- Lit: the associated Team member is conducting a call or has activated Do Not Disturb.
- Flashing fast: the associated Team member is conducting a call. The call can be accepted by pressing the Direct Station Select (DSS) key.
- Flashing slowly: the associated Team member is being called and has not yet answered. The call can be accepted by pressing the Direct Station Select (DSS) key.

### Ring type

For every Team configuration / Team group, an administrator with the **Expert** profile can define the acoustic signaling of incoming external calls via the ring type setting. You have the following options:

- Two rings (default setting)
- Three rings
- short-long-short ring

Only the default setting is possible for analog phones. Changes have no effect.

### Fax Box for Team Configuration / Team Group

For each Team configuration or Team group, a fax box can be set up via which the members can receive Fax messages directly through myPortal for Desktop or myPortal for Outlook.

If a fax box was already configured for the master (the first member) of the Team configuration/Team group, this fax box is taken over when setting up the Team configuration/Team group. Previously configured fax boxes of other members are deleted.

After a Team configuration or Team group is dissolved, only the prior master (i.e., the first member) can use his or her fax box.

### SIP Phones

SIP telephones can be integrated in a Team configuration / Team group. As a prerequisite, a system telephone (HFA or UP0 phone, for example) must have been defined as the first member of the Team configuration / Team group.

Dual-mode mobile phones that are configured as Mobility Entry stations, for example, can be integrated. Dual-mode mobile phones support both GSM/UMTS networks and WLAN networks. A dual-mode mobile phone can be registered as an IP station (SIP client) at the communication system over a WLAN.

---

**INFO:** No programming of MULAP keys and DSS keys is possible for SIP phones. Furthermore, no features can be activated or deactivated via codes. Specific display messages of the Team configuration / Team group are not supported.

---

---

**NOTICE:** High end phones, such as CP 400/600/600E/700/700X/710, keep their own journal entries and they have the capability to present more information. But regarding group configurations they rely on system data since the groups are configured on the system and not on the phones. As a result, information about groups might not be displayed in journal entries as they follow the system's limitations and configuration.

---

### Dependencies

| Topic              | Dependency                                                                                                                                |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| Call forwarding    | One team member has activated call forwarding for all calls. In this case, all calls for his or her own station number will be forwarded. |
| Do Not Disturb     | If a Team member activates the Do Not Disturb feature, incoming calls are not put through.                                                |
| ISDN Phones        | It is not possible to include ISDN telephones in Team configurations / Team groups.                                                       |
| Groups/Hunt groups | It is not possible to include a Basic/Executive MULAP master in Team configurations / Team groups.                                        |

### 15.2.2 Executive/Secretary or Top Group

Top groups can be configured if you need user-friendly executive and secretary functions (Top function).

Executive/secretary functions can be configured for groups with up to three executives and up to three secretaries.

---

**INFO:** The terms "executive" and "secretary" also apply to groups with more than one executive and more than one secretary. The terms "executive" and "secretary" used in this document are gender-neutral.

---

Every Top member (every executive and every secretary) is assigned a separate trunk, known as a MULAP (Multiple Line Appearance) trunk. The member's own MULAP trunk and the MULAP trunks of all other members are programmed as MULAP keys (trunk keys) for every Top member. The MULAP phone number is shown on the called party's display for outgoing calls via the MULAP trunk. The Secretary station can make calls via its own trunk or the MULAP trunk of all executives and other secretary stations. For example, if a connection is to be set up for an executive, the MULAP trunk of that executive can be used.

DSS keys are also programmed to allow the executive to call the secretary directly, and vice versa.

Incoming calls are visually signaled at the same time on all Top member phones via the LED on the trunk key. You can also specify for each Top member if incoming calls should also be signaled acoustically. Acoustic signaling depends here on the ring transfer key.

You can use a ring transfer key to change the signaling for incoming calls. Incoming calls are signaled either at the executive or secretary phone. If the executive presses the ring transfer key, incoming calls will still be displayed to the executive via a tray pop. Accepting a call can, however, only be done via an appropriate key on the phone and not via the tray pop.

You can use a group call key on Secretary phones to add or remove the station to or from the Executive/Secretary configuration or Top group. In this case, ring transfer has priority.

---

**INFO:** If the secretary uses the group call key to leave the Executive/Secretary configuration or Top group without activating ring transfer for the executive, incoming calls are not signaled at either the executive or the secretary.

---

An administrator with the **Advanced** profile can define up to two executives and two secretaries per Executive/Secretary configuration or Top group using the **Executive/Secretary** wizard. An administrator with the **Expert** profile can define up to three executives and three secretaries per Executive/Secretary configuration or Top group in **Expert mode**.

For every executive, a maximum of three phones can be set up; for every secretary, a maximum of two phones.

A single subscriber may also simultaneously belong to several groups. The following applies to groups of the type Group Call, Hunt Group, Team Configuration / Team Group and Executive/Secretary / Top Group: The sum of all the subscriber's memberships in these groups must not exceed 32.

Every Executive/Secretary configuration or Top group can be assigned a name containing up to 16 characters.

When setting up an Executive/Secretary configuration or Top group, the following properties are assigned to its members (these settings can be changed by an administrator with the **Expert** profile in **Expert mode**):

- **Master**

This parameter assigns executive functions to a member. The Executive MULAP trunk is automatically selected for a call on lifting the handset. Incoming calls via the associated Executive MULAP phone number are only signaled visually by default.

Default setting: All executives of the Executive/Secretary configuration or Top group receive Executive functions.

- **Acoustic ring**

If this parameter is activated, incoming calls are signaled acoustically.

Default setting: the parameter is active for all members with the secretary function.

- **Automatic seizure outgoing**

If this parameter is active, a call is automatically made via the MULAP trunk of this member on lifting the handset. If the parameter is not active, the subscriber must press the MULAP key before dialing is possible.

Default setting: the parameter is activated for all members.

- **No automatic incoming call acceptance**

If this parameter is activated, you cannot answer an incoming call by lifting the handset. An incoming call must be accepted by pressing the MULAP key.

Default setting: the parameter is not activated.

- **Automatic conference release**

If the parameter is active, you can release the seized MULAP line for a conference by pressing the MULAP key. The release of this line is signaled to all other members by the flashing MULAP key. They can join the conference by pressing the MULAP key.

Default setting: the parameter is not activated.

- **MULAP key set up**

If the parameter is active, a MULAP key is programmed on the associated phone. You can press the key to set up an outgoing call via the Executive MULAP trunk. The Executive MULAP phone number appears on the called party's display.

Default setting: the parameter is activated.

### Using MULAP Keys

Every Top member is assigned a separate trunk (MULAP trunk). The member's own trunk and the trunks of all other members are programmed as MULAP keys (trunk keys) for every Top member. This means that every Top member can use all available MULAP lines.

The LED on a MULAP key (trunk key) can have different statuses with the following meaning:

- Off: the relevant trunk is free and can be used.
- Lit: the relevant trunk is busy.
- Flashing fast: call on the relevant trunk.
- Flashing slowly: an on-hold call is waiting on the relevant trunk or the relevant trunk was released for a conference.

### Using DSS Keys

Every Top member has a DSS key for every other Top member. This means that Top members can reach each other directly at the push of a button.

A Direct Station Select (DSS) key can also be used to quickly transfer an existing call to the Top member programmed on it.

The LED on a DSS key can have different statuses with the following meanings:

- Off: The associated Top member is not conducting a call.
- Lit: the associated Top member is conducting a call or has activated Do Not Disturb.
- Flashing fast: the associated Top member is conducting a call. The call can be accepted by pressing the Direct Station Select (DSS) key.
- Flashing slowly: the associated Top member is being called and has not yet answered. The call can be accepted by pressing the Direct Station Select (DSS) key.

### Ring type

For every Executive/Secretary configuration or Top group, an administrator with the **Expert** profile can define the acoustic signaling of incoming external calls via the ring type setting. You have the following options:

- Two rings (default setting)
- Three rings
- short-long-short ring

Only the default setting is possible for analog phones. Changes have no effect.

### Fax Boxes for Executive/Secretary Configuration or Top Group

For each member of an Executive/Secretary configuration or Top group, a fax box can be set up via which the members can receive Fax messages directly through myPortal for Desktop or myPortal for Outlook.

If a fax box was already configured for the first executive of the Executive/Secretary configuration or Top group, this fax box is taken over when setting up the Executive/Secretary configuration or Top group. Previously configured fax boxes of other members are deleted.

After an Executive/Secretary configuration or Top group is dissolved, only the prior first executive can use his or her fax box.

### SIP Phones

SIP telephones can be integrated in an Executive/Secretary configuration or Top group. As a prerequisite, a system telephone (IP, HFA or SIP phone, for example) must have been defined as the first member of the Executive/Secretary configuration or Top group (Exec. 1).

Dual-mode mobile phones that are configured as Mobility Entry stations, for example, can be integrated. Dual-mode mobile phones support both GSM/UMTS networks and WLAN networks. A dual-mode mobile phone can be registered as an IP station (SIP client) at the communication system over a WLAN.

---

**INFO:** No programming of MULAP keys and DSS keys is possible for SIP phones. Furthermore, no features can be activated or deactivated via codes. Specific display messages of the Executive/Secretary configuration / Top group are not supported.

---

---

**NOTICE:** High end phones, such as CP600, keep their own journal entries and they have the capability to present more information. But regarding group configurations they rely on system data since the groups are configured on the system and not on the phones. As a result, information about groups might not be displayed in journal entries as they follow the system's limitations and configuration.

---

### Dependencies

| Topic           | Dependency                                                                                                                             |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------|
| Call forwarding | A Top member has activated call forwarding for all calls. In this case, all calls for his or her own station number will be forwarded. |
| Do Not Disturb  | If a Top member activates the Do Not Disturb feature, incoming calls are not put through.                                              |

| Topic              | Dependency                                                                                                        |
|--------------------|-------------------------------------------------------------------------------------------------------------------|
| ISDN Phones        | It is not possible to include ISDN or SIP phones in Executive/Secretary configurations or Top groups.             |
| Groups/Hunt groups | It is not possible to include a Basic/Executive MULAP master in Executive/Secretary configurations or Top groups. |

## 15.2.3 Configuring Team Configurations / Team Groups and Executive/Secretary Functions / Top Groups using Wizards

Several different wizards are available to conveniently configure team configurations (team groups) and executive/secretary functions (top groups).

The **Team Configuration** wizard can be used to set up Team configurations (Team groups). The following application cases, which can be configured using the wizard, are described here:

- [How to Add a Team Configuration / Team Group](#)
- [How to Edit a Team Configuration / Team Group](#)
- [How to Delete a Team Configuration / Team Group](#)

The **Executive / Secretary** wizard can be used to configure convenient Executive and Secretary functions (Top function). The following application cases, which can be configured using the wizard, are described here:

- [How to Add an Executive/Secretary or Top Group](#)
- [How to Edit an Executive/Secretary or Top Group](#)
- [How to Delete an Executive / Secretary or Top Group](#)

### Related concepts

[Configuring myPortal to go and Mobility Entry](#) on page 931

### 15.2.3.1 How to Add a Team Configuration / Team Group

The **Team Configuration** wizard can be used to create Team configurations (Team groups).

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > User Telephony**.
3. Click on **Edit** to start the **Team Configuration** wizard.
4. Click on **Add** to set up a new team configuration.
5. Select the station number of the first telephone of the Team configuration in the **First Telephone** drop-down list.
6. Click on **OK & Next**.
7. In the **Name** field, enter the name of the new team configuration if no name is displayed or if you want to change the displayed name.

Note: The **Name** field will already be preset with the name of the first telephone in the team configuration, provided a name was assigned to that telephone.

8. Enter the internal call number of the new team configuration in the **Internal Call Number** field if the displayed call number needs to be changed.

The **Internal Number** field is already preset with the internal station number of the first telephone of the team configuration.

---

**INFO:** If you want to use DID 879, 890 or 891, you must make the setting through ManagerE and not through WBM.

---

9. Enter the DID number of the new team configuration in the **Direct inward dialing number** field if the displayed DID number needs to be changed.

Note: The **Direct inward dialing number** field is already preset with the DID number of the first telephone of the team configuration.

10. Enter the internal number of the fax box for the new Team configuration under **Fax** in the **Internal Number** field if no call number is displayed or if the displayed call number needs to be changed.

The **Internal Number** field will be preset with the internal number of the fax box of the first phone in the Team configuration if a fax box has already been configured for that phone.

11. Enter the DID number of the fax box for the new Team configuration under **Fax** in the **Direct inward dialing number** field if no DID number is displayed or if the displayed DID number needs to be changed.

## Working in a Team (Groups)

The **Direct inward dialing number** field will be preset with the DID number of the fax box of the first phone in the Team configuration if a fax box has already been configured for that phone.

**12. Activate the **Team as group member** flag.**

The **Team as group member** flag is configurable only when the Team Group has members with the same station type, which results in a single MULAP group. When this flag is activated, the MULAP group can be added as a member in Groups.

**13. Select the station number of the second telephone of the new Team configuration from the **Second Telephone** drop-down list.**

**14. Select the station number of the third telephone of the Team configuration from the **Third Telephone** drop-down list.**

**15. Click on **OK & Next**.**

**16. If you want to configure another Team configuration, repeat steps 4 through 15.**

**17. Click on **OK & Next** followed by **Finish**.**

---

## 15.2.3.2 How to Edit a Team Configuration / Team Group

The **Team Configuration** wizard can be used to edit Team configurations (Team groups).

### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

### Step by Step

**1. In the navigation bar, click on **Setup**.**

**2. In the navigation tree, click **Wizards** > **User Telephony**.**

**3. Click **Edit** to start the **Team Configuration** wizard.**

**4. Click **Edit** in the row of the team configuration you want to change.**

**5. Change the required parameters.**

**6. Only with UC Smart: Assign a mailbox to the team configuration if needed:**

a) Select whether the team configuration is to receive a default mailbox or an attendant mailbox (AutoAttendant) in the **UC Smart Mailbox type** drop-down list.

b) Only with default mailbox: If a caller may leave a message in the voicemail box, select the **Recording** check box.

c) Select a greeting from the **Greeting** drop-down list.

d) If the password of the voicemail box is to be reset, select the **Password Reset** check box.

---

**NOTICE:** The **Password Reset** check box must be cleared when setting up a new voicemail box. It is used to reset the password of the voicemail box. When a new voicemail box is created, the subscriber must change the initial password anyway when accessing his or her voicemail box for the first time.

---

7. Click **OK & Next**.

8. Click on **OK & Next** followed by **Finish**.

---

### 15.2.3.3 How to Delete a Team Configuration / Team Group

The **Team Configuration** wizard can be used to delete Team configurations (Team groups).

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > User Telephony**.
3. Click on **Edit** to start the **Team Configuration** wizard.
4. Click **Edit** in the row of the team configuration you want to delete.
5. Click on **Delete Data**.
6. Click on **OK** to confirm the deletion.
7. Click on **OK & Next** followed by **Finish**.

---

**NOTICE:** In applications using CSTA interface (UC, OSCC, etc.) when a Team Group or a member of a Team Group is deleted, a system restart is needed.

### 15.2.3.4 How to Add an Executive/Secretary or Top Group

The **Executive / Secretary** wizard can be used to configure user-friendly executive and secretary functions (Top function).

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > User Telephony**.
3. Click on **Edit** to start the **Executive / Secretary** wizard.
4. Click on **Add** to set up a new Executive/Secretary configuration (Top group).
5. Enter the name of the new Executive/Secretary configuration in the **Name** field.
6. Select the desired call numbers for the new Executive/Secretary configuration in the associated drop-down lists.
7. Click on **OK & Next**.
8. Enter the internal number of the fax box for the new Executive/Secretary configuration under **Fax** in the **Call No.** field if no call number is displayed or if the displayed call number needs to be changed.

The **Call No.** field will be preset with the internal number of the fax box of the first executive in the Executive/Secretary configuration if a fax box has already been configured for this phone.

9. Enter the DID number of the fax box for the new Executive/Secretary configuration under **Fax** in the **DID** field if no DID number is displayed or if the displayed direct inward dialing number needs to be changed.

The **Direct inward dialing** field will be preset with the DID number of the fax box of the first executive in the Executive/Secretary configuration if a fax box has already been configured for this phone.

---

**INFO:** If you want to use DID 879, 890 or 891, you must make the setting through ManagerE and not through WBM.

---

10. Select a default for the key assignment:
  - If the keys for the Executive/Secretary functions are to be set up on the first or second add-on device, enable the check box **to first/second console**.
  - If the keys for the Executive/Secretary functions are to be set up on the first free function keys of the telephone, enable the check box **to first free key**.
11. Click on **OK & Next**.
12. If you want to configure another Executive/Secretary configuration, repeat steps 4 through 11.
13. Click on **OK & Next** followed by **Finish**.

### 15.2.4.1 How to Add or Delete a Member to or from a Team Configuration or Team Group

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

---

**INFO:** The **Team Configuration** wizard can be used by an administrator with the **Advanced** profile to define up to three members (phones) for a Team configuration (Team group). Additional members must be added by an administrator with the **Expert** profile in **Expert mode** (see the description below).

---

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Incoming Calls**.
3. Select one of the following options:
  - To add a member to the Team group, navigate in the menu tree under **Incoming Calls > Team/top > ...** down to the desired Team group. Click on the **Add Team/top Member** tab. Select the station type in the **Type** drop-down list and select the call number of the desired station in the **Call No.** drop-down list. Then click **Apply**, followed by **OK**.
  - To remove a member from the Team group, navigate in the menu tree under **Incoming Calls > Team/top > ...** down to the desired member of the Team group (Group Member, Call No, Name). Click on the **Delete Team/top Member** tab. Click on **Delete** followed by **OK**.

## 15.3 Basic MULAP and Executive MULAP

A Basic MULAP enables a subscriber who uses multiple telephones (e.g., a fixed-network telephone and a mobile phone) to be reached under a single phone number. You can configure Executive MULAPs if you want to use restricted executive and secretary functions.

### 15.3.1 Basic MULAP

Basic MULAPs can be configured if a subscriber is using a number of different phones (for example, a fixed-network phone and mobile phone) but would like to be reached at a single phone number (Basic MULAP phone number).

If a caller rings the Basic MULAP phone number, the call is visually signaled at all phones belonging to the Basic MULAP. The subscriber can also set whether or not incoming calls should also be acoustically signaled for each individual member. The status of the Basic MULAP changes to busy and other callers hear the busy signal when a call is answered.

The Basic MULAP phone number is shown on the called party's display for outgoing calls via the Basic MULAP trunk.

Up to 20 members can be configured per Basic MULAP.

Every Basic MULAP can be assigned a name containing up to 16 characters.

## Working in a Team (Groups)

Each of the subscriber's phones is a member of the Basic MULAP and each member can be assigned the following properties:

- **Master**

This parameter changes a member into a master of the Basic MULAP. If a master activates call forwarding, this feature applies to all members (phones) in the Basic MULAP. If the master activates an automatic callback on a Basic MULAP, the callback is initiated as soon as all masters are free.

A subscriber may not be included as a MULAP master in hunt groups more than 25 times.

Default setting: master is the first member of the Basic MULAP.

- **Acoustic ring**

If this parameter is activated, incoming calls are signaled acoustically.

Default setting: the parameter is active for all masters.

- **Automatic seizure outgoing**

If this parameter is active, the Basic MULAP trunk is automatically called when the subscriber lifts the handset. If the parameter is not active, the subscriber must press the MULAP key before dialing is possible.

Default setting: automatic outgoing seizure is assigned to all masters.

- **No automatic incoming call acceptance**

If this parameter is activated, you cannot answer an incoming call by lifting the handset. An incoming call must be accepted by pressing the MULAP key.

Default setting: the parameter is not activated.

- **Automatic conference release**

If the parameter is active, you can release the seized MULAP line for a conference by pressing the MULAP key. The release of this line is signaled to all other members by the flashing MULAP key. They can join the conference by pressing the MULAP key.

Default setting: the parameter is not activated.

- **MULAP key set up**

If the parameter is active, a MULAP key is programmed on the associated phone. You can press the key to set up an outgoing call via the Basic MULAP trunk. The Basic MULAP number appears on the called party's display.

Default setting: the parameter is activated.

### Number/Name Display

When an outgoing call is set up, a station number is assigned (local station number or MULAP group number).

When an incoming MULAP call is answered, the MULAP group number is assigned.

In the case of calls to a MULAP:

- Before the call is answered, the display of the calling party shows the MULAP name and/or MULAP number being called.
- After the call is answered, the display of the calling party shows the station name and/or MULAP number of the answering party.
- In the case of calls from a MULAP station (MULAP key or preference), the display of the called and answering parties always shows the station name and/or MULAP number.
- The following generally applies to outgoing seizures: If a station conducts a call using the local station number and the outgoing preference differs from the local station number, the display of the called party always shows the station number of the outgoing preference.

### Using MULAP Keys

The LED on a MULAP key can have different statuses with the following meaning:

- Off: the relevant trunk is free and can be used.
- Lit: the relevant trunk is busy.
- Flashing fast: call on the relevant trunk.
- Flashing slowly: an on-hold call is waiting on the relevant trunk or the relevant trunk was released for a conference.

### Ring type

For every Basic MULAP, an administrator with the **Expert** profile can define the acoustic signaling of incoming external calls via the ring type setting. You have the following options:

- Two rings (default setting)
- Three rings
- short-long-short ring

Only the default setting is possible for analog phones. Changes have no effect.

### SIP Phones

SIP telephones can be integrated in a Basic MULAP. As a prerequisite, a TDM, HFA or SIP phone must have been defined as the first member of the Basic MULAP.

Dual-mode mobile phones that are configured as Mobility Entry stations, for example, can be integrated. Dual-mode mobile phones support both GSM/UMTS networks and WLAN networks. A dual-mode mobile phone can be registered as an IP station (SIP client) at the communication system over a WLAN.

---

**INFO:** No programming of MULAP keys is possible for SIP phones. Furthermore, no features can be activated or deactivated via codes. Specific display messages of the Basic MULAP are not supported.

---

## 15.3.2 Executive MULAP

You can configure Executive MULAPs if you want to use restricted executive and secretary functions.

All members of an Executive MULAP can be reached at the Executive MULAP phone number as well as at their personal station numbers.

---

**INFO:** The terms "executive" and "secretary" used in this document are gender-neutral.

---

Up to 20 members can be configured per Executive MULAP.

Every Executive MULAP can be assigned a name containing up to 16 characters.

The parameters described below define which members of an Executive MULAP can use executive functions (Executive) and which can use secretary functions (Secretary).

If a caller rings the Executive MULAP phone number, the call is visually signaled at all phones belonging to the Executive MULAP. Incoming calls are also signaled acoustically for members with secretary functions.

The Executive MULAP phone number is shown on the called party's display for outgoing calls via the Executive MULAP trunk.

The members of an Executive MULAP can be assigned the following properties:

- **Master**

This parameter is used to assign executive functions to a member. The Executive MULAP trunk is automatically selected for a call when you lift the handset. Incoming calls via the Executive MULAP phone number are only signaled visually.

A subscriber may not be included as a MULAP master in hunt groups more than 25 times.

Default setting: the first member of the Executive MULAP is assigned executive functions.

- **Acoustic ring**

If this parameter is activated, incoming calls are signaled acoustically.

Default setting: the parameter is active for all members with the secretary function.

- **Automatic seizure outgoing**

If this parameter is active, the Executive MULAP trunk is automatically called when you lift the handset. If the parameter is not active, the subscriber must press the MULAP key before dialing is possible.

This parameter cannot be used by members with the secretary function.

Default setting: the parameter is active for all members with the executive function.

- **No automatic incoming call acceptance**

If this parameter is activated, you cannot answer an incoming call by lifting the handset. An incoming call must be accepted by pressing the MULAP key.

Default setting: the parameter is not activated.

- **Automatic conference release**

If the parameter is active, you can release the seized MULAP line for a conference by pressing the MULAP key. The release of this line is signaled to all other members by the flashing MULAP key. They can join the conference by pressing the MULAP key.

Default setting: the parameter is not activated.

- **MULAP key set up**

If the parameter is active, a MULAP key is programmed on the associated phone. You can press the key to set up an outgoing call via the Executive MULAP trunk. The Executive MULAP phone number appears on the called party's display.

Default setting: the parameter is activated.

### Using MULAP Keys

The LED on a MULAP key can have different statuses with the following meaning:

- Off: the relevant trunk is free and can be used.
- Lit: the relevant trunk is busy.
- Flashing fast: call on the relevant trunk.
- Flashing slowly: an on-hold call is waiting on the relevant trunk or the relevant trunk was released for a conference.

### Ring type

For every Executive MULAP, an administrator with the **Expert** profile can define the acoustic signaling of incoming external calls via the ring type setting. You have the following options:

- Two rings (default setting)
- Three rings
- short-long-short ring

Only the default setting is possible for analog phones. Changes have no effect.

### SIP Phones

SIP telephones can be integrated in an Executive MULAP. As a prerequisite, a system telephone (HFA or UP0 phone, for example) must have been defined as the first member of the Executive MULAP (Exec. 1).

Dual-mode mobile phones that are configured as Mobility Entry stations, for example, can be integrated. Dual-mode mobile phones support both GSM/UMTS networks and WLAN networks. A dual-mode mobile phone can be registered as an IP station (SIP client) at the communication system over a WLAN.

---

**INFO:** No programming of MULAP keys is possible for SIP phones. Furthermore, no features can be activated or deactivated via codes. Specific display messages of the Executive MULAP are not supported.

---

### 15.3.3.1 How to Add a Basic MULAP

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Incoming Calls**.
3. Click **Incoming Calls > Groups/Hunt groups** in the menu tree.
4. Click on the **Add Group** tab.
5. Enter the call number of the new Basic MULAP in the **Call number** field.
6. Enter the DID number of the new Basic MULAP in the **Direct inward dialing number** field.

---

**INFO:** If you want to use DID 879, 890 or 891, you must make the setting through ManagerE and not through WBM.

---

7. Enter the name of the new Basic MULAP in the **First Name** and **Last Name** fields.
8. Select **Basic MULAP** in the **Type** drop-down list.
9. Select the call number for the subscriber that you want to assign to the Basic MULAP group from the **Call number** drop-down list.
10. Click on **Apply** followed by **OK**.

---

**NOTICE:** In applications using CSTA interface (UC, OSCC, etc.) when a Basic MULAP group or a member of a Basic MULAP group is created, a system restart is needed.

---

### 15.3.3.11 How to Add a Basic MULAP in a Group

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony Server > Incoming Calls**.
3. Click to the desired Basic MULAP, in the menu tree under **Incoming calls > Groups/Hunt groups**.
4. Click on **Edit Group parameters** tab. The current settings of the group parameters are displayed.
5. Activate the **Mulap as group member** flag.
6. Click on the desired Group in the menu tree under **Incoming calls > Groups/Hunt groups** to add a Basic MULAP as a member in the Group.
7. Click on **Add Member** tab and select the Basic MULAP from the drop down menu in the **Call number** field.
8. Click on **Apply** followed by **OK**.

#### Restrictions:

- All the Basic MULAP members must be configured with M, R, A parameters.
- The maximum number of the Group members must be up to 20, including the members of the Basic MULAP.
- The Basic MULAP members cannot already be members of the Group.
- It is allowed to add a MULAP to:
  - 1) Linear hunt group
  - 2) Cyclical hunt group
  - 3) Group
- It is not allowed to add a MULAP to:
  - 1) Call waiting
  - 2) RNA
- A group cannot be changed to Call waiting or RNA if it contains a MULAP.

## 15.4 Voicemail Group and Fax Box Group

A voicemail group enables a subscriber group to access voicemails. When a call is placed to the call number of a voicemail group, the call is sent directly to the voicemail box (i.e., the voicemail) of the group and not to the group members. A fax box group (fax group) enables a subscriber group to access fax messages. The fax box of the group is reached directly via the station number of the fax box group.

### 15.4.1 Voicemail Group

A voicemail group enables a specific group of subscribers to access voicemails. When a call is placed to the call number of a voicemail group, the call is sent directly to the voicemail box (i.e., the voicemail) of the group and not to the group members. After a voicemail is left in the voicemail box of the group, it is forwarded to the voicemail boxes of all members.

All members receive the voicemail simultaneously. Whenever a member deletes a voicemail, this voicemail is also deleted from the voicemail boxes of all members and the voicemail box of the group. The personal voicemails of all members are not affected by this.

Every member of a voicemail group can be reached under his or her own station number.

Up to 20 members can be configured per voicemail group.

Every voicemail group can be assigned a name containing up to 16 characters.

At least one member of a voicemail group requires a Voicemail license.

#### Dependencies

| Topic            | Dependency                                       |
|------------------|--------------------------------------------------|
| Ringing group on | The <i>Ringing group</i> feature cannot be used. |

### 15.4.2 Fax Box Group

A fax box group (fax group) enables a specific group of subscribers to access fax messages. The fax box of the group is reached directly via the station number of the fax box group. After a fax message is left in the fax box of the group, it is forwarded to the fax boxes of all members.

## Working in a Team (Groups)

All members receive the fax message simultaneously. Whenever a member deletes a fax message, this voicemail is also deleted from the fax boxes of all members and the fax box of the group.

Every member of a fax box group can be reached under his or her own station number.

Up to 20 fax box groups can be configured.

Every fax box group can be assigned a name containing up to 16 characters.

At least one member of a fax box group requires a Fax license.

**Related concepts**

[Fax Box Group](#) on page 713

## 15.5 Speaker Call for Groups

Speaker call for groups enable the broadcasting of announcements to all internal members of a group.

### 15.5.1 Internal Paging

Internal paging enables internal members of a group to be addressed directly. This feature is also known as a group broadcast. Internal paging is not performed for group members who are busy or have activated the Do Not Disturb feature. Group members have no direct answering option. Answering is only possible by lifting the handset, which results in a transition to a normal two-way conversation.

Internal paging can be used via a function key programmed for this purpose, the menu item **Speaker call** or by entering the appropriate code and then dialing the station number of the target group. A function key can also be programmed with a group phone number. A connection to the programmed group is immediately set up when you press a function key of this kind.

**Dependencies**

| Topic                   | Dependency                                                             |
|-------------------------|------------------------------------------------------------------------|
| Do Not Disturb          | Group members who have activated DND do not receive any announcements. |
| ISDN phones, SIP phones | The "Internal Paging" feature cannot be used with ISDN or SIP phones.  |

### 15.5.2 Transfer to Group from Announcement

A call on consultation hold can be transferred to a group via Transfer from Announcement. An announcement to the group is initiated for this (internal paging). The system sets up a two-party call when another party in the group lifts the handset or turns on the loudspeaker and the party who transferred the call hangs up. The connection is cleared down for the other group members.

Internal paging can be used via a function key programmed for this purpose, the menu item **Speaker call** or by entering the appropriate code and then dialing the station number of the target group. A function key can also be programmed with a group phone number. A connection to the programmed group is immediately set up when you press a function key of this kind.

## Working in a Team (Groups)

### UCD (Uniform Call Distribution)

#### Dependencies

| Topic                   | Dependency                                                                                 |
|-------------------------|--------------------------------------------------------------------------------------------|
| Do Not Disturb          | Group members who have activated DND do not receive any announcements.                     |
| ISDN phones, SIP phones | The "Transfer to Group from Announcement" feature cannot be used with ISDN and SIP phones. |

## 15.6 UCD (Uniform Call Distribution)

The Uniform Call Distribution (UCD) feature of the communication system enables incoming calls to be uniformly distributed to a group of stations (UCD-group).

UCD groups are primarily used in technical hotline environments (e.g., customer service hotlines), for managing complaints, in market research, order processing and acceptance (e.g., by mail-order companies and ticketing services) and even for emergency services.

As a rule, call distribution occurs by sending an incoming call to a UCD group to the station (agent) in the UCD group whose last call lies furthest in the past. It is also possible to define other distribution rules.

If there is no agent free to accept an incoming call, the call is automatically forwarded to a queue. Waiting calls are distributed to free agents on the basis of priority and wait time.

Announcements or music on hold can be played for waiting callers.

#### Configuration

The **UCD** wizard can be used to configure groups and stations for intelligent call distribution (UCD). The following application cases, which can be configured using the wizard, are described here:

- [How to Configure Call Distribution / UCD Groups](#)
- [How to Add or Delete UCD Agents](#)
- [How to Change Announcements / Music on Hold for UCD](#)

Besides the configuration options available through wizards, administrators with the **Expert** profile are also offered additional configuration options in **Expert mode**.

### 15.6.1 Call Distribution / UCD Group

A UCD group contains agents (subscribers) that belong to a work group and can be reached at a single phone number. An incoming internal or external call is automatically delivered to the agent who is idle longest.

Every UCD group can be configured using the WBM (**in Expert mode**) so that incoming calls to an agent are automatically accepted by the communication system (Unattended Incoming Call Connection AICC).

If all agents of a UCD group are busy, incoming calls can be placed in a queue. The maximum number of calls in the queue can be individually set for every UCD group. When the maximum number of queued calls is reached, further calls can be forwarded to an overflow destination (which may be an external destination, another UCD group, an internal station or a group).

If the overflow destination is another UCD group and if all other agents in this UCD group are busy, the call remains in the queue associated with the original group and is also entered in the queue of the other UCD group (overflow destination).

Announcements or music can be played for on-hold callers.

Every UCD group can be assigned a name containing up to 16 characters.

### Dependencies

| Topic           | Dependency                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Call forwarding | <p>A call is not forwarded to a UCD group in the following cases:</p> <ul style="list-style-type: none"> <li>• If a hunt group is called and a subscriber with call forwarding to a UCD group is next, this call is not forwarded. In this case, the next station in the hunt group is immediately called.</li> <li>• A subscriber is a member of a group call with the property "Group" and has activated call forwarding to a UCD group.</li> <li>• A station is a member of a group call no answer. If the group is called, the call is not forwarded to the UCD group. Exception: The first subscriber entered has activated call forwarding to a UCD group. In this case, the call is forwarded.</li> </ul> |

### 15.6.1.1 How to Configure Call Distribution / UCD Groups

You can use the **UCD** wizard to configure intelligent call distribution to a group with selected stations.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > User Telephony**.
3. Click on **Edit** to start the **UCD** wizard. The list of all possible UCD groups is displayed.
4. To configure a UCD group, click **Edit** in the row containing the required UCD group.

## Working in a Team (Groups)

5. Enter the call number of the new UCD group in the **Call number** field.
6. Enter the DID number of the new UCD group in the **Direct inward dialing number** field.

---

**INFO:** If you want to use DID 879, 890 or 891, you must make the setting through ManagerE and not through WBM.

---

7. Enter the name of the UCD group in the **Name** field.
8. Click on **OK & Next**. The window **Assignment of UCD Agents** is displayed.
9. Mark the required UCD agent IDs in the **Selection** and assign them to this UCD group by clicking **Add**.
10. Click on **OK & Next**. The **Edit announcement/overflow** window appears.
11. Select the announcement of the UCD group in **Announcement** drop-down list. You can optionally select an announcement (if configured) or the internal Music On Hold (MOH). After you select the announcement, the **Ann. delay time** field appears.
12. In the field **Ann. delay time**, enter the time (in seconds) after which a caller in the queue is to receive an announcement.
13. Select the time after which a call is to be forwarded to the next UCD agent of the UCD group in the **Waiting time between agents** drop-down list.
14. Select the overflow destination for the UCD group in the **Overflow destination** drop-down list. You can select an external destination, another UCD group, an internal station or a group.  
If you select **External destination** as the overflow destination, the **External destination** field and the **Route** drop-down list appears.
  - a) Enter the call number of the external overflow destination in the **External destination** field.
  - b) If the external overflow destination is to be reached via a specific route, select the route in the **Route** drop-down list.
15. Click on **OK** to accept the entries.
16. If you want to configure further UCD groups, repeat steps 4 through 15.
17. Click on **OK & Next** followed by **Finish**.

### 15.6.2 UCD Agents

The stations of a UCD group (agents) comprise a workgroup and are typically deployed for technical hotlines, for example, or in order processing, order acceptance, CRM, etc. All incoming calls are distributed to the available stations in a UCD group.

The assignment of agents to the UCD groups occurs via identification codes (IDS). An ID can be assigned to no more than one UCD group. An agent can be assigned multiple IDs. This lets an agent work in

more than once UCD group. An agent, however, can only be logged on and therefore active in one UCD group at a time.

In order to use the UCD functions effectively, agents should have phones equipped with a display, function keys and a headset.

### Logging on/off

Agents can log into any phone of the communication system (except ISDN and SIP phones) by using their respective IDs (Identification Code). The agent is available following successful login and permanently assigned to the relevant phone until he or she logs off. The agent cannot log into another phone. Agents who have logged off are no longer considered for the call distribution.

The UCD functions for logging in, logging out and for changing the station status can be accessed by agents from the telephone via programmed function keys or via the associated menu items or via codes.

### Subscriber states

An agent's state is **available** following successful login. If required, a agent can set his or her own station status, or the status may be changed automatically, depending on the agent's current activity. The current subscriber state is shown on the phone's display.

The following displays are possible:

| Display              | Meaning                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| available            | The agent is available and can accept UCD calls.                                                                                                                                                                                                                                                                                                                                          |
| not available        | The agent temporarily logged off his or her workstation (for example, for a break).                                                                                                                                                                                                                                                                                                       |
| wrap up              | The agent is in wrap-up mode. He or she does not receive any UCD calls during the wrap-up time. Depending on the configuration, this can be an individual wrap-up time (the agent independently defines the length of the wrap-up time by changing his or her subscriber status) or an automatic wrap-up time (a wrap-up time is automatically available to all agents after a UCD call). |
| for <UCD group name> | The agent receives a UCD call.                                                                                                                                                                                                                                                                                                                                                            |

An agent logs off after his or her shift and is therefore no longer available for UCD calls. The agent can still be reached at his or her personal station number.

If all agents of a UCD group are in the state **not available**, incoming calls are forwarded to an overflow destination (an external destination, another UCD group, an internal station or a group).

## Working in a Team (Groups)

If an agent does not accept a call although he or she is logged on and available, the communication system automatically sets the status of that station to **not available**.

### Dependencies

| Topic                   | Dependency                                                                                                                         |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| Call forwarding         | If an agent activates the Call Forwarding feature, he or she is automatically logged off and is no longer available for UCD calls. |
| ISDN phones, SIP phones | It is not possible to use ISDN and SIP phones here.                                                                                |

### 15.6.2.1 How to Add or Delete UCD Agents

The **UCD** wizard can be used to add UCD agents to a UCD group or to delete them from a UCD group.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > User Telephony**.
3. Click on **Edit** to start the **UCD** wizard. The list of all possible UCD groups is displayed.
4. To add UCD agents to a UCD group or delete them, click **Edit** in the row containing the required UCD group.
5. Click on **OK & Next** to go to the **Assignment of UCD agents** window.
6. Select one of the following options:
  - If you want to add a UCD agent, mark the required UCD agent IDs in the **Selection** and assign them to this UCD group by clicking **Add**.
  - If you want to delete UCD agents, mark the desired **Members** and delete them from the UCD group by clicking **Delete**.
7. Click on **OK & Next** to confirm the entries.
8. Click on **OK**.
9. If you want to edit the UCD agents of another UCD group, repeat steps 4 through 8.
10. Click on **OK & Next** followed by **Finish**.

### 15.6.3 Wrap up

This feature temporarily removes an agent from the call distribution in order to allow the agent some time to wrap up the call just completed. The agent does not receive any UCD calls during the wrap-up time.

A distinction is made between:

- the individual wrap-up time.

The agent sets the wrap-up time length by changing his or her subscriber state.

- the automatic wrap-up time.

The Uniform Call Distribution (UCD) feature is configured for this in such a way that a wrap-up time is automatically made available to all agents in all UCD groups after a UCD call. The automatic wrap-up time is defined in ring cycles, that is, in increments of five seconds.

An agent can manually extend the automatic wrap-up time by changing his or her subscriber state.

An agent can be reached throughout the wrap-up time via his or her personal station number.

### 15.6.3.1 How to Change the Automatic Wrap-Up Time

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Incoming Calls**.
3. Click on **Incoming Calls > UCD** in the menu tree.
4. Click on the **Edit UCD Parameters** tab.
5. Select the wrap-up time that should be available to all UCD agents in the **Wrapup Mode (Cycles)** drop-down list. This is defined in ring cycles, that is, in increments of five seconds.
6. Click on **Apply** followed by **OK**.

### 15.6.4 Call Prioritization

You can set a priority for incoming internal and external calls for a UCD group. The queued calls are distributed to the agents in a UCD group on the basis of priority and the wait time.

A queued call with a high priority is answered before a call that has been waiting longer but has a lower priority. A queued call with low priority will be forwarded to an overflow destination before a queued call with high priority.

Priorities are assigned on the basis of trunks for external calls (per B channel), regardless of whether IP or TDM lines are involved.

Examples:

- Communication system with ISDN Primary Rate Interface (S<sub>2M</sub> interface) and ISDN Point-to-Multipoint connection (S<sub>0</sub> interface)

## Working in a Team (Groups)

Incoming calls via the ISDN Primary Rate Interface are normal customer calls. All B channels of the  $_{2M}$  interface are thus assigned a medium priority. Calls received via the ISDN point-to-multipoint connection are urgent calls, e.g., high-priority orders for spare parts. All B channels of the  $S_0$  interface are thus assigned a high priority.

- Communication system with a point-to-point connection to an Internet Telephony Service Provider ITSP and an ISDN point-to-multipoint connection ( $S_0$  interface)

Incoming calls via the PABX number for IP telephony are normal customer calls. All B channels of the LAN interface are thus assigned a medium priority. Calls received via the ISDN point-to-multipoint connection are urgent calls, e.g., high-priority orders for spare parts. All B channels of the  $S_0$  interface are thus assigned a high priority.

The priority is set system-wide for internal calls and therefore applies equally to all internal calls.

Ten priority levels (1 = high, 10 = low) are available.

By default, priority = 10 is set for internal calls, and priority = 1 for external calls.

### 15.6.4.1 How to Change Request Priorities

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Incoming Calls**.
3. Click on **Incoming Calls > UCD** in the menu tree.
4. Click on the **Edit UCD Parameters** tab.
5. In the **Priorities, internal** drop-down list, select the priority that should apply to all internal calls for all UCD groups (1 = highest priority, 10 = lowest priority).
6. For each trunk (B channel), select the priority, in the associated **Priority** drop-down list, that is to apply to external calls over this trunk to all UCD groups (1 = highest priority, 10 = lowest priority). For every B channel, an individual priority can be set.
7. Click on **Apply** followed by **OK**.

### 15.6.5 Accepting UCD Calls Automatically

This feature lets agents accept incoming calls without any additional operations (Automatic Incoming Call Connection AICC).

This feature can only be used if the agent's phone has a headset and Disconnect key. An audible tone notifies the agent via the headset about an incoming call that is then automatically put through.

An agent can clear down an ongoing call by pressing the Disconnect key.

The "AICC" feature is not activated by default. Activation is performed on a group-specific basis and applies to all agents in a UCD group, irrespective of whether or not the agent's phone features a headset.

### 15.6.5.1 How to Change the Automatic Acceptance of UCD Calls

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Incoming Calls**.
3. Navigate in the menu tree under **Incoming Calls > UCD > ...** down to the desired UCD group.
4. Click on the **Edit UCD Groups** tab.
5. Select one of the following options:
  - If you want the UCD agents of this UCD group to be able to accept incoming calls without additional operating steps, select **yes** in the **AICC** drop-down list.
  - If you do not want the UCD agents of this UCD group to be able to accept incoming calls without the usual operating steps (such as picking up the handset, for example), then select **no** in the **AICC** drop-down list
6. Click on **Apply** followed by **OK**.

### 15.6.6 UCD queue

If all agents of a UCD group are busy, incoming calls can be placed in a queue. Announcements or music can be played for on-hold callers.

If a call that is waiting in the queue for a specific period (first call cycle) is not accepted by the agent longest in **available** state, this agent's state is changed to **not available** and the call is transferred to the next available agent. If this agent does not answer the call either within a set period (second call cycle), the status of this agent is changed to **not available**. The call is routed to the overflow destination if the status of all agents is **not available**.

For every UCD group, the maximum number of calls in the queue can be set individually. If the maximum number of waiting calls is exceeded, further calls can be routed to an overflow destination.

You can select an external destination, another UCD group, an internal station or a group as the overflow destination. If the overflow destination is another UCD group and if all other agents in this UCD group are busy, the call remains in the queue associated with the original group and is also entered in the queue of the other UCD group (overflow destination).

## Working in a Team (Groups)

An agent can query the number of calls in the queue for his or her UCD group with a specially programmed function key or via the assigned menu item or code.

### Calls in a Queue

The maximum number of calls in the queue is 30 for UCD groups 1 through 59 and 72 for UCD group 60.

The minimum number of calls in the queue is zero. There is no queue if the minimum number is set to zero. Calls are redirected or rejected directly at an overflow destination if there is no agent available.

### 15.6.6.1 How to Change the UCD Queue

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Incoming Calls**.
3. Navigate in the menu tree under **Incoming Calls > UCD > ...** down to the desired UCD group.
4. Click on the **Edit UCD Groups** tab.
5. Select the number of primary ring cycles in the **Prim. ring cycles** drop-down list. This is defined in ring cycles, that is, in increments of five seconds. This setting specifies how long a call remains in the queue if not accepted by the agent longest in "available" state. The call is then forwarded to the next available agent.
6. Select the number of secondary ring cycles in the **Sec. ring cycles** drop-down list. This is defined in ring cycles, that is, in increments of five seconds. This setting specifies how long a call remains in the queue if not accepted by the next available agent.
7. Select whether a change of announcement (Ann. change) should take place:
  - If the queued callers should hear the announcement only once, select the item **once** in the **Ann. change** drop-down list.
  - If the queued callers should hear cyclically varying announcements, select the item **cyclic** in the **Ann. change** drop-down list.
8. In the field **Ann. delay time**, enter the time after which a caller in the queue receives an announcement. The specification is made in seconds.
9. Click on **Apply** followed by **OK**.

### 15.6.7 UCD Overflow

UCD calls can be forwarded to an overflow destination if they are not accepted by the agents of a UCD group and if no queue was set up or if the maximum number of calls in the queue was reached.

---

**NOTICE:** The UCD overflow concept defines only one overflow destination, the second CDL entry. Therefore, the announcements are played only when the call is at the UCD overflow destination and not for the whole ringing cycle. When a call leaves the UCD overflow destination then default MOH is opened.

---

The maximum number of calls in the queue can be individually set for every UCD group. If this number is exceeded, further calls can be routed to an overflow destination.

If you do not want a queue to be created, you can enter zero as the maximum number of calls in the queue. Unanswered calls are then immediately routed to an overflow destination.

#### Dependencies

| Topic         | Dependency                                                             |
|---------------|------------------------------------------------------------------------|
| AutoAttendant | It is not possible to use an AutoAttendant as an overflow destination. |

### 15.6.7.1 How to Change the UCD Overflow

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Incoming Calls**.
3. Navigate in the menu tree under **Incoming Calls > UCD > ...** down to the desired UCD group.
4. Click on the **Edit UCD Groups** tab.
5. Enter the maximum number of queued calls in the **Queued calls** field. Calls exceeding this number are redirected to an overflow destination.
6. Enter the desired time in the **Overflow time** field. The specification is made in seconds.  
Note: this setting is relevant only when an external UCD application is connected. If a queued call is not accepted by the UCD application within the overflow time, the call is processed further by the communication system in accordance with the Call Management specifications.
7. Click on **Apply** followed by **OK**.

### 15.6.8 UCD Night Service

An individual night service can be configured for every UCD group. Night service can also be activated and deactivated by every agent

## Working in a Team (Groups)

in a UCD group. Following activation, all calls for this UCD group are forwarded to the night destination.

The night service destination can be defined as an internal station, another group, an announcement/MoH, the voicemail box of the communication system or an external destination.

### Activating / Deactivating

Activation or deactivation of the UCD night service can be achieved via a programmed function key or via the associated menu items or via codes. The call number of the desired night service destination must be entered at activation.

For more information on the communication system's night service, see [Night Service](#).

### Dependencies

| Topic                                | Dependency                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Subscriber state                     | If you activate the UCD night answer feature, your current subscriber status does not change. A forced logout of the agents who are still logged in does not occur.                                                                                                                                                                                                     |
| Communication system's night service | The communication system's UCD night answer and night service can be activated and deactivated independently of one another. Example: A UCD group was entered as the night service destination for the communication system. Calls that reach this UCD group via the communication system's night service remain in this UCD group, irrespective of a UCD night answer. |
| Existing calls                       | Existing calls are not affected by the activation of UCD night answer.                                                                                                                                                                                                                                                                                                  |

## 15.6.9 Announcements / Music on Hold for UCD

Music On Hold (MoH) or announcements can be played to callers who cannot be switched through directly to the agents of a UCD group. Music on hold and announcements can be assigned to each UCD group individually.

You have the following options:

- Music On Hold (MOH)

Queued callers can be played music from the integrated source of the communication system. Further Music on Hold file(s) can be loaded from a PC into the communication system.

For more information, see [Music on Hold](#)

- Announcements

Queued callers can be played integrated announcements. Further announcements can be loaded from a PC into the communication system.

For more information, see [Announcements](#)

The time up to the start of the announcement can be set (**Ann. delay time**). You can suppress the announcement by setting the maximum value (600 seconds). It is assumed here that the call will be accepted within this time.

### 15.6.9.1 How to Change Announcements / Music on Hold for UCD

You can use the **UCD** wizard to configure announcements and/or Music on Hold for UCD groups.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > User Telephony**.
3. Click on **Edit** to start the **UCD** wizard. The list of all possible UCD groups is displayed.
4. To change the announcements / music on hold for a UCD group, click **Edit** in the row containing the required UCD group.
5. Click **OK & Next** until the **Edit announcement/overflow** window appears.
6. Select the announcement of the UCD group in **Announcement** drop-down list. You can optionally select an announcement (if configured) or the internal Music On Hold (MOH). After you select the announcement, the **Ann. delay time** field appears.
7. In the field **Ann. delay time**, enter the time (in seconds) after which a caller in the queue is to receive an announcement.
8. Click on **OK** to accept the entries.
9. If you want to add announcements / Music on Hold to another UCD group, repeat steps 4 through 8.
10. Click on **OK & Next** followed by **Finish**.

### 15.6.10 Transfer to UCD Groups

Internal and external calls can be transferred to UCD groups. If a call is not answered within a certain period, a recall is carried out.

The recall time is defined via the time parameter **Monitoring transfer to a UCD group prior to answer**. The default setting is 300 seconds. This setting can be changed by an administrator with the **Expert** profile in **Expert mode**.

#### Dependencies

| Topic         | Dependency                                                                                                    |
|---------------|---------------------------------------------------------------------------------------------------------------|
| Announcements | Announcements can be played for the external transferred calls. This is not possible for internal calls.      |
| Recall time   | The recall time for a transfer to UCD groups differs from the recall time for transfers to other subscribers. |

### 15.6.10.1 How to Edit the Recall Time for Calls Transferred to UCD Groups

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony** > **Basic Settings** in the navigation tree.
3. In the menu tree, click **Basic Settings** > **System** > **Time Parameters**.
4. Enter the desired recall time for the time parameter **Monitoring transfer to a UCD group prior to answer** (default setting = 300 seconds). If a call is not answered before this period expires, a recall occurs
  - a) Select the desired time base in the **Base** drop-down list.
  - b) In the **Factor** field, enter the value with which the time base is to be multiplied.
5. Click on **Apply** followed by **OK**.

### 15.6.11 Releasing UCD from Analog Lines

When UCD calls over analog lines are not answered within a specific time, these calls are released. This prevents analog lines from freezing up.

The release time is defined via the time parameter **Monitoring a UCD call on an analog line**. The default setting is 300 seconds. This setting (from 0 to 255 minutes) can be changed by an administrator with the **Expert** profile in **Expert mode**.

#### 15.6.11.1 How to Edit the Release Time for UCD Calls over Analog Trunks

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.

2. Click **Telephony** > **Basic Settings** in the navigation tree.
3. In the menu tree, click **Basic Settings** > **System** > **Time Parameters**.
4. Enter the desired release time for the time parameter **Monitoring a UCD call to an analog line** (settable from 0 to 255 minutes; default setting = 300 seconds). Calls that are not answered before this time expires are released.
  - a) Select the desired time base in the **Base** drop-down list.
  - b) In the **Factor** field, enter the value with which the time base is to be multiplied.
5. Click on **Apply** followed by **OK**.

## 16 Call Routing

The communication system provides several ways to assign calls to a desired destination, such as classes of service (toll restriction), day and night service, least cost routing and Call Admission Control (CAC). Emergency calls can be made from any configuration.

### 16.1 Classes of Service (Toll Restriction)

Classes of service (Toll restriction) control subscriber access to external lines that may be subject to toll charges.

---

**Related concepts**

[Configuring Stations](#) on page 427

#### 16.1.1 Class of Service (COS) Groups and Classes of Service

Every subscriber is assigned a Class of Service group that defines the class of service (i.e., the permissions) of the subscriber for incoming and outgoing calls.

For each route, one of the following classes of service is defined in the COS group:

- **Internal**

The subscriber may only make internal calls.

- **Outward-restricted**

The subscriber may only answer (not make) external calls.

- **Allowed list 1-6**

The subscriber may only dial the external numbers defined in the Allowed list. Outward-restricted trunk access applies if no call number is entered.

- **Denied list 1-6**

The subscriber is not permitted to dial the external numbers defined in the Denied list. Unrestricted trunk access applies if no call number is entered.

- **Unrestricted**

Subscribers can answer and set up incoming and outgoing external calls without restriction.

Some of the 15 possible COS groups are preset with the same class of service for all routes and given meaningful names (e.g., COS group **International** with the class of service **Unrestricted** or COS group **Incoming** with the class of service **Outward-restricted**). The names of all COS groups can be changed by the administrator.

---

**NOTICE:** By default every station belongs to COS group 7 and this can be changed. Also every trunk belongs to COS group 7 but this is not configurable so

as a result COS group 7 should not be used and let it have Unrestricted access to every Trunk Group.

---

### Dependencies

| Topic           | Dependency                                                                              |
|-----------------|-----------------------------------------------------------------------------------------|
| Speed Dials     | System speed dial destinations can be selected independently of the assigned COS group. |
| LCR             | The Class of Service Groups (Toll Restriction) and LCR Class of Service are different.  |
| Call forwarding | For forwarded calls, the caller's class of service applies.                             |

## 16.1.1.1 How to Edit COS Group Names

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Telephony > Classes of Service**.
3. Click on **Day: Class of Service Group** in the menu tree.

---

**NOTICE:** You can also click in the menu tree on **Night: COS group** to achieve the same result.

---

4. Click on the desired COS group in the menu tree.
5. Click on the **Edit COS Group** tab.
6. Enter the name of the COS group in the **Class of Service Group** field.
7. Click on **Apply**, followed by **OK**.

## 16.1.1.2 How to Edit the Classes of Service of a COS Group

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Telephony > Classes of Service**.
3. Click on **Day: Class of Service Group** in the menu tree.
4. Click on the desired COS group in the menu tree.
5. Click on the **Edit COS Group** tab.
6. Select to desired class of service for the Day mode for each route being used from the drop-down list.

7. If required, select the **Networking** class of service for the Day mode.
8. Click on **Night: Class of Service Group** in the menu tree.
9. In the menu tree, click on the COS group you have just edited.
10. Click on the **Edit COS Group** tab.
11. Now select the desired class of service for the Night mode for each route being used from the drop-down list.
12. If required, select the **Networking** class of service for the Night mode.
13. Click on **Apply**, followed by **OK**.

### 16.1.1.3 How to Display All Stations of a COS Group

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Telephony > Classes of Service**.
3. Click on **Day: Class of Service Group** in the menu tree.

---

**NOTICE:** You can also click in the menu tree on **Night: COS group** to achieve the same result.

---

4. Click on the desired COS group in the menu tree.
5. Click on the **Display COS Member** tab. All subscribers to whom the selected COS group is assigned are displayed with their respective call numbers and names.

### 16.1.2 Allowed and Denied Lists

Allowed and Denied lists are used to define which external phone numbers may and may not be dialed by the subscribers.

**Allowed lists** contain the digit strings permitted at the start of a phone number. The subscriber may only dial the external numbers defined in the Allowed list. Make sure that all required emergency numbers are also included in the list!

**Denied lists** contain the digit strings that are not allowed at the start of a phone number. The subscriber is not permitted to dial the external numbers defined in the Denied list. Make sure that no emergency numbers are included in the list!

The **List of Emergency Numbers** is a special case of the Allowed list. The subscriber may only dial the emergency numbers entered in the list. Make sure that all required emergency numbers are included in the list!

It is not necessary to enter the complete phone numbers in the lists. To permit users to dial (toll free) 0800xxx numbers, for example,

only 0800 needs to be entered here. Since these lists are only for outgoing external calls, it is not necessary to include the CO access code with the numbers you enter. Entering a # sign at the start of a denied number prevents the toll restriction from being bypassed for system telephones when an analog CO line is to be seized using DTMF signaling or when switching to DTMF during the dialing.

The Administrator can use **exception filters** for any Denied list to define which digits should not be compared with the corresponding Denied list. The communication system excludes the set range of digits before the digit analysis. By prohibiting the characters \* and #, subscribers are prevented from entering these characters to bypass the toll restriction.

### Configuration Limits

| Feature                                                                        | Number |
|--------------------------------------------------------------------------------|--------|
| Allowed list 1: long, 100 entries                                              | 1      |
| Allowed lists 2-6: short, 10 entries                                           | 5      |
| Denied list: long, 50 entries                                                  | 1      |
| Denied lists 2-6: short, 10 entries                                            | 5      |
| Number of characters in list entries (digits 0 - 9 and the characters * and #) | 26     |

## 16.1.2.1 How to Create a List of Emergency Numbers

You can create a list of emergency numbers for the "Emergency Numbers" COS group with the **Class of Service** wizard.

### Prerequisites

You are logged in at the WBM.

Your communication system is connected to a trunk.

### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > User Telephony**.
3. Click on **Edit** to start the **Classes of Service** wizard.
4. Enter an emergency phone number in the input field and click on **Add**. The phone number is added to the list of emergency numbers.
5. If you want to enter more numbers into the list of emergency numbers, repeat the previous step.
6. Keep clicking on **OK & Next** until you complete the configuration with **Finish**.

### 16.1.2.2 How to Create an Allowed and a Denied List

You can create an Allowed and a Denied list with the **Class of Service** wizard.

#### Prerequisites

You are logged in at the WBM.

Your communication system is connected to a trunk.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > User Telephony**.
3. Click on **Edit** to start the **Classes of Service** wizard.
4. Click on **OK & Next**.
5. Enter an allowed phone number without the CO access code in the input field and click on **Add**. The phone number is added to the Allowed list.
6. If you want to enter more numbers into the Allowed list, repeat the previous step.
7. Click on **OK & Next**.
8. Enter an denied phone number without the CO access code in the input field and click on **Add**. The phone number is added to the Denied list.
9. If you want to enter more numbers into the Denied list, repeat the previous step.
10. Keep clicking on **OK & Next** until you complete the configuration with **Finish**.

### 16.1.2.3 How to Create Additional Allowed Lists

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Telephony > Classes of Service**.
3. Click **Classes of Service > Allowed Lists** in the menu tree.
4. Click on the desired allowed list in the menu tree.
5. Click on the **Add Station Number** tab.
6. Enter the external **Call number** without the seizure code.
7. Click on **Apply**, followed by **OK**.
8. If you want to add more call numbers, repeat steps 6 and 7.
9. If you want to create additional allowed lists, repeat steps 4 through 7.
10. You can view all the phone numbers of the selected Allowed list on the **Display List** tab.

### 16.1.2.4 How to Create Additional Denied Lists

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Telephony > Classes of Service**.
3. Click **Classes of Service > Denied Lists** in the menu tree.
4. Click on the desired denied list in the menu tree.
5. Click on the **Add Station Number** tab.
6. Enter the external **Call number** without the seizure code.
7. Click on **Apply**, followed by **OK**.
8. If you want to add more call numbers, repeat steps 6 and 7.
9. If you want to create additional denied lists, repeat steps 4 through 7.
10. You can view all the phone numbers of the selected Denied list on the **Display List** tab.

### 16.1.2.5 How to Display all Call Numbers in a Denied List

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Telephony > Classes of Service**.
3. Click **Classes of Service > Denied Lists** in the menu tree.
4. Click the desired number on the Denied List in the menu tree.

### 16.1.2.6 How to Display all Call Numbers in an Allowed List

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Telephony > Classes of Service**.
3. Click **Classes of Service > Allowed Lists** in the menu tree.
4. Click on the desired number on the Allowed List in the menu tree.

### 16.1.2.7 How to Edit the Analysis Filter for the Denied List

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Telephony > Classes of Service**.
3. Click **Classes of Service > Denied Lists** in the menu tree.
4. Click the desired number on the Denied List in the menu tree.
5. Click on the **Edit Analysis Filter** tab.
6. Select a range in the **From digit** and **To digit** drop-down lists.

This enables a range within a call number to be configured. The starting position of the range is selected via the **From digit** drop-down list and the end position via **To digit**.

The default setting of \* and # for this field is intended as a means of blocking these characters, since \* and # could be used as "dummy" characters, which are not evaluated in the Central Office and would thus bypass the toll restriction. Entering \* and # in the Denied list causes these characters have no effect, so only the dialed digits are evaluated.

7. Enter the character(s) to be hidden in the **Character** field.
8. Click on **Apply** followed by **OK**.

### 16.1.3 Blacklist

A blacklist is available within the OpenScape Business system that allows blocking of incoming calls from specific caller numbers (CLI) and from calls without caller number or restricted presentation of caller number.

The blacklist supports up to 100 numbers with max 25 digits either in canonical format (e.g., +4989) or in international format (e.g., 004989). Supported characters are 0-9 digits and the '+' character. The '+' character refers to the international prefix that is configured in the system. It has to be entered always at the first position. Number fragments starting from the beginning of the caller number (CLI) are allowed. A logical check is performed during the entry of a number into the blacklist. The number is refused if it has already been entered or if it is covered by a number fragment.

Check of transmitted caller numbers is always done using the international format. Caller numbers are converted into the international format according to the route data, if they are transmitted in other formats.

The blacklist is applied to all Central Office trunks that are configured in the system. It supports multiple Central Office/ Telephony Providers with different country / local area codes.

An event log entry is created by the blacklist for each blocked call.

Within an OpenScape Business network, the blacklist needs to be configured in every node that is connected to Central Office / Telephony Providers, respectively in the gateways. Network internal calls are not restricted by the blacklist.

The blacklist can be enabled / disabled by the system administrator. In addition, a separated flag can be set for the blocking of anonymous calls.

**Service log** logs contain information about blocked called numbers. Log entries that correspond to blocked called numbers contain the EventText **!BlackListed Call:**. To find the called number that was blocked, you need to check the last two digits of the log entry. These digits (in hexademical form) correspond to the position in the blacklist that contains the blocked number. If these digits are ff, then the blocked call is anonymous.

### Dependencies

Calls with CLI suppression are not blocked as anonymous calls by the system in case that the flag **Call number suppression override** is set within the system. The caller number has to be entered explicitly in the blacklist in this case. The flag **Call number suppression override** is disabled in factory default settings. It can only be enabled using the Manager E.

The mobility feature of the system can be affected by the blacklist if mobile numbers of Mobility Users are entered in the blacklist. In this case the call to the DISA port in Call Through mode is blocked by the blacklist.

## 16.1.3.1 How to Create a Blacklist for incoming calls in Expert mode

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert mode**.
2. In the navigation tree, click on **Telephony Server > Classes of Service**.
3. Click **Classes of Service > Blacklist** in the menu tree.
4. Click on the **Add Call Number** tab.
5. Enter the **Call number**.
6. Click on **Apply**, followed by **OK**.
7. If you want to add more call numbers, repeat steps 5 and 6.
8. The added call numbers of the Blacklist are displayed on the **Display list** tab under **Blacklist** area or under **Blacklist** in the menu tree.

The system administrator should be able to block unwanted callers permanently.

- Enable the check box **Block Anonymous calls** in Anonymous calls area in order to block an anonymous incoming call.

---

**NOTICE:** Anonymous calls are defined as the calls for which the originator number will not be displayed to the user.

---

- Enable the check box **Blacklist feature on** in Blacklist area in order to block specific call numbers.

---

**NOTICE:** Blacklist feature is based only on calling party number (call originator) given by the provider.

---

### 16.1.3.2 How to Edit/Delete Call Numbers in the Blacklist

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert mode**.
2. In the navigation tree, click **Telephony Server > Classes of Service**.
3. Click **Classes of Service > Blacklist** in the menu tree.
4. Click on the desired number on the Blacklist in the menu tree.
5. The administrator can edit or delete the selected entry.

In order to edit the selected entry:

- Click on the **Edit Station Number** tab.
- Enter the desired call number in the **Call Number** field.
- Click on **Apply** followed by OK.

In order to delete the selected entry:

- Click on the **Delete Call Number** tab.
  - Enter the desired call number in the **Call Number** field.
  - Click on **Apply** followed by OK.
6. The system administrator should be able to block unwanted callers permanently.
    - Enable the check box **Block Anonymous calls** in **Anonymous calls** area in order to block an anonymous incoming call

---

**NOTICE:** Anonymous calls are defined as the calls for which the originator number will not be displayed to the user.

---

- Enable the check box **Blacklist feature on** in **Blacklist** area in order to block specific call numbers.

---

**NOTICE:** Blacklist feature is based only on calling party number (call originator) given by the provider.

---

### 16.1.3.3 How to Display Call Numbers in the Blacklist

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert mode**.
2. In the navigation tree, click **Telephony Server > Classes of Service**.
3. Click **Classes of Service > Blacklist** in the menu tree.
4. Call numbers are displayed under **Blacklist** in the menu tree or in the **Display List** tab under **Blacklist** area.

### 16.1.3.4 How to Create a Blacklist for incoming calls in Setup

You can create a Blacklist with the **Blacklist for incoming calls** wizard.

#### Prerequisites

You are logged in at the WBM.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > Central Telephony**.
3. Click on **Edit** to start the **Blacklist for incoming calls** wizard.
4. Enter an allowed call number in the input field and click on **Add**. The call number is added to the Blacklist.
5. Click on **OK & Next**.
6. If you want to enter more numbers into the Blacklist, repeat the steps 4 and 5.
7. If you want to delete a call number, click on **Delete**.
8. Keep clicking on **OK & Next** until you complete the configuration with **Finish**.

## 16.1.4 Night Service

During the night, incoming and outgoing calls can be treated differently than during the day. Incoming calls can be redirected to a night service destination, and internal subscribers can have different classes of service for their phones than during the day. The system-wide switching between the day and night service is performed automatically at a time specified by the administrator.

### Scheduled Night Service

#### Variable Night Service

Any phone can serve as a night service destination, provided the associated class of service group allows incoming calls. A telephone with internal authorization only cannot be entered as a night service destination. If the night service destination has activated call forwarding, this is followed.

In order to prevent toll fraud, for example, a COS group can be assigned different classes of service for the night and day modes.

In addition, you can also specify a different intercept position for the night service as opposed to the day service. This intercept position can be an individual station or a group.

The communication system activates and deactivates the night service in accordance with a schedule defined by the administrator.

---

**INFO:** With the scheduled night service, the active settings apply to ALL stations of the communication system. In the case of automatic COS changeover after time, all subscribers are combined into groups (profiles).

---

The variable night service is activated and deactivated manually by an authorized subscriber. The calls are handled as configured by the administrator in the call destination lists

By default, the first subscriber (with the station number "100") in the communication system can activate and deactivate the night service. The administrator can authorize up to five subscribers to activate and deactivate the night service.

#### UCD Night Service

An individual night service can be configured for every UCD group. It can be activated and deactivated independently of the system-wide night service. It can also be activated and deactivated by every agent in a UCD group. The current status of the individual agents and existing calls are not affected. Following activation, all calls for this UCD group are forwarded to the night service destination.

Another UCD group, an internal station or an external destination can all be set as a night service destination.

### 16.1.4.1 How to Assign Classes of Service for the (Manual) Night Service

You can use the **Classes of Service** wizard to assign individual subscribers the authorization to switch the communication system from the day to night service (and vice versa) via their telephones. The switch between day and night service occurs via the telephone by using a code.

**Prerequisites**

You are logged in at the WBM. Your communication system is connected to a trunk.

**Step by Step**

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > User Telephony**.
3. Click on **Edit** to start the **Classes of Service** wizard.
4. Click on **OK & Next** until you see the **Authorized station for night service** window.
5. Mark the desired station in the list under **Stations** and click **Add**. The station will then appear in the list under **Authorized station**.
6. Click on **OK & Next**.
7. A list of all authorizations (classes of service) appears in the **System Overview** window.
8. Click on **Finish**.

**16.1.4.2 How to Delete Classes of Service for the Manual Night Service**

The **Classes of Service** wizard can be used to delete the authorization of a station to switch from the day to night service.

**Prerequisites**

You are logged in at the WBM. Your communication system is connected to a trunk.

**Step by Step**

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > User Telephony**.
3. Click on **Edit** to start the **Classes of Service** wizard.
4. Click on **OK & Next** until you see the **Authorized station for night service** window.
5. Mark the desired station (whose class of service you want to delete) in the list under **Authorized station** and click **Delete**.
6. Click on **OK & Next**.
7. A list of all authorizations (classes of service) appears in the **System Overview** window.
8. Click on **Finish**.

**16.1.4.3 How to Configure the Scheduled Night Service****Prerequisites**

You are logged into the WBM with the **Expert** profile.

**Step by Step**

1. In the navigation bar, click on **Expert Mode**.

2. In the navigation tree, click on **Telephony > Classes of Service**.
3. Click in the menu tree on **Autom. night service > Monday** (Monday is just an example; all days of the week are available).
4. Under **Edit Zone**, select one of four possible zones to which a specific Class of Service should apply.
5. Specify the time (in hours and minutes) for this class of service with **Start** and **End**.
6. Under **Night Call no.**, select the authorized subscriber.  
Your settings for each zone will be displayed in the **Autom. night service** field.
7. Click on **Apply** followed by **OK**.

### 16.1.4.4 How to Configure a Special Day for the Scheduled Night Service

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Telephony > Classes of Service**.
3. Click **Classes of Service > Special Days** in the menu tree.
4. Select the year for which you want to define a holiday by using **>>** or **<<**.
5. Then use **>>** or **<<** to select the month for that holiday.
6. Then click in the calendar on the day to be defined as a holiday.
7. Enter a designation for the holiday under **Name**.
8. Click on **Apply** followed by **OK**.

### 16.1.4.5 How to Delete a Special Day for the Scheduled Night Service

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Telephony > Classes of Service**.
3. Click **Classes of Service > Autom. night service > Special Days** in the menu tree.
4. Under **Day**, click on the trash can to the left of the holiday to be deleted.
5. Click on **Apply**, followed by **OK**.

## 16.1.5 Automatic COS Changeover after Time

For the "automatic COS changeover after time", the stations are grouped into so-called station profiles that define which COS group applies in which time interval of the week. For each station profile, you can configure a schedule.

### Dependencies

Differences between "automatic COS changeover after time" and the "scheduled night service":

- Automatic COS changeover after time applies only to the day service (not the night service).
- Reaching the call destination via Call Management

This takes place via Call Management and does not depend on automatic class-of-service changeover. There are different call lists for day and night.

- With the scheduled night service, a distinction can only be made between day and night shifts, and this applies to ALL stations.
- Intercept destinations

The intercept destination is only defined by the scheduled night service.

- COS group:

During the night, the COS group is in a constant (configurable) relationship with the station; the automatic class of service changeover after a timeout has no impact on this.

During the day, the COS group may be changed during certain times of the day or also be in a fixed (configurable) relationship with the subscriber.

| Topic         | Dependencies                                                                                                                                                                                                                                             |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Night service | The "Automatic Night Service" feature has priority over the "Automatic COS Changeover after Time" feature. If the night service is activated, the COS group is handled normally and applied for the night. The schedule is only relevant during the day. |
| Networking    | Automatic COS changeover and night service do not function across all nodes.                                                                                                                                                                             |

### 16.1.5.1 Schedule

The schedule is used to control the Classes of Service for the "automatic COS changeover after time". It is possible to configure up to eight COS changeovers per day for each day of the week.

Each day begins at 00:00 hours. Entering the end time in each of the columns delineates the time zones. In the following example of a schedule, the individual COS changeovers are referred to as CG2, CG4 and CG5.

## Call Routing

The screenshot displays the 'COS schedule' configuration window. At the top, there are tabs for 'COS: Station', 'COS: Day', 'COS: Night', 'Allowed/Denied numbers', and 'Autom. night service'. Below these are 'Special days', 'Group assignment', 'Overview', and 'COS schedule' tabs. The 'COS schedule' tab is active, showing a grid with columns for days of the week and a 'Special da' column. The rows represent time slots from 00:00 am to 06:00 pm. The grid is populated with COS groups: CG 1 for most of the day, CG 2 for Monday and Tuesday from 08:00 am to 12:00 pm, and CG 1 for Wednesday and Thursday from 04:00 am to 07:00 am. To the right of the grid is a vertical list of 15 COS groups (CG 1 to CG 15) with corresponding colored buttons. At the bottom are 'Reset', 'Apply', and 'Help' buttons.

|          | Monday | Tuesday | Wednesday | Thursday | Friday | Saturday | Sunday | Special da |
|----------|--------|---------|-----------|----------|--------|----------|--------|------------|
| 00:00 am | CG 1   | CG 1    | CG 1      | CG 1     | CG 1   | CG 1     | CG 1   | CG 1       |
| 01:00 am |        |         |           |          |        |          |        |            |
| 02:00 am |        |         |           |          |        |          |        |            |
| 03:00 am |        |         |           |          |        |          |        |            |
| 04:00 am |        |         | CG 1      | CG 1     |        |          |        |            |
| 05:00 am |        |         | CG 1      | CG 1     |        |          |        |            |
| 06:00 am |        |         | CG 1      | CG 1     |        |          |        |            |
| 07:00 am |        |         | CG 1      | CG 1     |        |          |        |            |
| 08:00 am | CG 2   |         |           |          |        |          |        |            |
| 09:00 am | CG 2   |         |           |          |        |          |        |            |
| 10:00 am | CG 2   |         |           |          |        |          |        |            |
| 11:00 am | CG 2   |         |           |          |        |          |        |            |
| 12:00 am | CG 2   |         |           |          |        |          |        |            |
| 01:00 pm | CG 2   |         |           |          |        |          |        |            |
| 02:00 pm | CG 1   |         |           |          |        |          |        |            |
| 03:00 pm |        |         |           |          |        |          |        |            |
| 04:00 pm |        |         |           |          |        |          |        |            |
| 05:00 pm |        |         |           |          |        |          |        |            |
| 06:00 pm |        |         |           |          |        |          |        |            |

A station can have different class of service groups for the day and night.

If "Automatic COS changeover" is set system-wide for the day, the profile and schedule that is configured will determine the COS group that is assigned to a station. At night, the station has the same COS group as previously assigned (via the night service).

Automatic COS changeover after time is disabled by default

The communication system supports only one time zone (world time). Remote station groups working in different time zones are set to the communication system's time zone.

The schedule can only be configured using Manager E.

### 16.1.6 CON Groups

The CON Groups feature is used to define which subscribers of the communication system can establish connections to which other subscribers of the communication system. This feature is used for tenant systems, for example.

CON groups can also be used to configure which lines individual subscribers can access for incoming and outgoing calls..

The CON functionality does not access the applications; it is only significant for telephony. The presentation of the presence status, for example, is not prevented by an access restriction through CON.

The CON feature is implemented in two steps:

- Create CON groups
- Configure CON matrix

---

**INFO:** The CON feature should not be used in conjunction with UC functionality, since this could result in limitations.

---

### 16.1.6.1 CON groups (traffic restriction groups)

CON groups (also referred to as traffic restriction groups) control allowed and denied connections between subscribers and lines of the communication system.

Using CON groups, specific stations and lines can be combined into groups.

You can assign a CON group to individual stations and lines in the communication system via the CON Group Assignment. When coding the connection matrix, you can then access these groups and define which subscribers can reach which other subscribers and which lines can be accessed by them.

All stations and CO trunks are assigned to CON group 1 by default. This provides all subscribers with unrestricted access to other subscribers as well as trunks, both incoming and outgoing. The CON matrix specifies which of the six CON groups can set up connections to which other CON groups.

A maximum of 64 CON groups can be configured.

---

**NOTICE:** CON group rules do not apply to SIP phones when a conference is initiated from a SIP phone between two restricted trunks.

---

### 16.1.6.2 Assigning Speed-Dialing Numbers to CON groups

Every CON group is assigned a range of System Speed Dialing (SSD) destinations. When a subscriber dials an SSD, the associated CON group is checked to verify if the subscriber is authorized to do so. Dialing is performed if this speed-dialing number lies within the correct range for the relevant CON group, otherwise an error message is output.

When a user dials a speed-dial number, the system identifies the ITR group for the number, which determines whether or not the user is

authorized to dial that number. If not, an error message appears, and the dialing attempt is rejected

Speed-dial number ranges can overlap in the ITR groups.

By default, all speed-dial numbers are assigned to ITR group 1.

The speed-dial number ranges can overlap in the CON group. The following are permitted, for example:

| CON group | SSD range |
|-----------|-----------|
| 1         | 0000-7999 |
| 2         | 0050-0150 |
| 3         | 0200-0500 |

Please note, however, that you cannot enter individual system speed-dial (SSD) numbers or multiple SSD ranges in a CON group instead of a range. The following are not permitted, for example:

| CON group | SSD range            |
|-----------|----------------------|
| 1         | 0000, 0005, 0010     |
| 2         | 0050-0100, 0300-0500 |

### 16.1.6.3 How to Assign Stations to a CON Group

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Telephony > Classes of Service**.
3. Click **Classes of Service > CON Group Assignment > CON Group Assignment** in the menu tree.
4. Select the entry with the desired traffic restriction group for one of the stations displayed in the **Stations** column in the **Group** drop-down list.
5. Click on **Apply**, followed by **OK**.

### 16.1.6.4 How to Assign a Trunk to a CON Group

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Telephony > Classes of Service**.
3. Click **Classes of Service > CON Group Assignment > Trunk to CON Group** in the menu tree.

4. Select the entry with the desired traffic restriction group for one of the trunks displayed in the **Trunks** column in the **Group** drop-down list.
5. Click on **Apply**, followed by **OK**.

### 16.1.6.5 How to Edit the CON Matrix

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Telephony > Classes of Service**.
3. Click on **Classes of Service > CON Matrix** in the menu tree.
4. Edit the connection options as follows:
  - If you want to block all connection methods, click **Block all**.
  - If you want to release all connection methods, click **Release all**.
  - If you want to release only the group-internal connection methods, click **Group-internal only**.
  - If you want to selectively edit one connection method between two CON groups, click in the field at the intersection point of these CON groups in the CON matrix. Click repeatedly in the field to release or block the connection methods in one direction, the other direction, or both directions.
5. Click on **Apply** followed by **OK**.

### 16.1.7 System Telephone Lock (COS Changeover)

The central lock code enables an authorized subscriber (possibly the administrator) to set a comprehensive lock on most of the phone functions for other subscribers. Only the following features are still available: internal calls, system speed dialing and conferencing with internal subscribers. This lock code can be deactivated by either the authorized subscriber or the locked subscriber by entering their own lock codes.

The lock code of the phone for the which the lock is to be activated or deactivated by the authorized subscriber is not required to set the lock.

By default, the authorized subscriber is the subscriber with the call number "100" (reconfigured).

### 16.1.8 Individual Lock Code (Locking the Phone)

If the individual telephone lock is set for a phone, external calls cannot be conducted from that phone, and the user settings cannot be modified.

Emergency numbers can be dialed even if the phone is locked.

You can still conduct internal calls.

Incoming calls can be redirected to internal subscribers.

A locked telephone only supports features that do not require external dialing. The System Speed Dialing feature is the exception to this rule.

To remind subscribers that the station is locked, the phone receives a steady tone (special dial tone). In addition, on phones equipped with a display, the message "Unlock Phone" appears.

Subscribers can lock their phones via a key or code by entering their personal lock codes and then unlock the phone again as required.

The phone lock code must be configured first before the phone lock can be used. The phone lock code is set to 00000 by default for all phones and can be set individually. To do this, the must be unlocked. The phone lock code must always be 5 digits. Only digits 0-9 are allowed. If the subscriber has forgotten the phone lock code, he or she can have it reset to the default value 00000 by an authorized user (i.e., the first station in the system with the call number "100" or the administrator).

### 16.1.8.1 How to Reset the Individual Lock Code

Use the **Station name and release** wizard to reset the individual lock code on a phone.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > User Telephony**.
3. Click **Edit** to start the **Station Name and Release** wizard. The **Name Configuration and Unlock for Stations and Groups** window appears.
4. Enable the check box **System telephone lock reset**.
5. Click **OK & Next** followed by **Finish**.

### 16.1.9 Collect Call Barring per Trunk (for Brazil only)

Collect call barring per trunk provides for automatic release of incoming collect calls. This feature is available only in the country settings for Brazil. The setting is ignored in all other countries.

Users can configure it individually for each analog trunk. Ringback protection can be configured individually for each analog trunk. If this feature is enabled for a trunk, the system opens the loop for two seconds (default value) one second (default value) after an incoming

call is accepted. This ensures that collect calls are released in the network, while other calls continue unaffected.

### **16.1.10 Ringback Protection per Station (for Brazil only)**

Ringback protection per station (also called call collect barring per station) makes it possible to set up ringback protection individually for each station, thus making it possible to automatically refuse incoming ringback calls. This also applies in the case of call forwarding, call pickup, an intercept, etc.

Users can also program collect call barring system-wide. This applies if a caller dials a hunt group instead of an individual station or misdials a number.

## **16.2 LCR (Least Cost Routing)**

The Least Cost Routing (LCR) function automatically controls the paths used for routing an outgoing connection. This path can be routed via the public network, various network providers (ITSPs) or a private network. The most suitable connection path is selected for a call on the basis of the dial plan, route tables, and outdial rules.

Connections can be voice calls, analog data connections via fax and modem and ISDN data connections.

### **16.2.1 LCR Functionality**

You can use the LCR function to specify the provider you want to use, for example, for local calls, mobile phone calls or international calls. You use the communication system to define the least-cost provider and conduct all calls via this specific path.

If a pattern that matches the dialed phone number is found in the dial plan, the route tables are searched for a suitable route (Each trunk is assigned to a route. See [CO Access over Digital and Analog Lines](#) ). At the same time, the system checks if the LCR class of service applies to this route table entry. The LCR class of service and the difference between LCR and toll restriction are described in LCR Class of Service section.

The LCR function provides control over which stations of the communication system may use which routes or trunks (to ensure that faxes are routed exclusively via TDM trunks and not via ITSPs, for instance). It is also checked whether the caller has the required class of service as per the toll restriction to seize the route under consideration by LCR. This check can be disabled for tie trunks (PABX trunks) via the configuration.

The dialed digits are buffered until the routing tables with the LCR classes of service have been evaluated. It is only on completing this step that the connection is set up, in accordance with the outdial rules. A dial tone can be issued to signal the ready-to-dial condition to the subscriber.

When configuring outdial rules, you can enter information for the dialing station, e.g., by specifying that this connection is routed via a specific telephony provider (name of the provider) or that a connection is using a more expensive route. This information can either be displayed on the screen, output as a tone or output both on the display and as a tone.

In general:

- When LCR is activated, the check is performed for every external dialing operation. Exception: when dialing a specific trunk code or line key.
- If LCR determines that the preferred route cannot be used, the communication system will look for a (possibly more expensive) alternative from the routing table.
- Digits can be transmitted either individually or en-bloc, depending on the access method and the route table.
- If the table of DID numbers is empty, the table of internal call numbers is alternatively used. The corresponding rules apply to this table.

---

**INFO:** The location number (country code / possibly local area code / possibly PABX number) must be configured even for communication systems with analog trunks (MSI).

In addition, a DID number or, if the DID number table is empty, a DID number of the own analog trunk connection (MSI) must be configured. This is the only way to ensure that all external destinations can be reached.

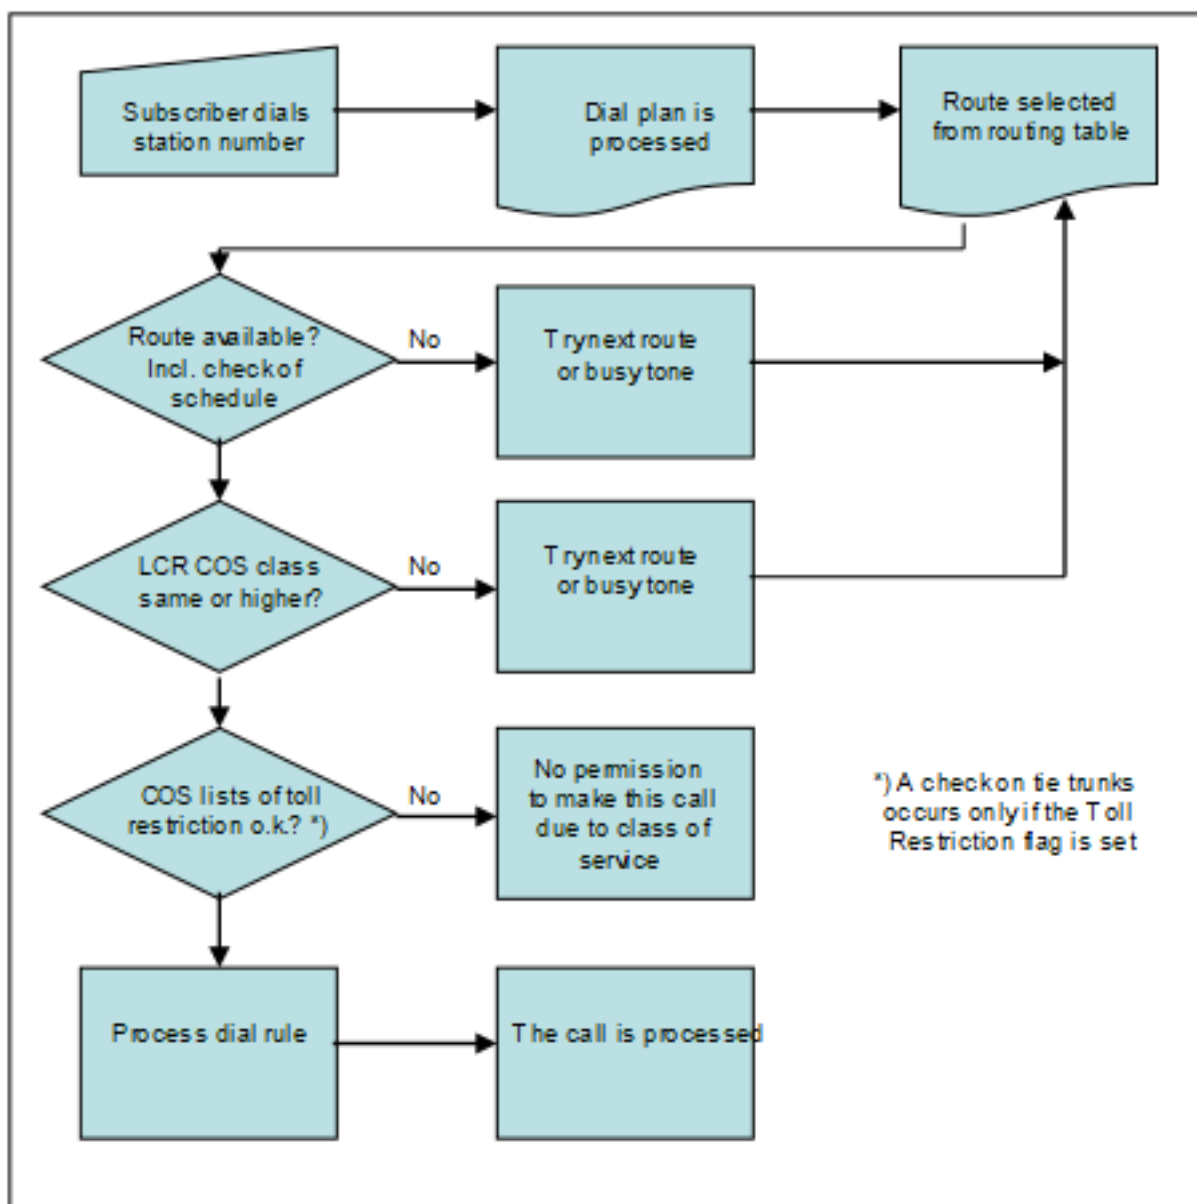

---

### System-Specific Information

The communication system evaluates a total of 24 characters.

The communication system can manage up to 1000 dial plans and 254 route tables with 16 entries each.

LCR Flowchart

### Digit transmission

There are two types of digit transmission: digit-by-digit and en-bloc sending. For digit-by-digit transmissions, each digit is transmitted and processed directly after dialing (prerequisites: the LCR analysis is complete, the dial plan entry is uniquely identified, and the classes of service have been checked). With block dialing, digit blocks are formed and transmitted as a block (i.e., line seizure occurs only after some time or when an explicit end-of-dialing code is recognized).

The digit transmission for ITSP routes must always be en-bloc. The setting of the route applies to the entire routing table.

### For U.S. only: Carrier Select Override

Carrier Select Override can be implemented through selective line seizure (code, key). The LCR mechanism is bypassed completely in this case.

#### Dependencies

| Topic                               | Dependency                                                                                                                                                           |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Schedule                            | If an LCR configuration with a schedule exists in a system migrated from HiPath 3000, these entries are still effective and can be administered with Manager E.      |
| System Speed Dialing                | To ensure that system speed dial destinations work properly, the LCR access code, followed by the destination number, must be entered in the speed-dial destination. |
| Name keys                           | Repertory dial keys to external destinations must have the LCR access code for proper operation.                                                                     |
| Class of service (Toll restriction) | The toll restriction classes of service are also applied in LCR. For PBX trunks, the toll restriction can be disabled; the configuration occurs via a flag.          |
| Prime Line                          | If Prime Line to the CO is used, no LCR is possible. These features are not mutually compatible.                                                                     |

### 16.2.1.1 How to Release LCR

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

---

**INFO:** Some entries such as the local area code or station numbers will have already been created in the **Basic Installation** wizard. Manual changes to these entries should only be made by trained technician. An invalid configuration in the LCR could potentially prevent or restrict outgoing connections.

---

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony Server > LCR**.
3. Click on the **LCR Flags** tab.
4. Select the **Activate LCR** check box.
5. Click on **Apply** followed by **OK**.

## 16.2.2 LCR Dial Plan

The dial plan is searched for patterns that match the dialed digits (dialing sequence). The result is used as a criterion for selecting the route table. At the same time, the system checks if the subscriber's LCR class of service matches for this dial plan entry.

The pattern of a dialing sequence is assigned in the dial plan to a routing table which, in turn, determines further parameters for the connection setup.

The dial plan is split into individual fields for identification and configuration purposes. The table shows the numbers 4922000 and 1603656260 entered in the dial-plan table.

| Field 1 | Field 2 | Field 3 | Field 4 | Field 5 |
|---------|---------|---------|---------|---------|
| 0       | C       | 492     | –       | 2000    |
| 0       | C       | 160     | –       | 365     |
|         |         |         | –       | 62      |
|         |         |         |         | –       |
|         |         |         |         | 60      |

**The following entries apply for the phone numbers:**

|           |                                                                                                             |
|-----------|-------------------------------------------------------------------------------------------------------------|
| 0 . . . 9 | Allowed digits                                                                                              |
| –         | Field separator                                                                                             |
| C         | Simulated dial tone (can be entered up to three times). This entry is also interpreted as a field separator |

### Global character

|   |                                                       |
|---|-------------------------------------------------------|
| X | Any digit from 0 to . . 9                             |
| N | Any digit from 2 to . . 9                             |
| Z | One or more digits to follow up to the end of dialing |

A digit sequence can be divided into a maximum of 10 fields.

Field separators are used to split the digit string into individual fields that can be evaluated separately. Example: After the first dialed digit, a separator is inserted so that a dialed "0" is detected as a separate field and thus simulates toll restriction.

Due to this field separation, these fields can be repeated or rearranged in the dial plan. The fields formed by the field separators "-" and "C" in the dial plan can be addressed selectively to repeat, suppress, exchange, or insert digits.

A "#" or "\*" character in the digit string dialed by the subscriber is the end-of-dial code or indicates dialing method changeover. This is why these characters are not valid entries in the dial plan.

Specific dialed numbers must precede wildcard entries to prevent conflicts in matches with wildcard entries.

The account code entry can be enforced per dial plan. The Account Code Checking Procedure applies.

If there are multiple dial plan entries that match a dial string, the closest match is used. Example: If 00894711 is dialed, and dial plan entries 0CZ and 0C089Z exist -> 0C089Z will be executed. The

position of the entries within the dial plan is irrelevant; no "sorted" entry is required.

OpenScape Business can evaluate a dialing sequence of up to 24 characters.

### LCR Entries for Initial Setup of the Communication System

When the communication system is started up for the first time, a number of country-specific default values are entered in the LCR dial plan. Up to and including dial plan 34, system-side entries for emergency calls, directory assistance, special numbers, default trunk seizure for PSTN and ITSP, for UC Suite, announcement connections, networking and for international dialing formats are preset to ISDN trunks. This range can be affected by configuration changes elsewhere (for example, by changes to the **Location number** flag). Consequently, whenever the location number is changed, it must be ensured that the default trunk seizure still works as expected (which is important when dialing public numbers).

---

**INFO:** From LCR dial plan 36 onwards, all entries are freely available.

---

## 16.2.2.1 How to Edit the Dial Plan

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > LCR**.
3. Click on **Dial Plan**.
4. The individual dial plans are listed under **Change Dial Plan** and you can edit the following fields:

- **Name**
- **Dialed digits**
- **Route table**
- **Acc. code**
- **Toll restriction**

The toll restriction flag is only relevant for the route type PABX. It has no meaning for the route type CO; this means that it is not possible to disable toll restriction for CO trunks here.

- **Emergency**

---

**NOTICE:** Click on the blue arrow next to the **Route table** field opens the associated routing table.

---

5. Click on **Apply** followed by **OK**

## 16.2.3 LCR Routing Table

Least Cost Routing (LCR) is achieved by searching for a suitable route in the LCR routing tables (every trunk must be assigned a route). At the same time, the system checks if the class of service (toll restriction) matches for this route. The outdial rule is also dependent on the assigned path.

The routing table describes:

- the route assigned to the relevant path.
- the outdial rule,
- the LCR Class of Service (COS) required for seizure,
- the warning method for a more expensive route (warning tone).
- the dedicated gateway and
- the GW node ID.

The table is searched from top to bottom in hierarchical order. The system checks to determine whether the route is free and the station has the requisite LCR class of service. If this is the case, dialing occurs according to the dial rule entered in the route table if this is permitted by the toll restriction class of service and the CON group assignment between the subscriber and the line.

If the first route selection in the route table is busy, the LCR function can advance to the next (possibly more expensive) route configured in the route group table. The system can notify the user of this with an audible signal, an optical signal, or both.

Up to 254 route tables with 16 routes each can be created.

### Dedicated Gateway

A dedicated gateway is a fixed partner node in an IP internetwork (Dedicated Gateway -> Forced). When a dedicated gateway with the corresponding GW node ID is entered for the IP networking route, routing to this gateway is enforced.

In a multi-gateway configuration, a dedicated gateway is determined via the subscriber configuration.

### 16.2.3.1 How to Edit Routing Tables

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > LCR**.
3. Click on **Route table**.
4. All routing tables are displayed for you:
  - **1-Table**
  - **2-Table**

- **nn-Table**

---

**INFO:** Routing tables 1 to 15 are intended for default entries or for configuration using wizards. During a migration, the existing entries are automatically entered into these routing tables.

However, this mechanism does not prevent any duplicates in the entries. Manual post-processing of the routing tables is therefore recommended.

---

5. Click on the desired routing table. The selected table with the **Change Routing table** tab is displayed.
6. The individual routing tables are listed under **Change Routing table** and you can edit the following fields:
  - **Route**
  - **Dial Rule**

---

**NOTICE:** By clicking on the blue arrow next to the desired rule, you can view and edit the dial rule properties.

---

- **min. COS (LCR Class of Service)**
  - **Warning**
  - **Dedicated Gateway**
  - **GW Node ID**
7. Click on **Apply** followed by **OK**.

### 16.2.4 LCR Class of Service

Every subscriber is assigned a separate LCR class of service (COS). A subscriber can only seize a route if his or her COS is greater than or equal to the LCR COS in the route table, i.e., a subscriber with a COS 7 cannot seize a route with COS 8. By default, all subscribers are entered with the maximum LCR Class of Service (15).

#### Dependencies

| Topic                | Dependency                                                                                                                                                            |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Toll restriction     | The Toll Restriction class of service has precedence over the LCR class of service. The Toll Restriction class of service can be enabled and disabled for tie trunks. |
| CON Group Assignment | Dialing occurs only if allowed by the CON matrix.                                                                                                                     |

### 16.2.4.1 How to Assign and Change an LCR Class of Service

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > LCR**.
3. Click on **Classes Of Service**.
4. Assign an LCR class of service under **Edit LCR Class of Service** in the **Class of Service** field or edit an existing class of service.

This only applies to the class of service of a subscriber for LCR. The field has no effect on the toll restriction.

5. Click on **Apply** followed by **OK**.

## 16.2.5 LCR Outdial Rules

LCR outdial rules can be used to convert the phone numbers entered into random new digit strings for additional processing. Access to different carriers is enabled via digit translation. The dial rule used is defined by the path or the route in the route table.

#### System-Specific Information

The communication system can administer up to 254 outdial rules in the LCR dialing rules table. The name of a dial rule can contain up to 16 characters.

The dialing rules address the dial plan fields selectively for the following operations:

- Repeating digits
- Suppressing digits
- Exchanging digits
- Inserting digits
- Switching the signaling method
- Detecting a dial tone
- Inserting pauses

#### Dial Rule

You can define up to 254 outdial rules here with a maximum length of 40 characters each.

The LCR dialing rules table is also referred to as the routing table.

#### Definition of Outdial Rules (Dial Rule Format)

- A:  
Repeat remaining fields (transmit). The letter "A" causes all subsequent digit fields to be transmitted. The point of reference is the last field delimiter in the field of dialed digits in the dial plan.

If "A" is entered without an explicit reference, it designates all digits after the access code, i.e., "A" is then equivalent to "E2A".

- B:

It is used for the multi-gateway network when a station number of type TON (Type Of Number) that was called from outside is "unknown" and must be routed to the multi-gateway node. To ensure that this station number is unique, it is extended to national or international in accordance with the TON in the LCR. This is required when the DID numbers are not unique and need to be configured in the national or international format.

- D (n):

Dial digit sequence (1 to 25 digits). "D" may occur multiple times and at any position in the string.

- E (n):

Transmit field contents (1 to 10). "E" may occur multiple times and at any position in the string. "E" can also appear in any order with relation to (n). A specific field can be addressed multiple times, including in sequence. With the exception of "E1" (access code), this letter can be surrounded by any parameters.

With digit-by-digit dialing (opposite of en-bloc dialing), the last element in the outdial rule cannot be E(n); it may be E(n)A.

- M (n):

Authorization code (1 to 16). This letter must not be in the final position.

- P (n):

P (n) can occur more than once in the string and can be placed in any position. P (n) can be surrounded by any other parameters. (1 to 60 times the system-wide pause unit).

- S:

Switch, changes signaling methods from DP to DTMF (with CONNECT, PROGRESS or CALL PROC with PI). The letter "S" may occur in the string only once and must not be in the final position. The "C" parameter cannot be used after "S".

- C:

Carrier "C" can be inserted in the string only once. The subsequent characters are transmitted without a dial pause and are used for single stage, two-stage, DICS (not for U.S.), BRI, and PRI carrier access.

- U:

Use subaddress signaling method. The letter "U" may occur in the string only once and must not be in the final position. The "S", "P", "M", and "C" parameters cannot be used after "U".

- N (n) (only for the U.S.):

Network SFG (1 to 5) or Band Number (1).

- L (for U.S. only!):

"L" must only occur at the end of a string of characters. "L" causes the call to be handled as an emergency call.

**Example:**

The system should automatically add a provider suffix.

Dial rule D010xxA means: the system first dials the Provider prefix (010xx), and then all the digits after the access code dialed by the subscriber (A).

### 16.2.5.1 How to Edit the Outdial Rules

**Prerequisites**

You are logged into the WBM with the **Expert** profile.

**Step by Step**

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > LCR**.
3. Click on **Dial rule**. All outdial rules are displayed for you.
4. Click on the desired dial rule in the menu tree.
5. You can edit the following fields:
  - **Rule Name**
  - **Dial rule format**
  - **Network provider's method of access** (**Unknown**, **Main network supplier**, **MCL Single Stage**, **MCL Two Stage**, **Corporate Network**, **Dial In Control Server**, **Primary Rate Interface**)
  - **Type** (**Unknown**, **Country code**, **Area code**, **PABX number**)
6. Click on **Apply** followed by **OK**.

### 16.2.6 Network carriers

You can assign network carriers to each route. The selection of the network carrier is defined by the LCR outdial rules.

**Unknown**

No explicit specification about a network carrier.

**Main network supplier**

When seizing a trunk using the main network supplier, simplified dialing into the public network is performed by en-bloc dialing or by dialing individual digits.

**MCL Single Stage**

With MCL Single Stage, a prefix is used to dial the desired network carrier, and the station number is then dialed. Dialing occurs in the D channel for ISDN or as normal dialing for MSI.

### MCL Two-Stage

With MCL Two Stage, a prefix is used to dial the desired network carrier. After a synchronization phase, a configurable authorization code is initially sent followed by the destination call number as DTMF digits.

With synchronization during timeout, you must program a pause of 2 to 12 seconds.

### Corporate Network

A corporate network is directly connected to the communication system. The LCR function determines the appropriate trunk group based on the station number dialed and then routes the call either via the trunk group in the public exchange or via the trunk group in the corporate network.

### Dial-In Control Server

With this type of LCR, the desired network carrier is dialed with a prefix via a dial-in control server, and the call number and configurable authorization code are transmitted in the subaddress. Dialing occurs in the D channel.

### Primary Rate Interface (PRI) (U.S. only)

In the case of the Primary Rate Interface, the selection of the network carrier or of a calling service is encoded in SETUP message using following information elements: Network Specific Facility, Operator System Access and Transit Network Selection.

### Dependencies

| Topic                                 | Dependency                                                                  |
|---------------------------------------|-----------------------------------------------------------------------------|
| Receiving/forwarding call information | Temporary or permanent station number suppression cannot be activated.      |
| ISDN/SUB addressing                   | The ISDN feature SUB must be applied for or released in the public network. |

## 16.2.7 Selective Seizure of Exchange Lines

Exchange lines (aka "outside lines" or "CO trunks") can also be seized selectively by subscribers.

The prioritization for the seizure of exchange lines is handled via Least Cost Routing by default. In most cases, the least-cost provider is selected first, followed by the second-lowest cost provider, and so on.

If a subscriber wants to conduct a call over a provider that is not first in the LCR (because this provider is cheaper for long-distance calls, for example), he or she can select this provider via a specific trunk code or trunk key.

Subscribers can likewise also use selective dialing via seizure codes to reach a number that can only be dialed using ISDN (in cases where Vodafone is otherwise preset as the provider, for example).

By default, the seizure code 88 is configured for the seizure of an outside line via ISDN. All codes can be configured later by the administrator or edited as required.

### 16.2.7.1 How to Configure the Code for the Selective Seizure of ISDN Trunks

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > LCR**.
3. Click on **Dial Plan**. The individual dial plans are listed.
4. Enter the desired name for the dial plan under **Name**.
5. Under **Dialed digits**, enter the seizure code and identifiers precisely (e.g., **88CZ**).

---

**NOTICE:** 88 is the default seizure code assigned by the system for the selective outside line seizure of an ISDN trunk.

For information about the abbreviations C and Z, see [LCR Dial Plan](#).

---

6. Under **Routing table**, enter a **1**.
7. Click on **Apply**, followed by **OK**.

### 16.2.7.2 How to Display the Seizure Code for the 'Outside Line Seizure'

The **CO Trunk ISDN / Analog / ITSP** wizard can be used to selectively display the codes for ISDN trunk seizure.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Your communication system is connected to an analog trunk.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > Central Telephony**.
3. Click on **Edit** to start the **CO Trunk ISDN / Analog / ITSP** wizard.
4. Continue clicking on **OK & Next** as often as needed until you reach the **Seizure Code for the 'Outside Line Seizure'** window.

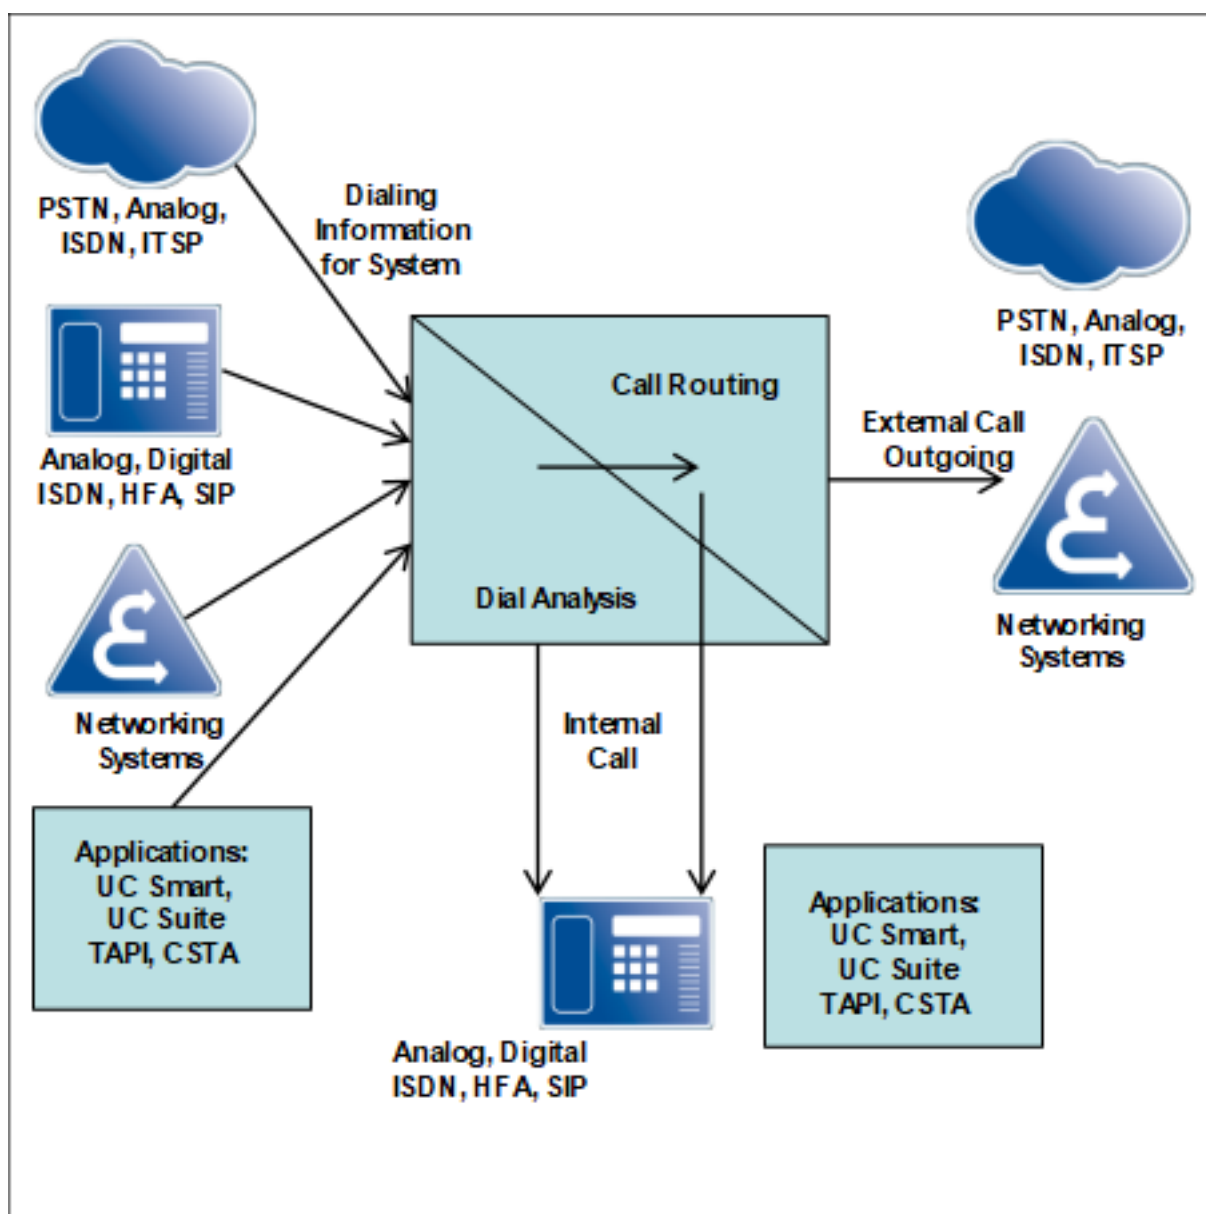

5. In the default view, you will see the code for the ISDN trunk seizure. For configured ITSPs, the corresponding codes are shown.
6. Click on **OK & Next** followed by **Finish**.

## 16.3 Digit Analysis and Call Routing

This section illustrates the relationship between digit analysis and call routing. It explains how the communication system analyzes call numbers dialed by subscribers, trunks and applications of various types to reach a specific destination and how the calls are routed upon completion of the digit analysis. The relevant system functions for this have already been described for the most part in the previous sections. This section describes dialing with public phone numbers within a node/network in detail.

### The Digit Analysis

- of the communication system records and evaluates all dialed numbers on the basis of the configuration data
- verifies classes of services (e.g., based on classes of service for stations, station flags, day/night, allowed and denied station numbers, LCR classes of service, schedules, connection matrices, etc.).
- determines whether a number can be dialed internally or whether a line is to be seized. This applies to the dialing of internal and public call numbers as well as for network-internal call numbers.
- normalizes call numbers so that they can be dialed by the communication system. (e.g., canonical format: "+49nnn" becomes "00049nnn", where the first '0' is the main access code of the PBX)
- truncates call numbers where necessary (the leading digits of destination numbers may have to be truncated for calls with inbound trunk seizure in order to determine the DID destinations in the short format)

### 16.3.1 Overview of Call Routing / LCR

An incoming call is subjected to various tests in the communication system and then forwarded accordingly.

Test 1 (internal call destination?)

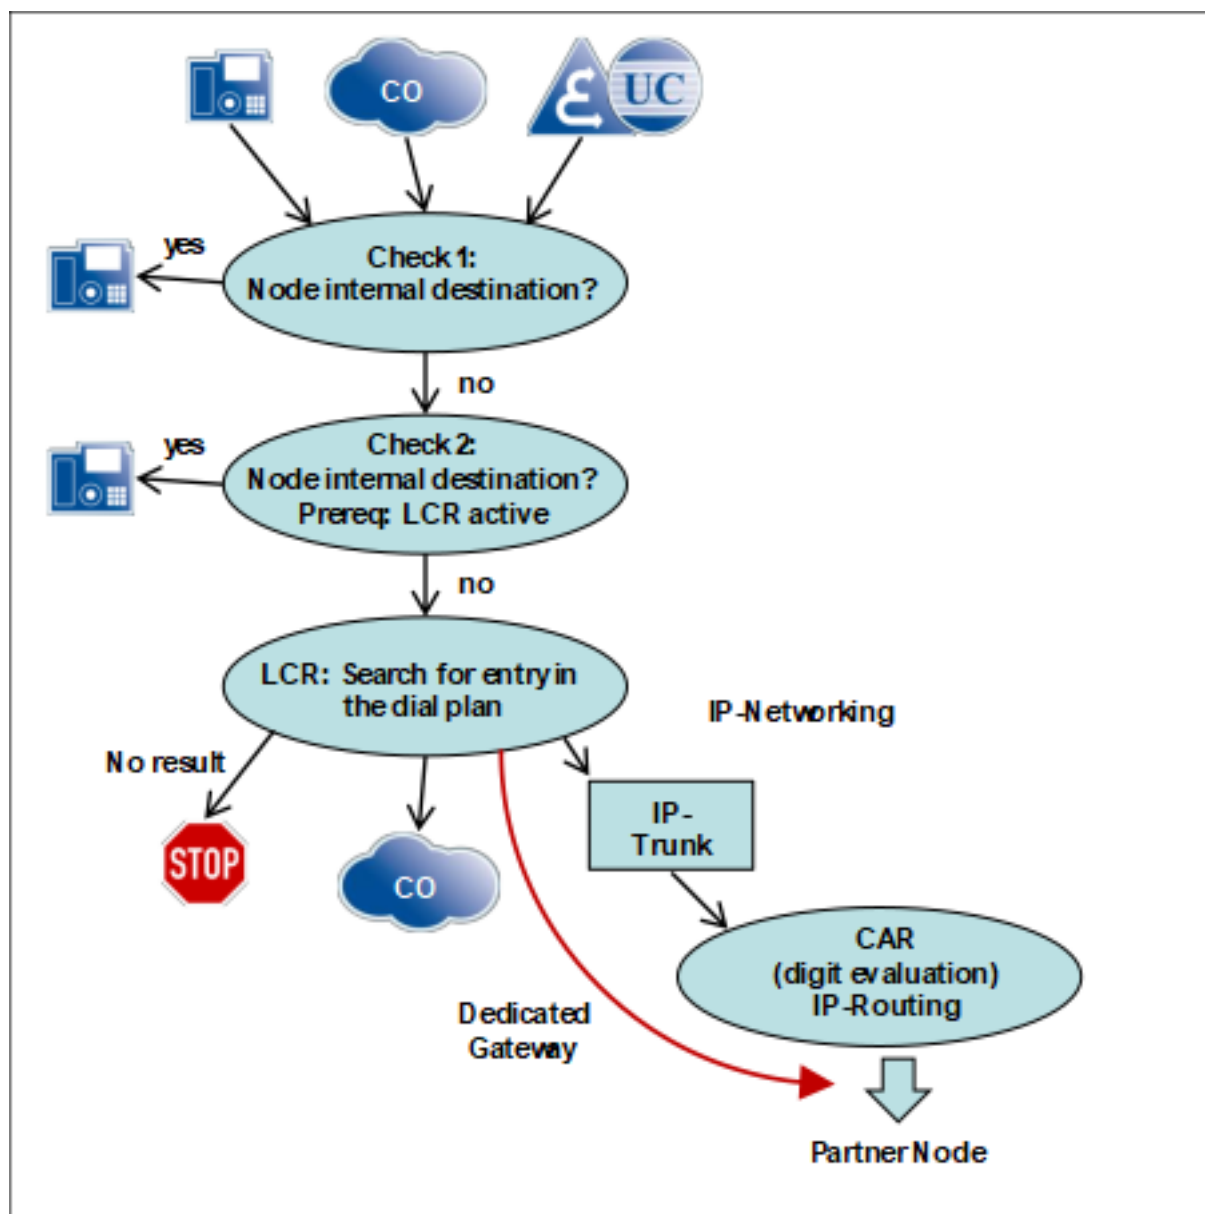

- Destinations with canonical call numbers are first converted into dialable numbers (at the station interface) or set to TON=International (ITSP interface).
- For trunk destination numbers, the call number portion of the PABX number of the corresponding route is stripped off if required.
- Internal calls are analyzed on the basis of the internal dial plan; for external calls, the dial plan for DID numbers is used.

Test 2 (internal call destination?)

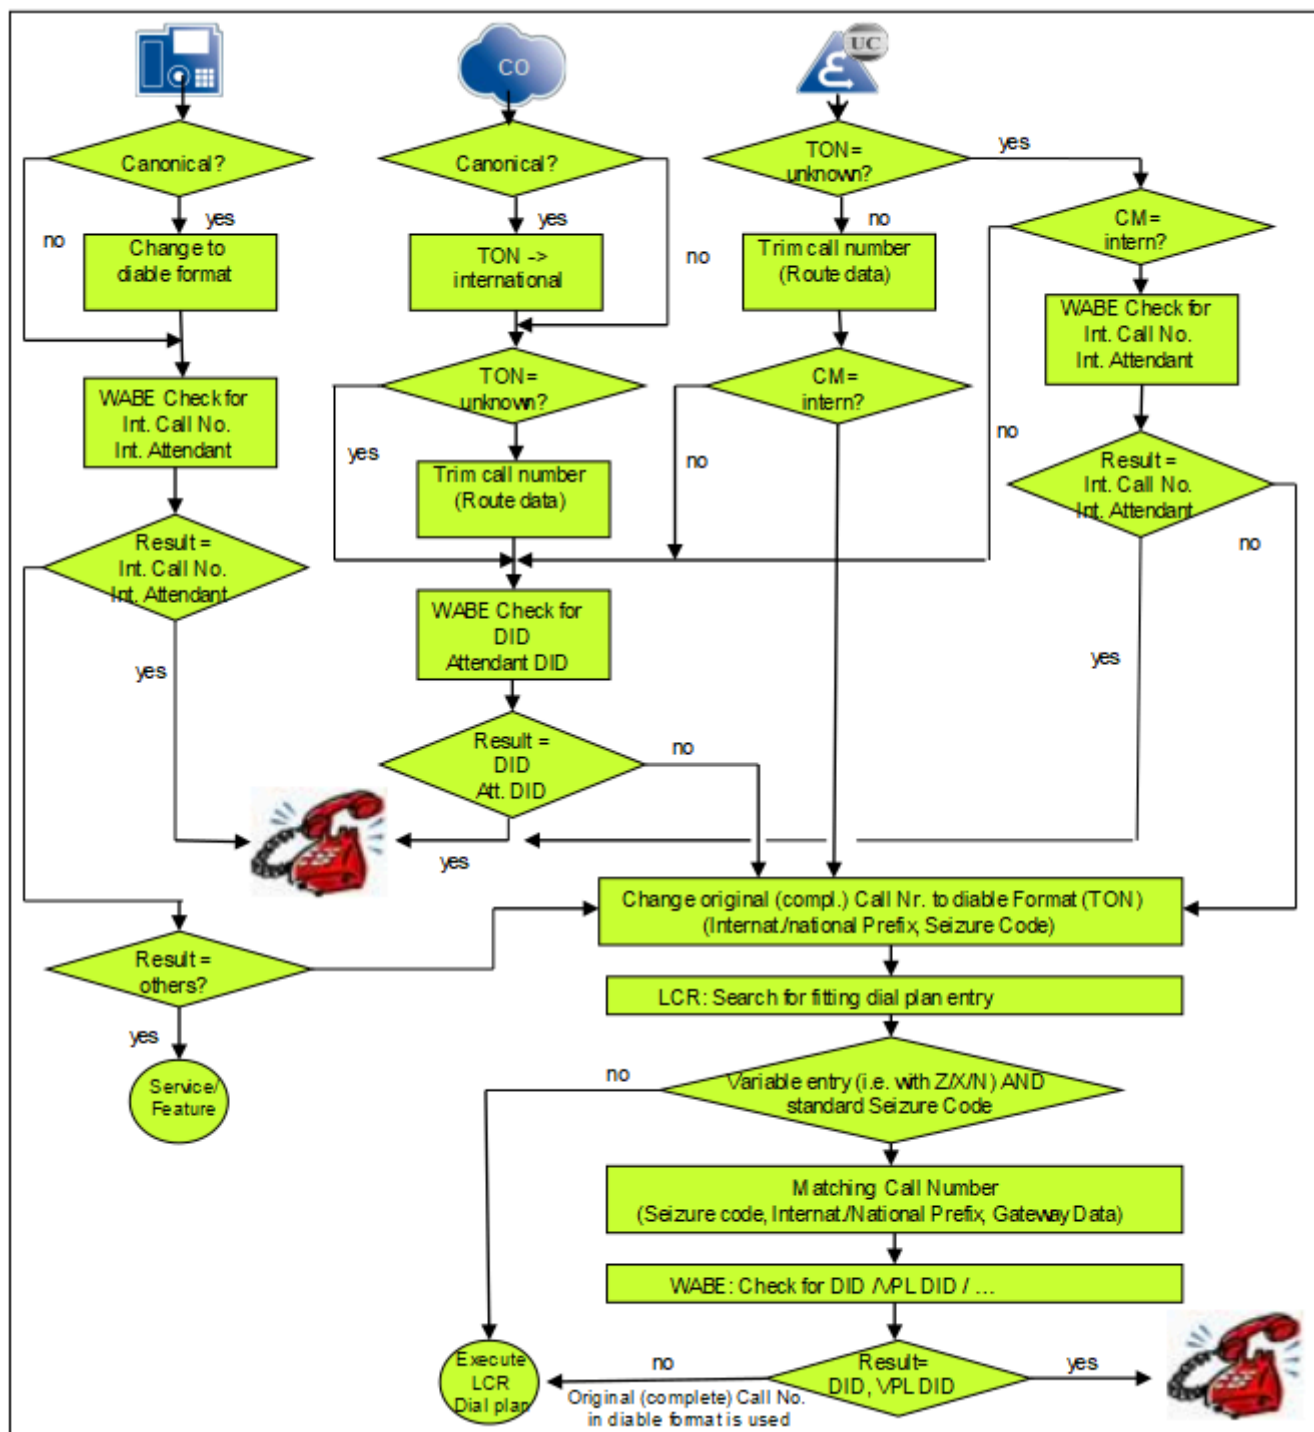

## Call Routing

- Subscribers, applications, clients or other communication systems use the public format (for example, 00049nnn) for dialing destination numbers
- Precondition: the default CO access code (e.g., "0") has been set up.
- The destination number is stripped to remove the location number (gateway location) portions and evaluated based on the dial plan of the DID numbers, regardless of whether an internal or external call is involved.
- If no internal call destination is found, the dialable, unstripped (!) call number is processed in the LCR, and the call is routed further over a line accordingly.

Within an IP network, the LCR routing table parameter "Dedicated Gateway" enables the direct addressing of a node for a dialed number by bypassing the CAR digit analysis.

### 16.3.2 Digit Analysis Flowchart

Explanations for the flowchart:

| German | English | Explanation                                                                         |
|--------|---------|-------------------------------------------------------------------------------------|
| WABE   |         | Digit analysis                                                                      |
| CM     | CM      | Classmark identifies the caller as an external caller or (network-) internal caller |

| German         | English       | Explanation                                                                                                                                          |
|----------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| TON            | TON           | Type Of Number (Call number type): Unknown, Subscriber, National or International; used for both destination numbers as well as originating numbers. |
| DuWa           | DID           | DID number                                                                                                                                           |
| TNR RNR        | Int. Call No. | Internal number                                                                                                                                      |
| Int. Attendant | VPL INT       | Attendant number for internal calls                                                                                                                  |
| VPL DID        | VPL DID       | Attendant number for external calls                                                                                                                  |
| SERVICE        | SERVICE       | Service code                                                                                                                                         |

For digit analysis, UC clients are treated as subscribers controlled via CSTA.

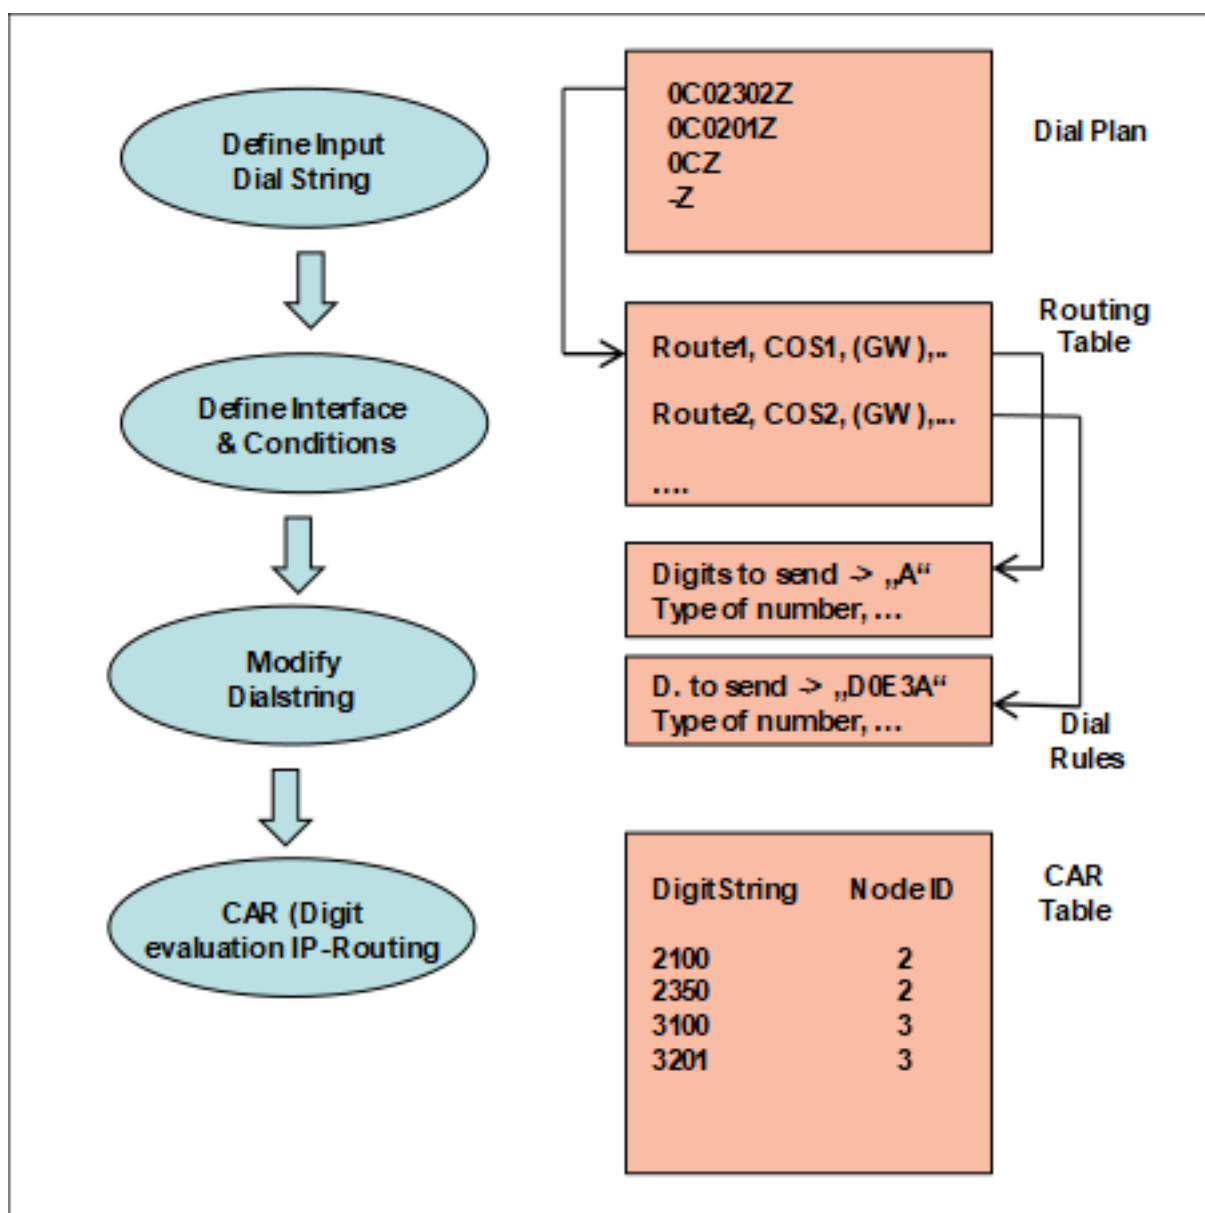

For digit analysis, the UC Suite behaves as a SIP-Q trunk.

### 16.3.3 Call Routing and LCR in the Internetwork

Call routing and LCR play an important role in networking. Calls are routed by using a dial plan and dial rules. The dedicated gateway plays a special role here.

## LCR Basics

## LCR Entries During the Initial Setup

If no line seizure is successful, the entries in the routing table are processed sequentially in a loop.

**NOTICE:** -z rule must be removed from stand-alone system configuration.

When the communication system is started up for the first time, a number of country-specific default values are entered in the LCR dial plan. Up to and including dial plan 35, system-side entries for emergency calls, directory assistance, special numbers, default trunk seizure for PSTN and ITSPs, for UC Suite and networking, and for international dialing formats are preset to ISDN trunks.

This range can be affected by configuration changes elsewhere (for example, by changes to the **Location number** flag. Consequently, whenever the location number is changed, it must be ensured that the default trunk seizure still works as expected (which is important when dialing public numbers).

---

**INFO:** From LCR dial plan 36 onwards, all entries are freely available.

---

### 16.3.3.1 Dedicated Gateway

The dedicated gateway is only relevant for an IP network.

**Why is a dedicated gateway required?**

**How can destinations be permanently set up through configuration?**

**Use cases for a dedicated gateway**

**The Dedicated Gateway in the WBM**

**The following values can be set:**

- The CAR table of each communication system includes network-wide numbers of the other nodes and is automatically refreshed (overwritten) cyclically during updates. Consequently, CAR tables are not suitable for the permanent use of manually added entries.
- Only numbers that apply network-wide are entered, i.e., no node-specific routing is possible (e.g., "0" to the respective gateway node)
- By using direct addressing in the LCR
- The dedicated gateway directly addresses the destination node using the node ID (IP address)
- When using the dedicated gateway, CAR tables are bypassed (see previous figure).

Direct addressing

- of TDM gateways to seize outside lines ("0CZ")
- of TDM gateways to implement breakouts via separate codes
- of internal network nodes that are to be reached via public numbers
- of TDM gateways to which the subscribers of a multi-gateway network (to an OpenScape Business S) are assigned (e.g., subscriber 1 belongs by definition to gateway 1, and subscriber 2 belongs to gateway 2).
- of gateways and calls whose origin CANNOT be associated with a specific gateway in a multi-gateway configuration (e.g., the fax group of a UC Contact Center)

|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>No</b>             | The station number analysis occurs on the basis of the CAR tables (no <b>GW node ID</b> required)                                                                                                                                                                                                                                                                                                                                                |
| <b>Forced</b>         | Routed directly to the appropriate gateway (GW node ID = n)                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Multi Location</b> | Only to be used with multi-gateway configurations: Based on the multi-gateway configuration of the OpenScape Business S subscribers, the communication system knows the assignment to their respective gateways and can selectively route outbound calls to the appropriate gateway. In the <b>Multi Location</b> configuration, the GW node ID is used only if no gateway can be identified through the assignment of the subscriber (default). |

## 16.3.4 Scenarios: Digit Analysis and Call Routing

In order to illustrate the above processes in the communication system, the dependencies and required configuration parameters are described here on the basis of specific scenarios. The presented scenarios may build on one another, depending on the use cases involved.

### Single System

#### Networked system as a subsystem (no CO trunk)

#### Internetwork with multi-gateway

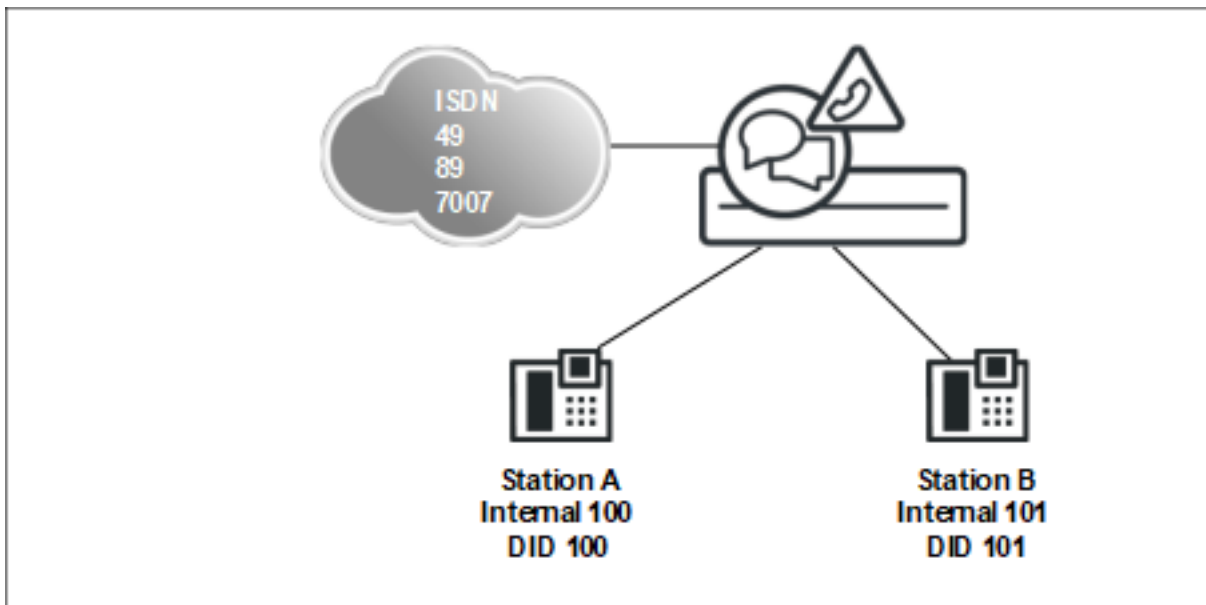

- 1) Subscriber A calls subscriber B via an internal phone number
- 2) Subscriber A calls subscriber B via a public phone number
- 3) Subscriber A calls an external station via the CO
- 4) ISDN trunk calls subscriber A
- 5) Special configurations and their corresponding effects

2 CO routes

- 1) Subscriber A Calls Subscriber C via an Internal Phone Number
- 2) Subscriber A calls subscriber C via a public number in the internetwork
- 3) ISDN trunk calls subscriber C
- 1) ISDN trunk gateway 1 calls subscriber D

2) Subscriber D calls external station via the CO

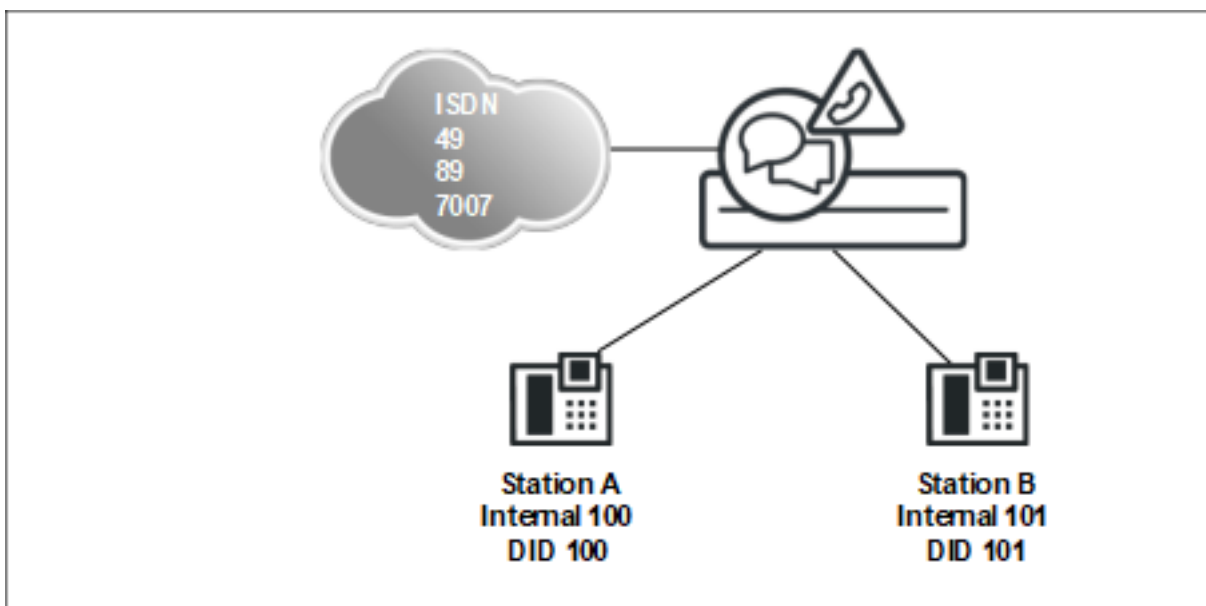

### 16.3.4.1 Subscriber A Calls Subscriber B via an Internal Phone Number

### 16.3.4.2 Subscriber A calls subscriber B via a public phone number

Configuration

Dependencies of the "Location Number" (Gateway Location)

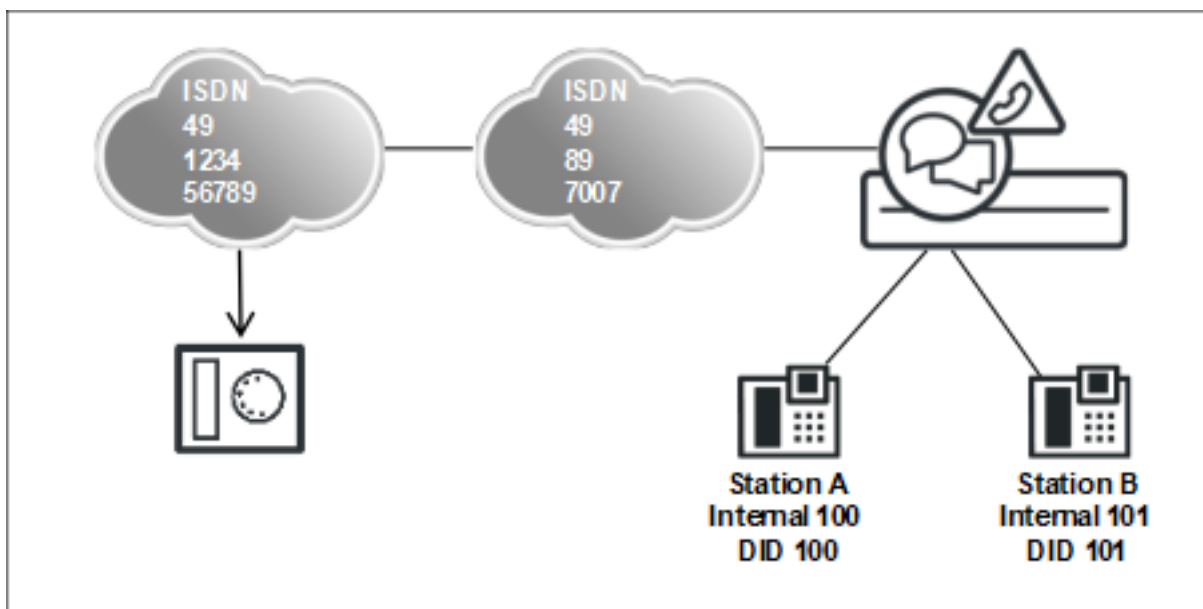

|                                                                                   | Box | Slot | Callno | Name | DID | Type            |
|-----------------------------------------------------------------------------------|-----|------|--------|------|-----|-----------------|
|  | 1   | 1    | 100    | -    | 100 | System Client ▼ |
|  | 1   | 1    | 101    | -    | 101 | System Client ▼ |

The location number (gateway location) is analyzed on dialing based on the public phone number. If the relevant portions of the dialed number matches this number, the DID table is analyzed and, if a match is found, the appropriate internal destination is dialed (without seizing a trunk!). By setting the Location Number flag, the location data is taken over automatically from the appropriate routing data (PABX number, incoming) and does not need to be changed in standard scenarios.

Consequently, only valid numbers assigned to this system should be entered in the DID tables; otherwise, masking effects could occur with numbers in the public network. For example, in some cases, an internal number identified by an invalid DID could be called even though a call via a trunk to an external destination was intended.

Changes to the "Location Number" flag may affect the preset default LCR entries. Whenever the location number is changed, it must be ensured that the default trunk seizure still works as expected. This is important when dialing public numbers.

#### 16.3.4.3 Subscriber A calls an external station via the CO

The call is routed via LCR because the destination is not in the own communication system.

In addition to the data of the previous scenario "Subscriber A calls subscriber B via a public phone number", a suitable dial plan entry to seize the CO trunk (e.g., "0CZ") must be present in the LCR.

The LCR route table and the dial plan must be set up accordingly.

16.3.4.4 ISDN trunk calls subscriber A

For an incoming call over an ISDN trunk, the route is stripped off from the destination number based on the configuration data of the PABX number, incoming. Using the remainder of the destination number (DID), a search for a destination is then performed in the DID dial plan.

The parameters of the gateway location and the **Location Number** flag play no role in this scenario.

### 16.3.4.5 Special Configurations

Special configurations and their corresponding effects: 2 CO routes

Example:

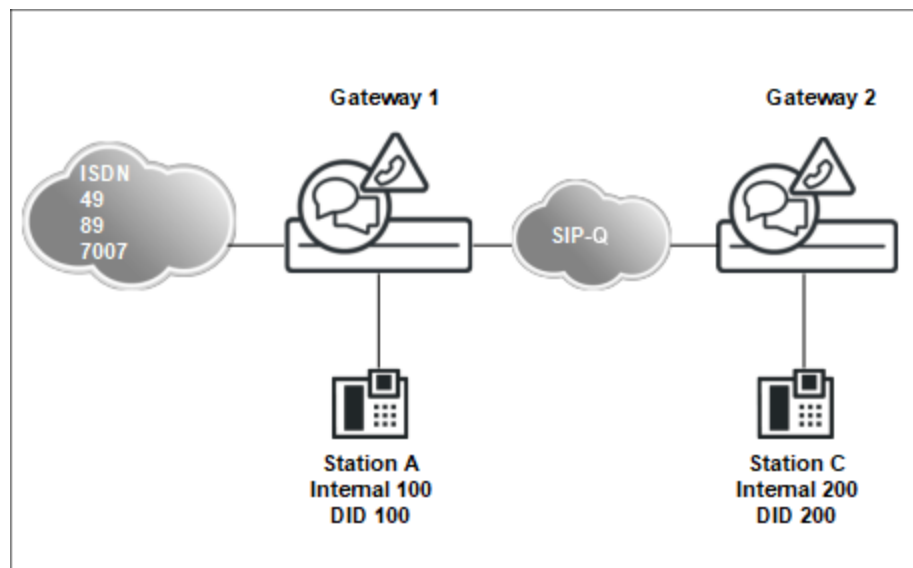

- A customer wants to use a standard ISDN 1 connection. This is set up as the location number.
- A second ISDN 2 connection is additionally used for special applications.

Notes and limitations:

- Only ONE CO trunk (ISDN 1 = location of the system) is fully supported, i.e., no multi-tenant configuration (tenant services) with equal trunk access rights can be configured.
- The additive ISDN 2 CO trunk can be used for Basic Call (incoming/outgoing).
- In complex switching scenarios, the correct representation of the call number may not be guaranteed under some circumstance.
- For connected applications, only the location number is supported, as is the case when dialing internal destinations with public numbers.
- The configuration with respect to the routing configuration and LCR can be derived from the previous examples.

### 16.3.4.6 Subscriber A Calls Subscriber C via an Internal Phone Number

Networked communication system as a subsystem (no CO trunk)

Prerequisites for standalone systems before networking:

- Both communication systems have unique IP addresses and are integrated in the IP network of the customer.
- Both communication systems can be administered in the customer network using WBM.
- A unique node ID for networking was assigned in the basic installation for each communication system (e.g., System 1 = Node ID 1 and System 2 = Node ID 2).
- Defining the numbering in the basic installation of the systems 1 and 2: The numbering of the standalone systems must take the closed numbering in the future internetwork into account.
- This example assumes that closed numbering is being used (mandatory when using UC Suite!); the configuration occurs via the Network wizard. With open numbering (possible for UC Smart), the Network wizard is not used. It is also not used with a connection of OpenScape Voice and OpenScape 4000.

Start the Network wizard in system 1. This system (this node) is declared as the master). The master has several central functions in the network (e.g., administration, license management with centralized licensing, network-wide CSP).

If an OpenScape Business S is located in the internetwork, it should be preferentially declared as the master (for bandwidth and performance reasons).

The IP addresses are entered for each node so that the systems can find one another independently after the administration. The OpenScape Business systems are entered **Type**.

This dialog must also be completed for node 2 (slave).

Upon successful configuration, the two systems (nodes) synchronize their phone numbers and enter the call numbers of the other node into the CAR table.

With the creation of the CAR tables, network-wide telephony with internal numbers is possible. UC Suite is also launched network-wide. Further steps for the complete startup of the network are presented in the other scenarios.

CAR entries are controlled via **Expert Mode > Voice Gateway > Networking > Routing**.

An overview of the automatic synchronization in the internetwork can be seen in the WBM (sync status).

Additional network nodes can now be administered with direct access under the menu item **Networking** in the navigation bar.

## 16.3.4.7 Subscriber A calls subscriber C via a public number in the internetwork

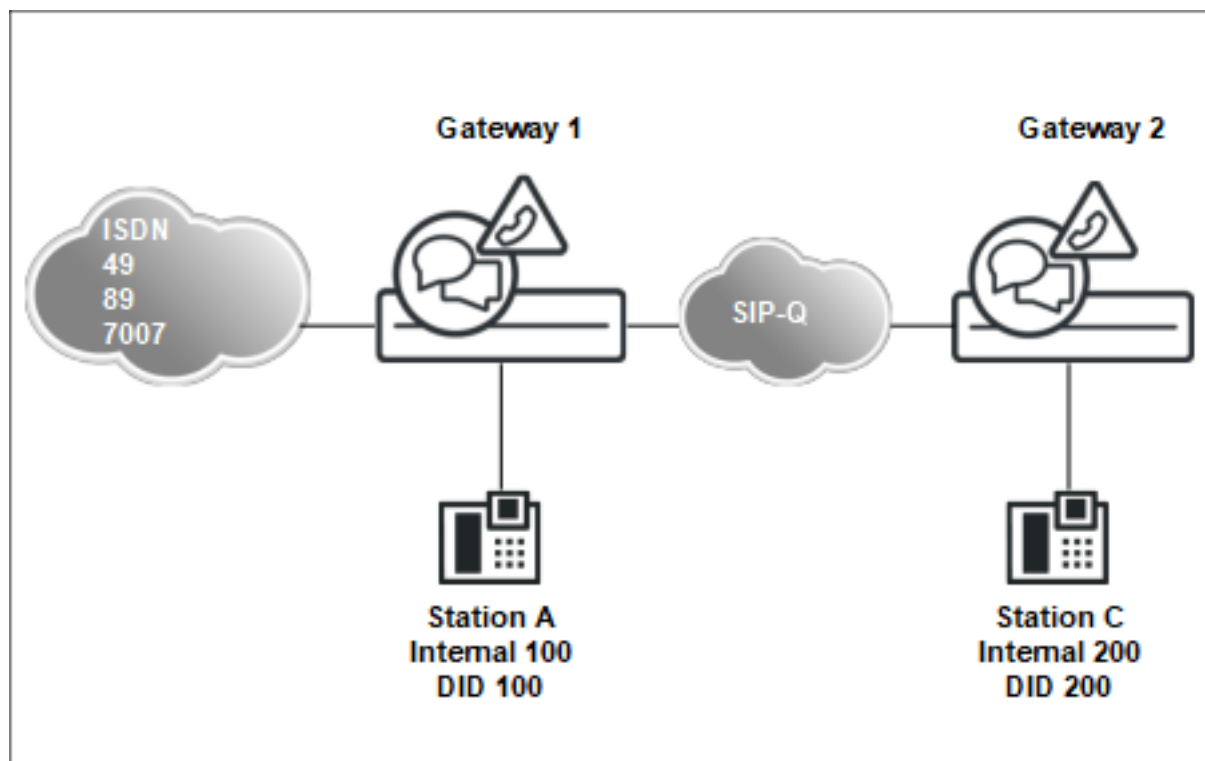

Networked communication system as a subsystem

### Configuration of Node 1, Setup in the LCR via Dedicated Gateway

### Configuration of Node 2, Setup of the "Networking" Route

### Configuration of Node 2, Setup of the Location Number at the "Dummy CO Trunk"

### Configuration of Node 2, Setup in the LCR via Dedicated Gateway

Special features of this scenario:

- System 1 detects that the destination phone number does not belong to the own system. A further search is thus performed in the LCR. The dedicated gateway in the LCR of system 1 must be used for the direct addressing of the node ID of system 2. The destination number is not an internal number of the network (it would otherwise be in the CAR table), but a public phone number, which can be dialed by the subscriber in three different lengths:

Long = 00049897007nnn

Medium = 00897007nnn

Short = 07007nnn

This example assumes that all 2xx DID numbers are subscribers in system 2.

---

**NOTICE:** The dial plan entries must be configured precisely so that ALL numbers involved really belong to the subnode (internetwork). This may require a larger number of entries in a dial plan with

peculiarities, e.g., when a shared trunk connection or an MSN configuration is involved.

- In node 2, a location number is entered with the location data of node 1 (gateway) using a "dummy CO trunk" so that the destination number from the public dialing can be stripped before searching for an internal destination in node 2.

In node 2, all public numbers that do not belong to their own node are routed to node 1 (default dialing, e.g., 0CZ)

16.3.4.8 ISDN trunk calls subscriber C

Networked System as a Subsystem

Special Features of this Configuration

Example: Incoming call with destination number with TON = subscriber

- Node 1 must be set up as described in the previous scenario.

The addressing of node 2 occurs with the public telephone number in both cases, regardless of whether the origin of the connection is located in node 1 (subscriber of system 1) or in the public network.

---

**INFO:** The dial plan entries must be configured precisely so that ALL numbers involved really belong to the subnode (internetwork). This may require a larger number of entries in a dial plan with peculiarities, e.g., when a shared trunk connection or an MSN configuration is involved.

---

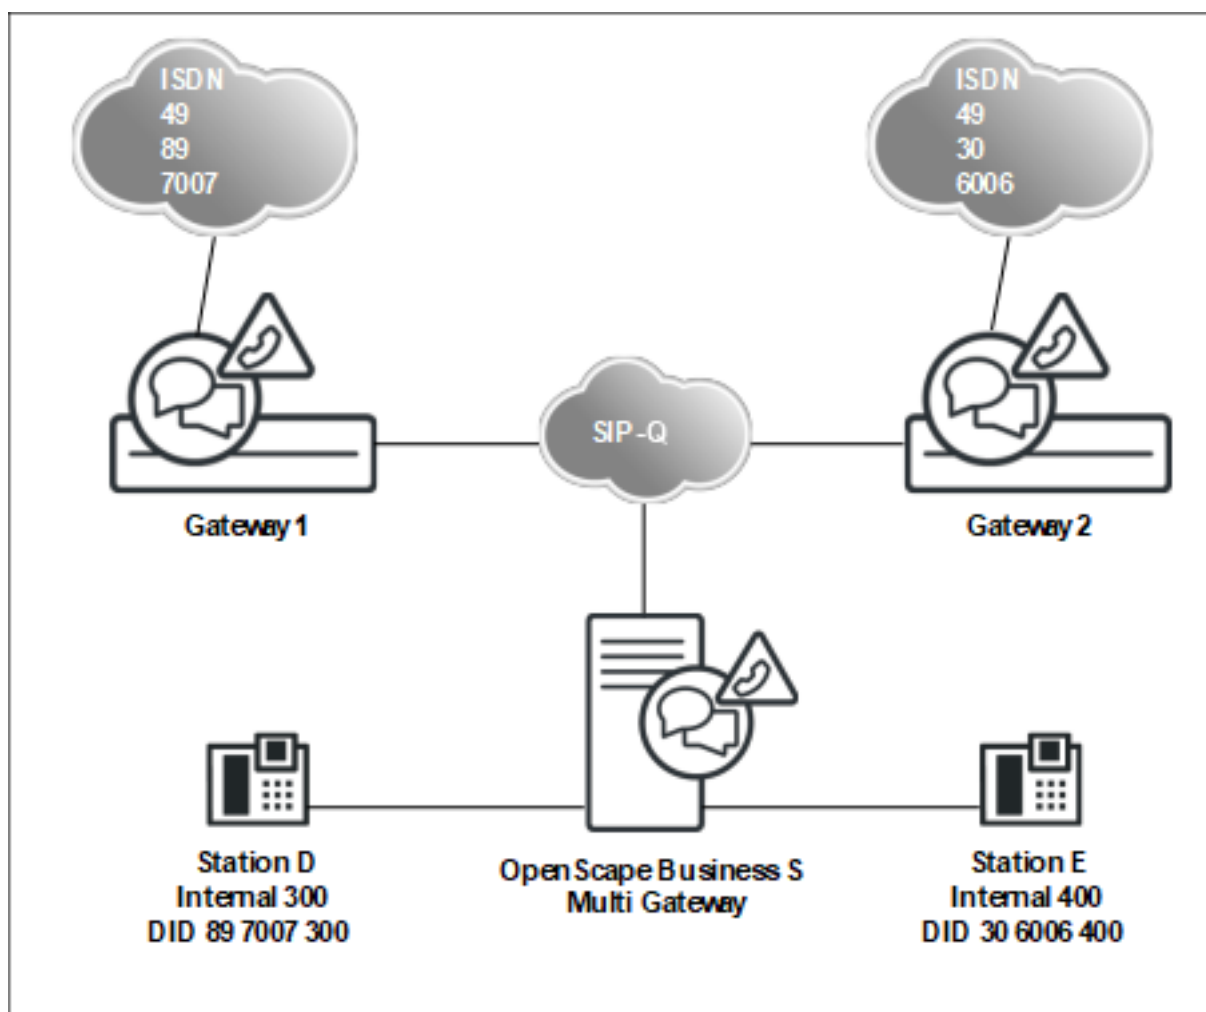

- Node 2 must likewise be set up as described in the previous scenario.

### 16.3.4.9 ISDN Trunk Gateway 1 Calls Subscriber D

Networked system in a multi-gateway configuration

#### Configuration

#### Configuring the Multi-Gateway, OpenScape Business S

## Call Routing

Example: Incoming call with destination number with TON = subscriber

Special features in this scenario:

- Gateway 1 is basically set up as in the previous scenario (gateway 1), i.e., through the basic installation first and then by running the Network wizard. The essential difference here is that the gateways are set up as slaves, and the OpenScape Business S is set up set as the master (performance, bandwidth licensing).
- In this example, only the essential differences to the previous scenario are indicated.

Basic installation for gateway 1

The screenshot shows the configuration interface for gateway 1. It has three main sections: **PABX number**, **General**, and **Network Parameters**. In the **PABX number** section, the Country code is 00 49 (mandatory), Local area code is 0 89 (optional), and PABX number is 7007 (optional). In the **General** section, the International Prefix is 00. In the **Network Parameters** section, Network Integration is unchecked and Node ID is 1.

Network wizard for gateway 1

The screenshot shows the Network wizard for gateway 1. It has a section titled "Node type" with a note: "If a network is configured, one system, and only one, in the network must be a MASTER node." Below this, there are two radio buttons: "This system is the MASTER node" (unchecked) and "This system is a SLAVE node" (checked). Below the radio buttons, there is a text field for "Enter the IP address of the MASTER node" with the value 172.30.111.22. A red warning message at the bottom states: "After 'OK & Next' you cannot undo the action by aborting the wizard."

The screenshot shows the Expert mode - Telephony Server interface. The left sidebar has a tree view with "Dial rule" selected. The main area is titled "Dial Rule" and "Change Dial Rule". It contains a table with 5 columns: Rule Name, Dial rule format, Network access, and Type. The table lists 15 rules, each with a unique identifier, a name, a format, a network access type, and a type.

| Rule Name           | Dial rule format | Network access      | Type         |
|---------------------|------------------|---------------------|--------------|
| 1 ISDN              | A                | Main network supply | Unknown      |
| 2 SIP               | A                | Main network supply | Unknown      |
| 3 SIP lokal         | HE2A             | Main network supply | Unknown      |
| 4 MEB               | E1A              | Corporate Network   | PABX number  |
| 5 IP-Network        | A                | Corporate Network   | Unknown      |
| 6 Multi-Location    | BA               | Corporate Network   | Unknown      |
| 7 Gateway call      | E1A              | Corporate Network   | Unknown      |
| 8 COInternat        | D0E4A            | Main network supply | Unknown      |
| 9 Add_cc_to_Canoni  | D49E2A           | Main network supply | Country code |
| 10 National_to_Cano | D49E3A           | Main network supply | Country code |
| 11 Internat_to_Can  | E3A              | Main network supply | Country code |
| 12 SIP lokal_Canoni | HE2A             | Main network supply | Country code |
| 13 networking_ext   | D855019036691007 | Main network supply | Unknown      |
| 14 Node 2 open Num  | E1A              | Unknown             | Unknown      |
| 15                  |                  | Unknown             | Unknown      |

In the OpenScape Business S, the destination number is already entered as a DID in the "national" format.

"BA" (Broaden All) is significant only in the gateway.

"BA" is only needed when the original destination number TON unknown has been received, i.e., contains only the "short DID" = extension portion.

- After completing the basic installation first, the Network wizard is run.
- The following is set up for each subscriber of OpenScape Business S:
  - Internal number in short format (e.g., 300)

- DID phone number in national format (e.g., 89 7007 300)
- Associated gateway node ID

### Basic installation of OpenScape Business S, multi-gateway

**Setup - Wizards - Basic Installation - Basic Installation**

1 System Overview    2 Central Functions for Stations    3 Provider configuration and activation for Internet Telephony    4 Select a station    5 Configured Stations    6 Automatic Configuration of Application Suite    7 Configure MeetMe Conference    8 Configure E-Mail Forwarding

**Note:** changes done in expert mode must be reviewed/repeated after running through the wizard.  
**Note:** At least the configuration of the 'Country code' is needed for features such as 'Internet telephony' and 'MeetMe conference'.  
 If you want your OpenScape Business in "OpenScape Business Network Integration" you should select the "Network Integration" check box and enter a node ID. In this case, make sure that this node ID is unique within the whole network integration.  
 Normally, this integration is done by a Service Technician.  
 For a standalone OpenScape Business clear the 'Network Integration' check box.

**PABX number**

Country code: 00 49 (mandatory)  
 Local area code: 0 (optional)  
 PABX number: (optional)

**General**

International Prefix: 00

**Network Parameters**

Network Integration: ☐  
 Node ID: 2

**INFO:** Only the country code needs to be entered in the system data; the rest of the complete call number is in DID entry of the subscriber.

### Network wizard of OpenScape Business S, multi-gateway

Node input

Enter the IP addresses of the corresponding OpenScape Business systems in the domain.  
 The Application Server IP address can be the IP address of an application board or a connected OSBiz UC BS.

|        | NodeID | OSBiz X / OSBiz S | Net Name | Type               | Application Server | Encryption               | Registration Status |
|--------|--------|-------------------|----------|--------------------|--------------------|--------------------------|---------------------|
|        | 2      | 192.168.186.13    | Master   | V2 Mainboard       |                    | <input type="checkbox"/> | ✓                   |
| Delete | 1      | 172.30.111.22     | Slave    | V3 Mainboard Basic |                    | <input type="checkbox"/> | ✗                   |

Select multi-gateway in the network configuration.

| 8     | <input type="checkbox"/> | None       | None         | 15       | None    | No                |            |
| 9     | <input type="checkbox"/> | None       | None         | 15       | None    | No                |            |
| 10    | <input type="checkbox"/> | None       | None         | 15       | None    | No                |            |
| 11    | <input type="checkbox"/> | None       | None         | 15       | None    | No                |            |
| 12    | <input type="checkbox"/> | None       | None         | 15       | None    | No                |            |
| 13    | <input type="checkbox"/> | None       | None         | 15       | None    | No                |            |
| 14    | <input type="checkbox"/> | None       | None         | 15       | None    | No                |            |
| 15    | <input type="checkbox"/> | None       | None         | 15       | None    | No                |            |
| 16    | <input type="checkbox"/> | None       | None         | 15       | None    | No                |            |

The setup of gateway 1 occurs as in the previous example. This also applies to gateway 2.

## 16.4 Emergency Calls

The communication system and the phones connected offer different options for making emergency calls. The administrator can configure a hotline or hotline after timeout or an emergency service.

Even if the activation period has not yet started or the communication system is in the failover period, emergency calls can always be made from the first two active telephones.

### Prerequisites

The emergency call center is reached by dialing the CO access code (e.g., 0) and the emergency number (e.g., 112). The destination number for emergency calls must therefore be dialed from applications together with the leading CO access code.

### Basic Sequence

#### Case 1: Dialing the emergency call over the PSTN line

#### Case 2: Dialing the emergency call via an ITSP

#### Case 3: Special agreement with ITSP or PSTN providers

#### Case 4: Emergency calls with Mobile Logon (IP Mobility)

Emergency calls are initiated by a subscriber of the communication system by dialing the CO access code and the emergency number. The emergency number is passed by the communication system on to the respective provider (PSTN or ITSP).

The emergency call is issued in the local network to which the communication system connection is assigned. The following must be observed here: All subscribers who are not in the same location

as the communication system (e.g., Mobility users, CallMe users (teleworkers) or users with remote WAN-linked phones) should dial the emergency call via a cell phone or another land-line phone to issue the emergency call in the local area network of their site.

Not all ITSPs support emergency calls. In this case, the LCR configuration should be used to ensure that emergency calls are routed via the PSTN.

In cases where all subscribers of the communication system are not located at one site, but are nonetheless permanently assigned to a single site without a PSTN of its own, a customized procedure for emergency signaling can be agreed upon in cooperation with the Provider. For example, depending on the caller ID of the caller, the emergency call can be routed by the provider to the appropriate local network as agreed. These agreements are made on an individual basis and not subject to any policy.

Mobile Logon (IP Mobility) means that subscribers can change their phones and take their phone numbers with them.

Emergency calls work in this case, so long as the phones are logged in at the locations of the gateways. All subscribers who are not at the site of the gateway (e.g., Mobility users, CallMe users, home workers and users with remote WAN-linked phones) should dial the emergency call via a cell phone or another land-line phone to issue the emergency call in the local area network of their site.

---

**INFO:** For multi-gateway scenarios in which the Mobile Logon feature is used, special requirements apply. The appropriate configuration is described in the section "Emergency Calls in combination with Mobile Logon".

---

### 16.4.1 Hotline after Timeout / Hotline

You can activate the Hotline function for every station. You can thus define whether the connection to the hotline destination should be established as soon as you lift the handset (hotline) or after a short delay (off-hook alarm after timeout).

#### Hotline after timeout

If the subscriber selects any digit during the predefined time (hotline timeout), **no** connection to the hotline destination is established.

The hotline timeout is configured centrally by the administrator and can be activated and deactivated individually for each station.

#### Hotline

When the hotline is activated, the subscriber has **no** way to enter a call number after picking up the handset. It is possible to dial a number before picking up the handset. On picking up the receiver, the subscriber always reaches the predefined internal or external hotline destination automatically.

If hotline destination is set for call forwarding or call forwarding-no answer (CFNA), the calling station will always be forwarded.

### System-Specific Information

The administrator can configure six hotline destinations and the length of the hotline timeout (0-99 seconds). If the administrator specifies the value 0 for the hotline timeout, the hotline destination is called immediately.

### Dependencies

| Topic          | Dependency                                                                                |
|----------------|-------------------------------------------------------------------------------------------|
| Do Not Disturb | A caller hears the busy tone if Do Not Disturb (DND) is active at the destination called. |

## 16.4.1.1 How to Configure and Change the Hotline Destination

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony** > **Basic Settings** in the navigation tree.
3. Navigate in the menu tree to **System** > **Intercept/Attendant/Hotline**.
4. You can enter six different hotline destinations (**Destination call number**) under **Hotline**.
5. Click on **Apply**, followed by **OK**.

## 16.4.1.2 How to Change the Hotline Timeout

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony** > **Basic Settings** in the navigation tree.
3. Click **System** in the menu tree.
4. Click on **Intercept/VPL/Hotline**.
5. You can change the hotline timeout (delay period in seconds) under **Hotline**.
6. Click on **Apply** followed by **OK**.

### 16.4.1.3 How to Configure an Off-Hook Alarm after Timeout or Hotline for a Station

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Telephony > Stations**.
3. In the menu tree, click **Stations**.
4. Click **IP Clients**, for example.
5. Click **System Clients**, for example.
6. Mark the relevant station and set the **Hotline** mode field to **Off-hook alarm after timeout** or **Hotline**.
7. If you have set Hotline, you will also need to set the **number of hotline destinations** in the Hotline field.
8. Click on **Apply** followed by **OK**.

### 16.4.2 Trunk Release for Emergency Call

If an emergency call is made, and no CO trunk is free, a forced disconnect occurs. The emergency caller is automatically assigned the free trunk.

Trunk release works for ISDN and ITSP trunks.

If all trunks are busy, subscribers can execute an automatic or manual trunk release.

- Automatic: The Least Cost Routing (LCR) feature is active, and there is an emergency number stored in the LCR.
- Manual: the "Release trunk" feature is always active for the Attendant Console and is executed via keys or codes.

#### System-Specific Information

The administrator can configure as many emergency numbers as required.

To ensure that automatic trunk release occurs when all lines are busy, the emergency number must be saved in the LCR dial plan and the *Expert Mode* emergency flag must be set for it.

### 16.4.2.1 How to Activate and Deactivate Trunk Release for Emergency Call

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Routing**.
3. Navigate in the menu tree to **LCR > Dial Plan**.
4. Select one of the following options in the **Change Dial Plan** window:
  - If you want to activate the function, enable the **Emergency Call No** check box for the corresponding call number.
  - If you want to deactivate the function, clear the **Emergency Call No** check box for the corresponding call number.
5. Click on **Apply** followed by **OK**.

### 16.4.3 For U.S. and Canada only: E911 Emergency Call Service

The enhanced E911 emergency service transmits geographical information on the caller (stored address) in addition to the phone number when an emergency call is dispatched.

The receiving station for the emergency call does not require human intervention to determine the site of the caller.

In the USA, this feature is only activated when the emergency number 911 is dialed.

Every station number must be assigned a valid DID number with LIN (location identification number) by the administrator for the E911 emergency service. Subscriber lines that are physically close to one another are given the same LIN. The emergency call center has a database that contains all LINs and uses the transmitted LIN to identify the name and address of the party placing the emergency call.

#### Dependencies

| Topic | Dependency                                                                                                                                                    |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLIP  | LIN is activated by default for the U.S. However, if CLIP (Calling Line Identification Presentation) is activated for the USA, LIN is automatically disabled. |

#### 16.4.3.1 How to Edit CLIP / Lin

##### Prerequisites

You are logged into the WBM with the **Expert** profile.

##### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Telephony > Stations**.
3. In the menu tree, click **Stations**.
4. Click **IP Clients**, for example.

5. Click on the **Edit Stations** tab.
6. Enter the 16-digit LIN for the relevant subscriber in the **CLIP/Lin** field.
7. Click on **Apply** followed by **OK**.

## 16.4.4 Emergency Calls in Combination with Mobile Logon

If you use the Mobile Logon feature in a multi-gateway internetwork, switching to another phone may also change the physical location. Consequently, special measures are required for the routing of emergency calls.

### Description of the Algorithm for Dialing an Emergency Number

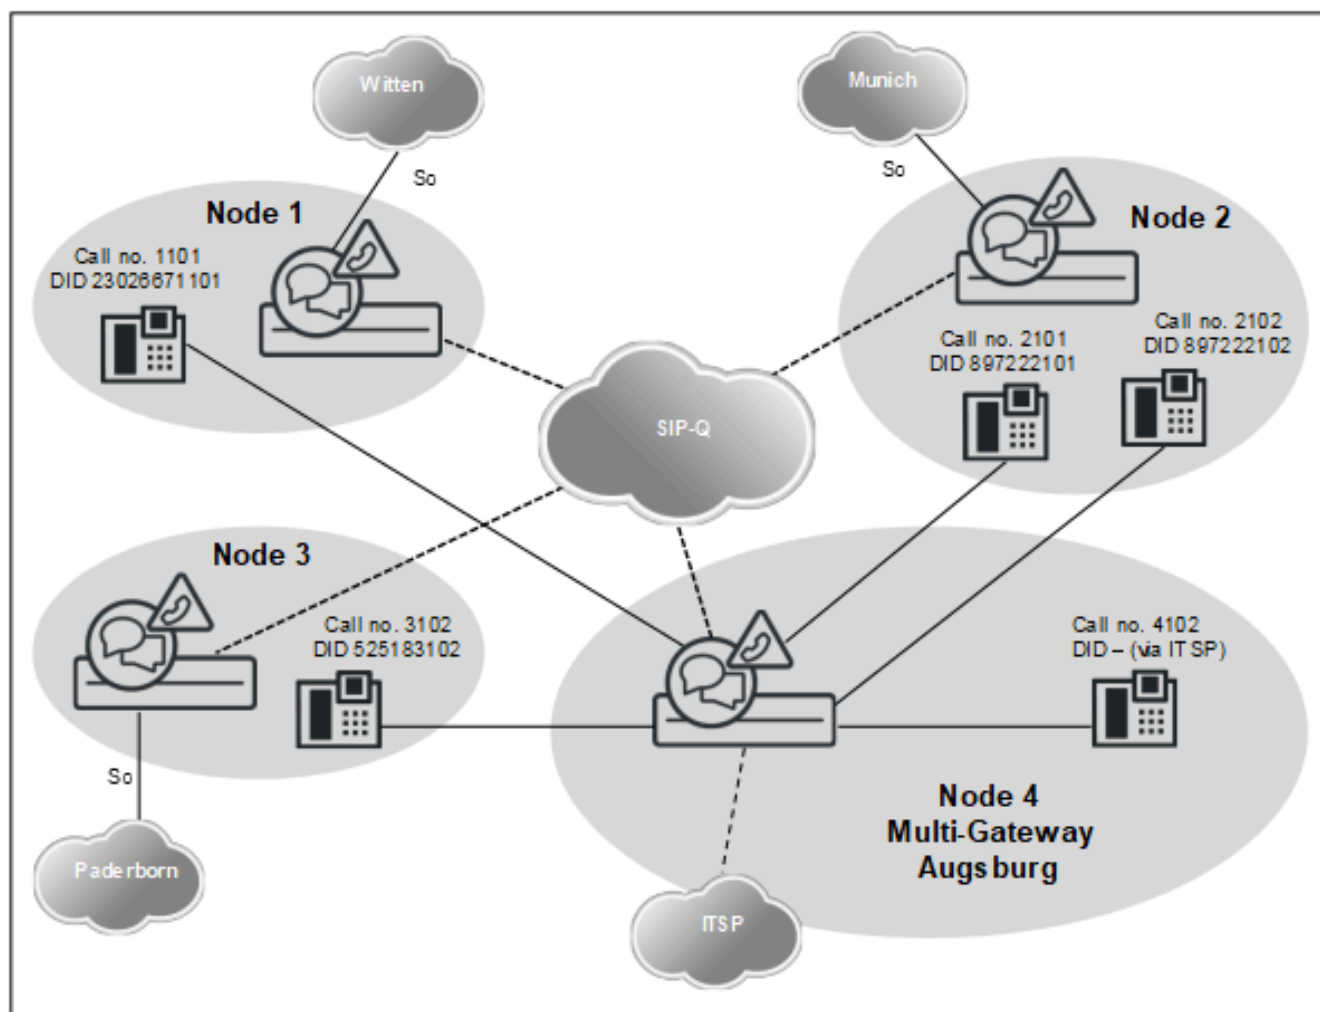

When a subscriber dials an emergency number (ID in the LCR), an algorithm checks whether or not an emergency number has been configured for the telephone. This is then used to produce a derived call number, which is used to route the call via the correct gateway in the internetwork.

Every number marked as an emergency number in the dial plan also features a reference to an entry in the route table. Every entry in the route table that is associated with an emergency number must be assigned a "low" class of service (COS). A low class of service means that every subscriber is authorized to call an emergency number.

### 16.4.4.1 Configuring the Emergency Scenario

The configuration of the emergency scenario shows which steps must be performed to set up emergency calling for a multi-gateway internetwork.

## Handling of Emergency Numbers

Mobile Logon is supported only within a node, i.e., location changes - and thus the special requirements for emergency calls - are only relevant for phones operated on the multi-gateway node (4). In general, all affected phones are logged in at node 4, but are physically located at different sites.

- In all affected phones, one entry is required for emergency calling (connection portion of the canonical phone number of the location node + seizure code for emergency route)
- The LCR entry (node\_4local) in the following table is only required if phones are physically present at node 4 (multi-gateway). It is also preceded by the location number which, however, is incomplete here (only country code). The prerequisite for this is an ITSP access to node 4, which supports emergency calls into the local network.
- On dialing at the telephone, an LCR rule marked with an emergency flag (e.g., 0C11x) is taken.
- The emergency number that is stored in the phone (and transmitted to the system at logon) is compared with the location data of the system (country code, area code, PABX number). If different, a "long" emergency number is formed:

- Removal of the access code: 0112 -> 112
- Insertion of <LDAP seizure code><international prefix><programmed emergency number>: e.g., 112 -> 0 00 49897220 112
- The "long" emergency number is routed through the LCR, either directly to the local CO (central office) using specific LCR rules or via tie lines to the respective partner node and from there into the CO.

---

**INFO:** Since the complete location number of the local node is not entered precisely in the telephone, a suitable LCR rule must also be entered for the local emergency call at the multi-gateway location.

---

## Setting up the Location Data for Node 4

### Routing parameters

#### Node 4, telephones

#### Overview of Entries Relevant for Emergency Calls in the LCR for Node 4

| Node 4                    | Gateway Node |
|---------------------------|--------------|
| G.-Location Country       | 49           |
| G.-Location Local Network |              |
| G.-Location System        |              |
| International Prefix      | 00           |
| National Prefix           | 0            |
| LDAP seizure code         | 0            |

| Route      | No. and type, outgoing | RNR type |
|------------|------------------------|----------|
| Networking | National               | Int/DID  |

| Networking Route          |   |
|---------------------------|---|
| CO code (2nd. trunk code) | 0 |

| Location Witten  |            |
|------------------|------------|
| Call Number      | 1101       |
| Emergency Number | 4923026670 |

| Location Munich  |          |
|------------------|----------|
| Call Number      | 2101     |
| Emergency Number | 49897220 |

## Call Routing

| Location Paderborn |          |
|--------------------|----------|
| Call Number        | 3102     |
| Emergency Number   | 49525180 |

| Location Augsburg |      |
|-------------------|------|
| Call Number       | 4102 |
| Emergency Number  | 490  |

| Dial Plan                    |                     | Route table         |            |                   | Dial Rule  |           |                       |         |
|------------------------------|---------------------|---------------------|------------|-------------------|------------|-----------|-----------------------|---------|
| Name                         | Dialed digits       | Emergency operation | Route      | Dedicated Gateway | Gateway ID | Dial Rule | Procedure             | Type    |
| Emergency calls <sup>5</sup> | 0C112               | X                   | Networking | Multi-Gateway     | 1          | E1A       | Corp. Network         | Unknown |
| Emergency calls <sup>5</sup> | 0C0110              | X                   |            |                   |            |           |                       |         |
| CO                           | 0CZ                 |                     |            |                   |            |           |                       |         |
| Emergency_calls_to1          | 0C00492302667-0-11X | X                   | Networking | Mandatory         | 1          | E3A       | Corp. Network         | Unknown |
| Emergency_calls_to2          | 0C004989722-0-11X   | X                   |            |                   | 2          |           |                       |         |
| Emergency_calls_to3          | 0C004952518-0-11X   | X                   |            |                   | 3          |           |                       |         |

### 16.4.5 E112 Emergency Call Service for Europe

The enhanced E112 emergency service transmits geographical information of the caller (stored address) in addition to the phone number when an emergency call is dispatched.

The geographical information is transmitted in a standardized XML document. The definition of the contents of this document depends on the country and ITSP. Thus you have to enter only the required subset of data you received from your ITSP (e.g. in Switzerland only the NAM field is used).

The feature is activated through configuration of emergency numbers in LCR and defining appropriate location information.

#### 16.4.5.1 How to add ITSP-Loc ID to a station

##### Prerequisites

You are logged into the WBM with the **Expert** profile

<sup>5</sup> With the above rules in this example, only the emergency situation will be detected, but no routing will occur. The derived "long" emergency number is used to route the emergency call.

<sup>6</sup> Since stations are physically connected at the multi-gateway location, a separate LCR rule must be entered for the local emergency call access (via the ITSP route).

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Telephony > Voice Gateway**.
3. In the menu tree, click **ITSP Loc-ID Settings**.
4. Fill the **Loc-ID Name** parameter (mandatory) and the parameter(s) defined for location information you received from your ITSP (e.g. in Switzerland only the NAM field is used).
5. Click on **Apply** followed by **OK**.  
An index id is assigned automatically to the **ITSP Loc-ID**.
6. In the navigation tree, click on **Telephony > Stations**.
7. In the menu tree, click **Stations**.
8. Click **IP Clients**, for example.
9. Click on the **Edit Stations** tab.
10. Enter the relevant index id of the to ITSP Loc-ID field.
11. Click on **Apply** followed by **OK**.

## 16.5 Call Admission Control

Using the Call Admission Control (CAC) feature, the used bandwidth can be restricted by limiting the number of calls.

The communication system offers three ways to influence the required bandwidth:

- Limiting the number of simultaneous calls via an ITSP
- Restricting the bandwidth requirements for gateway calls
- Limiting the number of calls in network scenarios

### 16.5.1 Limiting the Number of Simultaneous Calls via an ITSP

The maximum number of calls that can be conducted via an ITSP can be restricted by configuring the available upload bandwidth. By reducing the number of these calls (Internet calls), the bandwidth requirements can be reduced further.

The settings for this can be made in the **Network/Internet** and **Central Telephony** wizards.

The number of possible calls via an ITSP can be viewed in **Expert mode** under **Telephony > Voice Gateway > SIP Parameters**.

Internet calls are:

- ITSP calls
- myPortal@work calls
- Device@Home calls
- Circuit calls

Only LAN myPortal@work and pure WebRTC calls do not reserve bandwidth because payload is direct.

## 16.5.2 Restricting the bandwidth requirements for gateway calls

By configuring the codecs allowed for Gateway calls, the bandwidth requirements can be influenced.

If only compressed codecs are set, the bandwidth requirement is lower. When using mixed codecs the prioritization of the uncompressed codecs can be reduced so that they are used less frequently.

The corresponding settings for this are made in **Expert mode** under **Telephony > Voice Gateway > Edit Codec Parameters**.

## 16.5.3 Limiting the Number of Calls in Networking Scenarios

The communication system offers two options for controlling bandwidth in networking scenarios.

### **Limitation by restricting the number of lines to other network nodes**

#### **Limitation of bandwidth through specific codec selection**

By assigning a specific number of lines to other network nodes, an upper limit can be set on the number of simultaneous calls possible from and to these nodes.

The available bandwidth can be defined by configuring the codecs used from and to the partner (destination IP address).

The corresponding settings for this are made in **Expert mode** under **Telephony > Voice Gateway > Add Destination Codec Parameters**.

## 16.6 Tenant system

From an organizational point of view, the total capacity of the communication system can be split across a maximum of six subsystems. This makes it possible for several companies to share one communication system.

The tenant system feature is implemented using existing features. This means that it is not necessary for users to explicitly configure subsystems.

Users can control allowed and denied connections between individual stations and trunks via traffic restriction groups (CON groups).

Features in tenant service include:

- Intercept
- PABX number
- Caller list
- Override
- DISA

- Speaker call
- Call detail recording
- Hotline destinations
- Text messages, advisory messages
- Internal calls
- Internal Directory
- Customer Database Printout
- Night service
- Park slot
- Traffic Restriction Groups
- Voicemail
- Toll restriction

The communication system can be used as a tenant system, which allows it to be used simultaneously by several customers. All features have the same functionality for all users.

However, certain resources must be divided among the tenants (customers). They can be assigned to one, several, or all tenants. The resources to be divided are:

- Station
- Routes
- Attendant Console
- Intercept station
- Announcement devices, voicemail
- Traffic Restriction Groups
- Door Opener
- DISA trunks

Traffic restriction groups determine the ability of tenants to access each other.

Separate hotline destinations can be configured for each tenant.

## Dependencies

| Topic                      | Dependencies                                                                                                             |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------|
| CDRC                       | Only one CDRC exists for all tenants.                                                                                    |
| Internal calls             | Internal calls are possible between stations in "different" tenant systems if allowed by the traffic restriction groups. |
| LCR                        | Prime Line can be configured only for the entire system.                                                                 |
| Customer Database Printout | The database can only be printed for the entire system.                                                                  |
| Internal Directory         | The internal directory displays the names of all stations and speed-dialing numbers in the system.                       |
| Attendant                  | It is not possible to transfer undialed trunks.                                                                          |

| Topic     | Dependencies                                               |
|-----------|------------------------------------------------------------|
| Intercept | An intercept can be configured only for the entire system. |

## 16.6.1 System Speed Dialing in Tenant Systems

System speed dialing in tenant systems enables the selection of specific speed-dialing destinations, depending on the internal traffic restriction (ITR) groups. To do this, a range of speed-dialing destinations can be assigned to the appropriate traffic restriction groups using the WBM.

### Dependencies

| Topic                            | Dependencies                                                                    |
|----------------------------------|---------------------------------------------------------------------------------|
| External station numbers         | Speed-dial destinations can contain external station numbers only.              |
|                                  | The external station number must include the trunk group or seizure code.       |
| SSD names                        | You can assign a name to each speed-dialing destination.                        |
| Entrance Telephone (Door Opener) | The entrance telephone cannot dial speed-dial numbers.                          |
| ITR groups                       | You cannot assign more than one speed-dial number range for the same ITR group. |

# 17 Attendants

OpenScape Business provides attendant functions for every use case (e.g., AutoAttendants, phone- and PC-based attendants).

## Overview of Available Attendants

|                                  | Can be used for | Hardware                                                                                             | License  |

## 17.1 AutoAttendant

The AutoAttendant, together with the voicemail, provides an integrated automated Attendant service and a message store, e.g., for the company headquarters. The AutoAttendant plays a greeting to callers. During or after this announcement, the caller can be routed to an extension or mailbox automatically or by entering digits.

A wide range of functions for specific switching are available for this purpose, together with the corresponding prompts, e.g., "Press 1 for service, 2 for Sales, etc". After entering the desired digit, the caller is then automatically connected with the Sales or Service staff.

The Company AutoAttendant is not assigned to any internal call number, but to a central instance. Multiple Company AutoAttendants or mailboxes can thus be assigned to one extension. This makes it possible for the user to individually redirect to the appropriate Company AutoAttendant. Depending on the redirection, the caller hears either the announcement of the personal mailbox or the central company announcement. It is, however, also possible to play

back individual announcements via the Company AutoAttendant, regardless of the personal mailbox.

### Function Overview

- Intercept after announcement to a configured destination
- Status-based announcements - depending on the status of the extension (free or busy), different announcements can be played.
- Different day/night announcements (switching occurs either manually or automatically)
- Central calendar control via the automatic night service
- Suffix-dialing of any call number up to a configured length (can be deactivated)
- Speed dialing (= direct dialing external location) to configured destinations (any call number or mailbox)

A total of 4 lists with a total of 10 destinations and one intercept destination are possible. The active list is determined by the selected greeting.

- Suffix-dialing of any call number up to a configured length. Suffix-dialing can also be disabled to prevent toll fraud.
- Multistep AutoAttendant

AutoAttendant mailboxes can be configured as speed dial destinations (Manual 1 to 4, day/night). This allows for a concatenation of mailboxes.

In this case, the Company AutoAttendant acts in the same manner as for call forwarding, i.e., the call is forwarded from one concatenated mailbox to the next, and each time the respective announcement is played. In total, up to 100 AutoAttendant mailboxes are available.

- Speed dialing

Announcements can be disabled to guarantee fast switching.

- Announcement Prior to Answer with Parallel Signaling (without Speed Dialing)

While the greeting is being played to the caller, the call is also simultaneously signaled to the subscriber acoustically (and visually). If the subscriber picks up the call, the announcement is interrupted, and the subscriber is connected to the caller. If the subscriber does not pick up the call, the announcement is played in a loop until the caller hangs up or is routed through the call management.

- Busy tone detection
- Forwarding of fax calls (automatic fax tone recognition) to a preconfigured Fax destination.
- Automatic recall

In the case of a recall (except for fax calls), the caller is forwarded to the connected mailbox, if such a mailbox is available and message recording has been enabled.

---

**NOTICE:** In order to enable an automatic intercept from the voicemail system to the attendant console, the

attendant code must be entered internally (default 9, USA 0).

---

**NOTICE:** AutoAttendant mailboxes can only be administered from a telephone (TUI). This is why the password for the AutoAttendant mailbox should differ from the password for the personal mailbox of the phone!

---

### Use Cases

- Example 1: **Independent standby or emergency services announcements**

Outside business hours, the customer is redirected to the AutoAttendant (e.g., via the night service). The AutoAttendant connects to the respective on-duty service technician on request and offers the option of leaving a message in a central mailbox. In this case, one announcement enables redirection to the various mobile phone numbers of the service technician.

- Example 2: **Different Sunday services for medical practices**

It is now no longer necessary to record the currently applicable Sunday service on the answering machine and to replace the AB cartridge. The customer configures as many AutoAttendants as the number of available representatives. The AutoAttendants are recorded once and activated each weekend with a redirection (night service) to the appropriate AutoAttendant. Here the situation is reversed: several different announcements lead to the same mailbox.

## 17.1.1 Company AutoAttendant (UC Smart)

The Company AutoAttendant (UC Smart) is the Attendant Console of the UC solution UC Smart. It can be used as a personal AutoAttendant and as a central AutoAttendant. The initial setup is performed via the WBM, after which it can subsequently be controlled and configured over the telephone.

The Company AutoAttendant (UC Smart) can be operated in two modes:

- **Personal AutoAttendant**

The personal AutoAttendant is assigned to a subscriber or group and responds to the call number of the originally called, redirecting subscriber or group (e.g., 12345678-100).

The personal AutoAttendant is reached via the "voicemail" hunt group (default call number: 351). Operation occurs via SmartVM ports (EVM ports) of type "PhoneMail", which must all be assigned to this hunt group.

Parallel operation with UC Suite is not possible.

- **Central AutoAttendant**

The central AutoAttendant is used as a central attendant console and responds to its own call number (e.g., 12345678-0). Regardless of whether a direct call to the AutoAttendant or a diverted call is involved, the behavior is always the same.

The central AutoAttendant is reached via one or more of its own hunt groups (default call number: 352). Operation occurs via SmartVM ports (EVM ports) of type "Standard", which can be assigned to one or more hunt groups (max. 100).

By default, a Company AutoAttendant (group index 3) is configured with 2 SmartVM ports. The names and types of ports can be changed with the **Central Telephony > SmartVM** wizard (see also [How to Configure the Voicemail Box \(SmartVM\)](#)).

The speed dial list and the greetings upload be changed in Expert mode under **Telephony > Auxiliary Equipment > SmartVM** (see also [How to Load, Save and Delete Individual Greetings](#)). Additional (max. 99) Company AutoAttendants (UC Smart) can be likewise set up and activated.

Parallel operation with UC Suite is possible.

The Company AutoAttendant (UC Smart) requires a license (Company AutoAttendant license). If no license is present, the "rules" of the Company AutoAttendant are ignored, and calls are forwarded to the central intercept position.

### 17.1.1.1 How to Configure an Established Company AutoAttendant

As an example, for calls during the day, an announcement before answering is to be set up with a recording option (e.g., mailbox 100). During the night, after the appropriate announcement, calls are to be intercepted and sent directly the night voicemail box with a recording option (also mailbox 100).

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

UC Smart has been activated.

By default, during day and night service, an intercept to the intercept position occurs after the announcement.

By default, the speed-dial function and suffix-dialing are not enabled.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click on **Telephony > Auxiliary Equipment** in the navigation tree.
3. In the menu tree, click on **Auxiliary Equipment > SmartVM**.
4. Click on **AutoAttendant** in the menu tree.
5. Clear the **Intercept after announcem.** check box in the row of the desired AutoAttendant (e.g., 352) to enable the entry of speed dial digits during the greeting.

6. Select the **no suffix-dialing** check box. As a result, only the entry of speed dial digits will be possible (i.e., no internal call numbers can be entered).
7. Click on **Apply** followed by **OK**.
8. Click in the menu tree on **AutoAttendant** and then on the entry for the desired AutoAttendant (e.g., 352).
9. Click on the **Edit Speed Dial/Intercept Dest. Day** tab.
10. Select the station for the intercept position (e.g., station 100) from the **Select** drop-down list in the **Speed dial 0** row and then select the entry **Mailbox** in the **Type** drop down list.
11. Select the station for the intercept position (e.g., station 100) from the **Select** drop-down list in the **Intercept** row.
12. Click on **Apply** followed by **OK**.
13. Click on the **Edit Speed Dial/Intercept Dest. Night** tab.
14. Select the station for the intercept position (e.g., station 100) from the **Select** drop-down list in the **Intercept** row and then select the entry **Mailbox** in the **Type** drop down list.
15. Click on **Apply** followed by **OK**.
16. Click on **SmartVM** in the menu tree.
17. To avoid a two-fold greeting for the Intercept voicemail box, select the entry **None** from the **Greeting** drop-down list in the row of the intercept position (e.g., station 100). This causes the signal tone for recording to immediately follow the greeting of the Company AutoAttendant.
18. The greeting of the Company AutoAttendant can be changed through a telephone or via the **Expert Mode > Maintenance > SmartVM** (see [Configuring the Voicemail Box \(SmartVM\)](#) ).

### 17.1.1.2 How to Set up a New Company AutoAttendant

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

UC Smart has been activated.

Required licenses

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. First, configure the hunt group:
  - a) In the navigation tree, click **Telephony > Incoming Calls**.
  - b) Click **Incoming Calls > Groups/Hunt groups** in the menu tree.
  - c) Click on the **Add Group** tab.
  - d) Enter the station number of the new AutoAttendant (e.g., 353) in the **Station Number** field.
  - e) Enter the DID number of the new AutoAttendant in the **Direct inward dialing number** field (e.g., 353).

---

**INFO:** If you want to use DID 879, 890 or 891, you must make the setting through ManagerE and not through WBM.

---

- f) Enter the name of the new AutoAttendant in the **Name** field (e.g., **AutoAttendant 353**).
  - g) Select **Cyclical hunt group** from the **Type** drop-down list.
  - h) In the **Group member** area, select the desired AutoAttendant port (e.g., **745 SmartVM 7**) from the Call No drop-down list.
  - i) Click on **Apply** followed by **OK**.
  - j) To add another AutoAttendant port of the hunt group, click in the menu tree under **Groups/Hunt groups** on the desired AutoAttendant and then on the **Add member** tab. Then select another AutoAttendant port there (e.g., **746 SmartVM 8**) under **Station Number**.
  - k) Click on **Apply** followed by **OK**.
- 3. Configure the AutoAttendant mailbox:**
- a) Click on **Telephony > Auxiliary Equipment** in the navigation tree.
  - b) Click on **Auxiliary Equipment > SmartVM** in the menu tree.
  - c) Click on **AutoAttendant** in the menu tree.
  - d) Set the two check boxes as required in the row of the desired AutoAttendant (e.g., **353**):  
  
**Intercept after announcem.:** When activated, the caller can enter a speed dial digit for a switching option during the greeting.  
  
**No suffix-dialing:** If enabled, only speed-dial digits and no internal call numbers can be entered.
  - e) Click on **Apply** followed by **OK**.
  - f) Click on **SmartVM** in the menu tree.
  - g) Click on the
  - h) On the **Edit SmartVM Mailboxes** tab, select the desired greeting under **Greeting** in the row of the desired AutoAttendant.
  - i) Select the **AutoAttendant** check box in the row of the desired AutoAttendant.
  - j) Click on **Apply** followed by **OK**.
- 4. Configure the switching options (e.g., "0" to connect and "1" for an announcement):**
- a) Click in the menu tree on **SmartVM** and then on **AutoAttendant**.
  - b) Click in the menu tree under **AutoAttendant** on the entry of the desired AutoAttendant (e.g., **352**).
  - c) Click on the **Edit Speed Dial/Intercept Dest. Day** tab.
  - d) In the **Speed dial 0** row, enter the phone number to which calls should be connected under **Call number** and select the entry **Call no.** in the **Type** drop-down list.
  - e) Select the station for the intercept position (e.g., station 100) from the **Select** drop-down list in the **Speed dial 1** row and then select the entry **Mailbox** in the **Type** drop down list.

- f) Select the Company AutoAttendant (e.g., 353) from the **Select** drop-down list in the **Intercept** row.
- g) Click on **Apply** followed by **OK**.
- h) If the flag **no suffix-dialing** is disabled, internal numbers can also be dialed during the greeting. To prevent toll fraud, the **Call number length delimitation** should be checked and restricted so that no external phone numbers can be dialed (see **Expert Mode > Telephony > SmartVM > Edit SmartVM parameters**).

## 17.1.2 Company AutoAttendant (UC Suite)

The central Company AutoAttendant (UC Suite) is an attendant console which can only be configured by the administrator. To facilitate the installation and setup, there are five templates that can be customized by the administrator.

The administrator can configure the Company AutoAttendant (UC Suite) on the basis of rules and schedules. Schedules also make it possible to offer advanced selection options such as dialing by name, for example.

### 17.1.2.1 Schedules

This schedule and the rules contained in it (Call Control Vectors or CCVs) define how incoming calls are to be handled on specific dates and at specific times.

For example, on work days, separate rules may be defined for the morning shift (from 6:00 to 14:00 hours), the afternoon shift (14:00 to 22:00 hours) and the night shift (from 22:00 to 06:00 hours). Similarly, a weekend rule can be defined for the weekends. For each of these rules, you can define whether an announcement is to be played, for example, and/or the destination to which the calls are to be forwarded.

A schedule, in turn, must have at least one rule (called a Call Control Vector or CCV) assigned to it. The rules determine how incoming calls are to be handled during the time period to which the schedule applies. Rules apply only to calls and not to faxes and e-mails.

Rules are created with the graphical rule editor (CCV Editor) by combining predefined CCV objects and can be saved under a user-defined name upon completion.

Saved rules can be assigned to one or more schedules as a default rule (default CCV) or an exception rule (exception CCV). They can be opened, edited and saved again at any time by using the rule editor.

After a schedule has been assigned a default rule (default CCV), this schedule can be saved under a user-defined name. A schedule with an assigned default rule applies to a queue 24 hours a day, 365 days a year. If different rules are to be applied at certain times (breaks, weekends, holidays, vacations, etc.), these can be assigned to the schedule as exception rules (Exception CCV). This means that you can define how incoming calls are to be handled during the holiday

schedule, for example. Holiday schedules have precedence over the other schedules and rules.

### Rule Editor (CCV Editor)

The Rule Editor is used to create rules from predefined CCV objects. The arrangement of the CCV objects and their properties determine how incoming calls are to be handled.

---

**NOTICE:** A rule has an upper limit of 500 CCV objects.

---

The following predefined CCV objects are available:

---

**INFO:** For all of the named CCV objects, the two general properties listed below also apply:

**Description:** Optional entry to describe the CCV object, e.g., Greeting.

**Process digit:** specification of the digit(s) required without blanks, commas or other characters. The specification refers to the preceding CCV object. If 9 was specified there under Accepted Digits, then 9 must also be entered here.

---

- **Play Message**

Causes the desired message to be played. Any audio file present in the UC Suite can be selected. In addition, a new audio file can be imported into the UC Suite or a new announcement can be recorded and then imported as an audio file into the UC Suite.

The playback of the announcement seizes one respective Media Stream channel.

Properties:

- **File Name:** Selection of an announcement (audio file in WAV format)
- **Interrupt Digits:** specification of a key or key combination on the dial pad with which callers can stop the playback of an announcement.
- **File Manager:** Using this button, it is possible to directly upload an audio file in wav format or create a new voice file with the recording device.

- **Disconnect Caller**

Causes the call to be disconnected.

After this CCV object, no further CCV object may be inserted.

- **Go to CCV**

Causes a loop to another CCV object

Property:

- **Target CCV:** Selection of the CCV object
- **Process after digits**

Causes the next CCV object(s) to be executed, depending on the digits specified there (process digit).

Properties:

- **File Name:** Selection of one or more announcements (audio file in WAV format)
- **Playlist:** List of selected announcements (audio file in WAV format) in the order in which they are played
- **Digits Timeout:** Time, in seconds, for which the communication system waits for the input of digits.

If the required digits are not entered fully within the specified time, the message (announcement) is played again.

- **Link To:** List of digits with destination.

The digits and destinations can be added, edited and removed.

- **File Manager:** Using this button, it is possible to directly upload an audio file in wav format or create a new voice file with the recording device.

The contents of the Playlist are presented in the Rule Editor by a tool tip on hovering with the mouse pointer over the CCV object.

- **Single Step Transfer**

This function depends on the **Normal Attendant Console SST** setting (WBM, **Expert mode: Applications > OpenScape Business UC Suite > Server > General Settings**):

- **Normal Attendant Console SST** enabled (default setting; not for U.S.): Causes the call to be transferred, regardless of whether the destination is free, busy or unavailable.

---

**INFO:** For stations with call waiting rejection enabled, the call is switched through only if the destination station is free. No call waiting on busy occurs.

---

- **Normal Attendant Console SST** disabled (default setting, only for U.S.): Causes the call to be transferred if the destination is free.

If the destination is busy and call waiting rejection is disabled, or if the destination is unavailable, an announcement is played back to the caller. The caller can then optionally choose to leave a message in the voicemail box of the called subscriber or select the call number of another destination.

If the destination is busy and call waiting rejection is enabled, the call is not switched through.

After this CCV object, no further CCV object may be inserted.

Property:

- **Target Extension:** specification of the internal call number or external DID extension with the number of the CO trunk. Blanks, commas and other characters are not allowed.

The call number of the target extension is displayed in the CCV object.

---

**NOTICE:** After Single-Step-Transfer, the system disconnects the call after ringing for 5 minutes.

---

- **Record In Mailbox**

Causes the call to be sent to the desired voicemail box of a subscriber or a voicemail group

After this CCV object, no further CCV object may be inserted.

Property:

- **User Mailbox:** specifies the station number of the voicemail box of a subscriber or voicemail group

The station number and the name of the voicemail box or voicemail group are shown in the Rule Editor by a tool tip on hovering with the mouse pointer over the CCV object.

- **Supervised Transfer(also called screened transfer)**

Causes the call to be transferred to an internal destination. During the transfer, Music on Hold (MOH of UC Suite) is played back to the caller.

In contrast to the single-step transfer CCV object, two further CCV objects must be inserted here. This is because we now need to define how the communication system should behave if the call destination is busy or does not answer the call. Usually, an announcement is played to the caller in such cases.

Properties:

- **Target Extension:** Specification of the internal phone number.

Only internal call numbers are supported in the own node.

Forwarding to external destinations, virtual stations, additional AutoAttendants, UCD (incl. Contact Center) as well as external CallMe destinations is not allowed! For these scenarios, the SST (single-step transfer) should be used.

- **Ring Time Out (SEC.):** Time, in seconds, within which the call must be accepted.

If the call is not answered within the specified time, it is returned to the communication system, and the next CCV object is used.

---

**INFO:** The time specified here must be shorter than the time configured for call forwarding (the default setting for call forwarding = 15 seconds). See [How to Configure Call Forwarding](#).

---

- **Pull back call if destination device is forwarded / deflected:** Option (only applicable for internal call number.)

If this option is enabled, the call destination is first checked, and if a forwarding destination or deflection has been set for it, the call is returned to communication system, and the next CCV object is used.

- **Check Presence status when transferring call:** Option

If this option is enabled, the presence status of the call destination is checked, and if this status is any presence status other than Office, the call is returned to communication system, and the next CCV object is used.

---

**NOTICE:** If an incoming call comes from a suppressed/unknown number and the call is answered by UC Suite AutoAttendant and transferred using Supervised Transfer, the displayed caller number will be the UC Suite number.

---

- **Dial By Name**

Causes the caller to be prompted to enter the first three letters of the desired subscriber's last name via the dial pad.

If a unique subscriber name with the entered initial letters is found, a connection is established.

If there are several subscriber names with the entered initial letters, these subscriber names are announced to the caller (max. 10 subscribers). If a subscriber has no recorded name announcement, the call number is announced instead. After selecting the desired subscriber, a connection is made.

If none of the subscribers match the entered initial letters, the caller receives a corresponding message.

---

**INFO:** The keys on the dialpad respond to the first press of a key. With each key pressed, the system tries to determine whether there are subscriber last names with the letter assigned to that key.

Example: Let us assume the internal phone book has five last names with the initial letters t, u and v: Taylor, Taler, Ullrich, Vasquez and Volterra. To establish a connection with the subscriber Taylor, following keys must be pressed: 8 2 9

---

After this CCV object, no further CCV object may be inserted.

Properties:

- **Method:** Selection of **Transfer To Extension** or **Record In Mailbox**.

Depending on the method selected, a connection to the desired extension or its voicemail box is established. Note that only internal extensions for which the first and last names of the subscriber are entered in the internal directory are supported here.

- **Dial By Extension**

Causes the caller to be prompted to enter the station number (extension) of the desired subscriber via the dial pad.

If the caller dials the station number of a virtual station, the caller is prompted to enter another station number. A connection is then

established. If the desired subscriber does not respond, the call is accepted by his or her voicemail box.

After this CCV object, no further CCV object may be inserted.

Properties:

- **Method:** Selection of **Transfer To Extension** or **Record In Mailbox**.

Depending on the method selected, a connection to the desired extension or its voicemail box is established. Note that only internal extensions in the network for which the phone number is entered in the internal directory are supported here.

- **Set language**

Selects the language for each standard announcement based on the phone number of the caller. It should be noted that only standard announcements (i.e., system announcements) and no personal greetings are taken into account here.

For example, it is possible to have German announcements played back to callers with the country code +49 and French announcements for callers with the country code +33.

Properties:

- **Default language:** Drop-down list to select a language.

The language selected here is used for all phone numbers for which no specific language was defined.

- **Pattern:** Specifies the phone numbers to which a particular language is to be assigned.

The following placeholders can be used \* = any digit, ? = any digit.

- **Language:** Drop-down list to select the language to be assigned to the relevant phone numbers (matching **Pattern**).

A language can be assigned to any number of different phone numbers (matching **Pattern**).

- **CLI Routing**

Causes the forwarding of a call to one or more sequential CCV objects based on the caller's number.

For example, it is possible to first have a German announcement played back to callers with the country code +49 (CCV object **Play Message**) and then have the call forwarded to an internal phone (CCV object **Single Step Transfer**). The area code can also be used (e.g. 089 for Munich).

Properties:

- **Standard:** Drop-down list to select the CCV object.

The CCV object selected here is used for all phone numbers for which no specific destination was defined.

- **Pattern:** Specifies the phone numbers to which a specific CCV object is to be assigned as the destination.

The following placeholders can be used \* = any digit, ? = any digit.

– **Description**

Provides an explanation.

For the **Pattern** +49 (= country code for Germany), for example, Germany can be entered.

The text entered here will appear in the Rule Editor.

- **Target:** Drop-down list to select the CCV object that is to be assigned as a destination to the related phone numbers (matching **Pattern**).

A CCV object can be assigned as a destination to any number of different phone numbers (matching **Pattern**).

- **Branch on variable**

Causes the forwarding of a call to one or more sequential CCV objects based on a given condition.

You can thus define, for example, that an announcement (such as "Please call again later ...") should be played back to callers as soon as there are more than 20 calls in a queue.

Properties:

- **Variable:** Selection of **Calls** or **Available agents**.

Depending on the selected variable, the number of calls waiting in a queue or the number of available agents (including agents in wrap up time) is used as the defined condition. In the associated drop-down list, the condition (**less than, greater than, less than or equal to, equal to or greater than, equal to**) must be selected, and the comparison value must then be entered in the corresponding input field.

- **True branch:** Drop-down list to select the CCV object that is to be used as a destination when the condition is satisfied.
- **False branch:** Drop-down list to select the CCV object that is to be used as a destination when the condition is not satisfied.

The number of available agents in a queue is affected by the following status changes of the agents:

- Login of an agent into the queue using "Anmelden/Login": --> +1
- Logout of an agent from the queue using "Abmeldung/Logout": --> -1
- Agent in the status "Break":-->-1
- Agent in the status "Available after Break":--> +1

The number of available agents in a queue is **not** affected by the following status changes of the agents:

- Agent in the status "Ringing"
- Agent in the status 'Talking'
- Agent in the status "Wrap up"
- Agent in the status "Missed Call"
- Agent in the status "Overdue"

#### 17.1.2.1.1 How to add and Exception in CCV

If different rules are to applied at certain times (breaks, weekends, holidays, vacations, etc.), these can be assigned to the schedule as exception rules as an Exception CCV. This means that you can define

how incoming calls are to be handled during the holiday schedule, for example. Holiday schedules have precedence over the other schedules and rules.

### Step by Step

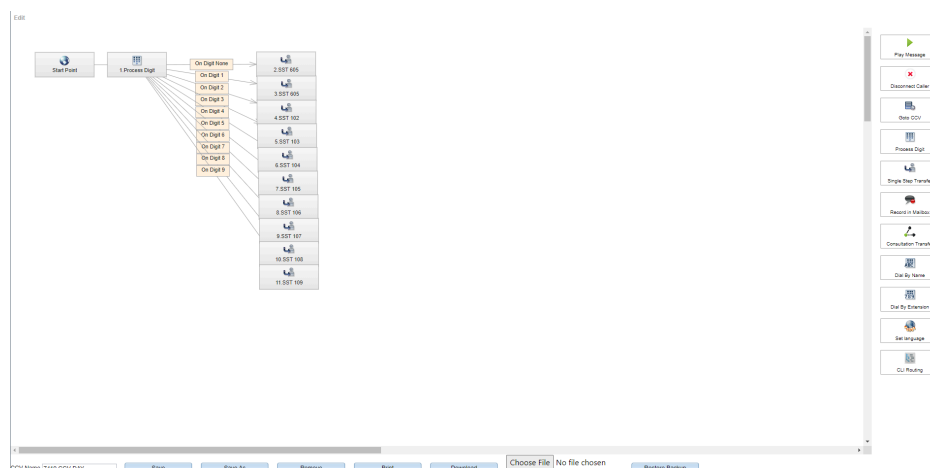

1. Navigate to **Expert mode > Applications > OpenScape Business UC Suite**.
2. Click on **Schedules**, select one of the available schedules and click on **Edit**.  
You can click on **Add** to create a new Schedule.
3. Click on **Add** in the **Exceptions** area.
4. Fill in the **Description** field, if you want.
5. Select the type of the exception from one of the available options:
  - **Within time range**: select a specific time, day and recurrence for the exception
  - **Within time date range**: select a specific date, time, day and recurrence for the exception
  - **Holiday Schedules**: select a specific Holiday date for the exception
  - **Yearly Recurrence**: select whether the exception will repeat every year
6. Click on **Save**.

## 17.1.2.2 Templates

The following templates are predefined, standardized templates for the Company AutoAttendant (UC Suite), but can be changed as desired and adapted to specific needs.

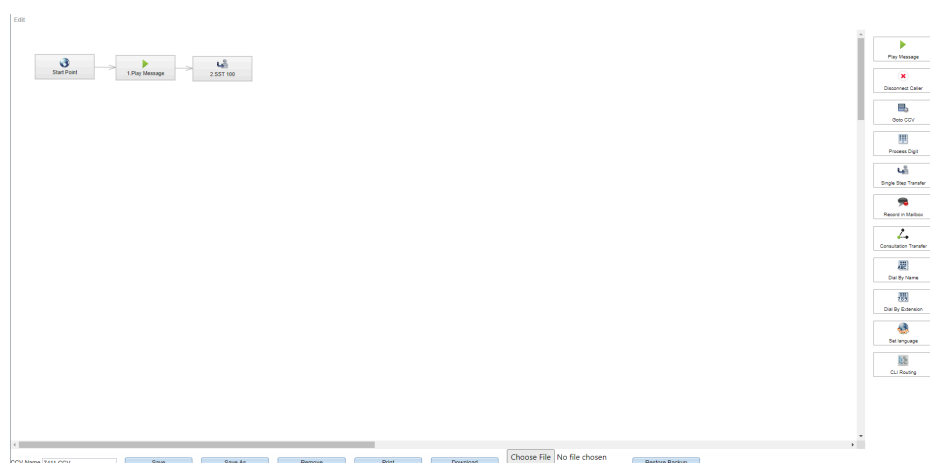

### Template 1 - 7410 CCV: Call with Switching (without Voicemail)

An announcement is played for the caller. The caller is then prompted to press a button (digit) and is connected to a subscriber. If the caller does not press any button, the call is switched to the intercept position (default 100).

### Template 2 - 7411 CCV: Announcement before Answering

An announcement is played for the caller. The call is then switched to the intercept position 100.

### Template 3 - 7412 CCV: Call Outside Business Hours

An announcement is played for an incoming call outside business hours. The call is then disconnected.

### Template 4 - 7413 CCV: Call Outside Business Hours with Call Forwarding to Voicemail

An announcement is played for an incoming call outside business hours. The caller is then prompted to optionally record and leave a message in a voicemail box.

### Template 5 -7414 CCV: Dial by Extension U.S. Feature

An announcement is played for the caller. If the caller then does not enter any further digits, the call is routed to the CCV Dial by Extension. If the caller presses digit 1, the call is switched to the intercept position (default 100).

## 17.1.3 Xpressions Compact

Xpressions Compact provides an integrated AutoAttendant solution for your communication system. Up to 500 mailboxes are available with a recording capacity of 100 hours.

### **More Information**

The AutoAttendant mailbox includes not only the mailbox for the Attendant Console, but also the option of recording messages. Incoming calls can be forwarded to:

- any extension
- a subscriber or guest mailbox
- an information mailbox
- some other user-specified destination, including external destinations
- a pre-defined destination depending on the number (10 destinations are available; no greeting is played in this case)
- an Attendant Console

Xpressions Compact features:

- Call forwarding to a mailbox
- Distribution lists for voice messages (20 lists are possible, with 499 destinations each)
- Message broadcasting
- Message Waiting Indicator
- Voice to E-mail
- Live Recording
- Notification call (SMS and pager possible)
- Forwarding messages by choice of name
- Forwarding of fax calls
- Statistics for Attendant mailboxes
- Central voice mailbox
- Access protection (3 to 8 digit password)

For more detailed information, refer to the Xpressions Compact Administrator Documentation

## **17.2 OpenStage Attendant**

Attendant functions can be performed using a specially configured OpenStage telephone. The OpenStage Attendant is also an intercept position.

### **Key layout**

OpenStage Attendant is the destination for all incoming non-DID calls and calls for which no users could be reached (intercept calls) via the call allocation criteria. The attendant then routes these calls to the correct destination.

The following OpenStage phones can act as an Attendant:

- OpenStage 30
- OpenStage 40
- OpenStage 60
- OpenStage 80

On OpenStage telephones configured as attendant consoles, the programmable function keys are assigned as follows:

## **Attendants**

### OpenScape Business Attendant

- Night service
- Directory (phone book)
- Queued calls
- Override
- Hold
- External 1
- External 2 (not for OpenStage 40)
- Empty unassigned key (not for OpenStage 40)

## **17.3 OpenScape Business Attendant**

The OpenScape Business Attendant provides switching functions as well as the connection of a phone book for OpenScape Business. In a network, the OpenScape Business Attendant can be expanded to show network-wide BLF and presence information.

The screenshot displays the Attendant software interface. At the top, there is a toolbar with icons for Consultation, Toggle, Consultation back, Transfer, and Disconnect. A status bar shows 'Status' and a search field 'Enter phone number / name-->'. Below this, a large white area is labeled 'Incoming calls' and 'Parked / Holded conversations'. A section below the toolbar is divided into 'Active:' and 'Passive:' tabs. Below this, there are tabs for 'BLF', 'Telephone book', 'List of callers', and 'Voicemail'. The main area contains a grid of call information. The grid is organized into columns for different offices and departments. The 'Active' tab is selected, showing a list of active calls. The 'Passive' tab is also visible. The grid includes columns for 'Office 1. Floor', 'Office 2. Floor', 'Office 3. Floor', 'Support', 'Labor', 'Sales', and 'Features'. The 'Features' column lists various call management functions like 'Override busy station', 'Activate night answer', 'Mute on/off', 'Display suppression', 'Hold', 'Park', and 'Call'. The 'Active' tab shows a list of active calls with details like phone number, name, and status. The 'Passive' tab shows a list of parked or held calls with details like phone number, name, and status.

| Office 1. Floor     | Office 2. Floor     | Office 3. Floor      |  |                       |
|---------------------|---------------------|----------------------|--|-----------------------|
| 100 John Smith      | + 104 Pierre Martin | 106 Christophe Lambe |  |                       |
| 101 Janet Jones     | 105 Natalie Dubois  | 107 Flor Peeters     |  |                       |
| 102 Susanne Mueller |                     | 108 Giovanni Rossi   |  |                       |
|                     |                     | 109 Angelina Mancini |  |                       |
|                     |                     |                      |  |                       |
|                     |                     |                      |  |                       |
|                     |                     |                      |  |                       |
| <u>Support</u>      | <u>Labor</u>        | <u>Sales</u>         |  | <u>Features</u>       |
| 110 Maria Sanchez   | 114 Anna Nowak      | 116 James Campbell   |  | Override busy station |
| 111 Julio Gomez     | 115 Jan Kowalski    | 117 Morag Reid       |  | Activate night answer |
| 112 Danny De Jong   |                     | 118 Buddy Miller     |  | Mute on/off           |
| 113 Antje Janssen   |                     | 119 Akiko Watanabe   |  | Display suppression   |
|                     |                     | 120 Kim Chang        |  | Hold                  |
| 130 FAX             |                     | 103 Manfred Schmitz  |  | Park                  |
|                     |                     | 199 FAX              |  | Call                  |

Ready to operate

Main attendant functions:

- Manage waiting or accepted calls
- Data of the active call
- Parked, held calls

## Attendants

- Call List
- Journal for answered, missed and outbound calls
- Personal VoiceMail

Directory (phonebook) application:

- Outlook contacts
- LDAP (connection via OpenDirectory Service)
- Personal directory

BLF status:

- Free, Busy, Called, Forwarded

Presence visibility:

- Office, Meeting, Sick, Break, Out of the Office, Vacation, Lunch, Gone Home

---

**NOTICE:** The "sick" presence status may not be available, depending on system settings by the administrator.

---

- Change the presence status for users within your own node (currently not possible for users from other nodes)

Two different "styles" are available for customizing the OpenScape Business Attendant user interface.

You can connect a maximum of eight OpenScape Business Attendants per communication system (a maximum of eight licenses per OpenScape Business X1/X3/X5/X8 and Business OpenScape Business S).

OpenScape Business Attendant is licensed via the WBM.

### Technical Requirements

- Standard Windows PC
- Possible use of a Terminal Server when using HFA telephones (see [Prerequisites for UC Suite PC Clients](#) for the related prerequisites)
- USB interface or LAN interface, depending on the telephone used
- Screen with a resolution of min. 1024x768, optional second screen to display the second BLF
- Video card with 16-bit color depth (min. 256 colors)
- Internet access for support or updates

### Operating System

- Microsoft Windows 10 / 8.1 / 8 / 7 (both 32-bit or 64-bit are possible)
- Microsoft Windows Vista (32 bit)
- Microsoft Windows Server 2015 (32 bit / 64 bit) as Microsoft Terminal Server
- Microsoft Windows Server 2012 (32 bit / 64 bit) as Microsoft Terminal Server
- Microsoft Windows Server 2008 R2 (64 bit) as Microsoft Terminal Server

Support for OpenScape Business Attendant for Microsoft Windows XP and Microsoft Windows Server 2003 will end at the same time as the end of support for these products by Microsoft. The product will still be supported, but will no longer be tested in detail.

### Supported Phones

- Openstage 40/60/80 HFA
- openStage 30T/40T/60T/80T
- OpenScape DeskPhone CP 100/200/205/400/600/600E/700/700X
- OpenScape DeskPhone CP 110/210/710

---

**NOTICE:** Regarding OpenScape DeskPhone CP 200/205/210, the name of the user is not shown for an external call.

---

Some of the older devices (e.g., optiPoint 410/420/500) are still supported. Please refer to the relevant release notes to see which devices have been tested and released.

### Plug-and-Play Installation

The initial setup of the OpenScape Business Attendant is wizard-based. The wizard automatically opens all required configuration dialogs.

e.g.:

- Query the terminal type
- Query and check system access
- Query and check internetwork, if any
- Automatic integration of the BLF.

## 17.3.1 OpenScape Business BLF

The Busy Lamp Field, OpenScape Business BLF, is a separate application for displaying busy states. Optional functions include displaying and setting the presence status, and setting up the connection for the associated phone.

### Technical Requirements

Main functions:

- OpenScape Business BLF is scalable and customizable
  - 10 to 350 BLF fields (user buttons), depending on the screen resolution
- Phone functions
  - Dial
  - Call answer
  - Disconnect
- Set the presence status (for own station)
- Directory (system directory)
- Call Journal

One OpenScape Business BLF license plus one UC User license are required to operate each OpenScape Business BLF.

- Standard Windows PC
- Microsoft Windows 10 / 8.1 / 8 / 7 (both 32-bit or 64-bit are possible)
- Microsoft Windows Vista (32 bit)
- Microsoft Windows Server 2015 (32 bit / 64 bit) as Microsoft Terminal Server
- Microsoft Windows Server 2012 (32 bit / 64 bit) as Microsoft Terminal Server
- Microsoft Windows Server 2008 R2 (64 bit) as Microsoft Terminal Server
- Screen with a resolution of min. 1024x768
- Video card with 16-bit color depth (min. 256 colors)
- LAN interface
- Standard mouse and keyboard
- Internet access for support or updates

### 17.3.2 Configuration Examples for OpenScape Business Attendant, OpenScape Business BLF

In the following sections you will find configuration examples for the general configuration of OpenScape Business Attendant, OpenScape Business BLF.

#### 17.3.2.1 Scenario 1: OpenScape Business Attendant Connected to an OpenScape Business Single System

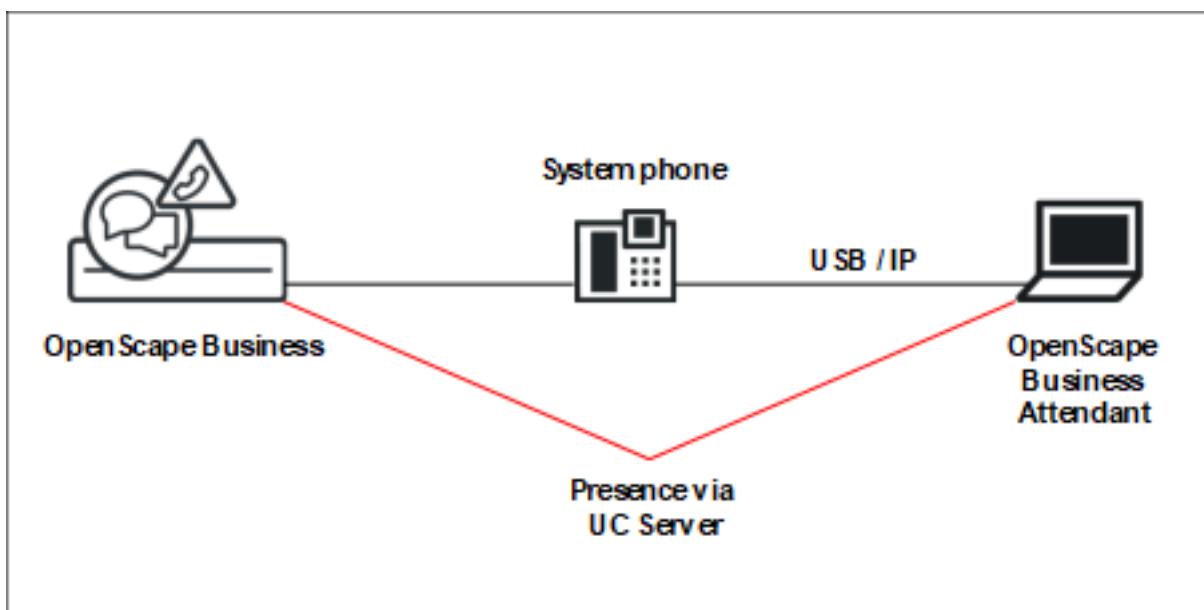

##### Prerequisites

The license for OpenScape Business Attendant is present.

Telephone with valid license

License for UC Smart or UC Suite for presence information (optional)

The IP address for the Web Service Interface is different for UC Smart and UC Suite. In the case of UC Smart, the WSI always runs on the communication system; for the UC Suite, by contrast, it runs on the Application Board or Application Server (see [UC Smart](#) and [UC Suite](#)). If Booster Server is in use, the IP-address of Booster Server has to be used while if OCAB is in use, the IP-address of the OCAB has to be used. Only if both components are not connected, communication system's IP must be used.

### Step by Step

1. Configure a station as an attendant using the WBM or Manager E (optiPoint 500, OpenStage 30T, 40T, 60T, 80T or OpenStage 40HFA, 60HFA, 80 HFA).

---

**INFO:** SIP or CMI phones have not been released.

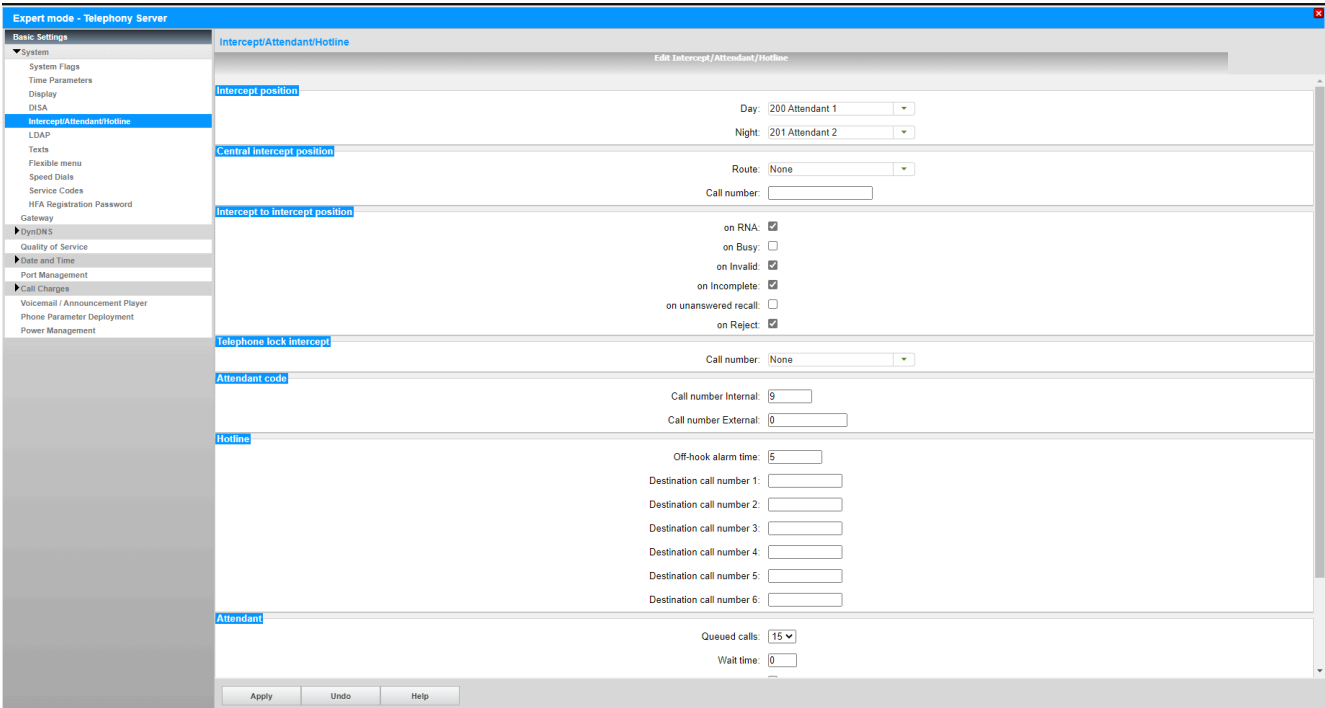

---

2. Configure the **Associated services** feature. This is needed for the OpenScape Business Attendant to enable and disable features for other stations.
3. Activate **Override Do Not Disturb** and disable **Call waiting rejection on**.

Attendants

4. Configure the intercept criteria and Attendant codes (define the intercept options and call numbers for the Attendant Console).

5. Licensing the OpenScape Business Attendant

USB - COM driver (CallBridge) for optiPoint 500, OpenStage 30T and OpenStage 40T

USB - RNDIS driver for OpenStage 60T and OpenStage 80T

- Install OpenScape Business Attendant via the installation routine (accept the license agreement, specify the storage location and the language of the OpenScape Business Attendant).

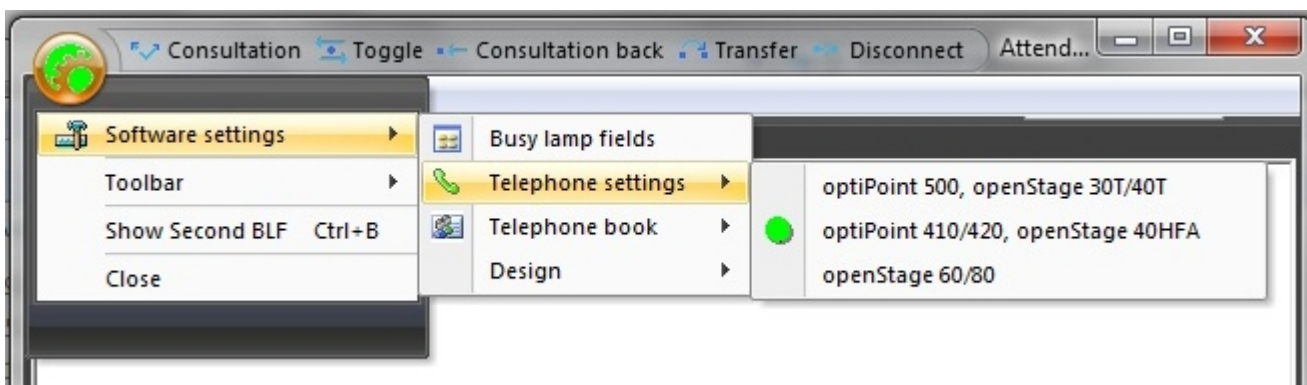

## Attendants

After the installation and the initial startup of the program, the configuration wizard starts automatically and requests the following settings:

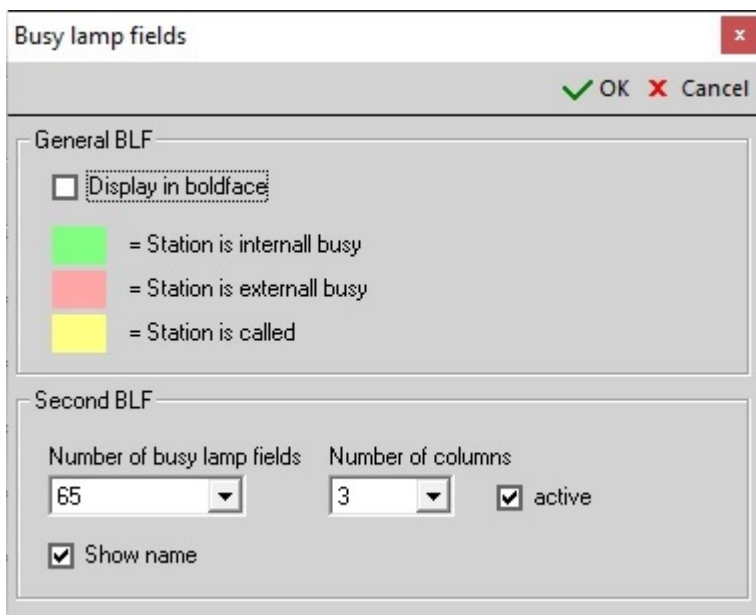

- Type of telephone
- Is the presence function to be used?

Configuration for access in the Attendant:

After logging into the communication system successfully, it is possible to fill the BLF automatically.

---

**INFO:** Assign or check the security settings (http or https) in the WBM.

### 17.3.2.2 Scenario 2: Two or More OpenScape Business Attendants Connected to an OpenScape Business Single System

#### Prerequisites

The following prerequisites are required in addition to those for scenario 1:

Sufficient licenses for UC Smart or UC Suite for presence information (optional)

Group configuration

#### Step by Step

1. Set up as a station as an Attendant via the WBM (see Configuration Example 1).
2. Define a group; hunt groups (linear and cyclic) and call groups are supported.

**INFO:** Configure the intercept criteria and Attendant codes (define the intercept options and call numbers for the Attendant Console). In these cases, the intercept position is the group phone number.

17.3.2.3 Scenario 3: OpenScope Business Network with Individual OpenScope Business Attendants (Network-wide BLF and Presence Status via WSI)

Prerequisites

License for UC Smart for presence information (optional)

Multiple OpenScope Business Attendants can be used in UC-Smart networks only. The WSI (Presence Server of OpenScope Business) provides netwide Hook states and Presence information. UC-Suite networks need myAttendant for netwide functionality.

17.3.2.4 Scenario 4: OpenScope Business Network with central OpenScope Business Attendant (Network-wide BLF and Presence Status via WSI)

Prerequisites

License for UC Smart for presence information (optional)

Multiple OpenScope Business Attendants can be used in UC-Smart networks only. The WSI (presence server of OpenScope Business)

provides netwide Hook states and Presence information. UC-Suite networks need myAttendant for netwide functionality.

Central intercept position (in the node in which no OpenScape Business Attendant is set up)

## Step by Step

1. Set up the OpenScape Business Attendant in accordance with configuration example 1.
2. Enter the central intercept position in the node (where no OpenScape Business Attendant has been set up).

## 17.3.2.5 Scenario 5: OpenScape Business BLF Connected to an OpenScape Business Single System

### Prerequisites

- One OpenScape Business BLF license is available for each station
- The phones are already assigned
- One UC User license is available for each station

### Step by Step

1. Configure the telephones via WBM
2. Configure the presence server via WBM
3. Install and start OpenScape Business BLF
4. The (optional) automatic assignment of the OpenScape Business BLF occur after the initial startup.

| OpenScape Business BLF |                       |                       |
|------------------------|-----------------------|-----------------------|
| Presence: Help         |                       |                       |

|                        |                       | 199 FAX               |

### **17.3.2.6 Scenario 6: OpenScape Business BLF Connected to an OpenScape Business Internetwork (BLF and Presence Status via WSI)**

#### **Prerequisites**

- One OpenScape Business BLF license is available for each subscriber
- The phones are already assigned
- A UC User license is available for each subscriber
- OpenScape Business BLF can be used in UC-Smart networks, not in UC Suite networks. The WSI (Presence server of OpenScape Business) provides netwide Hook states and Presence information.

#### **Step by Step**

- 1.** Configure the telephones via WBM
- 2.** Install and start OpenScape Business BLF
- 3.** The connection to the WSI and the manual assignment of the BLF occur after the initial startup. In this case, the BLF can be assigned for network-wide stations.

## **17.4 myAttendant**

A wide range of Attendant functions are available to you via myAttendant. Subscribers can be easily managed here via user buttons. In addition, messaging functions (voicemail, faxes, instant messages, SMS, and e-mails) are available via the Message Center.

#### **Main Attendant Functions**

A maximum of 20 myAttendants can be connected per communication system (per node). The maximum configuration of the internetwork is equal to the total capacities of the networked communication systems. The presence and phone status are shown for all subscribers in the network. The Message Center of myAttendant shows the subscribers of the own communication system.

- Manage waiting or accepted calls
- The data of the active call is displayed
- Parked calls on hold are displayed
- Caller list
- Journal for open, scheduled, internal, external, answered, missed and outbound calls
- Directory (phonebook) application
  - LDAP (e.g., ODS)
  - Personal directory / Outlook contacts
  - Internal directory, for all interconnected stations in the network.
- Busy Lamp Field status of all internal subscribers of the own system as well as all stations of the network
  - Phone status: Free, Busy, Called, Forwarded, Do Not Disturb

## Attendants

- Presence status (Office, CallMe, Meeting, Sick, Break, Out of the Office, Vacation, Lunch, Gone Home (netwide))

---

**NOTICE:** The "sick" presence status may not be available, depending on system settings by the administrator.

---

- There are three interface styles to choose from.
- A maximum of 20 myAttendants can be connected per communication system (up to 20 licenses per OpenScape Business X3/X5/X8 and OpenScape Business S). The licensing of myAttendant occurs via the WBM.

### Technical Requirements (see the Sales Information for Details)

- Standard Windows PC
- Microsoft Windows 10 / 8.1 / 8 / 7 (both 32-bit or 64-bit are possible)
- Microsoft Windows Vista (32 bit)
- Terminal server usage possible

### Additional Software

- Oracle Java 8 or higher or alternatively OpenJDK 8 (see **Service Center > Software**)

### Supported Phones

- Openstage 40/60/80 HFA
- OpenScape Desk Phone IP 35G/55G HFA
- OpenScape Desk Phone IP 35G Eco HFA
- OpenScape Desk Phone CP 100/200/205/400/600/600E/700/700X HFA
- OpenScape Desk Phone CP 110/210/710 HFA
- SIP phones with RFC 3725 support, e.g., OpenScape Desk Phone IP 35G/55G SIP, OpenScape Desk Phone CP 100/200/205/400/600/600E/700/700X SIP, OpenScape Desk Phone CP 110/210/710 SIP
- OpenStage 30T/40T/60T/80T

Simple plug and play installation; the first steps for the installation are sent to the user by the system (if his or her e-mail address has been configured).

## 17.4.1 Subscriber Management

Subscriber management is performed in myAttendant via user buttons, the internal directory, and the external directory.

### User Buttons

The user buttons are located on the **Default** tab and are a part of the main window of myAttendant.

There are 100 user buttons available on a user buttons tab by default. You can change the default number of user buttons per tab any time you want.

The user buttons are sorted in alphabetical order by default.

You can configure multiple tabs for user buttons and select the names for these user buttons freely.

Internal, external and personal contacts (users) can be assigned to user buttons.

## 17.4.2 Message Center

All voicemails, faxes, instant messages as well as SMS messages and e-mails are recorded and managed via the **Message Center** of myAttendant.

Messages can also be managed for other subscribers, provided these subscribers have granted the appropriate permission for this.

The Subscriber List window, contains a list of all communication system subscribers with their presence/absence status. Your own status is displayed first in a drop-down message overview. The other subscribers follow in alphabetical order.

Depending on what is selected in the message overview, message details are displayed, including a table of message-specific information that can be selected for further processing.

The various message types can be processed as follows:

- **Voice Messages (i.e., voicemails)** can be played back, deleted and forwarded,
- **LAN Messages** can be read, edited and deleted,
- **Fax messages** can be forwarded.

### LAN Messages

LAN messages can be created only by myAttendant users. They serve as a kind of "bulletin board" for the subscriber, on which he or she enters notes (about individual subscribers). These messages can be viewed, edited or deleted, but cannot be sent to other subscribers.

## 17.4.3 Scenario 1: How to Configure a myAttendant connected to an OpenScape Business Single System

### Prerequisites

The license for myAttendant is present.

Telephones with a valid license

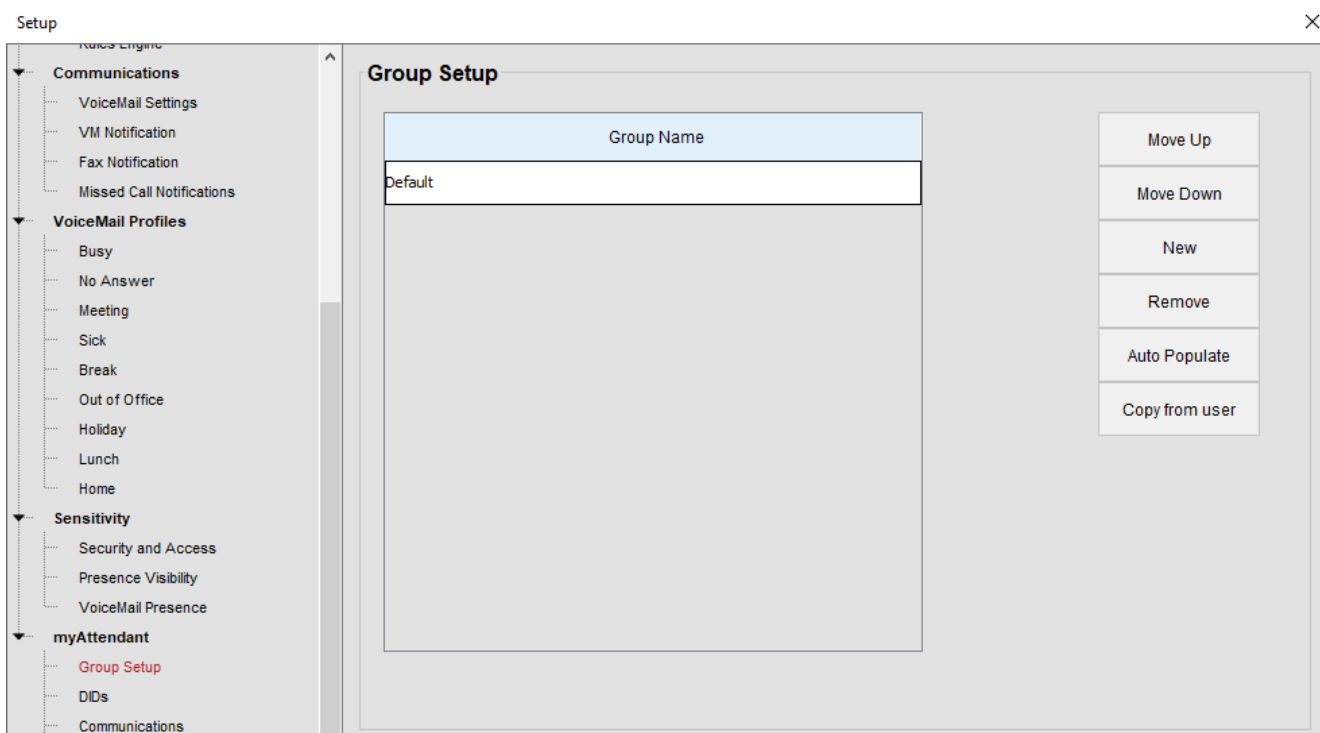

The Application Server or Application Board is available

UC Suite has been enabled via the Basic Installation wizard

### Step by Step

1. Configure the Attendant Console using the WBM
2. Disable **Call waiting rejection** in **Expert mode**, under **Stations>IP Clients>System Clients>Stations>Edit Station Flags**.
3. Enable the feature **Immediately camp on for attendant calls** in **Expert Mode** under **Telephony Server>Basic Settings>System> Intercept>Attendant>Hotline**.
4. Check or change the intercept criteria and Attendant codes (define the intercept options and call numbers for the Attendant Console).
5. Licensing of myAttendant
6. After logging into the communication system successfully, it is possible to fill the BLF automatically. This can be configured in myAttendant under **Setup > myAttendant > Group Setup**.

## 17.4.4 Scenario 2: How to Configure Two or More myAttendants connected to an OpenScape Business Single System

Scenario 2 is based on scenario 1 and is configured additively.

### Prerequisites

Sufficient licenses for myAttendant

Telephone with a valid license

### Step by Step

1. Configure a group (consisting only of Attendant Consoles) in the WBM under **Setup > User Telephony > Group Call / Hunt Group>Add**.

## Attendants

2. Select this group when configuring the OpenStage Attendant Console phones.

The screenshot shows the 'Expert mode - Telephony Server' interface. On the left is a navigation tree with categories: Basic Settings, System, Intercept/Attendant/Hotline, and Call Charges. The 'Intercept/Attendant/Hotline' section is selected. The main area is titled 'Intercept/Attendant/Hotline' and contains several configuration sections: 'Intercept position' with Day and Night time slots; 'Central intercept position' with a Route dropdown; 'Intercept to intercept position' with checkboxes for on RNA, on Busy, on Invalid, on Incomplete, on unanswered recall, and on Reject; 'Telephone lock intercept' with a Call number dropdown; 'Attendant code' with Call number Internal and External input fields; and 'Hotline' with a Call number input field. At the bottom are 'Apply', 'Undo', and 'Help' buttons.

### 17.4.5 Scenario 3: How to Set Up an OpenScape Business Network with a Central myAttendant

Scenario 3 builds on scenarios 1 and 2 and is set up additively. Node 1 is linked to node 2. The central Attendant Console is in node 2.

#### Prerequisites

Sufficient licenses for myAttendant are available

Licenses are available for networking

Telephone with a valid license

LCR is configured

#### Step by Step

1. Set up a central intercept position in node 1. The central intercept position must be created in a node in which NO Attendant Console is set up.

2. Set up the Attendant Console for system 2 (as described in Scenario 2).
3. Install myAttendant with the user data from node 2.

## 17.5 Intercept Position

The communication system diverts external calls that cannot be assigned to a station or answered to a set intercept position to ensure that no calls are lost. As an administrator, you can configure the intercept criteria.

The intercept position can be an individual station, a group or an announcement device:

- Intercept position (Attendant Console)
- Stations
- Hunt group
- MULAP group
- Group call
- External announcement device

A UCD group may not be selected as an intercept position.

If an intercept position is configured in the system, intercepted calls are forwarded to this intercept position. If no intercept position is configured, intercepted calls are signaled at the first IP station.

If an internal station is set up as an intercept position, the default key assignment is assigned to it automatically. In addition, the intercept position can be authorized for the Override feature.

As an administrator, you can assign one (two-digit) attendant code each to the intercept position for internal and external, under which the intercept position can be directly reached.

The intercept applies system-wide, i.e., identically for all subscribers in tenant systems. See also "Central Intercept Position in the Internetwork" in the section on Networking.

### Intercept criteria

As an administrator, you can specify in which situations the Intercept feature is used via intercept criteria. The following intercept criteria are possible:

- On RNA (ring no answer)

The call follows the entries in the call management (e.g., for a configured call forwarding). If no subscriber accepts the call, it is routed to the intercept position.

- On busy, if no additional forwarding is possible.

The system first checks if call waiting is possible. If call waiting is not possible, the call follows the entries in Call Management (e.g., the call forwarding instruction configured). If no subscriber accepts the call, it is routed to the intercept position. Intercept on busy is only performed for first calls, not for forwarded or outgoing connections. A recall of an external station is not immediately intercepted when the destination station is busy; instead, call waiting is activated.

- On Invalid (misdialing)

If the dialed station number is not configured or is inactive.

- On Incomplete

If the Dialed station number is too short. Incomplete dialing is not evaluated if a central intercept position is used.

- On unanswered recall

If an external call is not answered following an unscreened transfer (transfer before answer) and if the automatic recall to the original destination is also not answered, then an intercept is initiated after a preset time.

- On rejection

If the call was rejected by an internal subscriber, the call follows the entries in the call management (e.g., for a configured call forwarding). If no subscriber accepts the call, it is routed to the intercept position.

- On missing phone number

As for On Invalid.

- On chained call forwarding

If a forwarded call encounters another forwarding instruction at the call forwarding destination, and the number of chained forwarding instructions allowed is exceeded, an intercept occurs. The number of chained forwarding instructions depends on the entries in the call forwarding. A maximum of 3 are allowed.

- On lock code

If a subscriber at a telephone with an activated lock code dials a seizure code, an intercept occurs. A separate intercept is defined by the administrator for this purpose.

- On announcement (only with UC Suite)

If a subscriber dials the (two-digit) attendant code while listening to a voicemail announcement or the AutoAttendant, an intercept occurs. A separate intercept is defined by the administrator for this purpose.

### Dependencies

| Topic                  | Dependency                                                                                                                                                                                                                                                                                           |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Data calls             | Data calls are disconnected, not intercepted.                                                                                                                                                                                                                                                        |
| Hunt group             | Intercepts cannot extend beyond a hunt group; the call is forwarded to the first hunt group station and remains in the hunt group.                                                                                                                                                                   |
| Default key assignment | The default key assignment has also the <b>View number of calls</b> key. This can be assigned to only 6 telephones. If the limit has been reached, no more default key assignments are made. The assigned default keys are not canceled when a device is no longer defined as an intercept position. |
| S <sub>0</sub> trunks  | On S <sub>0</sub> lines, an evaluation takes place only when no day/night intercept position has been set up.                                                                                                                                                                                        |
| Night service          | In order to reach the same destination from both the DID trunks and the MSI trunks while the Night service is active, the entry for Night Station number under Intercept > Attendant must be identical to the <b>Night Number</b> in <b>Ringing assignment per Line</b> .                            |

## 17.5.1 How to Configure the Intercept Position and Intercept Criteria

The **Attendant Console** wizard can be used to configure the phone numbers for the Intercept position as well as the intercept criteria.

### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > User Telephony**.
3. Click on **Edit** to start the **Attendant Console** wizard.
4. Enter the desired call numbers for the Intercept position in the **Attendant Console** and **Attendant code** (two-digit) areas.
5. Define the desired values in the **Intercept criteria** area.
6. Click on **OK & Next** followed by **Finish**.

## 17.5.2 How to Configure the Central Intercept Position

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony** > **Basic Settings** in the navigation tree.
3. Click **Basic Settings** > **System** > **Intercept/Attendant/Hotline** in the menu tree.
4. Select the desired entry from the **Route** drop-down list in the **Central intercept position** area.
5. Enter the desired **Call number** in the **Central intercept position** area for **Day** and **Night**.
6. Click on **Apply** followed by **OK**.

## 17.5.3 How to Configure the Telephone Lock Intercept

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony** > **Basic Settings** in the navigation tree.
3. Click **Basic Settings** > **System** > **Intercept/Attendant/Hotline** in the menu tree.
4. Select the desired item in the **Telephone lock intercept** area from the **Station Number** field.
5. Click on **Apply** followed by **OK**.

## 17.5.4 How to Configure the Intercept Announcement

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Applications** > **OpenScape Business UC Suite**.
3. Click **Server** in the menu tree.
4. Click on the **General Settings** tab.
5. Enter the call number for the Intercept position in the **Target Number** field of the **Call number of intercept position** area.
6. Click **Save** and close the window.

## 18 Multimedia Contact Center

The Contact Center is a powerful solution for the optimal distribution and handling of incoming calls, faxes and e-mails. Intelligent, skills-based routing ensures that callers are always connected to the most qualified agent, regardless of the contact medium. A number of convenient functions for handling and wrapping up calls, faxes and e-mails are offered to the Contact Center agents via the myAgent application. myReports provides a number of report templates for analyzing the Contact Center operations.

The Multimedia Contact Center is fully integrated in the UC Suite software. It includes all required software components. The Contact Center functions themselves are released through licenses.

The Contact Center uses the resources of the communication system such as queues for incoming calls and unified communications functions to record and play back announcements.

The central software component of the Contact Center controls all routing functions for incoming calls, faxes, and e-mails and also controls the LAN-connected PC workplaces of agents and wallboard displays.

On the PC workplaces of agents, the myAgent application is installed. The myReports application can be optionally installed to generate and send reports. The required software can be downloaded directly from the download area of the communication system and installed on the client PC.

The WBM is used to set up the Contact Center basic functions, schedules, distribution rules as well as the agents. The settings for the daily operation of the Contact Center such as the assignment of agents to queues, for example, can also be made directly via myAgent.

If the Contact Center is unavailable due to problems (such as a system crash, dropped connection, etc.), a fallback solution can be implemented via the UCD feature of the communication system. Distribution rules for emergencies must be taken into account when setting up UCD groups within the framework of the initial setup of the Contact Center.

---

**INFO:** Information on the UC Suite and the unified communications features can be found in the UC Suite chapter.

---

### 18.1 Contact Center Clients

A number of convenient functions for handling and wrapping up calls, faxes and e-mails are offered to the Contact Center agents via the myAgent application. The myReports application can be used to generate reports on the calls, queues, agents, performance, GOS (Grade of Service) and wrapup codes of the Contact Center. More than 100 predefined report templates are available.

## 18.1.1 myAgent

Convenient functions for handling and wrapping up calls, faxes and e-mails are available to all agents via myAgent.

myAgent provides the following features:

- Processing of
  - Make Call
  - Faxes
  - E-mails
- Callback function for agents
- Displaying and changing the agent status
- Displaying and changing the presence status of internal subscribers of the communication system
- Real-time presentation of queues
- Recording of calls, if activated in the communication system
- Instant messaging
- Request for assistance through
  - Supervision of calls (depending on country)
  - Overriding calls
  - Instant Messaging
- Integration of the internal directory, external directory, external offline directory (LDAP) and Outlook Contacts for searches by name
- Creation of reports based on predefined report templates

Depending on the authorization level assigned to an agent, either a set of standard functions (agent) or advanced functions (Supervisor or Administrator) are available to the agents in myAgent (see [Agent Functions Independent of the Authorization Level](#) ).

The assignment of agents to queues occurs using the myAgent application. Only an agent with the authorization level of a Supervisor or an Administrator can make this assignment. The following properties, which affect the distribution of calls, faxes and e-mails in a queue, can be assigned here to the agents (agent assignment (binding)):

- **Primary Agent or Overflow Agent**

Calls are distributed uniformly to primary agents. An overflow agent receives a call only when the number of calls exceeds a defined number or when a call has exceeded a specified waiting period.

- **Enable agent callback**

Agent callback enables a caller in the queue to leave a voicemail for agents. As soon as an appropriate agent becomes free, that agent receives a call, hears the voicemail left by the caller, and can then call back that caller.

- **Skill Level**

Skill levels control the distribution of calls to agents in call queues. Agents with higher skill levels are given precedence when calls are

distributed. In cases where all agents have the same skill level the longest idle agent receives the call.

- **Work time**

The work time enables agents to finish any tasks, e.g., administrative tasks, that may be required after completing a call and before receiving the next call.

- **Overflow after calls in queue**

Calls that exceed the maximum number are received by an overflow agent.

- **Overflow after seconds in queue**

Calls that exceed this waiting period and received by an overflow agent.

The **agent binding list** area shows agents with the authorization level of a Supervisor or Administrator which agents are assigned to which queues. Agents with the agent authorization level can only see the queues to which they are assigned.

## 18.1.2 Prerequisites for myAgent

In order to use myAgent, the client PC of the subscriber must be equipped with the appropriate hardware and software configurations.

---

**INFO:** Please make sure that you refer to the current notes in the `ReadMe first` file, which is located in the storage directory of the install files.

---

### Telephones

myAgent can be used in combination with the following telephones:

- OpenStage HFA
- OpenScape Desk Phone IP 35G/55G HFA
- OpenScape Desk Phone IP 35G Eco HFA
- OpenScape Desk Phone CP 100/200/205/400/600/600E/700/700X HFA
- OpenScape Desk Phone CP 110/210/710 HFA
- OpenStage T
- OpenScape Personal Edition HFA
- OpenStage M3 (OpenScape Business Cordless)
- OpenScape DECT Phone S6/SL6/R6 (OpenScape Business Cordless)

Older devices (such as optiPoint 410/420/500 and Gigaset M2/SL3/S4/SL4/S5) are supported. Optiset E devices cannot be operated. myAgent cannot be used with SIP stations, Mobility stations, virtual stations, groups or MULAP stations. Details on the tested and released telephones can be found in the Release Notice.

### Operating Systems

myAgent can be used in combination with the following operating systems:

- Microsoft Windows 10 / 8.1 / 8 / 7 (both 32-bit or 64-bit are possible)
- Microsoft Windows Vista (32 bit)

---

**INFO:** The used operating system always requires the latest version of all available updates (Service Packs and patches).

---

Support for myReports for Microsoft Windows XP and Microsoft Windows Server 2003 will end at the same time as the end of support for these products by Microsoft. The product will still be supported, but will no longer be tested in detail.

### Additional Software

- Oracle Java 8 or higher or alternatively OpenJDK 8 (see **Service Center > Software**)
- Adobe Reader 9 or later (for reports in PDF format)

### Minimum Hardware Requirements

- 2 GHz CPU
- RAM: 2 GB
- 100 Mbps LAN
- XGA (1024x768) screen resolution, myPortal for Outlook: SVGA (800x600) screen resolution

### Microsoft Terminal Server, Citrix XenApp Server

myAgent can be used in Microsoft Terminal Server and Citrix Server environments under the following preconditions:

---

**INFO:** Terminal Server and Citrix Server environments, including hosted services and virtual environments are the responsibility of the customer.

---

---

**INFO:** Citrix server environments can decode some regional characters (e.g., German umlauts) correctly.

---

Operating systems:

- Microsoft Windows Server 2015 (32 bit / 64 bit) as Microsoft Terminal Server
- Microsoft Windows Server 2012 (32 bit / 64 bit) as Microsoft Terminal Server
- Microsoft Windows Server 2008 R2 (64 bit) as Microsoft Terminal Server
- Microsoft Windows Server 2008 R2 (64 bit) with Citrix XenApp 6.5 Server (Desktop Mode)

Support for myAgent for Microsoft Windows XP and Microsoft Windows Server 2003 will end at the same time as the end of support

for these products by Microsoft. The product will still be supported, but will no longer be tested in detail.

**Hardware Prerequisites:** The number of installable clients depends on the server performance and on the amount of available memory. If the server is also being used for other applications, their memory requirements must also be taken into account.

More information on the configuration of Citrix XenApp Server can be found under:

[http://wiki.unify.com/wiki/OpenScape\\_Business](http://wiki.unify.com/wiki/OpenScape_Business).

### **Installation Files**

The following options are available for providing installation files to users:

- The administrator downloads the installation files from the **Service Center** and makes them available to users via a network drive, for example.

Please refer to the notes in the `ReadMe first` file, which is located in the storage directory of the install files.

---

**INFO:** The automatic distribution of the MSI file via a deployment service with Microsoft Windows Server is not supported.

---

## **18.1.3 myReports**

Agents with the Supervisor or Administrator authorization level can use myReports to generate reports about agents and their activities, calls, queues, performance, GOS (Grade of Service) and wrap-up codes.

myReports offers the following features:

- More than 100 predefined report templates sorted by subject area (report groups) for the creation of reports
- Schedules for the scheduled generation of reports
- Immediate or scheduled sending of reports by e-mail
- Scheduled export of reports
- Output formats for report previews, sent e-mails and exported reports: Excel, PDF, and Word
- Report preview to check a report to be created in the desired output format.

### **User Roles**

myReports has its own user management, which controls access to the functions of myReports through user roles. A distinction is made here between the myReports users (standard user) and the myReports administrator.

The current user role is set when you log into myReports.

The differences between the roles are summarized in the following table.

| myReports:<br>Activity                                             | User Role         |                            |
|--------------------------------------------------------------------|-------------------|----------------------------|
|                                                                    | myReports<br>User | myReports<br>Administrator |
| <b>Reports</b>                                                     |                   |                            |
| Preview report                                                     | X                 | X                          |
| Send report immediately by e-mail                                  | X                 | X                          |
| Add report template                                                | X                 | X                          |
| Delete added report template                                       | X                 | X                          |
| Define new report template                                         |                   | X                          |
| Update predefined report templates                                 |                   | X                          |
| <b>Schedules</b>                                                   |                   |                            |
| Add a schedule                                                     | X                 | X                          |
| Display details of a schedule                                      | X                 | X                          |
| Edit schedule                                                      | X                 | X                          |
| Delete schedule                                                    | X                 | X                          |
| <b>Configuration</b>                                               |                   |                            |
| Change language of user interface                                  | X                 | X                          |
| Change color of user interface                                     | X                 | X                          |
| Configure e-mail template                                          | X <sup>7</sup>    | X                          |
| Change server address                                              | X                 | X                          |
| Change administrator password                                      |                   | X                          |
| Configure prefixes for external phone numbers                      |                   | X                          |
| Enable/disable data protection                                     |                   | X                          |
| Configure the storage location for the export of scheduled reports |                   | X                          |
| language, selecting                                                |                   | X <sup>8</sup>             |
| Set up default language                                            |                   | X <sup>8</sup>             |

<sup>7</sup> The administrator password must be entered to configure the e-mail template

<sup>8</sup> In order to configure languages and set the default language, you will need to log in as a myReports administrator with a special password.

### 18.1.3.1 How to Reset the myReports Administrator Password

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Applications > OpenScape Business UC Suite**.
3. Click on **Server**.
4. Click on **Maintenance**.
5. Click on **Reset Password**, under the **Reports** area.

#### Next steps

Inform the myReports administrator(s) that you have reset the administrator password to the default password `reports`.

### 18.1.4 Prerequisites for myReports

In order to use myReports, the client PC of the subscriber must be equipped with the appropriate hardware and software configurations.

---

**INFO:** Please make sure that you refer to the notes in the `ReadMe first` file, which is located in the storage directory of the install files.

---

#### Operating Systems

myReports can be used in combination with the following operating systems:

- Microsoft Windows 10 / 8.1 / 8 / 7 (both 32-bit or 64-bit are possible)
- Microsoft Windows Vista (32 bit)

---

**INFO:** The used operating system always requires the latest version of all available updates (Service Packs and patches).

---

Support for myReports for Microsoft Windows XP and Microsoft Windows Server 2003 will end at the same time as the end of support for these products by Microsoft. The product will still be supported, but will no longer be tested in detail.

#### Additional Software

- Oracle Java 8 or higher or alternatively OpenJDK 8 (see **Service Center > Software**)
- Adobe Reader 9 or later (for reports in PDF format)
- Microsoft Excel 16 / 2013 / 2010 (for reports in Excel format)

- Microsoft Word 16 / 2013 / 2010 (for reports in Word format)

### Minimum Hardware Requirements

- 2 GHz CPU
- RAM: 2 GB
- 100 Mbps LAN (1 Gbps LAN recommended)
- XGA (1024x768) screen resolution, myPortal for Outlook: SVGA (800x600) screen resolution

### Multi-user PCs

Under Microsoft Windows 7 and Microsoft Windows Vista with multi-user PCs, every local user can use myReports with his or her own custom settings, provided the first local user has installed the client with local administration rights. Only the first local user with local administration rights can perform updates via the AutoUpdate.

### Microsoft Terminal Server, Citrix XenApp Server

myReports can be used in Microsoft Terminal Server and Citrix Server environments under the following preconditions:

---

**INFO:** Terminal Server and Citrix Server environments, including hosted services and virtual environments are the responsibility of the customer.

---

---

**INFO:** Citrix server environments can decode some regional characters (e.g., German umlauts) correctly.

---

Operating systems:

- Microsoft Windows Server 2015 (32 bit / 64 bit) as Microsoft Terminal Server
- Microsoft Windows Server 2012 (32 bit / 64 bit) as Microsoft Terminal Server
- Microsoft Windows Server 2008 R2 (64 bit) as Microsoft Terminal Server
- Microsoft Windows Server 2008 R2 (64 bit) with Citrix XenApp 6.5 Server (Desktop Mode)

Hardware Prerequisites: The number of installable clients depends on the server performance and on the amount of available memory. If the server is also being used for other applications, their memory requirements must also be taken into account.

More information on the configuration of Citrix XenApp Server can be found under:

[http://wiki.unify.com/wiki/OpenScape\\_Business](http://wiki.unify.com/wiki/OpenScape_Business).

### Installation Files

The following options are available for providing installation files to users:

- The administrator downloads the installation files from the **Service Center** and makes them available to users via a network drive, for example.

Please refer to the notes in the `ReadMe first` file, which is located in the storage directory of the install files.

---

**INFO:** The automatic distribution of the MSI file via a deployment service with Microsoft Windows Server is not supported.

---

### 18.1.5 Notes on Using myAgent and UC Suite Clients Simultaneously

When myAgent and other UC Suite clients are used simultaneously via one UC Suite user account, the possibility of mutual interactions cannot be excluded.

The term myPortal is used generically in this section to represent myPortal for Desktop, myPortal for Outlook, myPortal @work and myPortal to go.

Examples of mutual interactions:

- Changing the presence status via myPortal

The examples apply to the default **Voicemail** setting for all call forwarding destinations.

- myAgent: Agent is logged on.

myPortal: The automatic reset of the presence status to Office is disabled.

Changing the presence status via myPortal causes the agent to be immediately logged out of the queue(s). After the agent logs off via myAgent, the presence status in myPortal is reset to **Office**.

A change in the agent status via myAgent (e.g., to **Break**) is registered by myPortal, but this does not apply to **Log in**, **Log out** and **Work Time**.

- myAgent: Agent is logged on.

myPortal: The automatic reset of the presence status to Office is enabled.

If the agent changes his or her status via myAgent to **Break**, he or she will be automatically available again after the break time has expired.

A change of the presence status via myPortal to **Break** causes the agent to be immediately logged out of the queue(s).

- myAgent: Agent is logged on.

A change of the presence status via myPortal to **Do Not Disturb** causes the agent to be immediately logged out of the queue(s).

- Outbound Calls via myPortal

The presence status of the subscriber is visible via myAgent.

The calls appear only in the journal of myPortal. No transfer to the statistics of the Contact Center occurs, since these are not Contact Center calls.

- Incoming calls to the station number of the agent

The presence status of the subscriber is visible via myAgent.

The calls appear only in the journal of myPortal. No transfer to the statistics of the Contact Center occurs, since these are not Contact Center calls.

- Recording a call

The recording of calls via myPortal is not registered by myAgent. myAgent offers this function even if the recording of a call is already occurring via myPortal.

## 18.2 Agents

The agents (stations) of a queue comprise a workgroup and are typically deployed for technical hotlines, for example, or in order processing, order acceptance, CRM, etc. The incoming calls, faxes and e-mails are distributed uniformly to the available agents for a queue.

In order to use a station of the communication system as an agent, this station must first be configured accordingly. The rights of the individual agents are defined by selecting their respective authorization levels (Agent, Supervisor or Administrator). An agent with the authorization level of a Supervisor or Administrator has elevated privileges (see [Agent Functions Independent of the Authorization Level](#) ).

An agent can be defined as a permanently available agent. Such agents remain available for calls, faxes and e-mails even when they do not accept a call, fax or e-mail.

### 18.2.1 Agent Functions Independent of the Authorization Level

When a user is configured as an agent, the rights of the agent are defined by selecting the appropriate class of service for that agent (i.e., the authorization level as an Agent, Supervisor or Administrator). An agent with the authorization level of a Supervisor or Administrator has elevated privileges.

The differences between the authorization levels are summarized in the following table.

| myAgent:<br>Activity       | Authorization level (class of service) |            |               |
|----------------------------|----------------------------------------|------------|---------------|
|                            | Agent                                  | Supervisor | Administrator |
| Assign an agent to a queue | –                                      | X          | X             |

| myAgent:<br>Activity                                             | Authorization level (class of service) |            |               |
|------------------------------------------------------------------|----------------------------------------|------------|---------------|
|                                                                  | Agent                                  | Supervisor | Administrator |
| Move an agent to another queue                                   | –                                      | X          | X             |
| Remove an agent from the queue                                   | –                                      | X          | X             |
| Change the status of an agent                                    | –                                      | X          | X             |
| Display / hide the agent binding list                            | Assigned queues                        | All queues | All queues    |
| Edit an agent assignment                                         | –                                      | X          | X             |
| Display list of Live calls                                       | Assigned queues                        | All queues | All queues    |
| Activate myAgent screen pop automatically for alarms             | –                                      | X          | X             |
| Activate alarm tone                                              | –                                      | X          | X             |
| Display wallboard                                                | Assigned queues                        | All queues | All queues    |
| Display the Grade of Service graph                               | Assigned queues                        | All queues | All queues    |
| Display the Average Times graph                                  | Assigned queues                        | All queues | All queues    |
| Move call to first position in a queue                           | –                                      | X          | X             |
| Record a call                                                    | Current call                           | All calls  | All calls     |

| Call supervision (country dependent)                             | –                                      | X          | X             |
| Override a Call                                                  | –                                      | X          | X             |
| Accept a request for assistance                                  | –                                      | X          | X             |
| Create reports                                                   | –                                      | X          | X             |
| Open WBM                                                         | –                                      | X          | X             |

## 18.2.2 Preferred Agents

Every caller (e.g., every calling customer) can be assigned one or more preferred agents of a queue. In such cases, the communication system first tries to switch the caller and his callback requests through to a preferred agent. If multiple preferred agents have been specified, a priority (sequence) can be defined to determine the order in which these agents are connected.

If no preferred agent is available, the call is forwarded to any available agent.

### 18.2.3 Agents in multiple queues

An agent can be assigned to multiple queues with different skill levels. In such cases, the function of the agent as a primary agent or an overflow agent must be defined.

### 18.2.4 Contact Center Breaks

In order to allow every agent the chance to take a defined break, Contact Center breaks of different lengths can be defined (e.g., for lunch or a cigarette break). Contact Center breaks are available system-wide and can be selected by an agent via myAgent as required.

### 18.2.5 Agent Login/Logout via Telephone

Login/Logout into the Contact Center is supported also via phone without the need to run myAgent in order to use the Contact Center functions. If an agent has been logged in via phone only voice calls can be processed. PopUp Window and WrapUp Code entry are not supported in this case. This applies also if myAgent is active and agent logs into the Contact Center using the phone. Full functionality of myAgent can be regained if the agent logs out via the phone and then logs in via myAgent.

#### Prerequisites and Constrains

- OpenScape Business Contact Center functions via telephone only work for agents for which a myAgent license is assigned within OpenScape Business
- All functions are only supported on such phones, which are released for use with OpenScape Business Contact Center
- In case that login via phone is successful and the associated myAgent client is not active, only Voice Calls are routed to the agent
- In case that login via phone is successful and the associated myAgent client is active, Email / Fax and Callback Calls are not be presented to agent if he logs in via phone. In this case screen-pops and wrap up work as usual but only voice calls will be delivered to the agent. To get full functionality, agent has first to logout via phone mode and login afterwards via myAgent

#### Login to Contact Center via Telephone

When the agents log into OpenScape Business Contact Center via the telephone, independent from myAgent client and Contact Center is active:

- The UCD functions for login are used at the phone
- The login function can either be executed via feature code or by a programmed key
- Agent is logged into all queues, to which he is assigned within the Contact Center configuration
- Telephone display informs agent about the login status
- Only UCD queue information (e.g. calls in queue information) is displayed on demand

The agent can use the following functions:

- Logon / Logoff (with UCD Agent ID)
- Wrap Up
- Available/Unavailable
- Display of calls within UCD Queue to which the UCD Agents ID has been assigned

---

**NOTICE:** UCD Night Service must not be used by the agent.

---

---

**NOTICE:** myAgent permanent available flag is supported for login via Phone. This means that in case an agent is logged in with his/her phone and a call was missed, this agent stays available for the next call. This is the same behavior as with using myAgent client.

---

In case that Contact Center fails during agent is logged on, the agent stays logged on into UCD and voice calls are routed as configured within the UCD routing. In case that agent was not logged in he can log into UCD via telephone.

### Logout of Contact Center via Telephone

When the agents log out of OpenScape Business Contact Center via the telephone, independent from myAgent client and Contact Center is active:

- The UCD functions for logout are used at the phone
- The logiout function can either be executed via feature code or by a programmed key
- Agent is logged out of all queues, to which he is assigned within the Contact Center configuration
- Telephone display informs agent about the logout status
- No other Contact Center / UCD information (e.g. calls in queue information) is displayed

### Set agent available/unavailable via Telephone

When an agent sets his status to available / unavailable for contacts routing of OpenScape Business Contact Center via telephone independent from myAgent client and Contact Center is active:

- Telephone display informs agent about the login status
- In case that myAgent is not active only voice calls shall be routed to the agent

### Set/Reset Working after call (Wrap Up) via Telephone

When an agent sets his status to "Working after call" (Wrap Up) via telephone independent from myAgent client and Contact Center is active, it does not route any calls to the agent until the agent's specific Wrap up time, which is configured within OpenScape Business Contact Center, is expired or agent has reset Wrap Up via telephone.

### Status Mapping

Agent status change via phone is mapped as follows to myAgent agent status:

| Phone Device |                      |                           | myAgent            |               |                                  |                                                                                                                                                                   |
|--------------|----------------------|---------------------------|--------------------|---------------|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Feature Code | Feature Code         | Description               | Phone Display Text | Status        | Additional Text                  | Remark                                                                                                                                                            |
| *401         | UCD Agent ID         | Log on UCD agents         | Available          | Available     | -                                | Agent is set as available in all assigned queues                                                                                                                  |
| #401         | -                    | UCD - agent log off       | Not Available      | Not available | -                                | Agent is set as not available from all assigned queues                                                                                                            |
| *402         | -                    | UCD - agent available     | Available          | -             | -                                | Available (end of Work Time)                                                                                                                                      |
| #402         | -                    | UCD - agent not available | Not Available      | Work Time     | countdown from 999.999 seconds   | -                                                                                                                                                                 |
| *403         | -                    | UCD work on               | Wrap up            | Work Time     | countdown of configured worktime | Work time must be finished before it can started again. No work time cumulating like in myAgent. After work time is elapsed agent is set available automatically. |
| #403         | -                    | UCD work off              | Available          | Available     | -                                | -                                                                                                                                                                 |
| *404         | night service target | UCD night service on      | -                  | Not supported | -                                | UCD Night Service must not be used                                                                                                                                |

| Phone Device |              |                       | myAgent            |               |                 |                                                                                                                                                       |

## 18.3 Queues and Schedules

Queues are the basis of the Contact Center. Calls, faxes and e-mails for a queue can be handled, depending on the skill levels of agents, the priorities and waiting periods. Announcements can be played for waiting callers. A schedule is used to define how incoming calls are to be handled on certain days and at specific times.

### 18.3.1 Queues

As a rule, call distribution occurs by sending any incoming call, fax or e-mail for a queue to the specific station in the group (i.e., the agent) whose last call lies furthest in the past. It is also possible to define other distribution rules (based on the different skill levels of agents, for example). If all agents are busy, any additional calls, faxes and e-mails are placed in the queue and then distributed to the next free agent based on their priority and the waiting time.

Schedules and the rules contained in them (i.e., the CCVs or call control vectors) can be used to define how a call to a queue at a specific time and on a specific date is to be handled. The rules define which announcement is to be played back to callers, for example, or where a call is to be forwarded.

Faxes, e-mails and agent callbacks are assigned to queues directly, independently of schedules.

When assigning agents to queues, different properties, which affect the distribution of calls in a queue, can be assigned to agents (e.g., Primary Agent or Overflow Agent and Skill Level). Agents can be assigned to queues

- via the WBM by an administrator with the **Advanced** profile.
- via the application myAgent by an agent with the Supervisor or Administrator authorization level.

If an agent is assigned to multiple queues, the queue priority can be used to define whether calls for a queue with higher priority should be forwarded to this agent with precedence over calls for other queues.

The following main settings can be made for queues via the WBM:

- Activating, deactivating and deleting queues

Note: After the deletion of a queue, no reports for past time periods can be generated. Queues that are no longer required should be deactivated.

- Configuring queue alarms

You have the following options:

- Queue Alarm Count (alarm threshold value): If the number of calls waiting in the queue exceeds the number specified here, the queue symbol for the agent changes from green to orange. Agents with the Supervisor or Administrator authorization level can set whether they should be warned with an alarm tone and whether myAgent should be automatically brought to the foreground with a screen pop.
- Queue Alarm Time (alarm threshold value): If the waiting time for a queued call exceeds the time specified here, the corresponding item in the list of Contact Center calls for the agents changes to red. Agents with the Supervisor or Administrator authorization level can set whether they should be warned with an alarm tone and whether myAgent should be automatically brought to the foreground with a screen pop.

- Defining timeouts for missed calls, faxes and e-mails

If a phone call, fax or e-mail is not accepted by the agent at the end of the time specified here, the call, fax or e-mail will be forwarded to the next available agent.

- Defining an abandoned call threshold

The time specified here determines whether or not an abandoned call is included in the statistics (i.e., in a report). Calls abandoned after the specified time has elapsed are included in the statistics.

- Configuring queue depth

Control of the maximum number of active and waiting calls in a specific queue. The Contact Center indicates to the system that the defined threshold of the queue size is reached. As a result the system rejects every new incoming call for the appropriate queue before the call is connected with the system, until the number of calls falls below the threshold.

The maximum queue size is determined by following parameters:

- Maximum number of waiting positions within the queue. (WLS = Waiting Loop Size)
  - Maximum number of active and waiting calls of the queue. (Queue Depth Size).
- Setting up inbound fax pilots

If configured, station numbers can be selected for incoming Fax messages. Faxes to these phone numbers will then be added to the queue and treated as incoming calls.

- Setting up an inbound e-mail service

Multiple e-mail addresses can be set up for a queue. E-mails sent to these addresses are placed in the queue and treated like incoming calls.

- Setting up a return e-mail address

E-mail address of the queue, which is displayed to the recipient when an e-mail is sent by an agent.

- Activating intelligent call routing

An incoming call is forwarded to the agent with whom the caller was last connected, provided no preferred agent was defined for that caller.

## 18.3.2 Schedules

For each queue, a schedule can be defined with rules (Call Control Vectors or CCVs) to determine how incoming calls are to be handled on specific dates and at specific times.

For example, on work days, separate rules may be defined for the morning shift (from 6:00 to 14:00 hours), the afternoon shift (14:00 to 22:00 hours) and the night shift (from 22:00 to 06:00 hours). Similarly, a weekend rule can be defined for the weekends. For each of these rules, you can define whether an announcement is to be played, for example, and/or the destination to which the calls are to be forwarded.

Schedules are the core of the Contact Center configuration. Without the definition of at least one schedule, the configuration of a Contact Center cannot be completed successfully. Every queue must be assigned at least one schedule. This may also be the same schedule in every case.

A schedule, in turn, must have at least one rule (called a Call Control Vector or CCV) assigned to it. The rules determine how incoming calls for a queue are to be handled during the time period to which the schedule applies. Rules apply only to calls and not to faxes and e-mails.

Rules are created with the graphical rule editor (CCV Editor) by combining predefined CCV objects and can be saved under a user-defined name upon completion.

Saved rules can be assigned to one or more schedules as a default rule (default CCV) or an exception rule (exception CCV). They can be opened, edited and saved again at any time by using the rule editor.

After a schedule has been assigned a default rule (default CCV), this schedule can be saved under a user-defined name. A schedule with an assigned default rule applies to a queue 24 hours a day, 365 days a year. If different rules are to be applied at certain times (breaks, weekends, holidays, vacations, etc.), these can be assigned to the schedule as exception rules (Exception CCV). This means that you

can define how incoming calls are to be handled during the holiday schedule, for example. Holiday schedules have precedence over the other schedules and rules of a queue.

### Rule Editor (CCV Editor)

The Rule Editor is used to create rules from predefined CCV objects. The arrangement of the CCV objects and their properties determine how incoming calls are to be handled.

---

**NOTICE:** A rule has an upper limit of 500 CCV objects.

---

The following predefined CCV objects are available:

---

**INFO:** For all of the named CCV objects, the two general properties listed below also apply:

**Description:** Optional entry to describe the CCV object, e.g., Greeting.

**Process digit:** specification of the digit(s) required without blanks, commas or other characters. The specification refers to the preceding CCV object. If 9 was specified there under Accepted Digits, then 9 must also be entered here.

---

- **Play Message**

Causes the desired message to be played. Any audio file present in the UC Suite can be selected. In addition, a new audio file can be imported into the UC Suite or a new announcement can be recorded and then imported as an audio file into the UC Suite.

The playback of the announcement seizes one respective Media Stream channel.

Properties:

- **File Name:** Selection of an announcement (audio file in WAV format)
- **Interrupt Digits:** specification of a key or key combination on the dial pad with which callers can stop the playback of an announcement.
- **File Manager:** Using this button, it is possible to directly upload an audio file in wav format or create a new voice file with the recording device.

- **Music on Hold**

Causes Music on Hold (MOH of the communication system) to be played for external calls for an adjustable period of time

Property:

- **Time Value:** Time, in seconds, for which the Music on Hold is to be played.

- **Disconnect Caller**

Causes the call to be disconnected.

After this CCV object, no further CCV object may be inserted.

- **Play Queue Position**

Causes information on the current queue position of the caller to be played.

- **Estimated Waiting Time**

Causes information on the estimated waiting time of the caller to be played.

The estimated waiting time is calculated based on:

- 1) Historical average queue time for all queues
- 2) Historical average queue time for the particular queue
- 3) Historical average talk time for the particular agent

- **Go to CCV**

Causes a loop to another CCV object

Property:

- **Target CCV:** Selection of the CCV object

- **Record Callback**

Enables a caller in a queue to enable an agent callback (record a voicemail). Instead of the actual caller, the agent callback remains in the queue. For agents with the **Enable agent callback** feature, the agent callback appears in the list of Contact Center calls.

After this CCV object, no further CCV object may be inserted.

Properties:

- **Type:** Selection of **Simple Callback** or **Extensive Callback**.

In contrast to simple callbacks, extensive callbacks offer callers additional options and information (e.g., the option to confirm or change the phone number that is to be called back and the option to confirm the voicemail).

- **Maximum message length:** Time, in seconds, that is available to a caller when recording a voicemail.

- **Process after digits**

Causes the next CCV object(s) to be executed, depending on the digits specified there (process digit).

Properties:

- **File Name:** Selection of one or more announcements (audio file in WAV format)
- **Playlist:** List of selected announcements (audio file in WAV format) in the order in which they are played
- **Digits Timeout:** Time, in seconds, for which the communication system waits for the input of digits.

If the required digits are not entered fully within the specified time, the message (announcement) is played again.

- **Link To:** List of digits with destination.

The digits and destinations can be added, edited and removed.

- **File Manager:** Using this button, it is possible to directly upload an audio file in wav format or create a new voice file with the recording device.

The contents of the Playlist are presented in the Rule Editor by a tool tip on hovering with the mouse pointer over the CCV object.

- **Single-step transfer**

This function depends on the **Normal Attendant Console SST** setting (WBM, **Expert mode: Applications > OpenScape Business UC Suite > Server > General Settings**):

- **Normal Attendant Console SST** enabled (default setting; not for U.S.): Causes the call to be transferred, regardless of whether the destination is free, busy or unavailable.

---

**INFO:** For stations with call waiting rejection enabled, the call is switched through only if the destination station is free. No call waiting on busy occurs.

---

- **Normal Attendant Console SST** disabled (default setting, only for U.S.): Causes the call to be transferred if the destination is free.

If the destination is busy and call waiting rejection is disabled, or if the destination is unavailable, an announcement is played back to the caller. The caller can then optionally choose to leave a message in the voicemail box of the called subscriber or select the call number of another destination.

If the destination is busy and call waiting rejection is enabled, the call is not switched through.

After this CCV object, no further CCV object may be inserted.

Property:

- **Target Extension:** specification of the internal call number or external DID extension with the number of the CO trunk. Blanks, commas and other characters are not allowed.

The call number of the target extension is displayed in the CCV object.

---

**NOTICE:** After Single-Step-Transfer, the system disconnects the call after ringing for 5 minutes.

---

- **Transfer To Queue**

Causes the call to be transferred to a queue.

After this CCV object, no further CCV object may be inserted.

Property:

- **Queue:** Selection of the queue

- **Record In Mailbox**

Causes the call to be sent to the desired voicemail box of a subscriber or a voicemail group

After this CCV object, no further CCV object may be inserted.

Property:

- **User Mailbox:** specifies the station number of the voicemail box of a subscriber or voicemail group

The station number and the name of the voicemail box or voicemail group are shown in the Rule Editor by a tool tip on hovering with the mouse pointer over the CCV object.

- **Supervised Transfer(also called screened transfer)**

Causes the call to be transferred to an internal destination. During the transfer, Music on Hold (MOH of UC Suite) is played back to the caller.

In contrast to the single-step transfer CCV object, two further CCV objects must be inserted here. This is because we now need to define how the communication system should behave if the call destination is busy or does not answer the call. Usually, an announcement is played to the caller in such cases.

Properties:

- **Target Extension:** Specification of the internal phone number.

Only internal call numbers are supported in the own node. Forwarding to external destinations, virtual stations, additional AutoAttendants, UCD (incl. Contact Center), Mobility users as well as external CallMe destinations is not allowed! For these scenarios, the SST (single-step transfer) should be used.

- **Ring Timeout:** Time, in seconds, within which the call must be accepted.

If the call is not answered within the specified time, it is returned to the communication system, and the next CCV object is used.

---

**INFO:** The time specified here must be shorter than the time configured for call forwarding (the default setting for call forwarding = 15 seconds). See [How to Configure Call Forwarding](#).

---

- **Pull back call if destination device is forwarded / deflected:** Option (only applicable for internal call number.)

If this option is enabled, the call destination is first checked, and if a forwarding destination or deflection has been set for it, the call is returned to communication system, and the next CCV object is used.

- **Check Presence status when transferring call:** Option

If this option is enabled, the presence status of the call destination is checked, and if this status is any presence status other than Office, the call is returned to communication system, and the next CCV object is used.

- **Dial By Name**

Causes the caller to be prompted to enter the first three letters of the desired subscriber's last name via the dial pad.

If a unique subscriber name with the entered initial letters is found, a connection is established.

If there are several subscriber names with the entered initial letters, these subscriber names are announced to the caller (max. 10 subscribers). If a subscriber has no recorded name announcement, the call number is announced instead. After selecting the desired subscriber, a connection is made.

If none of the subscribers match the entered initial letters, the caller receives a corresponding message.

---

**INFO:** The keys on the dialpad respond to the first press of a key. With each key pressed, the system tries to determine whether there are subscriber last names with the letter assigned to that key.

Example: Let us assume the internal phone book has five last names with the initial letters t, u and v: Taylor, Taler, Ullrich, Vasquez and Volterra. To establish a connection with the subscriber Taylor, following keys must be pressed: 8 2 9

---

After this CCV object, no further CCV object may be inserted.

Properties:

- **Method:** Selection of **Transfer To Extension** or **Record In Mailbox**.

Depending on the method selected, a connection to the desired extension or its voicemail box is established. Note that only internal extensions for which the first and last names of the subscriber are entered in the internal directory are supported here.

- **Dial By Extension**

Causes the caller to be prompted to enter the station number (extension) of the desired subscriber via the dial pad.

If the caller dials the station number of a virtual station, the caller is prompted to enter another station number. A connection is then established. If the desired subscriber does not respond, the call is accepted by his or her voicemail box.

After this CCV object, no further CCV object may be inserted.

Properties:

- **Method:** Selection of **Transfer To Extension** or **Record In Mailbox**.

Depending on the method selected, a connection to the desired extension or its voicemail box is established. Note that only internal extensions in the network for which the phone number is entered in the internal directory are supported here.

- **Set language**

Selects the language for each standard announcement based on the phone number of the caller. It should be noted that only standard announcements (i.e., system announcements) and no personal greetings are taken into account here.

For example, it is possible to have German announcements played back to callers with the country code +49 and French announcements for callers with the country code +33.

Properties:

- **Default language:** Drop-down list to select a language.  
The language selected here is used for all phone numbers for which no specific language was defined.
- **Pattern:** Specifies the phone numbers to which a particular language is to be assigned.  
The following placeholders can be used \* = any digit, ? = any digit.
- **Language:** Drop-down list to select the language to be assigned to the relevant phone numbers (matching **Pattern**).

A language can be assigned to any number of different phone numbers (matching **Pattern**).

- **CLI Routing**

Causes the forwarding of a call to one or more sequential CCV objects based on the caller's number.

For example, it is possible to first have a German announcement played back to callers with the country code +49 (CCV object **Play Message**) and then have the call forwarded to an internal phone (CCV object **Single Step Transfer**). The area code can also be used (e.g. 089 for Munich).

Properties:

- **Standard:** Drop-down list to select the CCV object.  
The CCV object selected here is used for all phone numbers for which no specific destination was defined.
- **Pattern:** Specifies the phone numbers to which a specific CCV object is to be assigned as the destination.  
The following placeholders can be used \* = any digit, ? = any digit.
- **Description**  
Provides an explanation.  
For the **Pattern** +49 (= country code for Germany), for example, Germany can be entered.  
The text entered here will appear in the Rule Editor.
- **Target:** Drop-down list to select the CCV object that is to be assigned as a destination to the related phone numbers (matching **Pattern**).

A CCV object can be assigned as a destination to any number of different phone numbers (matching **Pattern**).

- **Branch on variable**

Causes the forwarding of a call to one or more sequential CCV objects based on a given condition.

You can thus define, for example, that an announcement (such as "Please call again later ...") should be played back to callers as soon as there are more than 20 calls in a queue.

Properties:

- **Variable:** Selection of **Calls** or **Available agents**.

Depending on the selected variable, the number of calls waiting in a queue or the number of available agents (including agents in wrap up time) is used as the defined condition. In the associated drop-down list, the condition (**less than, greater than, less than or equal to, equal to or greater than, equal to**) must be selected, and the comparison value must then be entered in the corresponding input field.

- **True branch:** Drop-down list to select the CCV object that is to be used as a destination when the condition is satisfied.
- **False branch:** Drop-down list to select the CCV object that is to be used as a destination when the condition is not satisfied.

The number of available agents in a queue is affected by the following status changes of the agents:

- Login of an agent into the queue using "Anmelden/Login": --> +1
- Logout of an agent from the queue using "Abmeldung/Logout": --> -1
- Agent in the status "Break":-->-1
- Agent in the status "Available after Break":--> +1

The number of available agents in a queue is **not** affected by the following status changes of the agents:

- Agent in the status "Ringing"
- Agent in the status 'Talking'
- Agent in the status "Wrap up"
- Agent in the status "Missed Call"
- Agent in the status "Overdue"

- **Branch on data**

Causes the forwarding of a call to one or more sequential CCV objects based on a given condition.

You can thus define, for example, that an announcement (such as "Please call again later ...") should be played back to callers as soon as there are more than 20 calls in a queue.

Properties:

- **Variable:** Selection of **LDAP data1 (xmpp)** or **LDAP data2 (pager)**.

The data query is done via LDAP either directly to an LDAP capable database or indirectly via the Directory Service (ODS) to an SQL / ODBC database. The query results are assigned via the UC Suite LDAP field mapping to the appropriate criterias of the Contact Center. In the associated drop-down list, the condition (**less than, greater than, less than or equal to, equal to or greater than, equal to**) must be selected, and the comparison value must then be entered in the

corresponding input field. It is necessary to map the keywords "pager" and "info".

- **Timeout:** The time in seconds before a timeout occurs.
- **Timeout branch:** Drop-down list to select the CCV object that is to be used as a destination when timeout occurs.
- **True branch:** Drop-down list to select the CCV object that is to be used as a destination when the condition is satisfied.
- **False branch:** Drop-down list to select the CCV object that is to be used as a destination when the condition is not satisfied.
- **Description:** Provides an explanation.

### 18.3.3 Wrap up

Wrapup reasons can be used to assign incoming calls to specific categories (orders, complaints, service, etc.). The assignment is made by an agent after completing the call (during the work time) by entering the appropriate wrapup reason using myAgent.

Wrapup reasons can be defined individually for each queue.

A distinction is made here between:

- Simple Wrapup

One or more wrapup reasons can be defined for queues with the wrapup mode "Simple Wrapup".

Example: The two wrapup reasons "hardware problem" and "software problem" were defined for a queue. Every call is assigned one of these wrapup reasons by an agent during the work time. This makes it possible to subsequently create a report with an overview of all calls related to the subject of hardware problems, for example.

- Multiple Wrapup

For queues with the wrapup mode "Multiple Wrapup", one or more wrapup reasons can be defined and then classified into groups and subgroups.

Example: A Hardware group with the wrapup reasons Motherboard and Power Supply and a Software group with the wrapup reasons Operating System and Drivers were defined for a queue. Every call is assigned one of these wrapup reasons by an agent during the work time. This makes it possible to subsequently create a report with an overview of all calls related to hardware problems or also all calls related specifically to motherboard hardware problems.

### 18.3.4 Grade of Service

The Grade of Service can be used to assess the response rate of the queue. This is achieved by comparing the waiting time for callers in the queue with target values, which can be specified individually for each queue.

The target values for the Grade Of Service (GoS) can be defined freely, depending on the acceptable waiting time for callers in a queue. For each call to an appropriate queue, the service level is determined after the call and committed to the database. The Grade of Service can be evaluated by agents with the authorization level of a Supervisor or Administrator by using the myAgent application.

### 18.3.5 Wallboard

Queue details can be retrieved and displayed using myAgent. The display contains a table with statistical information on queues in real time for the current 24-hour period. The display can then be presented on a large LCD monitor, for example, or via a beamer (wallboard).

Agents with the agent authorization level receive information on the queues to which they are assigned. Agents with the Supervisor or Administrator authorization level receive information on all queues.

A separate station should be set up for a wallboard display. A Station license (IP User or TDM User) and a myAgent license are required for this.

### 18.3.6 Agent Callback

If the waiting time in the queue is too long for a caller, and the associated schedule includes the CCV object **Record Callback**, the caller can leave a callback request. This callback request retains the original position of the caller in the queue and is delivered to the agent in the form of a voicemail. After listening to the voice message, the agent can call back the caller via a screen pop.

If a preferred agent has been set for a caller, an attempt is first made to route the callback requests of that caller to the preferred agent. If the preferred agent is not available, the callback request is forwarded to any available agent.

## 18.4 VIP service

For each queue, you can individually define whether certain callers (with a VIP status) or callers which match configurable call number patterns should be given preferential treatment and thus allowed to reach a free agent faster.

If all agents of a queue are busy, VIP callers are preferentially connected to the next available agent.

### 18.4.1 VIP Caller Priority

The VIP Caller Priority can be defined individually for each queue in order to specify whether callers (customers, for example) included in the VIP Call List should be given preferential treatment.

The values for the VIP Caller Priority can be defined freely, depending on the waiting time for callers in a queue. This determines the level of preference for VIP callers as opposed to normal callers.

When a VIP caller activates an agent callback (by recording a voicemail with a callback request), the agent callback is retained in the queue instead of the VIP caller. but without the VIP Caller Priority.

VIP callers must be registered in the VIP call list directory (see [VIP Call List](#) ).

### 18.4.2 VIP Call List

Callers who have already been registered in the communication system (external directory) can be added to the VIP call list. Multiple selection can be done or the "**Select All**" function can be used. In addition, call number patterns can be entered. A call number pattern consists of a specific sequence of digits and a wildcard (placeholder). It can thus be used to transfer all employees of a company to the VIP call list, for example.

For each queue, the VIP caller priority can be used to define whether

- the callers included in the VIP call list and
- the callers who match the call number pattern contained in the VIP call list should be given preferential treatment.

It is not possible to enter call number patterns in the canonical call number format. The use of shortcut characters for country codes (for example +49 instead 0049) is likewise not possible. Call number patterns must always be specified without the CO access code.

Examples of call number patterns:

- 089 7577\* (089 = area code for Munich, 7577 = PABX number of a company, \* = wildcard for any number). By entering this call number pattern in the VIP call list, all callers from Munich, whose telephone number begins with 7577, are given priority.
- 0039\* (0039 = country code for Italy, \* = wildcard for any number). By entering this call number pattern in the VIP call list, all callers from Italy are given priority.

The following characters can be used as wildcards (placeholders) in a call number pattern:

- \* = wildcard for any number
- ? = wildcard for any digit

## 18.5 Fallback solution

If the Contact Center is unavailable due to problems (crash, connection down, etc.) the "Uniform Call Distribution (UCD)" feature of the communication system is automatically used. This feature thus serves as the fallback solution for the Contact Center.

In the event of a failure in the Contact Center, incoming calls are distributed according to the fallback solution. The distribution of faxes and e-mails is not possible.

Depending on requirements, one of the fallback solutions described below can be configured.

### Default Fallback Solution

In this case, the fallback solution is based on the UCD IDs (agent IDs) of the agents:

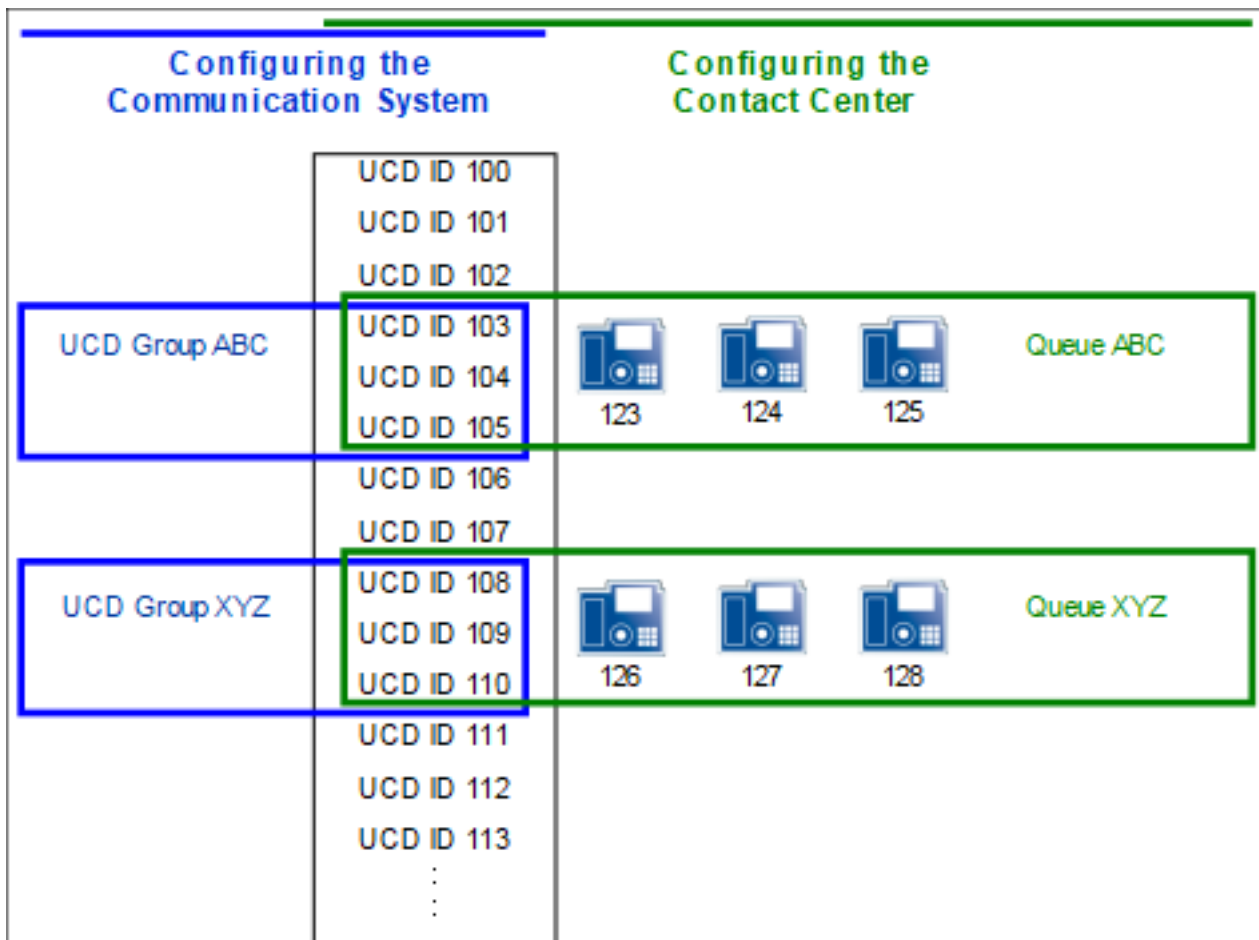

- Agents are assigned to the UCD groups of the communication system based on UCD IDs. The UCD ID determines to which UCD group this agent is assigned in the event of a failure at the Contact Center.

To ensure that the default fallback solution works properly, every queue must be assigned the Contact Center agents with the UCD IDs that were assigned to the appropriate UCD groups.

In the event of a failure in the Contact Center, incoming calls are distributed to the logged in agents via the different UCD groups.

Example:

- UCD IDs 103, 104 and 105 are assigned to UCD group ABC. UCD IDs 108, 109 and 110 are assigned to UCD group XYZ.
- The stations 123, 124 and 125 are configured as agents with the UCD IDs 103, 104 and 105. The stations 126, 127 and 128 are configured as agents with the UCD IDs 108, 109 and 110.
- When assigning agents to queues, the stations 123, 124 and 125 must be assigned to the queue ABC, and the stations 126, 127 and 128 to the queue XYZ.

### Basic fallback solution

In this case, all agents of the Contact Center are assigned using their UCD IDs to only the Backup UCD group. By assigning the appropriate agents, these UCD IDs are then also used in the queues of the Contact Center. This ensures that in the event of a failure in the Contact Center, the agents do not have to manually log in at their phones with a different ID. This Backup UCD group is defined as a second call forwarding destination for all UCD groups of the communication system.

**NOTICE:** The configured Backup UCD group must also be configured as group into the Contact Center. This is the only way to ensure that this group is also monitored.

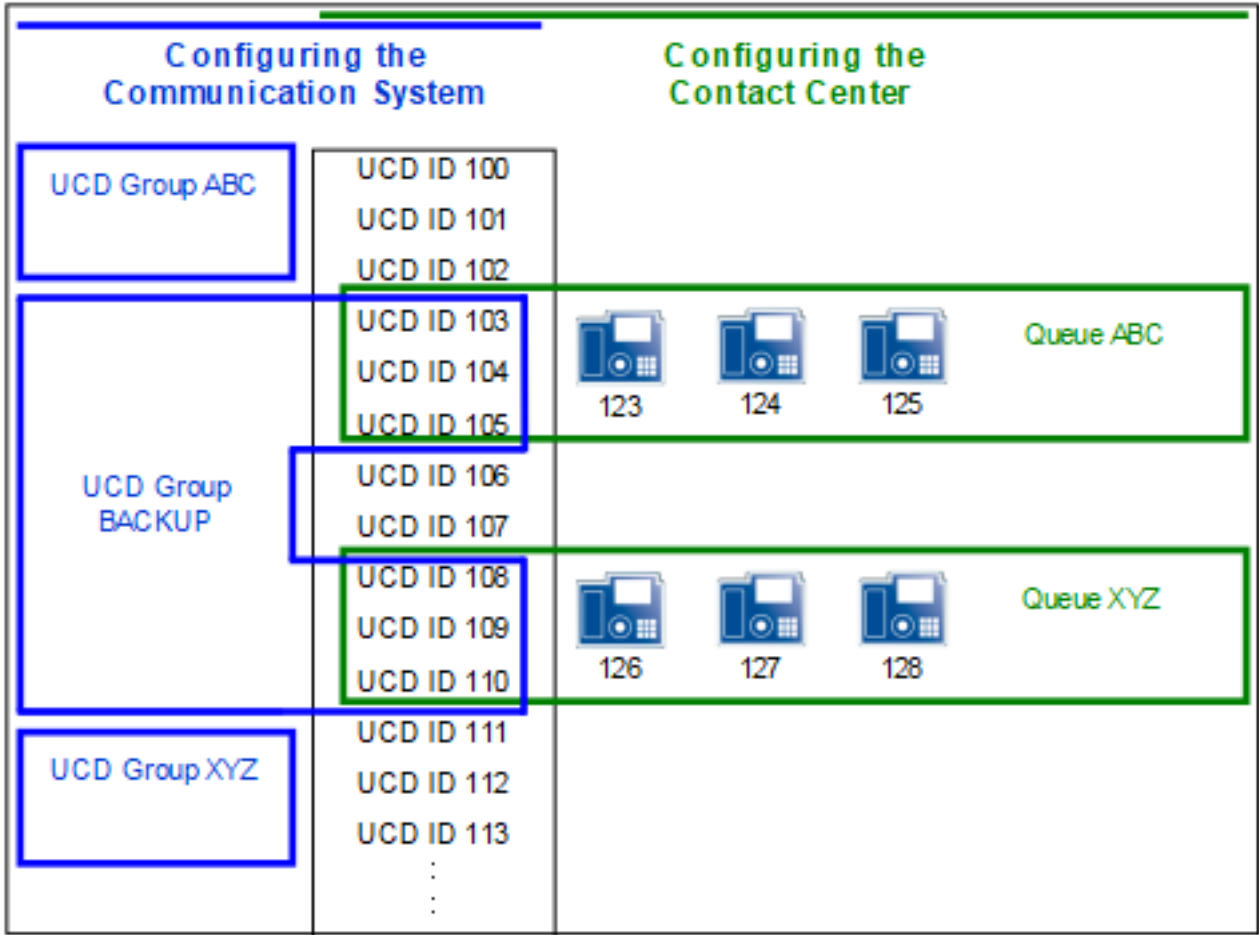

If the Contact Center fails, the incoming calls are then distributed to all agents of the backup UCD group.

Example:

- No UCD IDs were assigned to the UCD groups ABC and XYZ. UCD IDs 103 to 105 and 108 to 110 were assigned to the UCD group BACKUP.

Multimedia Contact Center

- The stations 123, 124 and 125 are configured as agents with the UCD IDs 103, 104 and 105. The stations 126, 127 and 128 are configured as agents with the UCD IDs 108, 109 and 110.
- When assigning agents to queues, the stations 123, 124 and 125 are assigned to the queue ABC, and the stations 126, 127 and 128 to the queue XYZ.

Custom fallback solution

In this case, the customized configuration of the Contact Center is mapped via multiple UCD groups.

If the Contact Center fails, similar behavior is thus achieved by the fallback solution.

For details on configuring call distribution via the "Uniform Call Distribution (UCD)" feature of the communication system, see [UCD \(Uniform Call Distribution\)](#) .

The main advantage of the of the custom fallback solution, by contrast, lies in its accurate mapping of the Contact Center operations.

The disadvantage of the custom fallback solution is the high configuration effort involved. Furthermore, to achieve similar call distribution behavior, all changes made to the Contact Center configuration also need to be mapped to the fallback solution.

The main advantage of the default and basic fallback solution is the easy configuration.

## 18.6 Configuring the Contact Center

When configuring the Contact Center, the UCD groups must be defined first. The queues of the Contact Center are essentially workgroups that are based on the UCD groups of the communication system. The actual configuration of the Contact Center (schedules, queues, etc.) can then be performed.

Before configuring the Contact Center, the standard processes for call distribution in normal and emergency modes must be coordinated with the customer.

---

**INFO:** The configuration of the Contact Center should only occur after the setup of the communication system and the UC suite have been fully completed.

---

If changes are made to the configuration of the UCD groups, then the UC Suite must be subsequently restarted via the Service Center of the WBM.

The following licenses are a prerequisite for the operation of a Contact Center:

- An appropriate number of licenses for agents (myAgent)
- Contact Center Fax License (for receiving and sending faxes), if necessary
- Contact Center E-mail License (for receiving and sending e-mails), if necessary

### 18.6.1 Example of a Contact Center Configuration

The operating principle of the Contact Center with OpenScape Business is presented here with the aid of an example. The structure and configuration of the example are based on a fictional customer scenario with standard Contact Center functions.

#### **Sample Scenario for a Contact Center**

Company XYZ operates a Contact Center with the following station numbers (queues):

- Station number 440 for the Service Department
- Station number 444 for the Sales department
- Station number 456 for free calls (Hotline). Callers receive an announcement and can then reach the Service or Sales Department by selecting the appropriate digit.

The Contact Center consists of six employees (agents), of which three work for the Service Department and three for Sales.

The queues for the Service and Sales Departments should be directly reachable during normal business hours from 09:00 to 17:00 hours. Both queues have a fax box and an e-mail address.

If all agents are busy or not available, callers are to be notified accordingly and have music played back to them. If no agent becomes free after a certain period of time, a caller can leave a callback request or reach the Attendant by dialing a specific number. If no digit is dialed, the caller should be automatically placed back in the queue.

During closed hours, callers are to hear an announcement enabling them to record a voicemail with a callback request (agent callback).

---

**NOTICE:** Playing announcements are only possible via trunks. In order to play the announcement the call must come from a trunk or the caller should be monitored by OpenScape Contact Center.

---

During the lunch break from 12:00 to 13:00 hours, an announcement is to be activated for the Service and Sales Departments to offer callers the option of recording a message with a callback request.

Fallback solution via Backup UCD group: If the Contact Center is unavailable due to problems (such as a system crash, dropped connection, etc.), the system should automatically switch to the "Uniform Call Distribution UCD" feature of the communication system as a fallback solution. This requires all of the Contact Center agents to be assigned to a single backup UCD group. For all UCD groups of the communication system, this Backup UCD group should be defined as a call forwarding destination. If the Contact Center fails, the incoming calls will then be distributed to the agents of the Backup UCD group.

### Configuring the Sample Scenario

The following actions must be performed for this sample scenario:

- Configure UCD groups

The queues of the Contact Center are essentially workgroups that are based on the UCD groups of the communication system. The UCD groups must be defined before the actual configuration of the Contact Center.

For this example of the Contact Center of company XYZ, three UCD groups (Service, Sales and Hotline) are to be configured.

- Configure the fallback solution

For this example, a Backup UCD group is to be configured and defined as a call forwarding destination for all UCD groups of the communication system.

- Configure subscribers as agents

For this example, six subscribers must be configured as agents.

- Record individual announcements

For this example, various announcements are to be recorded. This includes an announcement for situations when no agent is

available, for example, or an announcement to inform callers about possible options (using **Process after digits**).

- Load individual announcements

For this example, the recorded announcements are to be loaded into the communication system.

- Define schedules

For each time interval within a schedule, rules (Call Control Vectors or CCVs) can be defined to determine how incoming calls are to be handled on specific days and at specific times.

In the example, a standard schedule XYZ is to be defined with a rule for the times outside business hours and with exceptions for business hours and the lunch break. In addition, a second schedule (Standard Schedule Hotline) is to be defined with a rule for free calls (Hotline).

| Schedule                  | Rule (CCV)        |                                             |
|---------------------------|-------------------|---------------------------------------------|
| Standard Schedule XYZ     | Out of the Office | Times outside business hours                |
|                           | Open              | Business hours 08:00 to 11:59 hours = Open1 |
|                           |                   | Business hours 13:00 to 17:00 hours = Open2 |
|                           | Lunch Break       | Lunch 12:00 to 12:59 hours                  |
| Standard Schedule Hotline | Hotline           | 24 Hours                                    |

- Adding three queues

In this example, one queue is to be configured for the Service Department and one for Sales. A further queue (hotline) is to be configured for free calls.

- Assign agents to queues

For this example, three agents are to be assigned to the Service queue and three to the Sales queue.

More details on the configuration of all Contact Center functions can be found under the [Configuration Procedure](#).

### 18.6.1.1 How to Configure UCD Groups for the Sample Contact Center

This example shows you how to use the **UCD** wizard to define the three UCD groups (Service, Sales and Hotline) with the station numbers 440, 444 and 456 for the sample Contact Center of company XYZ.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.

2. In the navigation tree, click **Wizards > User Telephony**.
3. Click on **Edit** to start the **UCD** wizard. The list of all possible UCD groups is displayed.
4. To configure a UCD group, click **Edit** in the row containing the required UCD group.
5. Enter the call number 440 of the Service UCD group in the **Call number** field.
6. Enter the DID number 440 of the Service UCD group in the **Direct inward dialing number** field.
7. Enter the name **Service** in the **Name** field.
8. Click on **OK & Next**. The window **Assignment of UCD Agents** is displayed.
9. Click on **OK & Next**, since no UCD IDs may be assigned for the UCD group Service.

Since a fallback solution via a Backup UCD group is to be set up for the sample Contact Center of company XYZ, no UCD IDs should be assigned to the three UCD groups Service, Sales, and Hotline.
10. Click on **OK & Next**. The **Edit announcement/overflow** window appears.
11. Click on **OK**, since the displayed parameters are not relevant for the configuration of the UCD group.
12. Repeat steps 4 through 11 for the UCD group Sales with the call number 444 and for the UCD group Hotline with the call number 456.
13. Click on **OK & Next**, followed by **Finish**.

### 18.6.1.2 How to Configure a Fallback Solution for the Sample Contact Center

You can configure the Backup UCD group with the call 400 for the sample Contact Center of company XYZ with **UCD** wizard. In the example, the UCD agent IDs 101 to 106 are used. In addition, you will define the Backup UCD group as a call forwarding destination for all UCD groups of the sample Contact Center of company XYZ.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

The Backup-UCD group with the call number 400 needs to be configured in the UC Suite Contact Center queues.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > User Telephony**.
3. Click **Edit** to start the **UCD** wizard. The list of all possible UCD groups is displayed.
4. To configure a UCD group, click **Edit** in the row containing the required UCD group.

5. Enter the call number 400 of the UCD group Backup in the **Call number** field.
6. Enter the DID number **400** of the UCD group Backup in the *Direct inward dialing number* field.
7. Enter the name Backup in the **Name** field.
8. Click **OK & Next**. The window **Assignment of UCD Agents** is displayed.
9. Mark the required UCD agent IDs in the **Selection** and assign them to the UCD group Backup by clicking **Add**.
10. Click **OK & Next**. The **Assign stations** window appears.
11. Assign the desired stations to all UCD agent IDs.
12. Click **OK & Next**. The **Edit announcement/overflow** window appears.
13. Click **OK**, since the displayed parameters are not relevant for the configuration of the UCD group Backup.
14. To configure the new Backup UCD group as a call forwarding destination for the UCD group Service, click in the row of the UCD group Service on **Edit**.
15. Click **OK & Next** until the **Edit announcement/overflow** window appears.
16. Select the UCD group Backup with the call number 400 as the call forwarding destination in the **Overflow destination** drop-down list.
17. Click **OK**.
18. Repeat steps 14 through 17 to configure the new UCD group Backup as the call forwarding destination for the UCD groups Sales and Hotline, respectively.
19. Click on **OK & Next** followed by **Finish**.

### 18.6.1.3 How to Configure a Subscriber as an Agent for the Sample Contact Center

This example shows you how to use the **User Directory** wizard to configure subscribers as agents for the sample Contact Center of company XYZ. In the example, the subscribers with the station numbers 101 to 106 are configured as agents. The subscribers with the station numbers 101 and 104 are assigned the **Supervisor** authorization level, and the other subscribers are assigned the authorization level of an **Agent**.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **User Directory** wizard.
4. Mark the subscriber with the **Extension** 101 and click **Edit**.

5. Click in the menu tree on **Personal Details > User Level**.
6. Select the **Permanently available agent** check box. The agent will then remain available for calls, faxes and e-mails even when he or she does not accept a call, fax or e-mail.
7. Select the **Supervisor** authorization level in the **Level** drop-down list.
8. Click **Save**.
9. Repeat steps 4 through 8 to configure the subscribers with the station numbers 102 to 106 as agents.

### 18.6.1.4 How to Add Announcements for the Sample Contact Center

You can record announcements for the sample Contact Center of company XYZ with the **Recorder** wizard. Among other things, an announcement is needed for situations in which all agents are unavailable.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **File Upload** wizard.
4. Enable the **Recorder** radio button
5. Select the station number of the phone to be used for recording from the **Extension** drop-down list.
6. Click on **Make a Call**. The selected station number is called.
7. Pick up the handset and enter the name for your announcement in the **Filename** field.
8. Click on **Record** to start recording the announcement.
9. Click on **Stop** as soon as you have finished recording the entire announcement.
10. If you want to listen to your new announcement, click on **Play**.
11. Click on **Close** to save the announcement.

---

#### INFO:

After the announcement has been recorded and saved, it can no longer be deleted. However, it can be overwritten by saving another file with the same file name. For example, saving an audio file named `announcement1.wav` would overwrite any existing `announcement1.wav` file.

---

12. Repeat steps 3 through 10 to record further announcements for the sample Contact Center of company XYZ.

### 18.6.1.5 How to Load Announcements for the Sample Contact Center

You can upload announcements for the sample Contact Center of company XYZ with the **File Upload** wizard.

#### Prerequisites

An audio file in .wav format is available with the following properties: mono, audio sample rate 8 kHz, audio sample size 16 bit, frame size 2.

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **File Upload** wizard.
4. Click on the **Audio Files Manager** tab.
5. Select the destination **Auto Attendant** in the **Upload Destination** drop-down list.
6. Select the **Uploader** radio button and click on **Choose File**, navigate to the desired storage location of the audio file and click on **Open**.
7. Click on **Upload**.

---

#### INFO:

After the audio file is uploaded, it can no longer be deleted. However, it can be overwritten by uploading another file with the same file name. For example, uploading an audio file named `announcement1.wav` would overwrite any existing `announcement1.wav` file.

---

8. Repeat steps 4 through 7 to load further announcements for the sample Contact Center of company XYZ.

### 18.6.1.6 How to Add the Standard Schedule XYZ for the Sample Contact Center

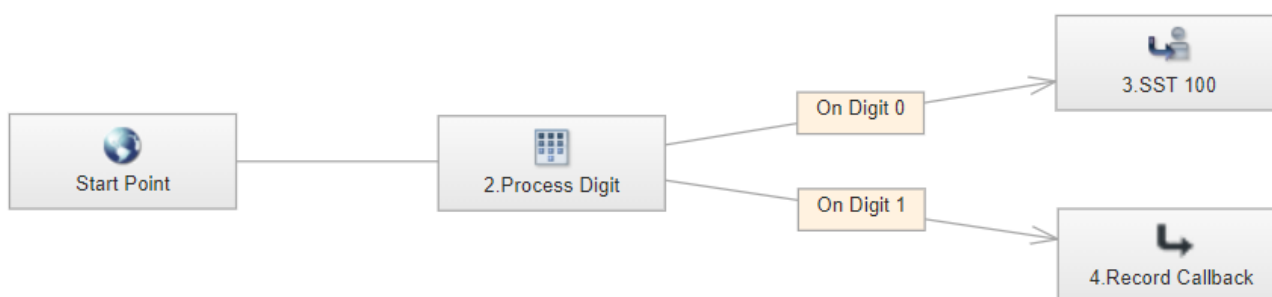

This example shows you how to use the **Contact Center** wizard to define a schedule with rules for breaks and business hours for the sample Contact Center of company XYZ. In the example, a schedule (Standard Schedule XYZ) is to be defined with a rule for the times outside business hours (Out of the Office) and exceptions for the business hours (08:00 to 11:59 hours = Open1, 13:00 to 17:00 hours = Open2) and the lunch break (12:00 to 12:59 hours = Lunch Break).

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

### Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **Contact Center** wizard.
4. Click on **Schedule**. All existing schedules are displayed.
5. Click on **Add**.
6. Click on **Add** under the **Schedule** area.
7. Define the new mapped rule for times outside business hours.

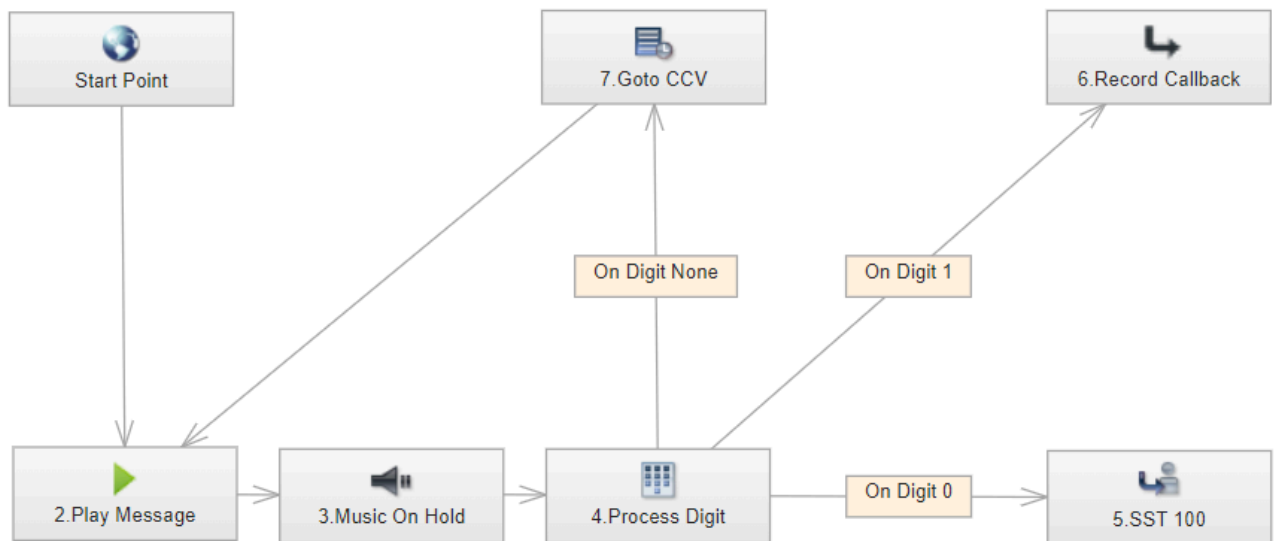

Click in the list of CCV tools on one of the CCV objects contained in the displayed rule and drag it into the Rules Editor. Enter the properties indicated below in the window of the CCV object that appears and confirm this by clicking **Save**. Repeat the procedure for any additional CCV objects. Connect the CCV objects by clicking the right mouse button on the first of the two CCV objects to be joined. Then select the second of the two CCV objects to be connected in the drop-down menu via **Link To**. Repeat the procedure for any additional CCV objects to be joined.

| Property                                     | Value                                                      |
|----------------------------------------------|------------------------------------------------------------|
| 1st. CCV object: <b>Process Digit</b>        |                                                            |
| <b>Playlist</b>                              | Audio file in wav format                                   |
| <b>Digits Timeout</b>                        | 5                                                          |
| <b>Description</b>                           | Announcement: "Press digit 0 to ...; Press digit 1 to ..." |
| 2nd. CCV object: <b>Single Step Transfer</b> |                                                            |
| <b>Target Extension</b>                      | 100                                                        |
| <b>Description</b>                           | Forward to Attendant Console                               |
| <b>Process after digits</b>                  | 0                                                          |
| 3rd CCV object: <b>Record Callback</b>       |                                                            |
| <b>Type</b>                                  | Extensive Callback                                         |
| <b>Maximum message length</b>                | 20                                                         |
| <b>Description</b>                           | Callback request (Agent callback)                          |
| <b>Process after digits</b>                  | 1                                                          |

Click on **Save ....** Enter `Out of the Office` as the **CCV Name** of the rule and then click **Save**. If the new rule is invalid, it cannot be saved. The invalid CCV object is marked red in the Rule Editor. Close the window confirming that the rule was saved.

Select the rule `Out of the Office` in the **Default CCV** drop-down list.

8. Enter the name `Standard Schedule XYZ` in the **Schedule Name** field.
9. Click on **Save**.
10. Click on **Add** under the **Schedule** area.
11. Define the mapped rule for the business hours.

Click in the list of CCV tools on one of the CCV objects contained in the displayed rule and drag it into the Rules Editor. Enter the properties indicated below in the window of the CCV object that appears and confirm this by clicking **Save**. Repeat the procedure for any additional CCV objects. Connect the CCV objects by clicking the right mouse button on the first of the two CCV objects to be joined. Then select the second of the two CCV objects to be connected in the drop-down menu via **Link To**. Repeat the procedure for any additional CCV objects to be joined.

| Property                              | Value                            |
|---------------------------------------|----------------------------------|
| 1st. CCV object: <b>Play Message</b>  |                                  |
| <b>File name</b>                      | Audio file in wav format         |
| <b>Interrupt digits</b>               | 5                                |
| <b>Description</b>                    | Agent not available announcement |
| 2nd. CCV object: <b>Music on Hold</b> |                                  |
| <b>Time value</b>                     | 30                               |
| <b>Description</b>                    | Music on Hold for 30 seconds     |

| Property                                    | Value                                                      |
|---------------------------------------------|------------------------------------------------------------|
| 3rd. CCV object: <b>Process Digit</b>       |                                                            |
| <b>Playlist</b>                             | Audio file in wav format                                   |
| <b>Digits Timeout</b>                       | 5                                                          |
| <b>Description</b>                          | Announcement: "Press digit 0 to ...; Press digit 1 to ..." |
| 4th. CCV object <b>Single Step Transfer</b> |                                                            |
| <b>Target Extension</b>                     | 100                                                        |
| <b>Description</b>                          | Forward to Attendant Console                               |
| <b>Process after digits</b>                 | 0                                                          |
| 5th. CCV object: <b>Record Callback</b>     |                                                            |
| <b>Type</b>                                 | Extensive Callback                                         |
| <b>Maximum message length</b>               | 20                                                         |
| <b>Description</b>                          | Callback request (Agent callback)                          |
| <b>Process after digits</b>                 | 1                                                          |
| 6th. CCV object: <b>Go to CCV</b>           |                                                            |
| <b>Target CCV</b>                           | 1. Play Message                                            |
| <b>Description</b>                          | Back to announcement                                       |

Click on **Save ...**. Enter `Open` as the **CCV Name** for the new rule and then click **Save**. Close the window confirming that the rule was saved.

In the drop-down list, select the rule `Open` for the `Open1` exception.

12. In the **Exceptions** area, click on **Add** to define the first exception for business hours.

13. Enter **Open1** in the `Description` field.

14. Define at what time the exception `Open1` is to apply:

Enable the **Within time range** radio button. Select **08:00** as start time in the `Start Time` list box and **11:59** as end time in the `End Time` list box to define the daily time period.

Select the weekdays on which the rule is to be applied in the **Select days** window. Then click **Save**.

15. In the **Exceptions** area, click on **Add** to define the second exception for business hours.

16. Enter `Open2` in the **Description** field.

17. In the drop-down list, select the rule `Open` for the `Open2` exception.

18. Define at what time the exception `Open2` is to apply:

Select the **Within time range** from the **Type** drop-down list. Select **13:00** as start time in the `Start Time` list box and **17:00**

as end time in the **End Time** list box to define the daily time period.

Select the weekdays on which the rule is to be applied in the **Select days** window. Then click **Save**.

- 19.** Define the mapped rule for the lunch break.

Click in the list of CCV tools on one of the CCV objects contained in the displayed rule and drag it into the Rules Editor. Enter the properties indicated below in the window of the CCV object that appears and confirm this by clicking **Save**. Repeat the procedure for any additional CCV objects. Connect the CCV objects by clicking the right mouse button on the first of the two CCV objects to be joined. Then select the second of the two CCV objects to be connected in the drop-down menu via **Link To**. Repeat the procedure for any additional CCV objects to be joined.

| Property                               | Value                             |
|----------------------------------------|-----------------------------------|
| 1st. CCV object: <b>Play Message</b>   |                                   |
| <b>File name</b>                       | Audio file in wav format          |
| <b>Interrupt digits</b>                | Select service                    |
| <b>Description</b>                     | Agent not available announcement  |
| 2rd CCV object: <b>Record Callback</b> |                                   |
| <b>Type</b>                            | Extensive Callback                |
| <b>Maximum message length</b>          | 20                                |
| <b>Description</b>                     | Callback request (Agent callback) |
| <b>Process after digits</b>            | 1                                 |

Click on **Save ....** Enter **Lunch Break** as the **CCV Name** of the rule. Close the window confirming that the rule was saved.

In the drop-down list, select the rule **Lunch Break** for the Lunch Break exception.

- 20.** In the **Exceptions** area, click on **Add** to define the exception for lunch break.
- 21.** Enter **Lunch Break** in the **Description** field.
- 22.** Define at what time the exception Lunch Break is to apply:

Select the **Within time range** from the **Type** drop-down list. Select 12:00 as the start time in the **Start Time** list box and 12:59 as the end time in the **End Time** list box to define the daily time period.

Select the weekdays on which the rule is to be applied in the **Select days** window. Then click **Save**.

23. If you want to test which rule (CCV) of the schedule is executed at a particular point in time, click on **Test Schedule**. Select the desired date and time in the **Date** and **Time** list boxes, respectively. Then click on **Test Schedule**. You will then be shown which rule (CCV) applies on that day and at that time. Click on **Close** to close the **Test Schedule** window.
24. Click on **Save**.
25. Close the window.

### 18.6.1.7 How to Add the Standard Schedule Hotline for the Sample Contact Center

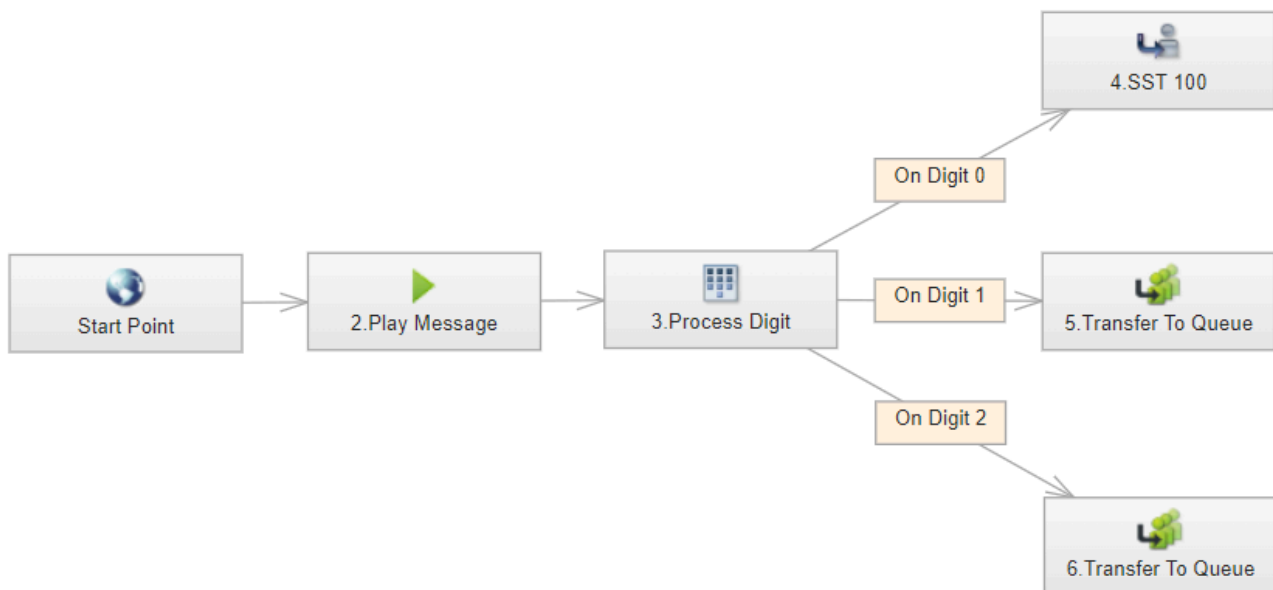

You can define the schedule with a rule for free calls (Hotline) for the sample Contact Center of company XYZ with the **Contact Center** wizard.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **Contact Center** wizard.
4. Click on **Schedule**. All existing schedules are displayed.
5. Click on **Add**.
6. Click on **Add** under the **Schedule** area.
7. Define the displayed rule for free calls (Hotline).

Click in the list of CCV tools on one of the CCV objects contained in the displayed rule and drag it into the Rules Editor. Enter the

properties indicated below in the window of the CCV object that appears and confirm this by clicking **Save**. Repeat the procedure for any additional CCV objects. Connect the CCV objects by clicking the right mouse button on the first of the two CCV objects to be joined. Then select the second of the two CCV objects to be connected in the drop-down menu via **Link To**. Repeat the procedure for any additional CCV objects to be joined.

| Property                                     | Value                                                      |
|----------------------------------------------|------------------------------------------------------------|
| 1st. CCV object: <b>Play Message</b>         |                                                            |
| <b>File name</b>                             | Audio file in wav format                                   |
| <b>Interrupt digits</b>                      | 5                                                          |
| <b>Description</b>                           | Announcement: Greeting                                     |
| 2nd. CCV object: <b>Process Digit</b>        |                                                            |
| <b>Playlist</b>                              | Audio file in wav format                                   |
| <b>Digits Timeout</b>                        | 5                                                          |
| <b>Description</b>                           | Announcement: "Press digit 0 to ...; Press digit 1 to ..." |
| 3rd. CCV object: <b>Single Step Transfer</b> |                                                            |
| <b>Target Extension</b>                      | 100                                                        |
| <b>Description</b>                           | Forward to Attendant Console                               |
| <b>Process after digits</b>                  | 0                                                          |
| 4th. CCV object <b>Transfer To Queue</b>     |                                                            |
| <b>Queue</b>                                 | 440                                                        |
| <b>Description</b>                           | Proceed to the Service queue                               |
| <b>Process after digits</b>                  | 1                                                          |
| 5th. CCV object <b>Transfer To Queue</b>     |                                                            |
| <b>Queue</b>                                 | 444                                                        |
| <b>Description</b>                           | Proceed to the Sales queue                                 |
| <b>Process after digits</b>                  | 2                                                          |

Click on **Save ....** Enter `Hotline` as the **CCV Name** for the rule and then click **Save**. If the new rule is invalid, it cannot be saved. The invalid CCV object is marked red in the Rule Editor. Close the window confirming that the rule was saved.

Select the rule **Hotline** in the `Default` CCV drop-down list.

8. Enter the name `Standard Schedule Hotline` in the **Schedule Name** field.
9. Click on **Save Schedule**.

### 18.6.1.8 How to Add Queues for the Sample Contact Center

This example shows you how to use the **Contact Center** wizard to configure queues for the sample Contact Center of company XYZ. In the example, one queue is to be configured for the Service Department (with station number 440) and one for the Sales Department (with station number 444). A further queue (Hotline, station number 456) is to be configured for free calls.

#### Prerequisites

The UCD groups **Service**, **Sales** and **Hotline** for the sample Contact Center have been configured.

The schedules **Standard Schedule XYZ** and **Standard Schedule Hotline** have already been created for the sample Contact Center.

At least one e-mail account is available for receiving e-mails.

The sending of e-mails has been configured in the communication system.

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **Contact Center** wizard.
4. Click on **Queue**.
5. Click on **Add**.
6. Click on the **General Settings** tab.
7. Enter the name `Service` in the **Queue Name** field.
8. In the **Queue Active** drop-down list, select the item **Active**.
9. Enter the number **440** in the `Hunt Group` field.
10. Select the item **CSP** in the **Phone Switch** drop-down list.
11. Select the item **Standard Schedule XYZ** in the **Schedule** drop-down list.
12. In the field **Queue Alarm Count**, enter the value `20`, for example.  
If there are more than 20 calls waiting in the queue, the queue symbol at the agent changes from green to orange.
13. In the **Queue Alarm Time** field, enter the value `300`, for example.  
Once the waiting time for a queued call specified exceeds 300 seconds, the corresponding item in the list of Contact Center calls for the agents changes to red.
14. In the field **Missed Call Timeout**, enter the value `100`, for example, so that any call not answered within 100 seconds is forwarded to the next free agent.
15. Enter a number in the **Abandoned Call Threshold** field, e.g., `120`. This causes calls abandoned after 120 seconds to be included in the statistics (of a report).

16. Select the check box **Screen Pop Enabled**. A screen pop for displaying and entering customer data will then appear on receiving incoming calls in myAgent.
17. Activate the **No Wrapup** option.
18. Select the item **Static** in the **Queue depth mode** drop-down list.
19. Enter a number in the **Queue depth size** field, e.g., 5.
20. Click on the **Queue Pilots** tab.

21. In the **Inbound Fax Pilots** drop-down list, select the appropriate option or options of the desired pilot/s (phone number/s) so that the faxes are queued.

Faxes to these phone number/s will then be added to the queue and treated as incoming calls.

22. Select one of the following options in the **Inbound Email Service**, area so that e-mails are placed in the queue:

- If you want to set up a new e-mail address, click on **Add**. The **Add** window is displayed.

Select the authentication method for your e-mail server from the **Auth Method** drop-down list. You can choose between **Basic** and **OAuth 2.0**.

Enter the designation of the e-mail server to be used for retrieving e-mails in the **Server** field (e.g., `pop3.web.de`).

Enter the port number of the e-mail server in the **Port** field (e.g., 110, the default port number for POP3).

If the authentication method selected is **Basic**, enter the access data for the e-mail server in the **User Name** field and **Password** fields.

If the authentication method selected is **OAuth 2.0**, enter the user name for accessing the e-mail server in the **User Name**, **Tenant ID**, **Application ID** and **Client Secret** fields. The Tenant ID, Application ID and Client Secret corresponds to the application that has been registered in Azure AD for E-mail Queues. They can be obtained from your Azure AD administrator. Enter the scope for the application in the **Scope** field (default value: `https://outlook.office365.com/.default`).

Select whether e-mails are to be sent via an SSL (Secure Socket Layer) connection. If you want to use an SSL connection, select the **Use SSL connection** check box. (Note that the port number of the E-mail server may be changed as a result. The default port number for POP3 via SSL = 995). If you do not want to use an SSL connection, clear the **Use SSL connection** check box.

Click on **Save**. The new e-mail address will then appear in the **Inbound Email Service** area.

- If you want to edit an existing e-mail address, mark the desired e-mail address and click **Edit**. The **Edit** window is displayed.

Change the required parameters and then lick **Save**.

- If you want to delete an existing e-mail address, mark the desired e-mail address and click **Remove Email**.

23. Click on the **Miscellaneous** tab.
24. In the field **Return Email Address**, enter the e-mail address that is to be displayed as the sender's address (for the recipient) when an e-mail is sent by an agent.
25. If you enable the **Intelligent Call Routing** checkbox, incoming calls are automatically forwarded to the agent with whom the caller was last connected.
26. Click on **Save**.
27. Repeat steps 5 through 23 to configure the Sales queue. Repeat steps 5 through 17 and step 23 to configure the Hotline queue.

### 18.6.1.9 How to Assign Agents to Queues of the Sample Contact Center

This example shows you how to use the **Contact Center** wizard to assign agents to the queues of the sample Contact Center of company XYZ. In the example, three agents of the Service queue and three agents of the Sales queue are assigned.

#### Prerequisites

The **Service** and **Sales** queues for the sample Contact Center have been set up.

Six agents were configured for the sample Contact Center.

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **Contact Center** wizard.
4. Click on **Queue Bindings**. The **Service** and **Sales** queues are displayed.
5. Select queue to which you want to assign an agent and click on **Edit**. All agents already assigned are displayed.
6. Select the first agent for the **Service** queue from the table and click on **Edit**. The **Edit** window is then displayed.
7. Select one of the following options:
  - If the agent is to receive calls without regard to the load on the **Service** queue, select the **Primary Agent** from the **Type** drop-down list.
  - If the agent is to receive calls only when the **Service** queue overflows, select the **Overflow Agent** from the **Type** drop-down list.
8. If you have selected **Overflow Agent**:
  - a) Enter the time after which incoming calls for an agent should be forwarded in an overflow situation in the **Overflow after seconds in queue** field.
  - b) Enter the maximum number of calls in the **Overflow after calls in queue** field. Calls that exceed this maximum number are received by an overflow agent.

9. Enter a percentage value for the **Skill Level** of the agent.  
Skill levels enable you to control the distribution of calls to agents in the **Service** queue. Agents with higher skill levels are given preference during the call distribution. In cases where all agents have the same skill level, the longest idle agent receives the call.
10. Select one of the following options:
  - If the agent is to receive callback requests in the form of voice messages, select the check box **Enable agent callback**.
  - If the agent is to be prevented from receiving callback requests, clear the **Enable agent callback** check box.
11. Enter the automatic work time in seconds for the agent of the **Service** queue in the **Work Time** field.
12. Click on **OK**.
13. Repeat steps 5 through 12 to assign all agents to the queues of the sample Contact Center.

## 18.6.2 Configuration Procedure

This section contains an overview of the actions to be performed when configuring the Contact Center.

- Configure UCD groups  
The queues of the Contact Center are essentially workgroups that are based on the UCD groups of the communication system. The UCD groups must be defined before the actual configuration of the Contact Center.
- Configure a fallback solution  
If the Contact Center is unavailable due to problems (crash, connection down, etc.) the "Uniform Call Distribution (UCD)" feature of the communication system is automatically used. This feature thus serves as the fallback solution for the Contact Center (see [Fallback solution](#) ).
- Configure subscribers as agents
- Record individual announcements for the Contact Center
- Load individual announcements for the Contact Center

---

**NOTICE:** Playing announcements are only possible via trunks. In order to play the announcement the call must come from a trunk or the caller should be monitored by OpenScape Contact Center.

---

- Add schedules
- Add queues
- Define target values for the Grade of Service
- Define the VIP caller priority
- Edit the VIP call list
- Define preferred agents
- Add Contact Center breaks
- Add wrap-up codes
- Assigning agents to queues

### 18.6.2.1 How to Configure UCD Groups for the Contact Center

You can configure UCD groups for the Contact Center with the **UCD** wizard.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > User Telephony**.
3. Click **Edit** to start the **UCD** wizard. The list of all possible UCD groups is displayed.
4. To configure a UCD group, click **Edit** in the row containing the required UCD group.
5. Enter the call number of the new UCD group in the **Call number** field.
6. Enter the DID number of the new UCD group in the **Direct inward dialing number** field.
7. Enter the name of the UCD group in the **Name** field.
8. Click **OK & Next**. The window **Assignment of UCD Agents** is displayed.
9. Mark the required UCD agent IDs in the **Selection** and assign them to this UCD group by clicking **Add**.
10. Click **OK & Next**. The **Assign stations** window appears.
11. Assign the desired stations to all UCD agent IDs.
12. Click **OK & Next**. The **Edit announcement/overflow** window appears.
13. Click **OK**, since the displayed parameters are not relevant for the configuration of the UCD group.
14. If you want to configure further UCD groups for the contact center, repeat steps 4 through 11.
15. Click **OK & Next**, followed by **Finish**.

### 18.6.2.2 How to Configure a Subscriber as an Agent

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **User Directory** wizard.
4. Mark the desired station in the user directory and click **Edit**.
5. Click in the menu tree on **Personal Details > User Level**.
6. Select one of the following options:

If the agent is to be permanently available, select the **Permanently available agent** check box. The agent will then remain available for calls, faxes and e-mails even when he or she does not accept a call, fax or e-mail.

If the agent is not to be permanently available, clear the **Permanently available agent** check box. The agent will then be assigned the status Unavailable when he or she does not accept a call, fax or e-mail.

7. Select the authorization level in the **Level** drop-down list.
8. Click **Save**.
9. If you want to configure another subscriber as an agent, repeat steps 4 through 8.

### 18.6.2.3 How to Record Custom Announcements for the Contact Center

You can record custom announcements for the Contact Center with the **Recorder** wizard.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **File Upload** wizard.
4. Enable the **Recorder** radio button
5. Select the station number of the phone to be used for recording from the **Extension** drop-down list.
6. Click on **Make a Call**. The selected station number is called.
7. Pick up the handset and enter the name for your announcement in the **Filename** field.
8. Click on **Record** to start recording the announcement.
9. Click on **Stop** as soon as you have finished recording the entire announcement.
10. If you want to listen to your new announcement, click on **Play**.
11. Click on **Close** to save the announcement.

---

#### INFO:

After the announcement has been recorded and saved, it can no longer be deleted. However, it can be overwritten by saving another file with the same file name. For example, saving an audio file named `announcement1.wav` would overwrite any existing `announcement1.wav` file.

---

### 18.6.2.4 How to Load Custom Announcements for the Contact Center

You can load custom announcements for the Contact Center with the **File Upload** wizard.

#### Prerequisites

An audio file in .wav format is available with the following properties: mono, audio sample rate 8 kHz, audio sample size 16 bit, frame size 2.

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **File Upload** wizard.
4. Click on the **Audio Files Manager** tab.
5. Select the destination **Auto Attendant** in the **Upload Destination** drop-down list.
6. Select the **Uploader** radio button and click on **Choose File**, navigate to the storage location of the desired audio file and click on **Open**.
7. Click on **Upload**.

---

**INFO:** After the audio file is uploaded, it can no longer be deleted. However, it can be overwritten by uploading another file with the same file name. For example, uploading an audio file named `announcement1.wav` would overwrite any existing `announcement1.wav` file.

---

### 18.6.2.5 How to Add a Schedule

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **Contact Center** wizard.
4. Click on **Schedule**. All existing schedules are displayed.
5. Click on **Add**.
6. Select one of the following options for choosing the rule (CCV):
  - If you want to assign a previously defined rule to the schedule, select the desired rule in the **Default CCV** drop-down list.
  - If you want to assign a new rule that has not yet been defined to the schedule click on **Edit** under the **Schedule** area and proceed as follows:

Click in the list of CCV tools on the desired CCV object and drag it into the Rule Editor. Enter the desired properties in the window of the CCV object that appears and click **Save**. If required, drag further CCV objects into the Rule Editor and define their properties. To connect two CCV objects, right-click with the mouse on the first of the two CCV objects to be connected. Then select the second of the two CCV objects to be connected in the drop-down menu via **Link To**.

If you want to delete a CCV object from the Rule Editor, right-click on that CCV object and select **Remove** in the drop-down menu.

Click on **Save ....** Enter a name for the new rule and then click **Save**. Close the window confirming that the rule was saved. If the new rule is invalid, it cannot be saved. The invalid CCV object is marked red in the Rule Editor.

Select the new rule just saved from the **Default CCV** drop-down list.

- If you want to assign a new rule that is based on a previously defined rule to the schedule, proceed as follows:

Select the desired rule from the **Default CCV** drop-down list and click **Edit**. The rule will be displayed in the Rule Editor. Edit the rule.

Click in the list of CCV tools on the desired CCV object and drag it into the Rule Editor. Enter the desired properties in the window of the CCV object that appears and click **Save**. If required, drag further CCV objects into the Rule Editor and define their properties. To connect two CCV objects, right-click with the mouse on the first of the two CCV objects to be connected. Then select the second of the two CCV objects to be connected in the drop-down menu via **Link To**.

Click on **Save ....** Enter a **CCV Name** for the new rule and then click **Save**. Close the window confirming that the rule was saved. If the new rule is invalid, it cannot be saved. The invalid CCV object is marked red in the Rule Editor.

Select the new rule just saved from the **Default CCV** drop-down list.

7. If you want to print the rule or send it via an e-mail, you can save the rule as a PDF file. To do this, click **Print**. The **Print** window appears.

Enter the name of the file and then select the directory in which the file is to be stored. Click on **Save**.

8. Enter the name of the new schedule in the **Schedule Name** field.

9. Click on **Save**.

10. If you want to assign another rule (CCV) for a specific time period within the schedule, click on **Add** in the **Exceptions** area. The fields for this exception will then be displayed.

11. Enter the name of the exception in the **Description** field.

12. Select one of the following options for choosing the rule (CCV):

- If you want to assign a previously defined rule to the time period within the schedule, select the desired rule from the drop-down list for this exception.
- If you want to assign a new rule that has not yet been defined to the time period within the schedule, proceed as follows:

Click on **Add** under the **Schedule** area.

Click in the list of CCV tools on the desired CCV object and drag it into the Rule Editor. Enter the desired properties in the window of the CCV object that appears and click **Save**. If required, drag further CCV objects into the Rule Editor and define their properties. To connect two CCV objects, right-click with the mouse on the first of the two CCV objects to be connected. Then select the second of the two CCV objects to be connected in the drop-down menu via **Link To**.

If you want to delete a CCV object from the Rule Editor, right-click on that CCV object and select **Remove** in the drop-down menu.

Click on **Save ....** Enter a name for the new rule and then click **Save**. Close the window confirming that the rule was saved. If the new rule is invalid, it cannot be saved. The invalid CCV object is marked red in the Rule Editor.

Select the new rule just saved for this exception from the drop-down list.

- If you want to assign a new rule that is based on a previously defined rule to the time period within the schedule, proceed as follows:

Select the desired rule from the drop-down list for this exception and click **Edit**. The rule will be displayed in the Rule Editor. Edit the rule.

Click in the list of CCV tools on the desired CCV object and drag it into the Rule Editor. Enter the desired properties in the window of the CCV object that appears and click **Save**. If required, drag further CCV objects into the Rule Editor and define their properties. To connect two CCV objects, right-click with the mouse on the first of the two CCV objects to be connected. Then select the second of the two CCV objects to be connected in the drop-down menu via **Link To**.

Click on **Save ....** Enter a name for the new rule and then click **Save**. Close the window confirming that the rule was saved. If the new rule is invalid, it cannot be saved. The invalid CCV object is marked red in the Rule Editor.

Select the new rule just saved for this exception from the drop-down list.

**13.** Select one of the following options to define at what time the exception is to apply:

- If the exception is to apply for an unlimited time period throughout the year, select the **Within time range** from the **Type** drop-down list. Select the start and the end of the daily time period in the **Start Time** and **End Time** list boxes.

Select the weekdays on which the exception is to be applied. Then click **Save**.

- If the exception is to apply for a limited time period during the year, select the **Within time range** from the **Type** drop-down list. Enter the starting and the ending dates for the time period during the year (format dd.mm.yyyy) in the **Start Date** and **End Date** fields, respectively. Select the exact time of the start date and the exact time of the end date in the **Start Time** and **End Time** list boxes. The exception will apply between start date/start time to end date/end time of the covered period.

Select the weekdays on which the exception is to be applied. Then click **Save**.

- If the exception is to apply on holidays, select the **Holiday Schedules** from the **Type** drop-down list. Enter the starting and ending dates for the holiday schedule in the **Start Date** and **End Date** fields, respectively. Select the starting and ending times for the holiday schedule in the **Start Time** and **End Time** list boxes, respectively.

---

**INFO:** Holiday schedules have precedence over the other schedules and rules of a queue.

---

- If the exception is to apply every year, select the **Yearly Recurrence** from the **Type** drop-down list. Enter the starting and ending dates for the yearly recurrence in the **Start Date** and **End Date** fields, respectively. Select the starting and ending times for the yearly recurrence in the **Start Time** and **End Time** list boxes, respectively.

**14.** Click on **Save**.

**15.** Repeat steps 10 through 14 if you want to define additional exceptions for specific time periods.

**16.** If you want to test which rule (CCV) of the schedule is executed at a particular point in time, click on **Test Schedule**. Select the desired date and time in the **Date** and **Time** list boxes, respectively. Then click on **Test Schedule**. You will then be shown which rule (CCV) applies on that day and at that time. Click on **Close** to close the **Test Schedule** window.

**17.** If you want to assign this schedule to one or more queues select the check box(es) for the desired queue(s) in the **Queues** area.

**18.** Close the window.

### 18.6.2.6 How to Edit a Schedule

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.

3. Click on **Edit** to start the **Contact Center** wizard.
4. Click on **Schedule**. All existing schedules are displayed.
5. Mark the schedule to be edited and click **Edit**.
6. Change the desired settings for the default CCV:
  - If you want to assign some other rule (CCV) than the one currently displayed in the **Default CCV** drop-down list, select the desired rule in the **Default CCV** list.
  - If you want to edit the rule (CCV) shown in the **Default CCV** list, **Edit** under the **Schedule** area. The rule will be displayed in the Rule Editor. Edit the rule. Click on **Save ....** Enter a name for the new rule and then click **Save**. Close the window confirming that the rule was saved.

Select the new rule just saved from the **Default CCV** drop-down list.

7. Click on **Save**.
8. Change the desired settings in the **Exceptions** area:
  - If you want to assign another rule (CCV) to a specific time period within the schedule, click **Add** under the **Exception** area. Select the desired rule in the drop-down list for this exception. Then use the radio buttons and drop-down lists to specify when this exception is to apply. Enter the name of the exception in the **Description** field. Click on **Save**.
  - If you want to edit this exception or one of the exceptions displayed, click on the **Edit** under the **Exception** area after the selection of the desired exception and then use radio buttons, drop-down lists, fields to specify when this exception is to apply and on which rule (CCV). Additionally you can click on **Edit CCV** under the **Exception** area to edit the associated rule (CCV). The rule will be displayed in the Rule Editor. Edit the rule. Click on **Save ....** Enter a name for the new rule and then click **Save**. Close the window confirming that the rule was saved.

Select the new rule just saved from the drop-down list. Then use the radio buttons and drop-down lists to specify when this rule (CCV) is to apply. Click on the green Save icon.
  - If you want to delete this exception or one of the exceptions displayed, click on the **Remove** after the selection of the desired exception.
9. If you want to test which rule (CCV) of the schedule is executed at a particular point in time, click on **Test Schedule**. Select the desired date and time in the **Date** and **Time** list boxes, respectively. Then click on **Test Schedule**. You will then be shown which rule (CCV) applies on that day and at that time. Click on **Close** to close the **Test Schedule** window.
10. If you want to assign this schedule to one or more queues select the check box(es) for the desired queue(s) in the **Queues** area.
11. Close the window.

### 18.6.2.7 How to Delete a Schedule

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **Contact Center** wizard.
4. Click on **Schedule**. All available schedules are displayed.
5. Mark the desired schedule and click **Remove**.

---

**INFO:** A schedule cannot be deleted as long as it is still assigned to any queue. Before deleting a schedule, its assignment to the queue(s) must be removed.

---

### 18.6.2.8 How to Save a Rule (CCV) as a PDF File

The **Contact Center** wizard enables you to save rules (CCV) as a PDF file. The PDF file can then be typically printed or sent by e-mail.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **Contact Center** wizard.
4. Click on **Schedule**. All existing schedules are displayed.
5. Select the schedule that contains the desired rule and click **Edit**.
6. Select the desired rule from the drop-down list and click **Edit**. The rule will be displayed in the Rule Editor.
7. Click on **Print**. The Save window appears.
8. Enter the name of the file and then select the directory in which the file is to be stored.
9. Click on **Save**.
10. Close the window and confirm the prompt about closing this window with **Yes**.

### 18.6.2.9 How to Download a Rule (CCV) as a Backup File

The **Contact Center** wizard enables you to download rules (CCV) as a backup file.

### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

### Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **Contact Center** wizard.
4. Click on **Schedule**. All existing schedules are displayed.
5. Select the schedule that contains the desired rule and click **Edit**.
6. Select the desired rule from the **CCV** drop-down list and click **Edit** under the **Schedule** area. The rule will be displayed in the Rule Editor.
7. Click on **Download**.

The desired rule (CCV) is now downloaded as a backup file.

### 18.6.2.10 How to Upload a Downloaded Rule (CCV) in a Backup File Format

The **Contact Center** wizard enables you to upload rules (CCV) which are previous downloaded in a backup file format.

### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Download a rule (CCV) in a backup file format.

### Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **Contact Center** wizard.
4. Click on **Schedule**. All existing schedules are displayed.
5. Select the schedule that contains the desired rule and click **Edit**.
6. Select the desired rule from the **CCV** drop-down list and click **Edit** under the **Schedule** area. The rule will be displayed in the Rule Editor.
7. Click on **Choose File**, navigate to the storage location of the desired rule's backup file and click on **Open**.  
If you choose a file which is not in a backup format an error occurs.
8. Click on **Restore Backup**.

The desired rule (CCV) is now uploaded on the system.

### 18.6.2.11 How to Add a Queue

#### Prerequisites

At least one UCD group has been configured.

At least one schedule has been set up.

At least one e-mail account is available for receiving e-mails (if e-mails are to be queued).

The sending of e-mails has been configured in the communication system (if e-mails are to be sent by agents of the queue).

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **Contact Center** wizard.
4. Click on **Queue**.
5. Click on **Add**.
6. Click on the **General Settings** tab.
7. Enter the name of the queue in the **Queue Name** field.

Recommendation: Use the name of one of your configured UCD groups.

---

**INFO:** To ensure that the queue name is displayed fully in a report, you should select short designations and avoid concatenations. Example: Domestic Sales Group 1 (not: DomesticSalesGroup 1)

---

8. Select one of the following options for the status of the queue:
  - If you want to activate the new queue, select the item **Active** in the **Queue Active** drop-down list.
  - If you want to deactivate the new queue, select the item **Not active** in the **Queue Active** drop-down list.

The deactivation of a queue leads to the activation of the fallback solution through the associated UCD group. If no agent for the UCD group is logged in, and if no further call forwarding destination has been entered for the UCD group, callers will hear the busy signal.
9. Enter the call number of a UCD group that you set up during the basic configuration of the Contact Center in the **Hunt Group** field.
10. Select the item **CSP** in the **Phone Switch** drop-down list.
11. Select the desired schedule in the **Schedule** drop-down list.
12. Enter the alarm threshold value in the **Queue Alarm Count** field.
 

If the number of calls waiting in the queue exceeds the number specified here, the queue symbol for the agent changes from green to orange.

- 13.** Enter the alarm threshold value in seconds in the **Queue Alarm Time** field.

If the waiting time for a queued call specified here exceeds the time specified here, the corresponding item in the list of Contact Center calls for the agents changes to red.

- 14.** Enter the time in seconds after which an unanswered call should be forwarded to the next free agent in the **Missed Call Timeout** field.

- 15.** Enter the time in seconds that determines whether or not an abandoned call should be included in the statistics (i.e., in a report) in the **Abandoned Call Threshold** field.

Calls abandoned after the specified time has elapsed are included in the statistics.

- 16.** Select one of the following options for the display of screen pops in the myAgent application:

---

**INFO:** Screen pops are needed to accept and execute callbacks and to accept faxes and e-mails.

---

- If you want a screen pop for displaying and entering customer data to appear in myAgent on inbound calls, select the check box **Screen Pop Enabled**.
- If you do not want a screen pop to appear in myAgent on inbound calls, clear the **Screen Pop Enabled** check box.

- 17.** Select one of the following options for the wrapup mode:

For queues with wrapup mode, agents can assign their calls to specific categories (orders, complaints, service, etc.) using wrapup codes.

- If you want to set up a queue with the wrapup mode Simple Wrapup, select the **Simple Wrapup** option.
- If you want to set up a queue with the wrapup mode Multiple Wrapup, select the **Multiple Wrapup** option.
- If you want to set up a queue without wrapup mode, select the option **No Wrapup**.

- 18.** If you want to change the priority of the queue, click on **Priorities**.

Click on and drag the red dots in the **Queue Priority Over Time** area to the desired positions. The horizontal axis shows the waiting time in the queue, and the vertical axis shows the priority of the selected queue as compared to other queues. If an agent is assigned to multiple queues, the queue priority can be used to define whether calls for a queue with higher priority should be forwarded to this agent with precedence over calls for other queues.

Drag the scroll bars in the **Call Type Priorities** area to the desired position. This defines the priority of the call types within the selected queue. Higher priorities are assigned by moving the scroll bars incrementally to the right.

---

**INFO:** A higher priority should be chosen for voice calls than for other types of calls. Otherwise, waiting callers could be superseded by callbacks, faxes or e-mails.

---

19. Select one of the following options for the Queue depth mode:  
Queue Depth can be set for each queue individually within the queue configuration dialog
  - In case the **Queue depth mode** is set to **Static**, **WLS** and **Queue depth size** parameters can be configured.
  - In case the **Queue depth mode** is set to **None**, the **WLS** parameter can be configured nevertheless and affects also the UCD configuration but parameter **Queue depth size** cannot be set.
20. Enter the time Waiting Loop Size in the **WLS** field. The **WLS** value which is the number of the voice calls waiting to be connected to an agent, affects directly the configuration of the parameter Queued Calls of the assigned UCD group.
21. If **Queue depth mode** is set to **Static**, enter the quantity of the queue depth in the **Queue depth size** field. The queue depth size is the summary of the waiting loop size (WLS) and the calls on agent.
22. Click on the **Queue Pilots** tab.
23. If faxes are to be queued, select the appropriate option or options of the desired pilot/s (phone number/s) in the **Inbound Fax Pilots** area.  
Faxes to these phone number/s will then be added to the queue and treated as incoming calls.
24. Select one of the following options in the **Inbound Email Service**, area so that e-mails are placed in the queue:
  - If you want to set up a new e-mail address, click on **Add**. The **Add** window is displayed.  
  
Select the authentication method for your e-mail server from the **Auth Method** drop-down list. You can choose between **Basic** and **OAuth 2.0**.  
  
Enter the designation of the e-mail server to be used for retrieving e-mails in the **Server** field (e.g., `pop3.web.de`).  
  
Enter the port number of the e-mail server in the **Port** field (e.g., `110`, the default port number for POP3).  
  
If the authentication method selected is **Basic**, enter the access data for the e-mail server in the **User Name** field and **Password** fields.  
  
If the authentication method selected is **OAuth 2.0**, enter the user name for accessing the e-mail server in the **User Name**, **Tenant ID**, **Application ID** and **Client Secret** fields. The Tenant ID, Application ID and Client Secret corresponds to the application that has been registered in Azure AD for E-mail Queues. They can be obtained from your Azure AD

administrator. Enter the scope for the application in the **Scope** field (default value: <https://outlook.office365.com/.default>).

Select whether e-mails are to be sent via an SSL (Secure Socket Layer) connection. If you want to use an SSL connection, select the **Use SSL connection** check box. (Note that the port number of the E-mail server may be changed as a result. The default port number for POP3 via SSL = 995). If you do not want to use an SSL connection, clear the **Use SSL connection** check box.

Click on **Save**. The new e-mail address will then appear in the **Inbound Email Service** area.

- If you want to edit an existing e-mail address, mark the desired e-mail address and click **Edit**. The **Edit** window is displayed.

Change the required parameters and then click **Save**.

- If you want to delete an existing e-mail address, mark the desired e-mail address and click **Remove**.

**25.** Click on the **Miscellaneous** tab.

**26.** In the field **Return Email Address**, enter the e-mail address that is to be displayed as the sender's address (for the recipient) when an e-mail is sent by an agent.

**27.** Select one of the following options for intelligent call routing within the queue:

- If incoming calls are to be forwarded automatically to the agent who was last connected with the caller, enable the check box **Search for last agent customer if no preferred agent is found**. As a prerequisite, no preferred agent must have been defined for the caller.
- If incoming calls are not to be forwarded automatically to the agent who was last connected with the caller, clear the check box **Search for last agent customer if no preferred agent is found**.

**28.** Click on **Save**.

### 18.6.2.12 How to Edit a Queue

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

- 1.** In the navigation bar, click on **Setup**.
- 2.** Click in the navigation tree on **Wizards > UC Suite**.
- 3.** Click on **Edit** to start the **Contact Center** wizard.
- 4.** Click on **Queue**.
- 5.** Mark the desired queue and click **Edit**.
- 6.** Click on the **General Settings** tab.
- 7.** Change the desired settings.
- 8.** Select one of the following options for the status of the queue:

- If you want to activate the queue, select the item **Active** in the **Queue Active** drop-down list.
- If you want to deactivate the queue, select the item **Not active** in the **Queue Active** drop-down list.

The deactivation of a queue leads to the activation of the fallback solution through the associated UCD group. If no agent for the UCD group is logged in, and if no further call forwarding destination has been entered for the UCD group, callers will hear the busy signal.

9. Select one of the following options for the display of screen pops in the myAgent application:

---

**INFO:** Screen pops are needed to accept and execute callbacks and to accept faxes and e-mails.

---

- If you want a screen pop for displaying and entering customer data to appear in myAgent on inbound calls, select the check box **Screen Pop Enabled**.
- If you do not want a screen pop to appear in myAgent on inbound calls, clear the **Screen Pop Enabled** check box.

10. Select one of the following options for the wrapup mode:

For queues with wrapup mode, agents can assign their calls to specific categories (orders, complaints, service, etc.) using wrapup codes.

- If you want to set the wrapup mode Simple Wrapup for the queue, select the **Simple Wrapup** option.
- If you want to set the wrapup mode Multiple Wrapup for the queue, select the **Multiple Wrapup** option.
- If you do not want to set any wrapup mode for the queue, select the **No Wrapup** option.

11. If you want to change the priority of the queue, click on **Priorities**.

Click on and drag the red dots in the **Queue Priority Over Time** area to the desired positions. The horizontal axis shows the waiting time in the queue, and the vertical axis shows the priority of the selected queue as compared to other queues. If an agent is assigned to multiple queues, the queue priority can be used to define whether calls for a queue with higher priority should be forwarded to this agent with precedence over calls for other queues.

Drag the scroll bars in the **Call Type Priorities** area to the desired position. This defines the priority of the call types within the selected queue. Higher priorities are assigned by moving the scroll bars incrementally to the right.

---

**INFO:** A higher priority should be chosen for voice calls than for other types of calls. Otherwise, waiting callers could be superseded by callbacks, faxes or e-mails.

---

12. Click on the **Queue Pilots** tab.
13. Select the desired settings in the **Inbound Fax Pilots** area:
  - If faxes are to be queued, select the appropriate check box or check boxes of the desired pilot/s (phone number/s) in the **Inbound Fax Pilots** area.
  - If faxes are not to be queued, clear the **Inbound Fax Pilots** check box(es).
14. Select the desired settings in the **Inbound Email Service** area:
  - If you want to set up a new e-mail address, click on **Add**. The **Add** window is displayed.

Select the authentication method for your e-mail server from the **Auth Method** drop-down list. You can choose between **Basic** and **OAuth 2.0**.

Enter the designation of the e-mail server to be used for retrieving e-mails in the **Server** field (e.g., `pop3.web.de`).

Enter the port number of the e-mail server in the **Port** field (e.g., `110`, the default port number for POP3).

If the authentication method selected is **Basic**, enter the access data for the e-mail server in the **User Name** field and **Password** fields.

If the authentication method selected is **OAuth 2.0**, enter the user name for accessing the e-mail server in the **User Name**, **Tenant ID**, **Application ID** and **Client Secret** fields. The Tenant ID, Application ID and Client Secret corresponds to the application that has been registered in Azure AD for E-mail Queues. They can be obtained from your Azure AD administrator. Enter the scope for the application in the **Scope** field (default value: `https://outlook.office365.com/.default`).

Select whether e-mails are to be sent via an SSL (Secure Socket Layer) connection. If you want to use an SSL connection, select the **Use SSL connection** check box. (Note that the port number of the E-mail server may be changed as a result. The default port number for POP3 via SSL = 995). If you do not want to use an SSL connection, clear the **Use SSL connection** check box.

Click on **Save**. The new e-mail address will then appear in the **Inbound Email Service** area.
  - If you want to edit an existing e-mail address, mark the desired e-mail address and click **Edit**. The **Edit** window is displayed.

Change the required parameters and then click **Save**.
  - If you want to delete an existing e-mail address, mark the desired e-mail address and click **Remove**.
15. Click on the **Miscellaneous** tab.
16. Change the desired settings.
17. Click on **Save**.

### 18.6.2.13 How to Activate or Deactivate a Queue

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **Contact Center** wizard.
4. Click on **Queue**.
5. Click on **Edit**.
6. Click on the **General Settings** tab.
7. Select one of the following options for the status of the queue:
  - If you want to activate the queue, select the item **Active** in the **Queue Active** drop-down list.
  - If you want to deactivate the queue, select the item **Not active** in the **Queue Active** drop-down list.

The deactivation of a queue leads to the activation of the fallback solution through the associated UCD group. If no agent for the UCD group is logged in, and if no further call forwarding destination has been entered for the UCD group, callers will hear the busy signal.

8. Click on **Save**.

### 18.6.2.14 How to Configure a Pilot for Incoming Fax Messages in Queues

#### Prerequisites

At least one fax number for receiving faxes is available.

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. Click on **Expert Mode** in the navigation bar.
2. In the navigation tree, click on **Telephony Server > Stations**.
3. In the menu tree, click on **Stations > UC Applications > Contact Center Fax**. The logical port numbers intended for fax boxes are displayed.
4. Click on the desired port number in the menu tree.
5. Click the **Edit Station Parameters** tab.
6. Enter the call number of the new pilot for incoming fax messages in the **Call Number** field.
7. Enter the name of the new pilot for incoming fax messages in the **Name** field.
8. Enter the direct inward dialing number of the new pilot for incoming fax messages in the **Direct inward dialing number** field.
9. Click **Apply** followed by **OK**.

The pilot for incoming fax messages can now be activated for the desired queue.

### 18.6.2.15 How to Define Target Values for the Grade Of Service

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **Contact Center** wizard.
4. Click on **Grade of Service**.
5. Mark the desired queue and click **Edit**.
6. Click on and drag the red dots to the desired positions.

The horizontal axis shows the waiting time in the queue in intervals of 10 seconds, and the vertical axis shows the target value for the Grade Of Service as percentage values.

This enables you to specify the target values for quality of switching in the queue. Quality assessments can then be made by comparing these target values with the actual waiting times for callers in the queue.
7. Click on **Save**.

### 18.6.2.16 How to Define the VIP Caller Priority

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **Contact Center** wizard.
4. Click on **VIP Caller Priorities**.
5. Mark the desired queue and click **Edit**.
6. Click on and drag the red dots to the desired positions.

This defines the priority of normal callers as opposed to VIP callers. The horizontal axis shows the waiting time in the queue in intervals of 30 seconds, and the vertical axis shows the priority of normal callers who are not registered in the VIP call list directory.

For example, you can set the red dots so that a priority of 100 percent is reached after 180 seconds. In this case, normal callers will be treated with the same priority as VIP callers only after 180 seconds. Earlier incoming calls from VIP callers are given prioritized treatment in the queue.

Alternatively, the values for individual waiting time intervals can also be entered in the input fields on the right next to the graph.

7. Click on **Save**.

### 18.6.2.17 How to Edit the VIP Call List

#### Prerequisites

The callers to be placed on the VIP Call List are in the external directory.

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **Contact Center** wizard.
4. Click on **VIP Call List**.
5. Mark the desired queue and click **Edit**.
6. Select one of the following options:
  - If you want to add a caller to the VIP Call List, click **Add** in the upper part of the window. Select the desired entry. Define the priority of this VIP caller as opposed to other VIP callers by dragging the scroll bar to the desired position. Higher priorities are assigned by moving the scroll bars incrementally to the right.
  - If you want to add a call number pattern to the VIP Call List, click **Add** in the lower part of the window. Enter the desired call number pattern (e.g., 089 7577\*) in the Pattern field. Define the priority of all VIP callers with this call number pattern as opposed to other VIP callers by dragging the scroll bar to the desired position. Higher priorities are assigned by moving the scroll bars incrementally to the right.

It is not possible to enter call number patterns in the canonical call number format. The use of shortcut characters for country codes (for example +49 instead 0049) is likewise not possible. Call number patterns must always be specified without the CO access code.

Example of a call number pattern: 089 7577\* (089 = area code for Munich, 7577 = PABX number of a company, \* = wildcard for any number). By entering this call number pattern in the VIP call list, all callers from Munich, whose telephone number begins with 7577, are given priority.

The following characters can be used as wildcards (placeholders) in a call number pattern:

- \* = wildcard for any number
- ? = wildcard for any digit
- If you want to edit an item in the VIP call list, mark the desired entry and click **Edit**. Change the desired settings.

- If you want to remove an entry from the VIP call list, mark the desired entry and click **Remove**.
7. Click on **Save**.

### 18.6.2.18 How to Define Preferred Agents

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **Contact Center** wizard.
4. Click on **Preferred Agents**.
5. Mark the desired queue and click **Edit**.
6. Mark the desired caller in the **Customers** area, which is the upper of the two tables.
7. Click on **Add Agent**.
8. Select the desired agent and click **Save**.

The name of the selected agent is then shown in the **Preferred Agents** area.

9. If you want to define another agent as a preferred agent, repeat steps 7 and 8.
10. Define the priority of the preferred agent if multiple preferred agents were defined. You have the following options:
  - If you want to assign a higher priority, mark the desired agent and move that agent to a higher position in the list by using the **Move Up** button.
  - If you want to assign a lower priority, mark the desired agent and move that agent to a lower position in the list by using the **Move Down** button.

### 18.6.2.19 How to Delete Preferred Agents

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **Contact Center** wizard.
4. Click on **Preferred Agents**.
5. Mark the desired queue and click **Edit**.
6. Mark the agent to be deleted in the **Preferred Agents** area.
7. Click on **Remove Agent**.

### 18.6.2.20 How to Add a Contact Center Break

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **Contact Center** wizard.
4. Click on **Contact Center Breaks**.
5. Click on **Add**.
6. Enter the name of the Contact Center break in the **Name** field.
7. Enter the duration of the Contact Center break in minutes in the **Duration (Minutes)** field.
8. Select the **Active** check box to activate the new Contact Center break system-wide.
9. Click on **Save**.
10. If you want to add another Contact Center break, repeat steps 5 through 9.

### 18.6.2.21 How to Edit a Contact Center Break

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **Contact Center** wizard.
4. Click on **Contact Center Breaks**.
5. Mark the desired Contact Center Break and click **Edit**.
6. Change the required parameters.
7. Select one of the following options:
  - If the Contact Center break should be available to agents, select the **Active** check box.
  - If the Contact Center break should not be available to agents, clear the **Active** check box.
8. Click on **Save**.

### 18.6.2.22 How to Delete a Contact Center Break

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

### Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **Contact Center** wizard.
4. Click on **Contact Center Breaks**.
5. Mark the desired Contact Center Break and click **Remove**.

## 18.6.2.23 How to Add a Wrapup Reason for a "Simple Wrapup"

### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

### Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **Contact Center** wizard.
4. Click on **Contact Center Wrapup Codes**. All queues for which a wrapup code for "Simple Wrapup" were defined are displayed.
5. Click on **Add**.
6. Select the queue for which you want to add a wrapup reason in the **Queue** drop-down list.
7. Enter a designation for the new wrapup reason in the **Description** field.
8. Click on **Save**.
9. If you want to add another wrapup reason, repeat steps 5 through 8.

## 18.6.2.24 How to Edit a Wrapup Reason for a "Simple Wrapup"

### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

### Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **Contact Center** wizard.
4. Click on **Contact Center Wrapup Codes**. All queues for which a wrapup code for "Simple Wrapup" were defined are displayed.
5. Mark the desired entry and click **Edit**.
6. If you want to assign the wrapup reason to another queue, select the new queue in the **Queue** drop-down list.
7. If you want to change the designation of the wrapup reason, enter the new designation in the **Description** field.
8. Click on **Save**.

### 18.6.2.25 How to Delete a Wrapup Reason for a "Simple Wrapup"

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **Contact Center** wizard.
4. Click on **Contact Center Wrapup Codes**. All queues for which a wrapup code for "Simple Wrapup" were defined are displayed.
5. Mark the desired entry and click **Remove**.

### 18.6.2.26 How to Add a Wrapup Reason for a "Multiple Wrapup"

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **Contact Center** wizard.
4. Click on **Multi-Wrapup Code**.
5. Select the desired queue in the **Contact Center Queue** drop-down list. The groups and subgroups already defined for this queue are displayed.
6. If you want to combine the new wrapup reason in a group with other wrapup reason, select one of the following options:
  - If you want to assign the new wrapup reason to an existing group or subgroup, select the desired group or subgroup and click **Add Item**. Enter a designation for the new wrapup reason in the **New Wrapup Item** field and click **OK**.
  - If you want to assign the new wrapup reason to a new group, click **Add Group**. Enter a designation for the new group in the **Group Name** field and click **OK**.  
 Select the new group and click **Add Item**. Enter a designation for the new wrapup reason in the **New Wrapup Item** field and click **OK**.
  - If you want to assign the new wrapup reason to a new subgroup, select the desired group and click **Add Group**. Enter a designation for the new subgroup in the **Group Name** field and click **OK**.  
 Select the new subgroup and click **Add Item**. Enter a designation for the new wrapup reason in the **New Wrapup Item** field and click **OK**.
7. If you want to add another wrapup reason, repeat steps 5 and 6.

### 18.6.2.27 How to Edit a Wrapup Reason for a "Multiple Wrapup"

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **Contact Center** wizard.
4. Click on **Multi-Wrapup Code**.
5. Select the desired queue in the **Contact Center Queue** drop-down list. The groups and subgroups already defined for this queue are displayed.
6. Mark the group or subgroup to which the wrapup reason to be edited is assigned. All wrapup reasons (items) assigned to this group will be displayed.
7. Mark the wrapup reason to be edited and click on **Rename Item**.
8. Enter a new designation for the wrapup reason in the **Rename Wrapup Code** field and click **OK**.
9. If you want to change the designation of the group or subgroup, click on **Rename Group**.
10. Enter a new designation for the group or subgroup in the **Group Name** field and click **OK**.

### 18.6.2.28 How to Delete a Wrapup Reason for a "Multiple Wrapup"

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **Contact Center** wizard.
4. Click on **Multi-Wrapup Code**.
5. Select the desired queue in the **Contact Center Queue** drop-down list. The groups and subgroups already defined for this queue are displayed.
6. Mark the group or subgroup to which the wrapup reason to be deleted is assigned. All wrapup reasons (items) assigned to this group will be displayed.
7. Mark the wrapup reason to be deleted and click on **Remove Item**.
8. If you want to delete the group or subgroup, click on **Remove Group**.

### 18.6.2.29 How to Assign an Agent to a Queue

You can assign agents to one or more queues with the **Contact Center** wizard.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **Contact Center** wizard.
4. Click on **Queue Bindings**. All existing queues will be displayed.
5. Select the queue to which you want to assign an agent and click on **Edit**. All agents already assigned are displayed.
6. Click on **Add** to add the appropriate agent into the desired queue. The **Add** window is then displayed.
7. Select one of the following options:
  - If the agent is to receive calls without regard to the load on the queue, select **Primary Agent** from the **Type** drop-down list.
  - If the agent is to receive calls only when the queue overflows, select **Overflow Agent** from the **Type** drop-down list..
8. If you have selected **Overflow Agent**:
  - a) Enter the time after which incoming calls for an agent should be forwarded in an overflow situation in the **Overflow after seconds in queue** field.
  - b) Enter the maximum number of calls in the **Overflow after calls in queue** field. Calls that exceed this maximum number are received by an overflow agent.
9. Enter a percentage value for the **Skill Level** of the agent.  
Skill levels enable you to control the distribution of calls to agents in a queue. Agents with higher skill levels are given preference during the call distribution. In cases where all agents have the same skill level, the longest idle agent receives the call.
10. Select one of the following options:
  - If the agent is to receive callback requests in the form of voice messages, select the check box **Enable agent callback**.
  - If the agent is to be prevented from receiving callback requests, clear the **Enable agent callback** check box.
11. Enter the automatic work time in seconds for the agent of this queue in the **Work Time** field.
12. Click on **Save**.
13. If you want to assign further agents to the queues, repeat steps 5 through 12.

### 18.6.2.30 How to Remove an Agent from the Queue

You can remove agents from one or more queues with the **Contact Center** wizard.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **Contact Center** wizard.
4. Click on **Queue Bindings**. All existing queues will be displayed.
5. Select the queue from which you want to remove an agent and click on **Edit**. All agents already assigned are displayed.
6. Select the desired agent and click on **Remove**.
7. If you want to remove further agents from queues, repeat steps 5 and 6.

## 18.7 Notes on Using the Contact Center

This section contains information about some special aspects and possible restrictions to be observed when using the Contact Center.

### 18.7.1 Restrictions on Operating the Contact Center

The operation of the Contact Center is subject to certain conditions. In addition, there are some restrictions on the use of system features by agents.

#### Conditions for the Operation of the Contact Center

The following conditions for the operation of the Contact Center must be taken into account:

- Trunks

The Contact Center does not support analog trunks (MSI). All external connections of the Contact Center must be made via ISDN or IP telephony. It should be noted that the integration of IP telephony is only possible through certified Internet Telephony Service Providers (ITSPs).

- Networking

In a networked scenario, all agents must be connected to the communication system in which the Contact Center is configured.

- Agent telephones

Agents can use all system telephones (IP phones (HFA) such as OpenStage 40, for example, or U<sub>P0/E</sub> phones such as OpenStage 40 T) and DECT telephones. Note that only the DECT telephones

that are currently released for operation with OpenScape Business Cordless may be used.

It is not possible to use analog, ISDN and SIP telephones here.

Agents are not allowed to be members of a group (Group Call, Hunt Group) or a MULAP. This restriction also applies to system features used in combination with MULAPs, i.e., Team Configuration (Team Group), Executive/Secretary (Top Group) and Mobility Entry.

- myAgent

myAgent should not be used simultaneously with other UC clients, since mutual interference with the presence status cannot be excluded (see [Notes on Using myAgent and UC Suite Clients Simultaneously](#) ). During normal operation of the Contact Center, agents use only myAgent to change their status (logged in, logged out, available, etc.).

- Connecting applications via the CSTA interface

It is possible to connect applications via the CSTA interface, provided the following conditions are met:

- The application should not produce any significant additional load on the CSTA interface.

Consequently, the connection of unified communications or call distribution solutions, CTI power dialers or even CTI solutions with many intensively used individual CTI clients is not allowed.

- The application must not control any agent telephones via the CSTA interface or set up any call forwarding for the agent telephones.

Consequently, the connection of CTI applications for agents, rule assistants or personal assistants is not allowed.

The connection of TAPI 120/170 has been basically approved. For the load of the communication system, the same conditions as for the connection of other applications via the CSTA interface apply. In connection with the Contact Center, TAPI 120/170 should preferably be used to connect CRM (Customer Relationship Management) or ERP (Enterprise Resource Planning) systems, provided they support TAPI.

### Restrictions on Using System Features

The following system features are not available to agents or are subject to restrictions. These features are, however, not mandatory for agents, since the allocation of calls is handled automatically by the Contact Center. The allocation depends on the set rules and the availability of agents.

- Locked Features

The activation of system features via myAgent and the associated agent telephone is not supported for the available agents of the Contact Center. Agents can activate system features only via myAgent.

The following system features are therefore not supported in conjunction with myAgent:

- Call waiting
- Second call
- Parking
- Group Call
- Do Not Disturb (for logged in agents)
- Intrusion on an agent call (exception: agents with the authorization level of a Supervisor or Administrator)
- Features that affect call routing and active call connections
- Features that affect call routing

The following features could potentially change the call routing in the contact center and should therefore not be executed by agents.

- Call forwarding

If a logged in agent activates call forwarding, a logout occurs.

Call forwarding is disabled as soon as an agent logs into a queue.

- Do Not Disturb

If a logged in agent activates Do Not Disturb via a UC client, an automatic logout occurs.

Do not Disturb is disabled as soon as an agent logs into a queue.

- Relocate

Relocating a telephone changes the logical assignment of the station numbers. The new station number assignment is only transmitted after restarting the Contact Center.

- Night service

When setting up a night service in the communication system, it must be ensured that the configurations of the Contact Center-related parameters (agents, queues, etc.) for the day and night service are identical.

- Features that affect reports

Executing the following features from an agent telephone can lead to a distortion of the information in reports:

- Call pickup of Contact Center calls by non-agents
- Call transfers (e.g., via the Direct Station Select (DSS) key) of Contact Center calls to non-agents
- Conferencing
- Toggle/Connect
- Parking

---

**INFO:** The "Consultation Hold" feature is transparent for the presentation of Contact Center calls in reports and can be used by agents, regardless of the consultation destination.

---

- Roles and functions not relevant for agents

The following functions are not relevant, since the "Call Waiting" feature (also called "camp on") is blocked for agents.

- Attendant Console
- Hotline destination

## 18.8 Notes on the Use of DECT Phones

DECT telephones can be used as phones for contact center agents. However, the differences in the operating procedure as compared to corded phones must be taken into account.

### Prerequisites for the Use of DECT Phones

- Only the DECT telephones that are currently released for operation with HiPath Cordless Office and OpenScape Business Cordless may be used.
- The area within which the contact center agents move about must provide a complete wireless coverage.
- The number of base stations must be such that enough B-channels are available for the DECT telephones of the contact center agents.
- As far as possible, a contact center agent should not leave the wireless range while logged into a queue of the contact center.

### Differences in the Operating Procedure as Compared to Corded Phones

- Logging into a queue of the contact center is only possible through myAgent.
- No messages such as **Available** or **Break**, for example, appear in the display of the DECT telephone.
- The control of a DECT telephone via myAgent (e.g., via the **Telephony** area of the myAgent main window or the screen pop of the incoming myAgent call) is not possible.
- Incoming calls can only be accepted via the DECT telephone.
- Outbound calls must be initiated via the DECT telephone.

Aspects to be considered when using DECT phones:

- Search time

For an incoming call, the time required to find the DECT telephone may take several seconds (at worst up to 20 seconds) before a call is signaled on the DECT telephone. During the search time, the caller hears the ringing tone.

The contact center evaluates this time as "pickup time". The actual pickup time by a contact center agent thus consists of the search time and the alert time (i.e., time until the call is answered).

If a contact center agent leaves the wireless range with his or her DECT telephone, this may result in longer search times.

- DECT telephone cannot be found

If a contact center call exceeds the prescribed time for a call to be answered by the agent (e.g., because the contact center agent is out of range), the agent is automatically logged out of the queue or queues involved. Logging in again is only possible through myAgent.

## 18.9 Reports

Reports are used to determine the current status of the Contact Center and to analyze the strengths and weaknesses of its associated components. This makes it possible to optimize the Contact Center configuration, for example, and to thus use the Contact Center resources more efficiently. The Contact Center provides users with real-time reports as well as historical reports.

### Real-time Reports

Real-time reports are continuously updated. They provide important information such as details on agent utilization, the grade of service, abandon rates and average processing times. Using these continually updated and filterable caller lists, the progress of a customer contact can be examined in stages. In addition, the activities of all agents can be reviewed. This information can be used for training purposes, for example, and for contact analysis and wrap-up activities.

Agents with the authorization level of a Supervisor or Administrator can be acoustically and visually informed when definable operating parameters are exceeded. Appropriate thresholds for each queue can be defined individually.

### Historical Reports

By selecting data elements and user-specific report parameters, historical reports can be set up quickly and retrieved in graphic or tabular form.

Using the myAgent application, more than 20 predefined report templates can be used for standard reports.

The optionally available myReports application expands the options for creating historical reports with over 100 predefined report templates. The report generation can be individually scheduled, and the prepared reports can be automatically sent at scheduled times in standard export formats to predefined e-mail addresses or stored at a location configured by the myReports administrator.

---

**INFO:** Reports based on the call history stored in the communication system. The maximum retention period for the call history is 365 days (default setting). An administrator with the **Expert** profile can set the retention period for the call history on a system-wide basis.

Example: The retention period was set to 100 days. This means that only data that is up to 100 days old can be used for the preparation of reports.

---

### Data Protection

If the myReports administrator enabled data protection when configuring myReports, the last four digits of the phone numbers (CLI column) will be replaced by \*\*\*\* in all relevant reports.

If the subscriber has flagged his or her private number, mobile number, external number 1 and/or external number 2 as invisible, these phone numbers will not be displayed in all relevant reports.

### **18.9.1 Predefined Report Templates**

myReports provides more than 100 predefined report templates for creating reports.

These templates are classified by subject area and assigned to the following report groups:

- **Agent Activity**
- **Agents**
- **CLI**
- **Call History**
- **Calls**
- **Fax / E-Mail**
- **Other**
- **Performance**
- **Queues**
- **User Presence Status**
- **Wrap-up Codes**

## 19 Mobility

OpenScape Business provides integrated mobility solutions for any business. This typically includes the integration of mobile phones/smartphones, the usage of Cordless/DECT and WLAN phones, etc., down to Desk Sharing and teleworking. Mobility includes Mobility on the road, Mobility in the office and Mobility at home.

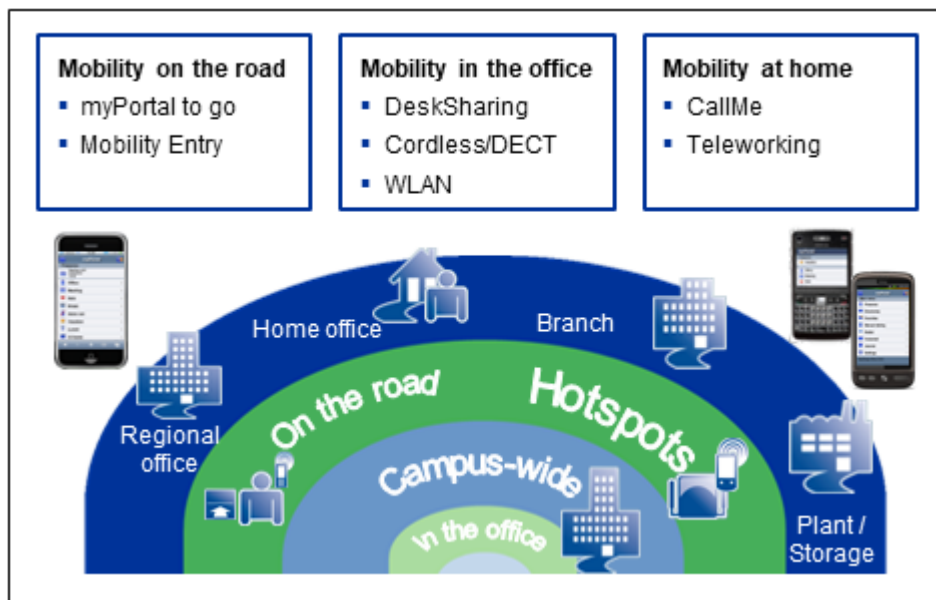

---

### Related concepts

[Stations](#) on page 403

### 19.1 Integrated Mobility Solution

The mobility solutions integrated in the communication system provide efficient communication everywhere and with a wide variety of endpoints.

### 19.2 Mobility on the Road

Mobility on the road is achieved through the integration of mobile phones via myPortal to go or Mobility Entry. The One Number Service enables a subscriber to be reached through a single phone number worldwide. Furthermore, with dual-mode telephony, additional cost savings can be achieved if the subscriber is within range of a WLAN.

Mobility on the road is the combination of:

- Office phone and smartphone (myPortal to go)
  - Availability under one number (One Number Service)
  - Control of features via the web client
  - UC features such as control of the presence status
- Office phone and mobile phone (Mobility Entry)

- Availability under one number (One Number Service)
- Control of features via DTMF codes

In addition to the combination of mobile phone and office phone, it is also possible to configure a mobile phone alone (i.e., without a parallel office phone) to be reached under a land-line number.

Full functionality is achieved with system telephones (HFA). SIP phones can be used with restrictions.

## 19.2.1 myPortal to go

myPortal to go is a powerful unified communications application for smartphones and tablet PCs which provides access to the unified communications features of the communication system. Besides convenient dialing aids via phone directories and favorites, and information on the presence status of colleagues, it can, for example, also be used to access voicemails.

myPortal to go is available in three variants:

- As a Mobile UC App for the Android operating system (version 5.0 or higher)
- As a Mobile UC App for the Apple iOS operating system (version 12.5 or higher)
- as a Web Edition for mobile web browsers with HTML5 support, e.g., for the Windows Phone (version 8.0 or higher) or BlackBerry (version 10 or higher) operating systems:

`http://<IP address of the communication system>:8801`

`https://<IP address of the communication system>:8802`

For security reasons it is recommended that only https be used. This requires port forwarding to be set up in the router from external TCP/443 to internal TCP/8802.

---

**NOTICE:** Please note that by using myPortal to go Web Edition with Desk phone operating mode, telephony is not possible from the client. You can place calls but payload will go through the desk phone which is connected.

---

myPortal to go can be used both on pure GSM mobile phones as well as dual-mode phones. In order to use myPortal to go, a mobile phone contract with data option (flat rate recommended) is required.

Apart from a few exceptions (e.g., access to contact details in the mobile phone), the scope of features is identical in all variants.

myPortal to go supports the following features:

- Presence status
- Status-based call forwarding
- CallMe service (only with UC Suite)
- Directories
- Favorites List
- Journal
- Search by phone number and name
- Call Functions
- One Number Service (ONS)
- Voicemail
- Text messages

CTI Features During a Call:

- Consultation
- Toggle/Connect
- Attendant
- Conferencing
- Disconnect

myPortal to go can be used with both the UC solutions, UC Smart and UC Suite. Depending on the UC solution and the licenses assigned to you, the scope of the available features may vary slightly.

myPortal to go supports the following operating modes:

- Mobility:  
Unrestricted access to the telephony and UC features, regardless of location (including One Number Service).
- Desk phone:

Use of UC features and as a convenient dialing aid for the office phone (without One Number Service).

Other features can be used with the UC clients (e.g., myPortal for Desktop)

myPortal to go establishes an encrypted connection (https) to the OpenScape Business UC Server. If the connection is interrupted (offline mode), you can still select and dial cached entries from the journal and the favorites list via GSM and perform GSM dialing manually.

---

**NOTICE:** For supporting mobility, myPortal to go has to be firstly registered as VoIP (HFA) user so that the Openscape Business System side relevant port to become active.

---

### **Dialing mode of myPortal to go**

Smartphone users can choose between different dialing modes for outbound calls, depending on which operating mode is set as the intended use.

- Call through (only in the Mobility mode)
- Preferred callback (only in the Mobility mode)
- Associated dialing (only in the Mobility mode)

myPortal to go controls the connection setup for the desk phone at the workplace. If a SIP phone or a SIP softclient is controlled via associated dialing, some CTI features such as consultation holds and conferencing are not available.

## **19.2.1.1 Prerequisites for myPortal to go**

In order to use myPortal to go, the smartphone must be equipped with the appropriate hardware and software.

The following requirements apply:

- myPortal to go as Mobile UC App: Android operating system (version 5.0 or higher) or Apple iOS (version 12.5 or higher)
- myPortal to go as Web Edition: Mobile web browser with HTML5 support, e.g., for the Windows Phone (version 8.1 or higher) or BlackBerry (version 10 or higher) operating systems. Web browsers without TLS 1.2 support are not supported anymore.

To enable access, port forwarding must be set up in the router from external TCP/443 to internal TCP/8802 (https) or internal TCP/8801 (http). For security reasons it is recommended that only https be used.

- myPortal to go iOS client:
  - A proper DNS server needs to be configured and internet access has to be granted so that public domain names can be resolved, and push notification messages can be send to the iOS device via Apple's APNS servers.

- If the company firewall restricts outbound internet access, make sure that the firewall is open for APNS on port TCP/443.
- For iOS push notifications, it is mandatory to keep the system software up to date, because mandatory certificates for communication with Apple's APNS service will be updated frequently with major/minor system releases and fix releases.
- Latest versions of myPortal to go (iOS) support Apple's CallKit API. CallKit is a framework that aims to enhance the VoIP experience by allowing myPortal to go (iOS) to integrate with the native device calling features. The minimum required system software version is V3R2.

Current myPortal to go (iOS) clients will not be able to login to older OpenScape Business versions.

- iOS security requirements apply when connecting to the communication server. The current Openscape Business auto-generated self-signed certificate is not sufficient if the app connects to the communication server using a domain name instead of a server IP address. Apple has revised its security requirements for TLS server certificates <https://support.apple.com/en-us/HT210176>.

To avoid problems when myPortal to go (iOS) cannot establish a connection to the communication server, we recommend either connecting to the communication server via the IP address or installing a trustworthy SSL certificate on the server side.

- Touch screen (recommended for ease of use)
- Display resolution for smartphones: at least 240 pixels \* 320 pixels (recommended: 320 pixels \* 480 pixels or higher)
- Display resolution for tablet PCs: at least 800 pixels \* 480 pixels (recommended: 1024 pixels \* 600 pixels or higher)
- Internet access
- Support for the simultaneous transmission of voice and data through mobile phones and the mobile network
- 3G data connection, for example, EDGE, UMTS, HSDPA (recommended for smooth service). GPRS can lead to slow page rendering.

Alternatively: a pure WLAN connection with a SIP client for telephony.

- Flat rate data plan (recommended for cost reasons), since data volumes of several 100 MB per month may be involved, depending on usage.

The mobile UC app can be downloaded free of charge from the Google Play Store or the Apple App Store.

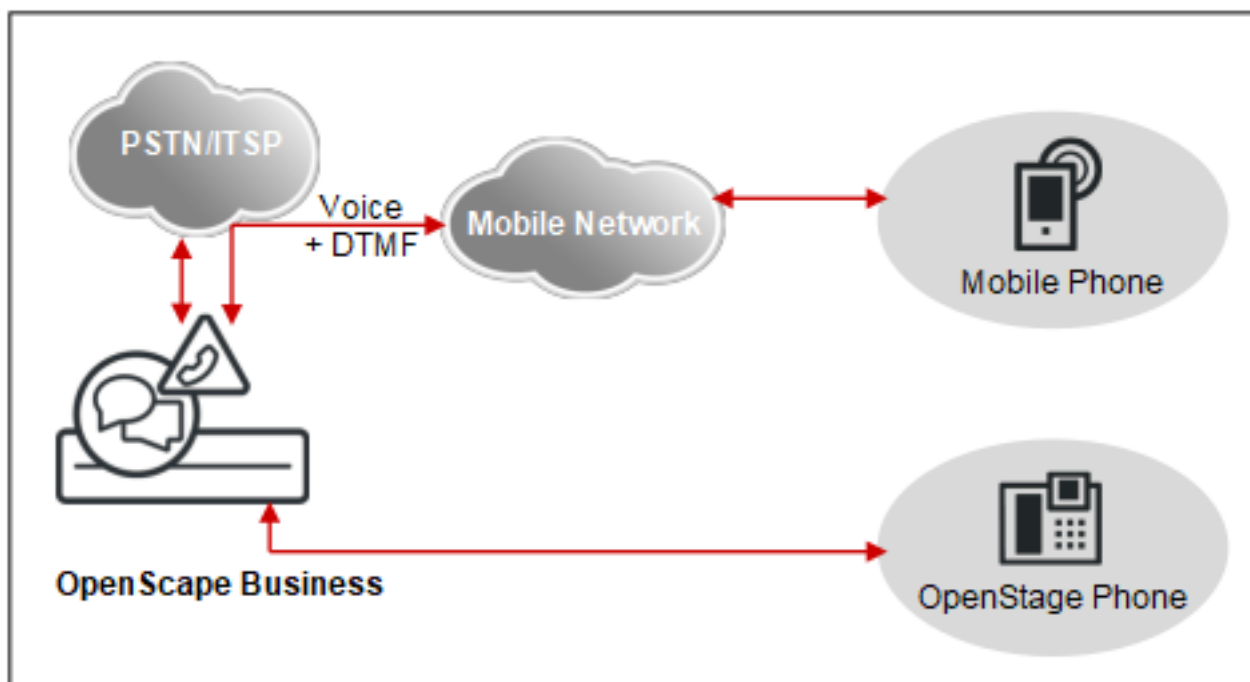

Depending on which device and operating system is used, the ease of use or function may be affected. Support is only provided if a reported problem with a reference device can be reproduced. For more information on reference devices, browsers and operating systems, refer to the Release Notes and the Experts wiki at [https://wiki.unify.com/wiki/myPortal\\_to\\_go](https://wiki.unify.com/wiki/myPortal_to_go).

## 19.2.2 Mobility Entry

Mobility Entry enables the integration of mobile phones. This provides subscribers with access to certain system features via mobile phones.

Mobility Entry enables subscribers to control voice connections using DTMF after dialing into the system.

### Dialing Methods for Mobility Entry

Mobile phone users can choose between different dialing methods for outbound calls.

Mobility Entry offers the following dialing methods:

- Callback
- Call Through

If a mobile phone subscriber at the communication system calls a special DID number with a callback, the call is automatically terminated before the connection is established, and a callback is executed immediately. After the callback, no further authorization is necessary. The mobile phone subscriber can conduct internal and external calls and also use all Mobility features via the communications system.

The prerequisites for a callback are as follows:

- The external number of the calling telephone must be registered and configured at the communication system. If not, the call is disconnected, and no callback is executed.
- The DISA direct inward dialing number has been configured.
- The external number of the mobile phone subscriber is transmitted to the communication system (CLIP information).

### Features in a Dormant State

- Dial a number
- Program or delete call forwarding
- Activate or deactivate Do Not Disturb
- Send message
- Reset all services
- Activate or deactivate station number suppression (CLIR)

### Features in the Call State

- Consultation
- Alternate (Toggle/Connect)
- Conferencing
- Disconnect and return to held call
- Activate callback
- Enabling DTMF suffix dialing

The signaling of features is handled via system codes (e.g., \*1 to program call forwarding).

---

**NOTICE:** For Mobility Entry users, the station flag **Disa Class of service** must be enabled.

A maximum of 16 DTMF code receiver resources are available with OpenScape Business X, i.e., a maximum of 16 subscribers (analog, Mobility, etc.) can simultaneously reserve DTMF code receivers. Subscribers for whom the **DTMF-based feature activation** flag is set reserve one code receiver each for the duration of the call.

With OpenScape Business S, the control of features using DTMF codes is supported if the DTMF digits are transmitted as per RFC 2833. If an external Session Border Controller (SBC) is used in the network, no DTMF detection is possible.

---

**NOTICE:** Mobility entry must be only configured at nodes with direct CO access.

---

---

[Dependencies for Mobile Clients and Mobility Entry](#) on page 928

## 19.2.3 Comparison between Mobile Clients and Mobility Entry

The mobile clients myPortal Mobile, myPortal to go and Mobility Entry support different features.

| Feature                                                                                                                    | myPortal to go                                                                            | Mobility Entry |
|----------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------|----------------|
| <b>General functions</b>                                                                                                   |                                                                                           |                |
| Mobile phone contract with data option                                                                                     | Yes (flat rate recommended)                                                               | no             |
| Parallel call signaling on system telephone and mobile phone (twinning)                                                    | yes                                                                                       | yes            |
| Transfer of caller number to the mobile phone (if the network transmits external phone numbers as CLIP; CLIP no screening) | yes                                                                                       | yes            |
| One Number Service (if the network transmits external numbers as CLIP, CLIP no Screening))                                 | yes                                                                                       | yes            |
| Do not Disturb / Disabable call forwarding                                                                                 | no                                                                                        | yes            |
| Station number suppression, enableable/disableable                                                                         | no                                                                                        | yes            |
| Automatic identification of registered stations                                                                            | yes                                                                                       | yes            |
| Operation without the Office phone (as a virtual station)                                                                  | yes                                                                                       | yes            |
| Can be used with OpenScope Business S                                                                                      | yes                                                                                       | yes            |
| <b>Presence status, Journal, voicemail box</b>                                                                             |                                                                                           |                |
| Change own presence status                                                                                                 | yes                                                                                       | no             |
| View presence status of other subscribers                                                                                  | yes                                                                                       | no             |
| Journal                                                                                                                    | New, All, Missed, Answered, Inbound, Voicemail                                            | no             |
| Shared voicemail box; can also be checked on the go                                                                        | yes                                                                                       | yes            |
| Display received voicemail                                                                                                 | Display new, retrieved and saved voicemails                                               | no             |
| <b>Dial</b>                                                                                                                |                                                                                           |                |
| Access to contacts in mobile phone                                                                                         | yes                                                                                       | yes            |
| Access to contacts in the communication system                                                                             | External directory (UC Suite), internal directory, personal contacts and system directory | no             |
| Favorites                                                                                                                  | yes                                                                                       | no             |
| Manual dialing                                                                                                             | yes                                                                                       | yes            |
| Redialing                                                                                                                  | yes                                                                                       | no             |

## 19.2.4 Dependencies for Mobile Clients and Mobility Entry

myPortal to go and Mobility Entry have dependencies on other features (e.g., DISA).

| Dependency                        | myPortal to go                                                                                                                                                                                                                                  | Mobility Entry |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|
| Mobility Callback DID             | For the Mobile Callback dialing mode, the Mobility Callback DID must be configured.                                                                                                                                                             |                |
| External destination phone number | Dialing external destination phone numbers by the mobile subscriber is controlled by the system because of the LCR configuration. Dialing can therefore be performed via the ISDN fixed network, analog fixed network or via ITSP.              |                |
| Activate CLIP No Screening        | You cannot display a caller's number on the mobile station unless it was supplied unverified by the network provider.                                                                                                                           |                |
| Mobile subscriber CLIP            | The CLIP of the mobile subscriber must be transmitted to the communication system. This must be made available by the network provider.                                                                                                         |                |
| LCR Administration                | As some network providers (fixed-network or ITSP) do not accept destination numbers with a separate international prefix, the system must delete this prefix from these destination numbers. This can be performed in least cost routing (LCR). |                |

| <b>Dependency</b>                                                     | <b>myPortal to go</b>                                                                                                                                                                                                                                                                                                                                                                            | <b>Mobility Entry</b>                          |
|-----------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------|
| B channels / External connections                                     | The number of B channels depends on the connection duration or the number of mobile stations. Every incoming external call to a mobile subscriber requires two voice channels in the system. If there are not enough voice channels available, it may not be possible to reach a mobile subscriber, and the mobile subscriber may not be able to initiate any calls with the One Number Service. |                                                |
| Emergency Numbers                                                     | When a mobile user dials an emergency number via the communication system, the location of his or her mobile phone cannot be identified. It is therefore advisable to dial an emergency number directly.                                                                                                                                                                                         |                                                |
| Dialing internal station numbers                                      | When dialing internal phone numbers in international format (e.g., 0004989100) at the mobile station, the location number of the communication system must be configured. Otherwise, internal destinations are routed via the exchange, which can result in costs.                                                                                                                               |                                                |
| Directory maintenance                                                 | To ensure that the called party can be reached when dialing from directories in all dialing modes, all external phone numbers should be entered in canonical format (e.g., +49 89 100).                                                                                                                                                                                                          | -                                              |
| Firewall                                                              | A data channel is set up to the integrated web server of the communication system. Consequently, port forwarding to port 8801 (http) and port 8802 (https) must be configured in the firewall. However, it is recommended not to configure any port forwarding for port 8803 (https) in order to access UC Smart Assistant.                                                                      | -                                              |
| Data connection                                                       | It is advisable to sign a mobile phone contract with a flat-rate data plan. Users of volume rates should disable the "Auto Refresh" option in the settings of myPortal to go.                                                                                                                                                                                                                    | -                                              |
| Parallel connections                                                  | For some features, a simultaneous voice and data connection is required. This must be supported by both the mobile network providers and the mobile devices.                                                                                                                                                                                                                                     | -                                              |
| Connection setup from the communication system to mobile stations via | All feature types                                                                                                                                                                                                                                                                                                                                                                                | All line types that support DTMF transmission. |

---

## 19.2.5 One Number Service (ONS)

The One Number Service (ONS) effectively makes mobile phones operate as fixed network extensions. This means that subscribers can be reached under one phone number world-wide and can identify themselves only by their respective fixed network numbers.

Setting up a team configuration enables the One Number Service with a single phone number for the workplace (system telephone) and the mobile phone. The caller dials the system phone's number (fixed network). Outgoing calls from mobile phones are signaled to the called party with the fixed network number. Another advantage of the One Number Service is the busy indicator for the mobile subscriber.

---

### Related concepts

[Mobility Entry](#) on page 925

## 19.2.6 Dual-Mode Telephony

Dual-mode mobile phones support both GSM/UMTS networks and WLAN networks. Registration at the communication system is possible over a WLAN either as SIP station or as system client (i.e. HFA station).

If the dual-mode mobile phone is in the WLAN range, it is automatically called as system client (HFA station) or SIP station. If it is outside the WLAN range, the dual-mode mobile phone is called via GSM/UMTS (i.e., mobile phone integration functionality is available).

---

**NOTICE:** Dual mode for HFA is supported only when using myPortal to go client and not with other devices or clients.

---

Automatic forwarding to the GSM phone number only works if the associated HFA or SIP station is entered in the system as a mobile phone station (mobile phone integration). This means that if the HFA or SIP station is registered, it is called as HFA or SIP station, and if it is not registered, it is called via the GSM phone number assigned in the mobile phone integration configuration. CTI call features are not available for SIP clients in myPortal to go. Call control usually occurs within the HFA or SIP clients instead (see also the Release Notice and <http://wiki.unify.com>).

Calls on the company premises occur over the WLAN. As long as calls are made over the WLAN, no call charges are incurred on the mobile phone. Handover and roaming are supported within the WLAN range (if the wireless LAN infrastructure is designed for it), but not from WLAN to GSM, and vice versa.

## 19.2.7 Configuring myPortal to go and Mobility Entry

myPortal to go (Web Edition) and Mobility Entry are configured with the **Mobile Phone Integration** wizard.

Using the **Mobile Phone Integration** wizard, the administrator can:

- Set up the One Number Service
- Set up myPortal to go (Web Edition)
- Set up Mobility Entry
- Set up dual-mode phones

The mobile phone integration of GSM phones occurs via virtual stations. Features are transferred to the mobile station in this way. Every station with a corresponding license (mobility user) can be assigned a maximum of one mobile station

### Operating Modes of Mobile Phones

The following operating modes are implemented for mobile phones:

- **GSM Mode**

Calls to the internal mobile call number are signaled at the GSM mobile phone.

- **WLAN Mode**

If the WLAN mobile phone is reachable via the WLAN, the call is conducted via the WLAN. If the WLAN is not available, the call is made via GSM.

### Twinning

Calls are signaled in parallel at the mobile phone and the system telephone (twinning). To implement twinning, a team configuration must be set up once the configuration of the **Mobile Phone Integration** has been completed. To do this, use the **Team Configuration** wizard and first select the phone number under which the parallel signaling is to occur (e.g., the system telephone). For the use of myPortal to go (Web Edition), the last step is to reconfigure the user name to the team group in the **Mobile Phone Integration** wizard. On the system telephone, a Direct Station Select (DSS) key to the Mobility stations can be programmed for the seamless (i.e., uninterrupted) transfer of mobile phone calls. Full functionality is achieved with system telephones (HFA). SIP phones can be used but are subject to certain restrictions, e.g., they do not support MULAP keys.

### 19.2.7.1 How to Integrate GSM Mobile Phones

Mobile phones can be integrated in the communication system with the **Mobile Phone Integration** wizard.

Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Step by Step

- 1. In the navigation bar, click on **Setup**.
- 2. In the navigation tree, click on **Wizards > User Telephony**.
- 3. Click **Edit** to start the **Mobile Phone Integration** wizard. The **Select Station for Mobility** window appears.
- 4. Under **DISA access**, select (or enter) the **DID** number with which mobile stations can dial into the communication system.

| Mobility User callno | Mobility User DID | Display | Trunk access code + Mobile Call number | User name for mobile UC clients | State |
|----------------------|-------------------|---------|----------------------------------------|---------------------------------|-------|
|----------------------|-------------------|---------|----------------------------------------|---------------------------------|-------|

**NOTICE:** DISA is required for Mobility Entry (to control the system using DTMF) and for myPortal for Mobile (only when using Call Through).

- 5. Click on **Add** or **Edit** for the appropriate subscriber whose GSM mobile phone is to be integrated into the communication system. The **Assign Mobility Stations** window appears.
- 6. Select **GSM Mode** as the mode for your mobile phone operation.
- 7. Under **Trunk access code+Mobile phone number**, enter the phone number of the mobile phone (e.g., 0016012345678).
- 8. Under **Internal call number of the Mobility station**, enter the corresponding internal number (e.g., 777) an **internal name** and the **DID number** of your choice. Note that the internal call number must not have been already assigned.

**INFO:** If you want to use DID 879, 890 or 891, you must make the setting through ManagerE and not through WBM.

- 9. In the **Username for myPortal to go (Web Edition)** drop-down list, select **Automatic**; this will cause the internal number of the user to be used as the user name.

Trunk access code+Mobile Call number: 0016012345678

Internal call number of Mobility User: 777

DID of Mobility User:

First Name:

Last Name:

Display:

User name for mobile UC clients: Automatic

10. Only with UC Smart: Assign a mailbox to the station if needed:
  - a) Select whether the station is to receive a default mailbox or an attendant mailbox (AutoAttendant) in the **UC Smart Mailbox type** drop-down list.
  - b) Only with default mailbox: If a caller may leave a message in the voicemail box, select the **Recording** check box.
  - c) Select a greeting from the **Greeting** drop-down list.
  - d) If the password of the voicemail box is to be reset, select the **Password Reset** check box.

---

**NOTICE:** The **Password Reset** check box must be cleared when setting up a new voicemail box. It is used to reset the password of the voicemail box. When a new voicemail box is created, the subscriber must change the initial password anyway when accessing his or her voicemail box for the first time.

---

11. Click **OK & Next**.
12. Click **OK & Next** followed by **Finish**.

## 19.2.7.2 How to Integrate Dual-Mode Telephones (GSM/WLAN) with HFA or SIP Client

The **Mobile Phone Integration** wizard can be used to configure a mobile phone as a dual-mode phone with system client (HFA client) or SIP client (WLAN mode).

### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

The HFA device or SIP station must be configured via the WBM.

Mobility user license has been assigned to the subscriber.

### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > User Telephony**.
3. Click **Edit** to start the **Mobile Phone Integration** wizard. The **Select Station for Mobility** window appears.
4. Under **DISA access**, select (or enter) the **DID** number with which mobile stations can dial into the communication system.

| Setup - Wizards - User Telephony - Mobile Phone Integration |                   |         |                                        |                                 |       |  |
|-------------------------------------------------------------|-------------------|---------|----------------------------------------|---------------------------------|-------|--|
| Select station for Mobility                                 |                   |         |                                        |                                 |       |  |
| DISA                                                        |                   |         |                                        |                                 |       |  |
| Direct inward dialing: 234                                  |                   |         |                                        |                                 |       |  |
| Add Mobility User                                           |                   |         |                                        |                                 |       |  |
| Add New Mobility User                                       |                   |         |                                        |                                 |       |  |
| Mobility User calino                                        | Mobility User DID | Display | Trunk access code + Mobile Call number | User name for mobile UC clients | State |  |

**NOTICE:** DISA is required for Mobility Entry (to control the system using DTMF) and for myPortal for Mobile (only when using Call Through).

5. Click on **Add** or **Edit** for the appropriate subscriber whose GSM mobile phone is to be integrated into the communication system. The **Assign Mobility Stations** window appears.
6. Select **WLAN Mode** as the mode for your mobile phone operation.
7. Under **Trunk access code+Mobile phone number**, enter the phone number of the mobile phone (e.g., 0016012345678).
8. Select **Assigned System- or SIP Client** from the drop-down list.

If the assigned system (HFA client) or SIP client is not yet configured, click on **Configure Client** and set up a system or SIP client. After the system or the SIP station configuration, you will be automatically returned to this page.

9. In the **Username for myPortal to go (Web Edition)** drop-down list, select the corresponding SIP or HFA device. **If you select Automatic**, the internal number of the user will be used as the user name.
10. Click **OK & Next**.
11. Click **OK & Next** followed by **Finish**.

### 19.2.7.3 How to Enable the Web Interface for Mobile Phones and Web Clients

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

Web services must be enabled as a prerequisite for the following features:

- Mobile Phone Integration
- Application Launcher

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. If you are using UC Smart, click in the navigation tree on **Applications > UC Smart > Basic Settings**.
3. Make sure that UC Smart is **Active**.
4. If you want to enable web services for mobile phones, select at least one of the following options:
  - If you want to enable encrypted connections, select the check box **HTTPS**.
  - If you want to enable unencrypted connections, select the check box **HTTP**.

The screenshot shows the 'UC Smart Assistant' interface. On the left is a navigation pane with 'Administration' expanded, showing 'Basic Settings', 'User Management', and 'Status'. The main area is titled 'Basic Settings'. It contains several sections: 'Enable / Disable UC Smart' with an 'Active' checkbox checked; 'Access Rules' with 'HTTP' and 'HTTPS' checkboxes both checked; 'Password Policy' with 'Force user to choose secure password' unchecked, 'Save login data for devices' unchecked, and a 'Configure' button for the 'System-wide initial UC Smart password'; 'Office Hours' with 'Start Time' set to 08:00 and 'End Time' set to 20:00; and 'Presence' with 'Hide sick status' unchecked. At the bottom are 'Apply' and 'Undo' buttons.

**NOTICE:** For security reasons, it is strongly recommended that only an encrypted connection (HTTPS) be used when working with myPortal to go (Web Edition) over the Internet.

5. Click on **Apply** followed by **OK**.

## 19.2.7.4 How to Delete Mobile Phone Integration

Use the **Mobile Phone Integration** wizard to delete the integration of the mobile phone.

### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > User Telephony**.

## Mobility

### Mobility in the office

3. Click on **Edit** to start the **Mobile Phone Integration** wizard. The **Select Station for Mobility** window appears.
4. Click on **Edit** for the appropriate subscriber you want to delete. The **Assign Mobility Stations** window appears.
5. Click in the window below on **Delete Data**.
6. Click on **OK & Next**.
7. Click on **OK & Next** followed by **Finish**.

## 19.3 Mobility in the office

Mobility in the office is achieved via Desk Sharing, Cordless Phones and WLAN phones. For Desk Sharing, IP Mobility (Mobile Logon and Flex Call) offers features for mobile users who want to use the phone at a different workplace just like their own phone.

### 19.3.1 Desk Sharing

With Desk Sharing, multiple subscribers can share one system telephone and thus one IP phone (HFA).

With Desk Sharing, subscribers have no fixed workplace and no fixed office telephone. Desk Sharing enables multiple mobile subscribers of the communication system to share an office workplace and/or the phone. The subscriber simply logs in at the workplace phone where he or she happens to be currently working.

After the login, the station number of the logged in subscriber is transferred to the used system telephone. The used system telephone can no longer be reached under its original station number. If the subscriber logs in at another system telephone, his or her station number is transferred to that new system telephone. When the user logs out (Logout), the system phone automatically logs back on with its own non-mobile number.

One of the following steps must be performed at the system phone to activate the feature:

- Enter code for "mobile logon" + number of mobile station + optional password/PIN

When using phones with different numbers of function keys, the transfer of key layouts may be subject to restrictions.

If Desk Sharing is to be implemented for IP telephones (HFA) in networked nodes, an external DLS (Deployment Service) must be installed. The required expertise for this purpose is assumed.

The following features can be used for Desk Sharing:

- Speaker call (paging)
- Conferencing
- Override
- Toggle/Connect
- Parking

- Consultation
- Transfer
- Call pickup
- Do not disturb
- Call forwarding
- Send message (message waiting)
- Callback
- Station number suppression
- Ringing group on

---

**NOTICE:** For each mobile phone number, an additional Deskshare license is required. This Deskshare license must be activated for the subscriber, and the subscriber must be configured as **mobile**. In addition, the Relocate feature must be enabled.

A system telephone that is used for Desk Sharing does not necessarily require a license. However, if no license is activated and no Desk Sharing subscriber is logged in, not even emergency calls will be possible from this phone. The system telephone/subscriber must be configured as **Non-mobile**.

If a system telephone is not to be used for Desk Sharing, it must be configured as **Non-mobile and blocked**.

---

---

**NOTICE:** Desk Sharing feature must be used with IP station port 3 or higher.

---

## 19.3.2 Integrated Cordless Solution

OpenScape Business Cordless is the integrated cordless solution for operating cordless telephones (DECT phones) via the communication system. The HFA features of OpenScape Business can then be used with the connected DECT phones.

In the integrated cordless solution, the DECT phones are internal, system-specific stations as opposed to separate DECT systems, which are connected via standard interfaces.

The connection of OpenScape Business base stations for the operation of DECT phones can be implemented via:

- For OpenScape Business X1/X3/X5: direct connections to the  $U_{P0/E}$  interfaces of the mainboard of the communication system (DECT Light)
- For OpenScape Business X3/X5: connection to the  $U_{P0/E}$  interfaces of an SLU8N/SLU8NR board (DECT Light)
- For OpenScape Business X8: connection to the  $U_{P0/E}$  interfaces of an SLMUC (SLMU + CMAe)

The Cordless radio technology corresponds to the DECT (Digital Enhanced Cordless Telecommunications) Standard. The entire radio

area administered by the system is made up of base stations, which together form either a complete network of overlapping radio cells or individual radio "islands". The size of a radio cell is dependent on the local/structural factors.

### ECO Mode

In ECO mode (economic mode), the transmit power of DECT phones is either reduced by a fixed value (static) or every DECT phone adjusts its transmit power independently to the received signal strength (adaptive). ECO mode can be enabled at the communication system on a system-wide basis for all DECT phones (**Expert Mode > Telephony > Cordless > System-wide**). No configuration is required at the DECT telephones. A manual system restart is needed to activate the feature in case of OpenScape Business X1, X3, X5.

- Static adjustment of transmit power

The DECT phones and base station reduce the transmit power to a set fixed value.

- Adaptive adjustment of transmit power

The DECT phones transmit with normal or reduced transmit power, depending on the reception field strength. During a handover, the system first switches to the high transmit power and then reduces the transmit power, depending on the reception.

### DECT phones

The integrated Cordless solution supports GAP-enabled mobile telephones from third-party manufacturers. The full scope of HFA services can, however, only be used with approved DECT phones.

### Configuration

For a description of the configuration, see [Configuring the Integrated Cordless Solution](#).

### Boards and Base Stations

The descriptions of the boards and base stations can be found in the found in the *OpenScape Business Service Documentation in chapters Boards and Base Station*.

## 19.3.2.1 System Overview

The connection of the OpenScape Business base stations for OpenScape Business X3/X5 occurs either directly at the U<sub>P0/E</sub> interfaces of the mainboard or at the UP0/E interfaces of an installed SLU8N/SLU8NR board (DECT Light). With OpenScape Business X8, the base stations can be connected to the Cordless SLMUC boards.

### Direct Connections (DECT Light)

The base stations can be connected directly to the U<sub>P0/E</sub> interfaces of the OCCM, OCCMB, OCCMA and OCCMR, OCCMBR, OCCMAR of the OpenScape Business X3R/X3W and OpenScape Business X5R/

X5W communication systems or to the UP0/E interfaces of an SLU8N/SLU8NR8 board.

By using the CMAe subboard on the mainboards the ADPCM conversion and echo cancellation functions (48 channels for CMAe) are made available. Up to four calls can be conducted per base station. Up to seven base stations can be connected to the UP0/E interfaces of the mainboards OCCM, OCCMB, OCCMA and OCCMR, OCCMBR, OCCMAR.

If no CMAe is installed, a maximum of two calls can be conducted per base station. In this case, the ADPCM conversion is performed directly by the DECT base station.

---

**NOTICE:** In case of no CMAe is installed no echo handling functions are available.

---

When connecting base stations to an SLU8N/SLU8NR board, the following connectivity requirements apply:

- In total, a maximum of 15 base stations (7 at the mainboard and 8 more at an SLU8N/SLU8NR board) can be operated. The maximum number of connectable DECT telephones is 64 with a CMAe.
- Only one SLU8N/SLU8NR board can be used for the connection of base stations.
- Only the first port on the base station can be used to connect of the base station to a UP0/E interface of the SLU8N/SLU8NR board. The ports 2 and 3 of the base station are not supported for connection to a further UP0/E interface.
- The UP0/E interfaces of the SLU8N/SLU8NR board can be used with a mixed combination of base stations and/or telephones.

### Connecting Cordless Boards

The base station BS5 can be connected to the UP0/E interfaces of the following Cordless boards:

- SLMUC (SLMU + CMAe) with OpenScape Business X8 (see *Service Documentation SLMUC chapter*)

The connection of the base stations can be made via one, two or three UP0/E interfaces. The last 8 interfaces of an SLMUC can only be used as 2nd or 3rd UP0 interface of the base station. The additional connection of UP0/E interfaces increases the traffic capacity of the base station and thus the number of simultaneously available voice channels.

## 19.3.2.2 System Configuration

Depending on the communication system, up to 64 base stations can be connected, and up to 250 DECT phones can be used.

The following table shows the maximum possible system configuration for the integrated cordless solution.

**NOTICE:** The base stations BS4 (S30807-U5491-X), BS3/1 (S30807-H5482-X), BS3/3 (S30807-H5485-X) and BS3/S (X30807-X5482-X100) are being phased out and can no longer be ordered. However, they can still be connected to OpenScape Business X communication systems. In the event of a failure, the current base stations should be used.

**NOTICE:** If no CMAe is installed, a maximum of two calls can be conducted per base station. In this case, ADPCM conversion is performed directly by the DECT base station, but echo cancellation is not directly supported. In case that echo cancellation is required a CMAe subboard is needed.

| OpenScape Business      | Maximum number of boards |       | Clock Module | Max. number of Base Station BS when connected via 1xUp0 | Ports/ Simultaneous calls per BS | Max. number of registered devices | Max. number of simultaneous calls |
|-------------------------|--------------------------|-------|--------------|---------------------------------------------------------|----------------------------------|-----------------------------------|-----------------------------------|
|                         | SLUN                     | SLMUC |              |                                                         |                                  |                                   |                                   |
| X1                      | -                        | -     | -            | 7                                                       | 1/2                              | 16                                | 14                                |
|                         | -                        | -     | CMAe         | 7                                                       | 1/4                              | 16                                | 16                                |
| X3                      | -                        | -     | -            | 7                                                       | 1/2                              | 32                                | 14                                |
|                         | -                        | -     | CMAe         | 7                                                       | 1/4                              | 64                                | 28                                |
|                         | 1                        | -     | CMAe         | 15                                                      | 1/4                              | 64                                | 48                                |
| X5 Onboard Up0/E (SLUC) | -                        | -     | -            | 7                                                       | 1/2                              | 32                                | 14                                |
|                         | -                        | -     | CMAe         | 7                                                       | 1/4                              | 64                                | 28                                |
|                         | 1                        | -     | CMAe         | 15                                                      | 1/4                              | 64                                | 48                                |
| X8                      | -                        | 4     | CMAe         | 64                                                      | 3/12                             | 250 (128 per SLMUC)               | 192 <sup>9</sup>                  |

**NOTICE:** The designation SLUC in the table refers to the UP0/ E interfaces of the mainboard. SLUN generally refers to the SLU8N or SLU8NR boards.

### 19.3.2.3 Cordless/DECT Phones

Inserting the SLC board and entering the DECT system ID will automatically configure 16 handsets. The handset codes (PIN) are allocated and the handsets can be registered. Any additional handsets must be released before they can be used.

<sup>9</sup> The max. value per SLMUC is 48. Depending on the location of the cordless telephones in case of roaming, all devices that are registered (250) could be active if 4 SLMUC are available.

If a handset is replaced for servicing, the PIN must be changed before logging on the replacement handset. When a handset is replaced, a new PIN must be assigned to the relevant station in the communication system. This ensures that the handset is automatically logged off. It also improves security by preventing unauthorized parties from misusing the old PIN to log on the mobile handset.

### 19.3.2.4 Significance of Results Obtained from Testing the Radio Area

#### IMPORTANT:

Values recorded with a mobile telephone are not very precise and are intended to provide a rough assessment only. In addition, different values may be recorded on each mobile telephone even though the ambient conditions are identical. If you require more accurate results, we recommend that you use the Hicom Cordless Service tool (HCS-DECT).

The following figure shows a sample display of the measuring results for a Gigaset mobile telephone when a call is in progress:

**Figure 8: Measurement result**

| Section             | Description                                                                                                                                                                                                                                |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RSSI (radio signal) | Field strength of the radio signals received from the base station, normalized to a maximum of 100. If the value is < 50, the radio connection to the base station is no longer guaranteed. Acceptable field strength is > 50 (> -60 dBm). |
| Frequency           | Frequency (0 – 9)                                                                                                                                                                                                                          |
| Time slot (Slot)    | Time slot (0 – 11) of the receiving channel on which the measurement is carried out.                                                                                                                                                       |

| Section             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RPN (port number)   | <p><b>OpenScape Business X1/X3/X5/X8</b></p> <p>Base station ID, for example, 048, port number in the SLC boards. If the handset switches to an overlapping radio cell/base station, the current port number (where the D channel of the base station is configured) is shown on the handset display. Formula: <math>A \times 16 + B</math> A = number of the SLC board (1 - 127); 16 = factor B = port of the associated SLC board (where the D channel of the base station is configured) Examples: <math>RPN = 1 \times 16 + \text{port } 0 = 016</math> <math>RPN = 2 \times 16 + \text{port } 8 = 040</math>.</p> <p>The Port Number (PRN) is displayed for the Gigaset S3 professional and Gigaset SL3 professional handsets in hexadecimal format with an appended H. The hexadecimal value is shown without an appended H, e. g. "-028-" in the case of the Gigaset S4 professional and OpenStage SL4 professional handsets. Example: If the value 040 was displayed previously, the value 028H is now displayed for the Gigaset S3/SL3 professional. The hexadecimal notation is differentiated uniquely on the basis of the "H" suffix. This is also valid for OpenScape DECT Phone S5/SL5/S6/SL6/R6 devices (prefix H is not present).</p> |
| FRAQ(frame quality) | <p>Transmission quality in %. 95 % to 100 % satisfactory (for short periods 90 % to 94 % non-critical), &lt; 95 % faulty.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

For more information regarding the measurement menu, see: *OpenScape Cordless Enterprise, Service Documentation, Chapter: Testing the Radio Area* and *OpenScape Business X3/X5/X8, Service Documentation, Chapter: Check the Radio Coverage*.

### 19.3.3 Configuring the Integrated Cordless Solution

The configuration of the integrated Cordless solution includes setting up the base stations and the registration of DECT phones / mobile handsets at the communication system.

The configuration is performed in Expert mode.

The requisite steps for project planning, lighting, installation and cabling, setting up the system physically and inserting the SLC or CMAe boards have been completed (see also Service Documentation). The DECT phones are charged. The DECT system ID is known. Information about subscribers, station numbers, names and, if necessary, their allocation to the SLC board is available.

#### General Process for Configuring the Integrated Cordless Solution

- 1) Configure the DECT system ID and other Cordless parameters, if necessary
- 2) Configure Cordless base stations
- 3) Log on the DECT phone at the Cordless base station
- 4) If necessary, add more DECT phones as required.

After the DECT phones have been commissioned, the phone numbers and names and other settings of the DECT subscribers can be edited via the WBM with the **Telephones/Subscribers** wizard.

#### DECT System ID

The DECT system ID is used to distinguish the different DECT systems and thus to identify the radio signals. Specifying the DECT system ID is necessary for synchronizing the registered handsets with the system.

The DECT system ID is an 8-digit hexadecimal string that is supplied on purchasing the DECT system. It is valid throughout the system (even for maintenance and service).

The DECT system ID consists of:

| Digit              | Meaning                         |
|--------------------|---------------------------------|
| 1st. digit         | E/ARC (Access Right Code)       |
| 2nd. - 5th. digits | EIC (Equipment Installers Code) |
| 6th. - 7th. digits | FPN (Fixed Part Number)         |
| 8th. digit         | FPS (Fixed Part Subscriber)     |

#### 19.3.3.1 How to Configure the DECT System ID and Other Cordless Parameters (System-wide Data)

##### Prerequisites

You are logged into the WBM with the **Expert** profile, or Hipath 3000 Manager. Below steps refer only to WBM, but similar actions can be performed using Hipath 3000 Manager.

An OpenScape Business base station is connected to the communication system.

The 8-digit DECT system identifier supplied with the ordered DECT system is available.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click on **Telephony > Cordless** in the navigation tree.
3. In the menu tree, click on **Cordless > System-wide**.
4. Enter the 8-digit DECT system identifier under **System ID**.
5. The system-wide settings under **Echo Handling** and **Economic Mode** should only be only if required. An explanation of the settings can be found under [Cordless>System-wide](#).
6. Click on **Apply**, followed by **OK**.

### 19.3.3.2 How to Configure Cordless Base Stations

#### Prerequisites

You are logged into the WBM with the **Expert** profile, or Hipath 3000 Manager. Below steps refer only to WBM, but similar actions can be performed using Hipath 3000 Manager.

An OpenScape Business base station is connected to the communication system.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click on **Telephony > Cordless** in the navigation tree.
3. In the menu tree, click on **Cordless > Base Stations**. All connected base stations are displayed.
4. If one or more base stations are connected directly (without SLC board) to the system (SLUC), you can enable or disable the base stations via the **Type** selection list:
  - a) **Base station**: The base station is activated, and 16 DECT phones and one SLC networking line are automatically preconfigured.
  - b) **No Port**: The base station is deactivated with all associated DECT phones and the SLC networking line.
5. If required, edit the preconfigured name of the base station (e.g., **Base 1**) under **Name**.
6. Specify the level for the base station (50% or 100%) under **Level**.
7. Click on **Apply** followed by **OK**.

### 19.3.3.3 How to configure DECT Phones for the First Time

#### Prerequisites

You are logged into the WBM with the **Expert** profile or you are using Hipath 3000 Manager.

An OpenScape Business base station is connected to the communication system.

The following configuration steps should be done before registering DECT devices to the system.

### Step by Step

1. Perform the following steps, if you are using WBM:
  - a) In the navigation bar, click on **Expert Mode**.
  - b) Click on **Telephony > Cordless** in the navigation tree.
  - c) In the menu tree, click on **Cordless > SLC**. All DECT phones already configured are displayed. When connecting a base station, 16 DECT phones are automatically preconfigured.
  - d) If required, edit the preconfigured internal call number of the DECT phone under **Call No**.
  - e) If required, edit the preconfigured direct inward dialing call number of the DECT phone under **DID**.
  - f) If required, edit the preconfigured name of the DECT phone under **Name**.
  - g) If required, edit the preconfigured mobile code (PIN) of the DECT phone under **Mobile code**. This code must be entered at the DECT phone when logging into the base station for the first time.
  - h) Click on **Apply** followed by **OK**.
2. Perform the following steps, if you are using Hipath 3000 Manager:
  - a) Upload the KDS database checking **Read/Write Database** and **System > PC**
  - b) In the menu tree go on **Settings > Cordless** in the navigation tree.
  - c) In the menu tree, click on **Cordless > SLC** then on the parameter **Portable parts** check all. All DECT phones already configured are displayed. When connecting a base station, 16 DECT phones are automatically preconfigured.
  - d) If required, edit the preconfigured internal call number of the DECT phone under **Call Number**.
  - e) If required, edit the preconfigured name of the DECT phone under **Name**.
  - f) If required, edit the preconfigured mobile code (PIN) of the DECT phone under **Mobile code**. This code must be entered at the DECT phone when logging into the base station for the first time.
  - g) Click on **Apply** followed by **OK**.
  - h) Transfer the KDS to system, if any change have been made.

---

### Related tasks

[How to Configure DECT Stations](#) on page 439

### 19.3.3.4 How to Register a DECT Phone (OpenStage/Gigaset Handset) at the Cordless System

Before registering a DECT phone on, you must use a system telephone and open the registration window with the DECT registration code. Then, enter the station numbers of the DECT phones that you want to register. A maximum of 10 station numbers can be registered in the same registration window. A registration window is open for up to 10 minutes.

If no system phone is available, then you can use Hipath 3000 Manager **Online** feature and make the actions from there instead of using a physical phone. Below steps refer to the physical telephone.

Below steps refer to the physical telephone.

#### Step by Step

1. Open the registration window at the communication system:
  - a) On the physical phone enter the code \*94 2 then 19970707.
  - b) Enter the station numbers of the DECT phones that you wish to register.
2. Register the DECT phone:
  - a) From the DECT phone from home screen, press the **menu key**.
  - b) Navigate to **Settings > Registration > Register Handset** and select **Base**.
  - c) You will be asked to enter the Station system PIN. Enter the eight-digit mobile telephone code and confirm your entry.

You must wait one or two silent calls, which means short automatic calls (on some devices this is like 2 rings).

If you are registering an inactive call number (which has not been used before, it looks black at WBM and gray in KDS) then the registration is completed with one silent call. If you are registering an active call number that has been used before (looks green at WBM and KDS) then the registration is completed with two silent calls.

Please do not take any further action (e.g. initiating DECT phone calls) until this process is complete!

On successful registration, you will see the station number in the Home Screen and you will be able to use the device.

Example: Registering the mobile telephone (station number 125) to DECT telephone system using the mobile telephone code (PIN) 11112345 (which has been configured as a mobile code via Manager E or using WBM- as was mentioned on the chapter: [How to configure DECT Phones for the First Time](#) on page 944.)

- 1) Activate the Registration window from a physical phone connected to the system entering \*942.
- 2) You will view on the display of the phone: **Code**.
- 3) Enter 19970707 and you will view on the display of the phone: **Tel. no:** Enter 125.

- 4) If needed, switch On the mobile telephone by pressing the on-hook key for longer than one second. You will then hear a confirmation tone.
- 5) You must make the following entries within ten minutes. Press the menu key.
- 6) Navigate to **Settings** of the phone menu and confirm.
- 7) Navigate to **Registration** and confirm the first choice: **Register Handset** (do not select the second option: Select Base)
- 8) Select a station (in this example **Base 2**) and confirm. You will view in the middle of the display **Registration** and **Please enter system PIN**.
- 9) Enter the eight-digit PIN (mobile telephone code; in this case, **11112345**) and confirm your entry. If registration is successful, you have to wait for a "silent call", which means a short automatic call (on some devices this is like 2 rings). If you are registering an inactive call number (which has not been used before, it looks black at WBM and gray in KDS) then the registration is completed with one silent call. If you are registering an active call number that has been used before (looks green at WBM and KDS) then the registration is completed with two silent calls. Please do not take any further action (e.g. initiating DECT phone calls) until this process is complete! Then on the left side of the screen you will see Base 2 (in this case). After this, you will view the station number (125) at your Home Screen.
- 10) You can change the name Base 2, if needed. To do this, navigate to Settings and confirm, go to Registration and confirm and then choose the second option Select Base. Select the Base name which has to be renamed, pressing **Name**, and rename the base name (for example renaming it to 125).

### 19.3.3.5 How to Add Additional DECT Phones

#### Prerequisites

You are logged into the WBM with the **Expert** profile, or Hipath 3000 Manager. Below steps refer only to WBM, but similar actions can be performed using Hipath 3000 Manager.

An OpenScape Business base station is connected to the communication system.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click on **Telephony** > **Cordless** in the navigation tree.
3. In the menu tree, click on **Cordless** > **SLC**.
4. Click on the desired board in the menu tree.
5. Click on the **Add DECT Stations** tab.
6. Enter the number of newly added DECT phones under **Number of DECT phones**. The newly added DECT phones are displayed under the **Edit DECT Stations**.
7. Click on **Apply**, followed by **OK**.

### 19.3.3.6 How to Delete DECT Telephones

#### Prerequisites

You are logged into the WBM with the **Expert** profile, or Hipath 3000 Manager. Below steps refer only to WBM, but similar actions can be performed using Hipath 3000 Manager.

An OpenScape Business base station is connected to the communication system.

DECT phones are configured.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click on **Telephony** > **Cordless** in the navigation tree.
3. In the menu tree, click on **Cordless** > **SLC**. All DECT phones already configured are displayed.
4. Select the DECT phones to be deleted in the **Delete** column.
5. Click **Apply**, followed by **OK**.

### 19.3.3.7 How to Configure the Multi-SLC Parameters

#### Prerequisites

You are logged into the WBM with the **Expert** profile, or Hipath 3000 Manager. Below steps refer only to WBM, but similar actions can be performed using Hipath 3000 Manager.

There are multiple SLMUC boards inserted in the OpenScape Business X8.

An OpenScape Business base station is connected to the communication system.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click on **Telephony** > **Cordless** in the navigation tree.
3. In the menu tree, click on **Cordless** > **Multi-SLC**.
4. Edit parameters of the SLMUC board:
  - a) If required, edit the preconfigured system-wide unique ID of the SLMUC board under **SLC No.**  
Range of values: 1-15,17-31,33-47,...,127. Multiples of 16 are not allowed.
  - b) If required, edit the preconfigured system-wide unique call number of the SLC networking line of the SLMUC board under **SLC number**.

---

**NOTICE:** For each SLC networking line, an internal  $S_0$  station is set up. The SLC call number corresponds to the number of internal  $S_0$  station.

---

- c) Make sure that the station flag **Call waiting rejection on** is disabled for the internal S<sub>0</sub> station.
- 5. If necessary, repeat step 4 for the other SLMUC boards.
- 6. Click on **Apply** followed by **OK**.

### 19.3.3.8 How to Query the Data for Base Stations

#### Prerequisites

You are logged into the WBM with the **Expert** profile, or Hipath 3000 Manager. Below steps refer only to WBM, but similar actions can be performed using Hipath 3000 Manager.

An OpenScape Business base station is connected to the communication system.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance > Cordless** in the navigation tree.
3. In the menu tree, click on **Cordless > Base Stations**.
4. Click on the desired base station in the menu tree. The data of the base station is displayed. An explanation for the data can be found under [Cordless>Base Stations](#).
5. You can select up to 10 different frequency channels simultaneously for a base station. An explanation of the frequency channels can be found in the table under [Cordless>Base Stations](#).
6. Click on **Apply**, followed by **OK**.

### 19.3.3.9 How to Enable the Message Waiting Indication (MWI) for DECT Telephones

#### Prerequisites

You are logged into the WBM with the **Expert** profile, or Hipath 3000 Manager. Below steps refer only to WBM, but similar actions can be performed using Hipath 3000 Manager.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click in the navigation tree on **Telephony Server > Basic Settings**.
3. In the menu tree, click **Basic Settings > System > System Flags**.
4. Select the **CMi MWI ringer** check box in the **System flags** area.
5. Click on **Apply**, followed by **OK**.

### 19.3.3.10 How to Check the Logon Status of DECT Phones

#### Prerequisites

You are logged into the WBM with the **Expert** profile, or Hipath 3000 Manager. Below steps refer only to WBM, but similar actions can be performed using Hipath 3000 Manager.

An OpenScape Business base station is connected to the communication system.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click on **Telephony** > **Cordless** in the navigation tree.
3. In the menu tree, click on **Cordless** > **SLC**. All DECT phones already configured are displayed.
4. For each DECT phone, the login status is displayed in the **Active** column as follows:
  - Green: The mobile phone is active.
  - Red: The board lockout switch was set for a logged-on mobile phone.
  - Yellow: The mobile phone was automatically logged off on changing the PIN.
  - Gray: No mobile phone has ever been logged on at this port.
5. Click on **Apply**, followed by **OK**.

### 19.3.4 Cordless IP

Cordless IP (IP DECT) is the optional Cordless solution that serves as an alternative to the integrated Cordless solution or is used with OpenScape Business S.

The DECT phones at Cordless IP communicate via the BSIP base station with the communication system like SIP phones. Consequently, only SIP features can be used with Cordless IP. For more information on Cordless IP, refer to the documentation for HiPath Cordless IP.

For all SIP subscribers who are logged on at a Cordless IP, the station parameter **autom. connection, CSTA** must be disabled. Otherwise, this could cause calls between SIP subscribers to not be set up via DECT IP.

### 19.3.5 WLAN Phones and Access Points

WLAN phones and dual-mode telephones enable mobile communications. These phones can be integrated in already existing WLAN infrastructures. With WLAN Access Points, you can build wireless networks and use the same infrastructure for voice and data services. It is only recommended that only high-performance WLAN Access Points (e.g., from Enterasys) be used.

### 19.3.5.1 WLAN Requirements

When using a WLAN, it is important to ensure that the basic requirements for Voice-over-WLAN are satisfied. To implement the wireless portion of the network, a site survey may need to be conducted.

Decision-making aids:

- Smaller installations with up to three APs can be effectively assessed during a site visit or by studying the floor plans. It is not generally necessary to perform a site survey in this scenario.
- Site surveys should always be performed for installations with more than four APs. This applies specially to installations extending across multiple buildings or floors within buildings.
- A site survey is required irrespective of the number of APs in scenarios involving an RF-intensive environment or if you want the solution to operate alongside preexisting WLAN systems.

## 19.4 Mobility at Home

Mobility at Home is achieved through teleworking. This is done by integrating non-local phones (such as a home phone or mobile phone) in the OpenScape Business communication network.

The following types of teleworking stations are available:

- VPN stations

OpenScape Business has a built-in VPN functionality. A total of 10 teleworkers can be simultaneously active via VPN. This may involve a home PC or a mobile phone with an Android or iOS operating system. The VPN connection is established between the native VPN client of the PC or of the mobile phone and the OpenVPN server of OpenScape Business.

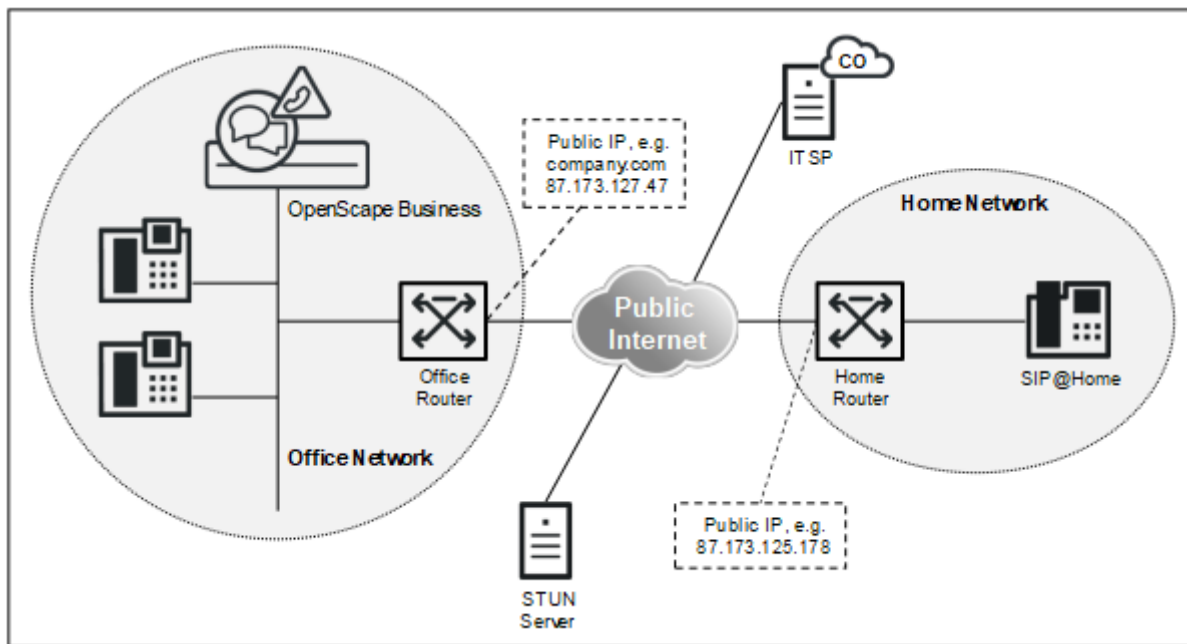

Users of UC Suite can specify their home phone number from home via their UC client and then use their private phone as an office phone (CallMe).

- Device@Home: SIP@Home stations or System Device@Home stations

STUN-enabled SIP phones (e.g., Yealink T19) (SIP Device@Home stations) or HFA phones (System Device@Home stations) can register themselves at the communication system over the Internet by using the internal SBC function of OpenScape Business. To do this, the feature must be enabled in the station data for each SIP phone or HFA phones via the WBM.

A STUN server must be additionally specified in the WBM only if no ITSP is being used or if the used ITSP does not offer any STUN server.

SIP Device@Home does not support the transmission of video signals.

**Figure 9: Device@Home (SIP Device@Home or System Device@Home) components**

### 19.4.1 Configuring a VPN

In order to connect subscribers to the communication system via the integrated VPN functionality, certain configurations must be performed at both OpenScape Business and the VPN stations.

#### Configuring OpenScape Business

For the VPN configuration of the communication system, see [How to Connect Teleworkers via a VPN](#) .

#### Configuring VPN Stations (VPN Clients)

To configure the VPN client, see [VPN Clients](#) .

### 19.4.2 Configuration for SIP Device@Home

In order to set up connections from a STUN-enabled SIP phone to OpenScape Business over the Internet, certain configurations must be performed.

#### Configuring OpenScape Business

In order to enable a SIP station to register at the communication system over the Internet, the integrated SBC function must be activated for the SIP station (see [How to Enable Device@Home](#)).

The integrated SBC function detects the public IP address of the communication system and the port used with the aid of the STUN protocol. If the communication system is connected to an ITSP that

offers a STUN server, no further configuration must be performed on the communication system. However, if either no ITSP is used or if the used ITSP does not offer any STUN server, then a STUN server must be configured in the system (see [How to Specify a STUN Server for Device@Home](#)).

### Configuring the Office Internet Router

In order to enable SIP phones to reach the communication system over the Internet, port forwarding for the external SIP port must be set up in the Office Internet router. To prevent SIP attacks from the Internet, a SIP port other than the default must be used as an external SIP port.

The transport protocol is set at the SIP phone.

**Table 9: Configure Port Forwarding in the Office Router**

| Transport protocol | Internal SIP port                      | External SIP port                                | Comment                                                                                                                                                                                                                                                                                       |
|--------------------|----------------------------------------|--------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| UDP                | 5070                                   | Entering 5090, for example.                      | For port forwarding, the external and internal SIP ports must not be the same. A port with a different value than the internal default SIP port 5070 can thus be entered as an external SIP port.<br><br>UDP is therefore recommended.                                                        |
| TCP                | 5070<br>Switching to 5080, for example | Entering 5080 (= internal SIP port), for example | For port forwarding, the external and internal SIP ports must be the same. To use an external SIP port other than the default 5070, the internal SIP port must be changed. This requires a reconfiguration of all IP components that use SIP.<br><br>TCP is therefore <b>not</b> recommended. |
| TLS                | 5071                                   | Entering 5071 (= internal SIP-TLS port)          | For port forwarding, the external and internal SIP-TLS port must be the same. Since the internal SIP-TLS port already differs from the default SIP-TLS port, 5071 can also be entered as the external SIP-TLS port.<br><br>TLS is therefore recommended.                                      |

---

**NOTICE:** In an upgraded system no change regarding SIP ports is performed automatically. After upgrade the ports are:

SIP\_EXT = 5060

SIP\_TLS\_SUB\_EXT = 5062

These values must be changed manually by the administrator if Device@Home is used in a migrated system.

---

For TLS, valid certificates must be enabled in the communication system. TLS connections for SIP stations are supported at the LAN interface of the communication system, but not at the WAN interface. SRTP payload with SDES signaling is not supported.

If the Office Internet router is connected to the Internet without a fixed IP address, then DynDNS must be configured at the Office Internet router so that SIP stations can reach the communication system over the Internet. The current IP address is registered via the DynDNS account at regular intervals. With free DynDNS accounts, which expire at regular intervals, this may temporarily lead to disruptions.

### Configuring SIP Phones

As an example for the configuration you can find some tested SIP phones that support STUN, please refer to the Unify Experts wiki on the Internet. You will find the values that need to be entered at the SIP phone there.

### Configuring the Home Internet Router

No special configuration is needed on the home Internet router.

The home Internet router must meet the following requirements:

- The router must provide VoIP functionality with NAT enabled (not a symmetric NAT).
- The ALG function must be disabled in the router.

The Internet connection must provide enough bandwidth for the transmission of the call. For asymmetric DSL connections, in particular, the availability of sufficient upload bandwidth must be ensured.

### Configuring myPortal @work

In order to enable myPortal @work to reach the communication system over the Internet, you have to perform the following:

- Configure the STUN server to the system/client.
- Open and forward port 8802 (no other forwarding is required).
- The SBC flag is not needed . Based on WebRTC, the integrated SBC function is not required to be activated.

## 19.4.3 Configuration for System Device@Home

In order to set up connections from a System Device phone to OpenScape Business over the Internet, certain configurations must be performed at OpenScape Business, the office Internet router and the System Device phone.

- **Figure 10: Example of System Device@Home use case**

### Configuring OpenScape Business

In order to enable a System Device@Home station to register at the communication system over the Internet, the integrated SBC function must be activated for the System Device@Home station (see [How to Enable Device@Home](#) on page 956).

The integrated SBC function detects the public IP address of the communication system and the port used with the aid of the STUN protocol. If the communication system is connected to an ITSP that offers a STUN server, no further configuration must be performed on the communication system. However, if either no ITSP is used or if the used ITSP does not offer any STUN server, then a STUN server must be made known to the communication system (see [How to Specify a STUN Server for System Device@Home](#)).

### Configuring the Office Internet Router

In order to enable System Device@Home stations to reach the communication system over the Internet, port forwarding for the System Device port must be set up in the Office Internet router. To be able to register from the Internet, the office router/ firewall must be configured with a port forwarding rule:

- external port TCP/4060 to internal port TCP/4062(HFA), for non-TLS
- external port TCP/4061 to internal port TCP/4063(HFA), for TLS

**NOTICE:** During migration from V2R1 to a higher version, the office internet router should also be reconfigured according to this rule.

Above mentioned ports are only needed for System Devices (HFA Phone).

- RTP port range in OpenScape Business X: 30274-30529 RTP port range in OpenScape Business S: 30528-30887 (default values)

VoIP enabled UC Clients such as myPortal to go, myPortal @work do need these ports as well.

- TCP/8802 (HTTPS) (required for Unified Communications client (e.g myPortal to go, myPortal to go Web, my Portal @work or VoIP for myPortal to go configured as System Device@Home))

---

**NOTICE:** The internal firewall zone must be closed.

---

The transport protocol is set at the System Device@Home station.

If the Office Internet router is connected to the Internet without a fixed IP address, then DynDNS must be configured at the Office Internet router so that System Device@Home stations can reach the communication system over the Internet. The current IP address is registered via the DynDNS account at regular intervals. With free DynDNS accounts, which expire at regular intervals, this may temporarily lead to disruptions.

### Configuring the Home Internet Router

No special configuration is needed on the home Internet router.

The home Internet router must meet the following requirements:

- The router must provide VoIP functionality with NAT enabled (not a symmetric NAT).
- The ALG function must be disabled in the router.

The Internet connection must provide enough bandwidth for the transmission of the call. For asymmetric DSL connections, in particular, the availability of sufficient upload bandwidth must be ensured.

### Configuring the HFA Phone

The Gateway must be configured with the DNS name (e.g. mycompany.net) so that the phone can reach the system over the Internet. The IP of DLI is also needed to be configured. An internal phone number must be added for the subscriber. The device's password must also be set.

### Restrictions

- It is not possible to configure XML applications at OpenStage

## 19.4.4 How to Enable Device@Home

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Telephony > Stations**.

3. In the menu tree, click **Stations > IP Clients > SIP Clients** or **System Clients**
4. Click on the desired SIP or HFA station in the menu tree.
5. Click the **Edit Workpoint Client Data** tab.
6. Make sure that a password is entered. The values specified here must also be entered on the SIP phone or System Device.

**NOTICE:**

A strong password should be used when connecting over the Internet (at least 8 characters including uppercase, numeric, and special characters).

**NOTICE:** The password of Deskshare clients which are declared as @Home should contain only numerical characters. This password is actually the pin code for the activation of the mobility feature (feature's service code: \*9419). Devices support only numerical characters for pin.

After setting the password, the **Internet Registration with internal SBC** is available to be enabled.

**NOTICE:** After speed upgrade or system restart, **Authentication active** checkbox will be activated for all SIP endpoints and will be greyed-out so the user cannot disable it, if at least one SIP station has the **Internet Registration with internal SBC** flag activated.

## 19.4.5 How to update software for System Device (HFA) @Home

The normal SW-Update procedure of the DLI for an internally connected device cannot be used for System Device (HFA)@Home as this requires direct access to the IP address of the device for the file transfer. The DLI cannot determine the IP address of the System Device@Home due to the following reasons:

- The Device@Home resides in a home network using private IP addresses. Internet access is done via a Home Router with Network Address Translation (NAT).
- The DLI within OpenScape Business is located in a company/office network using private IP addresses. The company network is connected to the Internet via the Company/Office Router.

Therefore the DLI SW-Update procedure uses an additional HTTPS connection via port 8804 (default setting) in combination with the DLI port 18443 (default setting) to determine SW version of the Device@Home and to perform the SW-Update.

The SW-version check for a Device@Home is only done if one condition of the following applies:

- Device restart
- Configuration change locally or remotely
- Inventory changes of the device.
- Logon or logoff of a mobile user on a device.

In these cases the DLI checks the software version of the device and performs an SW update in case that a newer SW version is available in OpenScape Business.

Automatic software update of a Device@Home by the DLI has to be configured in OpenScape Business. It is disabled per default and needs to be enabled explicitly.

The following steps are needed.

### Step by Step

1. You are logged into the WBM with the Expert profile.
2. In the navigation bar, click on **Expert Mode**.
3. Click **Telephony Server > Basic Settings** in the navigation tree.
4. Click on **Basic Settings > Phone Parameter Deployment** in the navigation tree.
  - Clicking on **Deploy SW to @Home devices**, permissions are given for software update via DLI for System Devices (HFA) @Home. The default value is 'unchecked'.
  - Click on **Apply** followed by **OK**.
5. Firewall Settings

No manual firewall settings are required in OpenScape Business. The port 8804 is opened during system startup and requests that arrive at this port are answered only by the system if **Deploy SW to @Home devices** flag is enabled.
6. Open the used ports 18443 and 8804 for the DLI with the proper configuration (port forwarding) in the company/office router.

### Limitations

The HFA@Home device resides behind a firewall (home router). The router or firewall induces a network address translation (NAT) and this makes IP address impossible to be visible from the outside world. As a result, IP phones can not be seen remotely in order to be administered by the DLI.

The side affect of the above network restriction is that any DLI driven events can not be accomplished, as these events are sent towards to the local (not accessible) IP address of the device.

The impact is that no on-demand software update will be possible. On the other hand, the software update will be possible when the device initiates a message exchange by opening an HTTPS session to DLI. Sessions are opened due to specific device-driven events, such as:

- the device restarts.

- a configuration change has been done on the device (via local display or web-based management).
- inventory changes of the device.
- logon or logoff of a mobile user on a device.

In all these cases, DLI will check the software of the device and if needed the device will be updated to the official software that OSBiz supports.

---

**NOTICE:** Software deployment takes place when the phone starts up (either when it gets registered to OSBiz, or when the OSBiz system comes in service).

---

## 19.4.6 How to Specify a STUN Server for Device@Home

### Prerequisites

You are logged into the WBM with the **Expert** profile.

No ITSP is being used or the used ITSP does not provide any STUN server.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Telephony > Voice Gateway**.
3. In the menu tree, click **Internet Telephony Service Provider**.
4. Click the **Edit STUN Configuration** tab.
5. Enter the IP address or the host name of the STUN server (e.g., `stun.serviceprovider.com`) under **IP Address / Host name** in the **Default STUN Server** area.
6. Enter the port of the STUN server (e.g., 3478) under **Port** in the **Default STUN server** area.
7. Click **Apply**, followed by **OK**.

## 20 Security

Security involves protecting the communication system and the stored and transmitted data against unauthorized access. This can be achieved through access protection for the IP network (firewall) and encrypted transmissions (SSL VPN, for example).

### Security Checklist

The aspect of secure communications has been taken into account in the default settings of the communication system. During the initial setup, the functions and settings may need to be adapted to the specific situation of the customer, and additional provisions may have to be made in the customer environment. In order to raise the awareness of security risks and to implement suitable measures to counteract them, a security checklist is provided in the product documentation. It is urgently recommended that this checklist be discussed with the customer during the initial setup and that all implemented measures be carefully documented.

### 20.1 Firewall

A firewall is a system of software and hardware components that restricts access to different networks in order to implement a security concept.

Firewalls are installed at the interfaces between individual networks and control the data flow between the sub-segments to prevent unwanted data traffic and only allow the desired traffic. Firewalls are most frequently used to control traffic between a local network (LAN) and the Internet.

In any corporate network, a firewall isolates the internal LAN from the Internet.

The communication system provides integrated security functions. Different functionality is offered by OpenScape Business X and OpenScape Business S for this purpose.

OpenScape Business X provides the following features:

- Port Firewall / NAT (firewall between WAN port and LAN)
- Application Firewall (firewall for access to the communication system)

OpenScape Business S uses the Linux firewall.

#### 20.1.1 Port Handling

Port handling is used for activating ports (port mapping, port forwarding) in the firewall of the integrated router of the OpenScape Business X.

## Port Numbers

---

**NOTICE:** You should open ports only if it is absolutely necessary for a particular application!

---

Ports or services are required for communication via the protocols TCP and UDP because they allow multiple applications to exchange data simultaneously over a single connection.

The term firewall is generally understood as a port firewall (i.e., the blocking of individual services, or ports). The port firewall affects only the WAN port of OpenScape Business.

With OpenScape Business S, a port firewall can be enabled on the LAN port under Linux. With OpenScape Business X, the firewall on the WAN port is enabled in order to protect the internal network (LAN ports) against attacks from the Internet. If any specific ports/services need to be accessible from the Internet, they must be explicitly released (see [Opening Ports](#)). All ports/services for the functionality of OpenScape Business X are automatically released on the LAN port (into the internal network).

OpenScape Business S has only one LAN port (into the internal customer network) and is protected from the Internet by other components/routers in the customer network. In addition, the Server-internal Linux firewall is enabled. To provide the required OpenScape Business functionality, specific ports/services must be opened (to allow the phones to communicate with OpenScape Business S, for example). This is done automatically, but the administrator can disable individual services.

Port numbers can accept values between 0 and 65535 which is how they are assigned to the different applications. The ports between 0 and 1023 are referred to as 'well-known ports' and are permanently assigned by the IANA (Internet Assigned Numbers Authority). A list of these ports can be found under <http://www.iana.org/assignments/port-numbers>.

### 20.1.1.1 Opening Ports

If the system sets up the Internet access (via the WAN port), then, by default, the only communication allowed is from within the internal network (i.e., from the corporate network or the communication system itself) to the Internet and the associated response packets. Requests initiated from the Internet are blocked. This security setting can be bypassed by opening the port selectively to operate a Web server on the network, for example.

---

**NOTICE:** If the communication system is used as an Internet router, port 5060 must be closed (default setting). For Internet telephony via an ITSP, the communication system opens the relevant ports and keeps them open.

---

Port 5060 must likewise be closed If an external router or firewall is being used. The communication system is responsible for opening this port (if required).

---

### 20.1.1.2 How to Configure the Opening of Ports

The **Firewall** wizard can be used to open ports so that the communication system or PC on the LAN are accessible via the WAN port. The opening of ports entails the risk of access by unauthorized persons. Consequently, only the ports that are urgently needed should be opened.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > Security**.
3. Click on **Edit** to start the **Firewall** wizard. The **Opening ports** window appears.
4. Select the check box **NAT Rule Active** in the row associated with the relevant application or required service for which you want to release ports.
5. Enter the data for the release in the **Global Port**, **Local IP Address**, and **Local Port** fields.
6. To open a port for a service that is not entered, click **Add** and fill in the **Description**, **NAT Rule Active**, **Global Port**, **Local IP Address** and **Local Port** fields.
7. Click on **OK & Next**.
8. Click on **Finish**.

### 20.1.1.3 Port Management

Port Management can be used to change some of the ports used by the communication system itself. This enables the network communication to be customized for each customer network even if the ports are already being used elsewhere.

If changes are to be made at the port administration, these changes must generally be made in all components (phones, systems, etc.) simultaneously in order to retain functionality.

### 20.1.1.4 How to Edit Global Port Management Settings

You can specify port numbers for the individual functions here.

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony > Basic Settings** in the navigation tree.
3. In the menu tree, click **Port Management**. The **Edit Global Port Management Settings** tab appears.
4. Enter the port for each respective function under **Port Number** or leave the default settings unchanged.
5. Click on **Apply** followed by **OK**.

## 20.1.2 NAT

NAT (network address translation) is a procedure for replacing one IP address in a data packet with another. The clients in an internal network use private IP addresses. As private IP addresses are not forwarded in a public network, you can use NAT to map the private IP addresses to a public IP address. This gives internal clients access to the public network while masking the structure of the internal network with its private IP addresses and keeping it separate from the public network (for example, the Internet). NAT and NAT rules are needed for the opening of ports.

Address translation is performed at the gateway between an internal and a public network. NAT can run on an Internet router, a server or another specialized device. An Internet router can use NAT, for instance, to connect the internal network to the Internet.

The internal network appears on the Internet with only a single public IP address, which is assigned to the Internet router by the Internet Service Provider (ISP). All access attempts made from the internal network are routed via this official IP address with different port numbers. The Internet router replaces the private IP addresses with the official IP address assigned by the ISP. In the case of incoming data packets, the official IP address is replaced by the private IP addresses. The relevant port numbers are important for allocation. Only specially enabled private IP addresses can be reached directly from the Internet.

### NAT rules

You can use NAT rules to define if private (local) IP addresses should be reached directly from the Internet. Individual NAT rules can be defined for this or the default NAT rules already set can be used for the services FTP Server, HTTP Server, etc. A total of 20 NAT rules can be defined. In order to use a NAT rule, the local address data of the client PC that will provide these services for the Internet must be entered, and the NAT rule must be activated. Multiple NAT rules can be configured together with the help of a NAT table editor. You can delete NAT rules that are no longer needed.

### Ports

At startup, servers usually require the operating system to provide specific ports in order to accept connections. Typical examples include an HTTP server on port 80, an FTP server port 21, etc. Clients

normally request the operating system for a random port in order to set up connections.

### 20.1.2.1 How to Configure a NAT Rule

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Routing**.
3. Configure the NAT rule:
  - If you want to define a new NAT rule, click on **NAT** in the menu tree and then on the **Add NAT** tab.
  - If you want to edit an existing NAT rule, navigate in the **NAT** menu tree down to the desired NAT rule.
4. Enter a name for the NAT rule in the **Description** field. In the case of a standard NAT rule, this name cannot be changed.
5. Enter the IP address you want to enable for the client in the internal network in the **Local IP Address** field.
6. Enter the port number used by the internal client's application in the **Local Port** field.
7. Enter the port number used by the external communication partner's application in the **Global Port** field.
8. In the **Protocol** drop-down list, select the transport protocol (**TCP** or **UDP**) used by the application. The protocol cannot be changed in the case of a standard NAT rule.
9. Select the radio button **NAT Rule Active** if you want to apply the NAT rule.
10. Click on **Apply** followed by **OK**. The activated NAT rule is identified under the menu item **NAT** with a green symbol.

### 20.1.2.2 How to Configure NAT Rules with the NAT Table Editor

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation bar, click on **Telephony > Routing**.
3. In the menu tree, click on **Routing**.
4. Click in the **NAT** menu tree and then on the **NAT Table Editor** tab.
5. Configure the NAT rule:
  - If you want to define a new NAT rule, fill in the fields of the first row as described below.

- If you want to edit an existing NAT rule, click in the desired field of the NAT rule and fill them in as described below.
- 6. Enter the IP address you want to enable for the client in the internal network in the **Local IP Address** column.
- 7. Enter the port number used by the internal client's application in the **Local Port** column.
- 8. Enter the port number used by the external communication partner's application in the **Global Port** column.
- 9. In the **Protocol** drop-down list, select the transport protocol (**TCP** or **UDP**) used by the application. The protocol cannot be changed in the case of a standard NAT rule.
- 10. To apply the NAT rule, enable the **Active** column with a check mark.
- 11. Enter a name for the NAT rule in the **Description** column. In the case of a standard NAT rule, this name cannot be changed.
- 12. Saving the NAT rule:
  - If you have configured a new NAT rule, click **Add** and then **OK**. The new NAT rule is inserted at the end of the table.
  - If you have edited an existing NAT rule, go to step 5.
- 13. Click on **Apply**. An activated NAT rule is identified under the menu item **NAT** with a green symbol.

### 20.1.2.3 How to Delete a NAT Rule

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Telephony > Routing**.
2. In the navigation tree, click **Routing**.
3. Click on **NAT** in the menu tree.
4. Click on the NAT rule to be deleted in the menu tree and click the **Delete NAT** tab. You cannot delete predefined default NAT rules.
5. Confirm the warning with **Delete** and then click **OK**. The NAT rule is deleted from the list of NAT rules under the **NAT** menu item.

### 20.1.3 Application Firewall

The Application Firewall is used to restrict access to specific services such as FTP or LDAP. It is disabled by default and can be enabled by defining appropriate rules.

The following services can either be blocked or restricted to specific IP addresses or IP address ranges by the Application Firewall in OpenScape Business X:

| Service                 | Ports                            |
|-------------------------|----------------------------------|
| FTP                     | 21, 40000 - 40040                |
| ssh (locked by default) | 22                               |
| LDAP                    | 389                              |
| HTTPS                   | 443                              |
| Postgres                | 5432                             |
| Manager E               | 7000                             |
| CSTA                    | 7001 (FP), 7004 (FP), 8800 (CSP) |

Only the listed services can be blocked via a selection menu in Expert mode.

Telephone features such as SIP, HFA, etc. cannot be blocked using the Application Firewall.

A service can be selected multiple times; each time, different IP restrictions can be specified.

---

**NOTICE:** The activation/deactivation or modification of firewall parameters may severely restrict the functionality of the board (LAN-based administration may no longer be possible, for example).

---

### 20.1.3.1 How to Display the Configuration of the Application Firewall

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Security**.
3. Navigate in the menu tree to **Application Firewall**.
4. Click on the **Display Services** tab to view the blocked services.
5. The name of the rule is displayed in the **Rule Name** field.
6. The check mark under **Rule activated** shows you whether or not a rule is enabled.
7. In the field **Lower Limit of Source IP Address Range** you will see the lower limit of the blocked IP addresses.
8. In the field **Upper Limit of Source IP Address Range** you will see the upper limit of the blocked IP addresses.

### 20.1.3.2 How to Restrict Services using the Application Firewall

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

**Step by Step**

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Security**.
3. Navigate in the menu tree to **Application Firewall**.
4. Click on the **Add Service** tab to block a range of IP addresses and/or a service.
5. Assign a name for this service (this rule) under **Rule Name**.
6. Under **Address Range**, enter the **Lower Limit** and the **Upper Limit** for the allowed source IP addresses.

It is possible to block access completely by entering 127.0.0.1.

---

**INFO:** You should activate a rule only after you are convinced that the authorized IP addresses have been configured correctly!

---

7. Click on **Save**.

### 20.1.3.3 How to Delete the Configuration of the Application Firewall

**Prerequisites**

You are logged into the WBM with the **Expert** profile.

**Step by Step**

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Security**.
3. Navigate in the menu tree to **Application Firewall**.
4. Click on the **Delete all Services** tab to delete all services.

### 20.1.4 Services Administration (OpenScape Business S)

The Linux-internal firewall is enabled by default, which prevents access to OpenScape Business S. The communication system does, however, also provide services (e.g., the telephony service) that require open ports (services). After the installation of OpenScape Business S, these required ports/services must therefore be opened in the firewall. If services such as SNMP are not to be used, they can be disabled in the Linux firewall.

---

**NOTICE:** Note that the blocking of services that are used by OpenScape Business S can lead to a degradation and/or failure in the functionality of the communication system.

---

### 20.1.4.1 How to Add or Block Services

#### Step by Step

1. Click on **Computer** in the task bar.
2. In the menu tree, click on **System > YaST**.
3. Enter the password for the root user and click **Continue**.
4. Click on **Security and Users** in the menu tree.
5. In the **Security and Users** area, click on **Firewall**.
6. In the menu tree of the **Firewall Configuration: Start-up** window, click on **Allowed Services**.
7. In the field **Allowed Services for Selected Zone**, select the area for which you want to change services (**External Zone**, **Demilitarized Zone**, **Internal Zone**).
8. In the field **Service to allow**, select the specific services to be enabled (added) and click on **Add**. All currently permitted services are listed in the pull-down menu.
9. In the **Allowed Service** field, select the services to be disabled and click on **Delete**.
10. Enable the **Protect Firewall from Internal Zone** check box required.
11. Click on **Advanced** to add any ports or numeric protocols to the firewall (**TCP Ports**, **UDP Ports**, **RPC Ports** and **IP Protocols**). Click OK when finished.
12. Click on **Next** to display a window with your firewall settings. If required, you can view more information via **Show Details**.
13. Click on **Finish**.

## 20.2 Signaling and Payload Encryption (SPE)

SPE is a security feature for the transmission of signaling and payload data between IP system phones and the communication system. The feature is based on an asymmetrical encryption mechanism in which public and private keys are used.

Encryption of signaling and payload data:

- Signaling encryption: The signal transmission between the gateway and clients is encrypted with a 128-bit key. The TLS protocol with AES encryption is used for the transmission.
- Payload encryption: The payload or voice data is transmitted using the Secure Real-time Transport Protocol (SRTP). They are likewise encrypted with a 128-bit key (AES). SRTP is also used for IP networking. The procedure for exchanging the key for SRTP is known as Multimedia Internet Keying (MIKEY).

For SPE, the individual system telephones and communication systems involved must be able to uniquely identify one another. This is achieved through certificates, which also provide the public keys.

The keys and certificates are distributed by the DLS server; however, they can also be distributed manually.

**INFO:** The SPE feature is not offered for SIP and WL2 subscribers.

An encrypted connection only exists for direct connections between two system telephones or for conferences.

### SRTCP Encryption

SRTCP (Secure Real-time Transport Control Protocol) is an extension of the SRTP protocol and implements the security of control data. The extension consists of three additional fields: an SRTCP index, an encryption flag and an authentication tag.

### SPE conformity

| Family<br>Protocol / Interface | Signalling Encryption |                |                |                |                   |                |         | Payload Encryption |         |                 |                 |                 |                    |                     |
|--------------------------------|-----------------------|----------------|----------------|----------------|-------------------|----------------|---------|--------------------|---------|-----------------|-----------------|-----------------|--------------------|---------------------|
|                                | Column1               | HFA Subscriber | SIP Subscriber | TDM Subscriber | Analog Subscriber | SIP-Q Trunking | ISDN CO | FAX (T38, G711)    | Column2 | HFA Subscriber2 | SIP Subscriber2 | TDM Subscriber2 | Analog Subscriber2 | IP-Q Trunking (G W) |
| OpenScape Office MX/LX         |                       |                |                |                |                   |                |         |                    |         |                 |                 |                 |                    |                     |
| HFA                            |                       | s              | nv             | t              | t                 | s              | t       | t                  |         | y               | n               | y               | y                  | y                   |
| SIP-UA                         |                       | t*             | t*             | nv             | nv                | t*             | nv      | nv                 |         | n               | n               | n               | n                  | n                   |
| SIP-Trunking/ITSP              |                       | t*             | nv             | nv             | nv                | t*             | nv      | nv                 |         | n               | n               | n               | n                  | n                   |

| *                  | No End-to-end Signaling Encryption (TLS) |
| Payload encryption |                                          |
| y                  | Secure Payload (SRTP)                    |
| n                  | Non-Secure Payload (RTP)                 |

### 20.2.1 How to Enable or Disable SPE Support

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony** > **Basic Settings** in the navigation tree.
3. In the menu tree, click on **System** > **System Flags**.
4. Select one of the following options:
  - If you want to enable Signaling and Payload Encryption, select the **SPE Support** check box.
  - If you want to disable Signaling and Payload Encryption, clear the **SPE Support** check box.
5. Click on **Apply** followed by **OK**.

### 20.2.2 How Change the SPE Security Settings

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Security** > **Signaling and Payload Encryption (SPE)**.
3. In the **Edit Security Configuration** tab, under **Minimal length of RSA keys**, select the minimum key length for the security protocol (512, 1024 or 2048).
4. Select the item **Check certificate with CRL monitoring** if you want to a comparison with the CRL (certificate revocation lists) lists.
5. Under **Maximum Re-Keying interval [hours]**, enter the time (in hours) after which the key pairs are reassigned.
6. Click on **Apply**.

## 20.2.3 How to Import an SPE Certificate and Private Key (PKCS#12)

If no custom certificate is available, a self-signed CA certificate can be generated via **SSL > Certificate Generation** to produce and save a CA-signed server certificate (PKCS #12) that can be saved. This is then imported for SPE.

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Security > Signaling and Payload Encryption (SPE)**.
3. Navigate in the menu tree to **SPE Certificate**.
4. Enter the password for decryption that was created when generating the file under **Import SPE certificate plus private key (PKCS#12 file)** in the **Passphrase for decryption** field.
5. Under **File with certificate and private Key (PEM or PKCS#12 format)**, enter the name of the certificate file or click on **Browse** to search for it.

---

**INFO:** After you install a certificate for the first time with SPE enabled, an automatic reset is performed!

---

6. Click on **View Fingerprint of Certificate** to check the integrity of the certificate.

## 20.2.4 How to Import an SPE CA Certificate

This step is not required when using certificates that were created under **SSL Certificate Generation** itself.

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Security > Signaling and Payload Encryption (SPE)**.
3. Navigate in the menu tree to **SPE CA Certificate(s)**.
4. In the **Import trusted CA certificate (X.509 File) for SPE** window, under **File with certificate (PEM or binary)**, enter the file name of the certificate file or click **Browse** to select a file.
5. Under **CRL Distribution Point (CDP) Protocol**, select the protocol for the CRL (certificate revocation lists) lists (**LDAP** or **HTTP**).

6. Under **CDP (without ldap://, for example)**, enter the desired server.
7. Click on **View Fingerprint of Certificate**.

## 20.2.5 How to Enable or Disable SPE for a Station

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Navigate in the menu tree under **Stations > Station > IP Clients** down to the desired station (system client).
3. Navigate in the **Stations** window under the **Edit station parameters** tab to the **Payload Security** entry.
4. Select one of the following options:
  - If you want to activate the function, select the item **On** under **Payload Security**.
  - If you want to deactivate the function, select the item **Off** under **Payload Security**.
5. Click on **Apply**.

## 20.3 Virtual Private Network (VPN)

A virtual private network (VPN) is a PC network used to transport private data in a public network (such as the Internet). It therefore transfers data securely over an insecure network. Data is transmitted in encrypted format.

### Overview of a VPN

VPN offers you:

- Secure connection via an unprotected medium (Internet)
- Protection of confidential data against manipulation
- Reliable integration of external partners in the corporate network
- Access to corporate information for field service

To ensure secure communications, VPN works as follows: A tunnel is created between the communication peers. In this instance, tunnel configuration is subject to authentication and authorization. The actual data is encrypted following tunnel configuration.

A VPN can be set up between (at least) two computers or networks (tunnel endpoints).

Two types of networking exist:

- Site-to-Site VPN

This type of networking performs encryption between two VPN gateways; data is transferred unencrypted within the LANs.

- End-to-Site VPN

Remote access VPN (remote access by mobile teleworkers)

### System-Specific Information

The VPN parameters are principally administered via the VPN wizard.

Note that the connection to the communication system must be a secure SSL connection using OpenSwan or OpenSSL.

### Dependencies

| Topic  | Dependency                                                                                                                                                                                                                                                         |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DynDNS | The VPN endpoints must be reachable via a domain name or a fixed IP address. If this is not the case, DynDNS can be used.                                                                                                                                          |
| DynDNS | If you change an IP address in VPN, the communication system updates the host-name-specific data (IP address) in DynDNS.                                                                                                                                           |
| DNS    | Every VPN partner can resolve the host name/IP address via the standard DNS protocol. All DNS names (such as host name) must be fully qualified domain names (FQDN). Connections via IPSec tunnels are not possible while the IP address is being updated via DNS. |

## 20.3.1 Requirements for VPN

To ensure the quality of the voice and data transmissions, the networks being used must satisfy certain requirements. Due to encryption, in particular, more bandwidth than for other networks must be planned.

In the following examples and in the tables, the encryption mode "ESP Tunnel Mode with Authentication" is used as a basis. This mode offers the highest security for site-to-site VPNs.

### Structure of an encrypted voice packet:

#### Length of the ESP Header

#### Padding

#### Bandwidth calculation for the AES encryption algorithm:

#### Bandwidth calculation for the DES/3DES encryption algorithm:

#### Bandwidth for T.38 Fax

| Protocol    | Bytes      |           |
|-------------|------------|-----------|
| ESP Trailer | 12         |           |
| ESP Padding | varies (y) | encrypted |

| Protocol                  | Bytes                   |           |
|---------------------------|-------------------------|-----------|
| ESP Padding Header        | 2                       | encrypted |
| Voice Payload             | varies (x)              | encrypted |
| RTP                       | 12                      | encrypted |
| UDP                       | 8                       | encrypted |
| IP (original)             | 20                      | encrypted |
| ESP header                | 8 + iv                  |           |
| IP (tunnel)               | 20                      |           |
| 802.1Q VLAN Tagging       | 4                       |           |
| MAC (incl. Preamble, FCS) | 26                      |           |
| <b>Total</b>              | <b>112 + iv + x + y</b> |           |

The length of the ESP header depends on the encryption algorithm used.

Required for Cipher Block Chaining. The ESP header contains an initialization vector (IV). The length of the IV is identical to the length of the cipher block.

Padding is required, since the encryption algorithm is based on cipher block chaining. This means that the entire encrypted portion of the packet (original IP/UDP/ RTP header + voice payload+ESP header padding) must correspond to an integral multiple of the cipher block length.

Block length of the encryption algorithm:

| Encryption Algorithm | Block length       | Length of the initialization vector |
|----------------------|--------------------|-------------------------------------|
| AES                  | 16 bytes (128 bit) | 16 bytes (128 bit)                  |
| 3DES                 | 8 bytes (64 bit)   | 8 bytes (64 bit)                    |

Calculation of the required padding bytes for voice packets:

$(42 + x + y) \text{ (bytes)} = N \times (0 \text{ or } 16 \text{ (bytes)}) \text{ (N integer)}$

| Codec  | Packet parameter | Frame size (ms) | Payload (bytes) | Padding (Bytes) | Ethernet packet length (bytes) | Payload / Packet overhead ration | Ethernet load (incl.) header (kbps) |
|--------|------------------|-----------------|-----------------|-----------------|--------------------------------|----------------------------------|-------------------------------------|
| G.711  | 20               | 20              | 160             | 6               | 294                            | 75%                              | 117.6                               |

## 20.3.2 Connecting Teleworkers via a VPN

Teleworkers can be connected to the communication system via a secure VPN connection.

### Stand-alone System with Integration of Teleworkers via a VPN

The communication system provides integrated VPN functionality (configured using a wizard). Per communication system, up to 10 teleworkers can be simultaneously active via a VPN connection.

The following VPN clients have been released for OpenScape Business:

- NCP VPN Client
- Shrew Soft VPN Client
- Android VPN Client
- iOS VPN Client
- Mac OS-X VPN Client

### Exporting the Teleworker Data

The teleworker data can be exported as a ZIP file (unencrypted). For each supported VPN client, the ZIP file contains a separate text file with the teleworker data. This is an `.ini` file for the NCP VPN client, a `.vpn` file for the Shrew Soft VPN Client and a `.networkConnect` file for the OS X VPN client. These text files can be imported at the VPN client.

---

**INFO:** Umlauts or accents in the text files with the teleworker data are ignored. Blanks are replaced by underscores.

---

### Status Display of VPN Connections

A status display of all VPN connections can be found in the **VPN** wizard. A detailed overview of all VPN connections can be found in the **Service Center** under **Diagnostics > Status > VPN Status**.

### VPN with OpenScape Business S

With OpenScape Business S, the VPN is terminated via an external router. The description of external applications is not part of this documentation.

## 20.3.2.1 How to Connect Teleworkers via a VPN

The **VPN** wizard can be used to grant VPN teleworkers (VPN partners) access to the internal LAN and to connect communication systems via a VPN (virtual private network). If the communication system does not have any fixed external IP address (public IP address, global IP address), a DynDNS service will need to be configured (at [www.dyndns.org](http://www.dyndns.org), for example).

### Prerequisites

Internet access via the WAN interface has been configured.

If the WAN interface has no fixed (public) IP address, DynDNS must be configured. A connection to the Internet is required for a successful DynDNS test.

You are logged on to the WBM with the **Advanced** profile.

### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > Network / Internet**.

3. Click **Edit** to start the **VPN Configuration** wizard. The default setting is **VPN is switched off**.
4. Click **Configuration of VPN**.
5. If you want to edit a configured VPN connection, click on **Edit** for the desired VPN connection.
6. If you want to create a new VPN connection, click on **Add**.
7. Enter a name for the VPN connection (e.g., `node2mch.dyndns.org`) in the **System name** field.
8. If desired, enter a **Comment** in the corresponding field.
9. Select the **enabled** check box (already preset by default).
10. Select the check box **Use Data of own System**.
11. If required, select the **Address Type**:
  - If the WAN interface has a fixed (public) IP address, select the entry **IP Address** from the **Address Type** drop-down list and enter the fixed (public) IP address under **Global Address / DNS Name (WAN)**.
  - If the WAN interface does not have a fixed (public) IP address, select the entry **DNS Name** from the **Address Type** drop-down list. The DNS name of the communication system that is already configured for DynDNS will be displayed under **Global Address / DNS Name (WAN)**.
12. The **Local IP Address (LAN)** should only be changed if required.
13. The **Local Subnet Mask (LAN)** should only be changed if required.
14. If you want to edit one of the already configured teleworkers, click on **Edit** next to the desired teleworker in the **Teleworkers** area.
15. If you want to create a new teleworker, click on **Add** in the **Teleworkers** area.
16. Enter a teleworker configuration name in the **Name** field.
17. Configure the type of the VPN client being used:
  - For pure IPSec VPN teleworkers (NCP and Shrew Soft VPN Clients):  
Clear the **L2TP/IPSec** check box and select the **IP Address** as **Address Type**. Enter a virtual IP address / DynDNS name for the teleworker in the field **Virtual IP address/ DynDNS Name** if the VPN client being used supports virtual IP addresses (regardless of whether the teleworker has an Internet connection via a DSL router or DSL modem).
  - For L2TP/IPSec VPN teleworkers (iOS, Android and MAC OS X VPN clients):  
Select the **L2TP/IPSec** check box and assign a **User name** and a **Password** to the teleworker.
18. Select the **enabled** check box (already preset by default).
19. Click **OK**. The window with the overview of teleworkers is displayed again. You can enter further teleworkers.
20. When you have set up all teleworkers, click **OK & Next**. The **System Selection** window is displayed.

21. Click **OK & Next**. The **Security setup for connections** window appears.
22. To ensure a secure VPN connection, assign a key for the newly configured VPN connection under **PreShared Secret** and repeat it under **Repetition of the PreShared Secret**. The key must be at least 20 characters in length.
23. Enter a **Comment** if required.
24. Click **OK**. The **VPN Status Information** window appears.
25. Click on **Switch VPN on**.
26. Only if the address type DNS Name has been selected: Check the already configured data of the DynDNS account and click on **Connection test**. The DNS access data is now transmitted to the service provider. This procedure takes approximately 10 seconds. If the test is not successful, check your access data. After the test succeeds, click **OK**.
27. Click **OK & Next**. The teleworkers can now access the WAN interface of the communication system.
28. Click **Finish**.

### 20.3.2.2 How to Export Teleworker Data

You can export the teleworker data with the **VPN** wizard.

#### Prerequisites

A VPN connection is configured.

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > Network / Internet**.
3. Click **Edit** to start the **VPN Configuration** wizard. The default setting is **VPN is switched off**.
4. Click on **Export/Import**.
5. Click on **Export** in the **Export Teleworker Data from System** area. Save the ZIP file to a location of your choice.

---

**INFO:** For each supported VPN client, the ZIP file contains a separate file with the teleworker data. The teleworker data is not encrypted! Please take a responsible approach to the data.

---

6. Click **OK & Next** followed by **Finish**.

### 20.3.3 Networking Communication Systems via a VPN

Several OpenScape Business communication systems can be networked together securely using a site-to-site VPN network.

## Networking via VPN

You can optionally configure all the data required for networking multiple systems on one communication system, encrypt and export this topology data and then import it on all other systems. This enables a fast and consistent configuration on all systems in the internetwork.

The distinction between the own system and the foreign systems occurs through the detection of the own DynDNS name or (when using fixed IP addresses) through the own Internet address.

- Exporting topology data from a system
  - All data about the topology of the VPN network is written to an encrypted XML file and provided as a ZIP export file for import into another system.
- Importing topology data into a system
  - All data about the topology of the VPN network can be imported from the ZIP file (with the encrypted XML file) and applied to this system.

The key (password) for export is freely selectable and must be communicated to any other administrator who may want to import these settings.

### Status Display of VPN Connections

A status display of all VPN connections can be found in the **VPN** wizard. A detailed overview of all VPN connections can be found in the **Service Center** under **Diagnostics > Status > VPN Status**.

## 20.3.3.1 How to Configure Networking via a VPN

The **VPN** wizard can be used to configure all communication systems which are connected to a system via VPN. This topology data can be exported and imported into all systems in the VPN internetwork.

### Prerequisites

Internet access via the WAN interface has been configured.

If the WAN interface has no fixed (public) IP address, DynDNS must be configured. A connection to the Internet is required for a successful DynDNS test.

You are logged on to the WBM with the **Advanced** profile.

### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > Network / Internet**.
3. Click **Edit** to start the **VPN Configuration** wizard. The default setting is **VPN is switched off**.
4. Click **Configuration of VPN**.
5. Click **Add**.

6. Enter a name for the first system in the VPN internetwork (e.g., `node1mch.dyndns.org`) in the **System name** field.
7. If desired, enter a **Comment** in the corresponding field.
8. Select the **enabled** check box (already preset by default).
9. Select the check box **Use Data of own System**. The following fields are automatically populated with the system data.
10. The preset **Address Type** should only be selected if required:
  - If the WAN interface has a fixed (public) IP address, select the entry **IP Address** from the **Address Type** drop-down list and enter the fixed (public) IP address under **Global Address / DNS Name (WAN)**.
  - If the WAN interface does not have a fixed (public) IP address, select the entry **DNS Name** from the **Address Type** drop-down list. The DNS name of the communication system that is already configured for DynDNS will be displayed under **Global Address / DNS Name (WAN)**.
11. The preset **Local IP Address (LAN)** should only be changed if required.
12. The preset **Local Subnet Mask (LAN)** should only be changed if required.
13. Click **OK & Next**. The **System Selection** window is displayed.
14. Click again on **Add**.
15. Enter a name for the second system in the VPN internetwork (e.g., `node2mch.dyndns.org`) in the **System name** field.
16. If desired, enter a **Comment** in the corresponding field.
17. Select the **enabled** check box (already preset by default).
18. Select the **Address Type** for the second system:
  - If the WAN interface has a fixed (public) IP address, select the entry **IP Address** from the **Address Type** drop-down list and enter the fixed (public) IP address under **Global Address / DNS Name (WAN)**.
  - If the WAN interface does not have a fixed (public) IP address, select the entry **DNS Name** from the **Address Type** drop-down list. The DNS name of the communication system that is already configured for DynDNS will be displayed under **Global Address / DNS Name (WAN)**.
19. Enter the **Local IP Address (LAN)** of the second system.
20. Enter the **Local Subnet Mask (LAN)** of the second system.
21. Click **OK & Next**. The **System Selection** window is displayed.
22. Repeat steps 14 through 21 for other systems in the VPN internetwork.
23. Then click **OK & Next**. The **Security setup for connections** window appears.
24. Assign a separate key for each VPN connection between systems under **PreShared Secret** and repeat it under **Repetition of the PreShared Secret**. The key must be at least 20 characters in length.
25. Enter a **Comment** for each VPN connection if required.
26. Click **OK**. The **VPN Status Information** window appears.

27. Click on **Export/Import** to export the topology data. The **Export and Import of VPN Configuration Data** window appears.
28. In the **Export Topology Data from System** area, specify a key (at least 7 digits) for backing up the data under **Key** and **Repeat Key** and then click on **Export**. Save the file to a location of your choice.
29. Click **OK & Next**.
30. Click on **Switch VPN on**.
31. Only if the address type **DNS Name** has been selected: Check the already configured data of the DynDNS account and click on **Connection test**. The DNS access data is now transmitted to the service provider. This procedure takes approximately 10 seconds. If the test is not successful, check your access data. After the test succeeds, click **OK**.
32. Click **OK & Next** followed by **Finish**.
33. In the WBM of the second system, click on **Setup** in the navigation bar and on **Wizards > Network / Internet** in the navigation tree.
34. Click **Edit** to start the **VPN Configuration** wizard. The default setting is **VPN is switched off**.
35. Click on **Export/Import** to import the topology data. The **Export and Import of VPN Configuration Data** window appears.
36. Click on **Import Topology Data to System** to import the topology data into the system.
37. Enter the **Key** (password) you used when exporting the data from the first system.
38. Navigate to the storage location of the ZIP file. Then click on **Import**.
39. Click **OK & Next**. You can see the configured systems.
