40. Click on **Switch VPN on**.
41. Only if the address type **DNS Name** has been selected: Check the already configured data of the DynDNS account and click on **Connection test**. The DNS access data is now transmitted to the service provider. This procedure takes approximately 10 seconds. If the test is not successful, check your access data. After the test succeeds, click **OK**.
42. Click **OK & Next** followed by **Finish**.
43. Repeat steps 33 through 42 for the remaining systems in the VPN internetwork.

### 20.3.3.2 How to Import and Export the Topology Data of a VPN Network

The **VPN** wizard can be used to export and import the topology data of the VPN network.

#### Prerequisites

A VPN connection is configured.

In order to import the topology data, you will need to know the key that was assigned when exporting that data.

You are logged on to the WBM with the **Advanced** profile.

### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > Network / Internet**.
3. Click **Edit** to start the **VPN Configuration** wizard. The default setting is **VPN is switched off**.
4. Click on **Export/Import**.
5. If you want to export the topology data, in the **Export Topology Data from System** area, specify a key (at least 7 digits) for backing up the data under **Key** and **Repeat Key** and then click on **Export**. Save the file to a location of your choice.
6. If you want to import the topology data, in the **Import Topology Data to System** area, enter the key to decrypt the data under **Key** and then navigate to the storage location of the ZIP file. Then click on **Import**.
7. Click **OK & Next** followed by **Finish**.

## 20.3.4 VPN - Security Mechanisms

In VPN, the encryption of data occurs via different security mechanisms such as IPSec tunneling, Security Associations and authentication methods (peer-to-peer, digital signatures).

### IPSec Tunnels

IPSec is used to encrypt data and can generally be implemented with and without tunnels. IPSec is an option for implementing VPN. You can encrypt the entire IP packet here with the IP header: this occurs in tunnel mode.

Tunnels must always be configured for both VPN peers.

IPSec supports the automatic key management system, Internet Key Exchange (IKE). This is a standard that is integrated in IPSec.

### Security Associations SA

#### IKE SA

#### Payload SA

### Authentication

A security association (SA) is an agreement between two communicating units in computer networks. It describes how the two parties will use security services to communicate securely with each other.

VPN connections always require three security associations (SA), negotiated in two phases:

- Phase 1 - Generating the IKE SA  
One for the initial mutual authentication and for exchanging the session keys (IKE-SA)
- Phase 2 - Negotiating the payload SAs  
One for each direction in the connection for payload traffic once established (payload SAs)

The IKE protocol has essentially two different tasks. Start by creating a protocol used exclusively by the IKE protocol (IKE-SA). The existing IKE-SA is then used for secure negotiation of all further SAs (payload SA) for the transmission of payload data. IKE therefore operates in the two consecutive phases:

When setting up a call between VPN partners, various parameters must be negotiated (such as how often a key is regenerated or which encryption procedures are used). These parameters are stored and administered in IKE SAs.

IKE phase 2 is used to negotiate all security parameters for the payload SAs between the VPN partners.

You always have to configure two SAs for transmission and receipt.

The following steps are essentially performed:

- Negotiating the algorithms for encryption and authentication
- Negotiating the security protocols used (ESP and AH)
- Negotiating the security protocol operating mode
- Negotiating the SA lifetime
- Defining the key material

Peer-to-peer communication in VPN. The following two types of authentication are possible for VPN peers:

- Pre-shared keys  
Pre-shared keys are also mostly used for VPN. A key pair is configured for both VPN partners for this. These keys form a "hash value" which is verified by the relevant partners for authentication purposes.
- Digital signatures  
Every VPN partner is assigned a certificate. For successful authentication, the VPN peers at both tunnel endpoints must check the digital signature of their peer against a trusted CA.

### System-Specific Information

The VPN parameters are principally administered via the wizard.

Note that the administrator connection must run via a secure connection with SSL.

- Security Associations SA  
The communication system supports Oakley groups 1, 2, and 5.
- IPSec  
The communication system uses IPSec tunnel mode with ESP (Encapsulating Security Payload). ESP is an IPSec protocol that

guarantees packet encryption, packet integrity as well as packet authenticity

- Payload SA

The communication system supports the encryption algorithms DES, 3DES, and AES

Of all the MAC algorithms (MAC=Message Authentication Code) for authenticating data origin and data integrity, HMAC-SHA1, HMAC-SHA2, and HMAC-MD5 are supported.

- Recommended operating modes
  - IKE in "Main Mode" with Perfect Forward Secrecy
  - Hash function with SHA-2
  - Authentication with certificates (RSA)
  - Encryption with AES (up to 256 bits)
  - Support for dynamic public IP addresses via virtual IP addresses or DynDNS updating mechanisms for teleworker PCs

### 20.3.5 VPN - Certificates

A certificate binds a specific public key to a specific VPN client. In this case, the client can be both a client of the communication system and a teleworker. The unique combination of public key and VPN client provides the basis for authentication.

#### **Certificates and certificate authority**

##### **Lightweight CA**

##### **Certificate revocation lists (CRL)**

Certificates are digitally signed and generated by a certificate authority (CA). IPsec accepts a certificate if it is issued by a trusted certificate authority.

In a simple VPN environment, the definition of an individual certificate authority may be sufficient; this CA operates as a trusted master certificate authority for the entire VPN and uses its self-signed CA certification for identification at all VPN clients.

Every VPN client needs one of the certificates issued by this CA.

Certificates based on the X.509 standard (the most widely used standard today) include the following main elements:

- information about the identity of the certificate owner
- the public key of the certificate owner,
- information about the CA that signed the certificate (a serial number, the validity period, information about the identity of the CA, and the digital signature of the CA)

A Lightweight CA function helps with certification in environments where the customer is not already using a PKI. A Lightweight CA offers the following options:

- creating public/private key pairs
- signing and generating corresponding certificates

- saving key pairs with associated certificates in files

In cryptographic terms, a PKI (public key infrastructure) is a system for generating, distributing, and verifying digital certificates.

A critical situation occurs when a certificate has become known (or if this is suspected), and this certificate is hence no longer trustworthy for the peer authentication. In this case, the certificate authority must revoke the certificate and the revocation must be signaled to all peers as soon as possible. A remote peer's attempt to authenticate its identity using a revoked certificate is denied.

Basically, a CRL is a list of all revoked certificates. CRLs always have to be generated by the CA where the certificates originate.

A CRL contains the following main elements:

- a list of all revoked certificates; the certificates are identified by serial numbers
- the publication date for the next CRL updated (specifies the time to live for the CRL)
- information about the CA that generated the certificate (information on the identity of the CA and the digital signature of the CA)

The administrator must manually update and distribute the CRLs at regular intervals.

### System-Specific Information

Authentication is performed on the basis of cryptographic algorithms with public keys. The communication system supports RSA as the algorithm for cryptography with public keys. The communication system only supports certificates that correspond to the X.509 standard.

The communication system always operates as a VPN client for authentication.

- Lightweight CA

The communication system offers restricted CA functionality (Lightweight CA). The administrator provides the key material for a system by manually importing private/public key pairs and certificates via the SSL-secured administration connection for all communication partners involved.

- CRL

CRLs (certificate revocation lists) are used to revoke certificates. The CRL is imported into the communication system by the administrator via an SSL-protected connection.

## 20.3.5.1 VPN - How to Generate Lightweight CA Certificates

Lightweight CA is a licensed function for generating and managing CA and peer certificates.

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Security**.
3. Navigate in the menu tree to **VPN > Lightweight CA**. You can generate a CA certificate of your own in the **Generate Certificate** window.
4. Enter a name for the requested certificate under **Certificate Name**.
5. Enter a serial number of your choice under **Serial Number of the Certificate**

---

**INFO:** A serial number that has already been assigned cannot be used again for another certificate, since the serial numbers for all certificates that were ever created must be unique.

---

6. Under **Type of Signature Algorithm**, enter the desired algorithm for the certificate (sha256RSA or sha512RSA).
7. Under **Public Key Length**, enter the length of the public key (e.g., 2048).
8. Enter the date and time for the start of the validity period under **Start Time of Validity Period (GMT)**. The date specified is interpreted as Greenwich Mean Time (GMT).
9. Enter the date and time for the end of the validity period under **End Time of Validity Period (GMT)**.
10. Under **Subject Name**, enter the **Country (C)**, the **Organization (O)**, the **Organization Unit (OU)** and **Common Name (CN)**.
11. You can optionally also enter an alternative subject name under the **Subject Alternative Name** field. If you have done this, you will also need to select a format (e.g., IP address or DNS name). The input window depends on the selected format.
12. Enter the distribution point for the CRL lists ( listed in a drop-down menu) in the **CRL Distribution Point** field.
13. Click on **Generate Certificate**.

### 20.3.5.2 VPN - Certificate Management - How to View a Certificate

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Security**.
3. Navigate in the menu tree to **VPN > Certificate Management**. The **View Certificate From File** window appears.
4. Activate the **PKCS#12 Format** check box if required.
5. Enter the **Passphrase for decryption**.

6. Enter the certificate file under **File with Certificate** or select it using **Browse**.
7. Click on **Load**.

### 20.3.5.3 VPN - How to Import a Trusted CA Certificate (X.509)

X.509 is a standard for certificates. In this case, the name and digital signature of the issuer of the certificate are also saved in the certificate. X.509 is part of the X.500 directory service for world-wide, distributed, and open systems.

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Security**.
3. Navigate in the menu tree to **VPN > Certificate Management > Trusted CA Certificates > Configured Certificates**.
4. Enter a name for the requested certificate under **Certificate Name**.
5. Enter the certificate file under **File with Certificate** field or select a certificate file using **Browse**.
6. Confirm and click on **Activate the Configured VPN Tables**.

### 20.3.5.4 VPN - Peer Certificates - How to Generate a Certificate Signing Request (CSR)

You can generate a CA-signed peer certificate based on a CA certificate. This requires at least one CA certificate to have already been generated. The certificate generated is saved in a PKCS#12 file. PKCS#12 files (Personal Information Exchange Syntax Standard) save certificates with the private key. A PKCS#12 file therefore contains the necessary data for personal encryption and decryption.

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Security**.
3. Navigate in the menu tree to **VPN > Peer Certificates**.
4. Enter the required data on the **Generate Certificate Signing Request (CSR)** tab.
5. Enter the **Certificate Request Name**.
6. Enter the desired algorithm (sha256RSA or sha512RSA) under **Type of Signature Algorithm**.

7. Enter the key length (2048) under **Key Length**.
8. Under **Subject Name** enter all the relevant data for **Country (C)**, **Organization (O)**, **Organization Unit (OU)** and **Common Name (CN)**.
9. Under **Subject Alternative Name**, enter the **Distinguished Name Format**, any possible **Other Format** or an **Alternative Subject Name**.
10. Save the \*.csr file to be signed by a CA.

### 20.3.5.5 VPN - Peer Certificates - How to Generate a Certificate (PKCS#12)

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Security**.
3. Navigate in the menu tree to **VPN > Lightweight CA**.
4. Click on the CA certificate and then on **Generate CA-Signed Peer Certificate [PKCS#12]**.
5. Enter the **Passphrase for decryption**.
6. Enter a serial number of your choice under **Serial Number of Certificate**.
7. Enter the key length (1024, 1536 or 2048) under **Key Length**.
8. Enter the date and time for the start of the validity period under **Start Time of Validity Period (GMT)**. The specified date and time is in Greenwich Mean Time.

---

**NOTICE:** The validity period of the peer certificate must be carefully adapted to comply with the applicable security guidelines in the company. Shortly before the validity period expires, the certificate must be extended or a new certificate must be issued.

---

9. Enter the date and time for the end of the validity period under **End Time of Validity Period (GMT)**.
10. Under **Subject Name** enter all the relevant data for **Country (C)**, **Organization (O)**, **Organization Unit (OU)** and **Common Name (CN)**.
11. You can optionally also enter an alternative subject name under the **Subject Alternative Name** field. If you have done this, you will also need to select a format (e.g., IP address or DNS name). The input window depends on the selected format.
12. Enter the **CRL Distribution Point** (optional).
13. Click on **Generate Certificate**.

### 20.3.5.6 VPN - How to Import a Peer Certificate (PKCS#12)

PKCS#12 files (Personal Information Exchange Syntax Standard) save certificates with the private key. A PKCS#12 file thus contains the essential data for personal encryption and decryption.

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Security**.
3. Navigate in the menu tree to **VPN > Peer Certificates**.
4. Click on the **Import Peer Certificate (PKCS#12)** tab.
5. Enter a name for the requested certificate under **Name of the Certificate**.
6. Under **Passphrase for decryption**, enter your personal password for decrypting this certificate.
7. Enter the file name under **File with Certificate** or locate the file by using the **Browse** button.
8. Click on **View Fingerprint of Certificate**.
9. Click on **Import Certificate from File**.

### 20.3.6 VPN Clients

Teleworkers can establish a secure VPN connection to the corporate network using a VPN tunnel over the Internet. To do this, a VPN client must be installed on their device (PC, tablet PC, smartphone). All data transmitted between the VPN client, the corporate firewall and the VPN server of the communication system is encrypted.

The following VPN clients are supported:

- **NCP VPN Client**

NCP clients can be used in any VPN environments with IPSec. This is significant if access is required from a remote PC to VPN gateways of different manufacturers or if a central VPN gateway from a third-party vendor is already installed in the company network. In the case of a branch office network, the NCP Secure Enterprise Gateway can be used with other VPN gateways on the basis of IPSec connections.

The NCP client is not free, but it offers the benefits of a graphical user interface and a status indicator for the connection.

- **Shrew Soft VPN Client**

The Shrew Soft VPN Client is a free VPN client with a graphical user interface that supports version 2.1.5 and hybrid authentication.

The Shrew Soft VPN client includes, among other things, ISAKMP, Xauth and RSA support, AES, Blowfish and 3DES encryption

protocols, and numerous other features that are usually found only in professional solutions.

- **iOS and Android VPN Client**

The L2TP/IPSec VPN client is integrated in the iOS or Android operating system.

The L2TP/IPSec VPN clients use the IP address range 10.254.253.x. If IP addresses from this range are already being used in the customer network, the IP address range needs to be changed in the WBM (e.g., from 10.254.253.1 to 10.254.252.1) via **Expert mode > Maintenance > Application Diagnostics > IPSec Test: IPSec Test Routines > Set IP Address for L2TP**.

- **Mac OS-X VPN Client**

The Mac OS X VPN client is integrated in the MAC OS X operating system.

### System-Specific Information

- The teleworker data of a VPN client can be exported as a ZIP file (unencrypted). For each supported VPN client, the ZIP file contains a separate text file with the teleworker data. This is an `.ini` file for the NCP VPN client, a `.vpn` file for the Shrew Soft VPN Client and a `.networkConnect` file for the OS X VPN client. These text files can be imported at the VPN client.

- LAN infrastructure with multiple subnets

If VPN is to be used for a LAN infrastructure with multiple subnets, it is necessary to create rules for these subnets. These rules cannot be created via wizards, but must be configured in Expert mode.

- Tunnel in Tunnel

It is not possible create a second VPN tunnel through an already existing VPN tunnel.

### 20.3.6.1 NCP VPN Client Settings

VPN connections via the NCP VPN client require the following settings if the configuration is to be performed manually. You can export a text file with the configured VPN client data (`ncp_vpn.ini`) from your communication system and import it into the VPN client. This ensures that the respective configuration settings are populated automatically.

#### Basic Settings

- Profile name  
freely selectable; use of meaningful names recommended
- Connection type  
VPN to IPSec peer
- Connection medium  
In accordance with the Internet connection used  
e.g., LAN (over IP) or xDSL (PPPoE)

**Dialing into network**

No configuration required.

**HTTP Login**

No configuration required.

**Modem**

No configuration required.

**Line Management**

- Call setup  
automatic or manual  
Timeout = 0

---

**NOTICE:** This ensures the connection is not cleared due to idle time!

---

- Prioritizing Voice over IP (VoIP)  
Set check mark
- EAP Authentication  
No configuration required
- HTTP authentication  
No configuration required

**IPSec Settings**

- Gateway = IP address or DNS name of the communication system  
The communication system can be reached via the Internet under this IP address or DNS name.  
Designation in the VPN wizard: **IP Address/DynDNS Name**
- IKE Policy = Unattended Mode
- IPSec Policy = Unattended Mode
- Exchange Mode = Main Mode
- PFS Group = DH Group 2 (1024 bits)
- Validity / Duration
  - IKE Policy: 000:00:07:00 (7 minutes)
  - IPSec Policy: 000:00:08:00 (8 minutes)
- Editor  
No configuration required

**Advanced IPSec Options**

No configuration required

**Identity**

- Type = IP address  
ID = IP address of the teleworker PC (see also: Assigning IP addresses)

Use Pre-shared key

Set check mark

Shared Secret = This is the password for the VPN connection

Designation in the VPN wizard: **PreShared Secret**

- Extended Authentication (XAUTH)  
not used, no configuration required

### **IP address assignment**

- Assign IP address manually

IP address = IP address of the teleworker PC

Designation in the VPN wizard: **IP Address/DynDNS Name**

- DNS / WINS

Set check mark

- DNS server = IP address of the communication system

Designation in the VPN wizard: **Local IP Subnet Address (LAN)**

### **VPN - IP Networks**

No configuration required.

### **Certificate check**

No configuration required

### **Link Firewall**

- Activate Stateful Inspection:  
for existing connection
- Allow only communication in the tunnel:  
Set check mark

## **20.3.6.2 How to Configure an NCP VPN Client**

An NCP VPN client must be installed and configured on the teleworker device for a secure VPN connection to the communication system.

### **Prerequisites**

The administrator of your communication system has set you up as a teleworker in the WBM of OpenScape Business and made the export ZIP file with the teleworker data available to you.

The administrator of your communication system has communicated the PreShared Secret Key for the VPN connection to you.

The NCP VPN client (LANCOM Advanced VPN Client) is installed on the teleworker device. The information required for this can be found in the documentation of the NCP VPN client.

The teleworker device has an existing and active connection to the Internet.

**Step by Step**

1. Extract the files `ncp_readme.txt` and `ncp_vpn.ini` and place them in a local directory. The entries in the `ncp_vpn.ini` file refer to the `HOOME` profile.
2. Import the `HOOME` profile into the NCP VPN client.
3. Extend the `HOOME` profile with a DNS server. The address of the DNS server is the private IP address (LAN) of your communication system.
4. Start the NCP VPN client
5. Select the `HOOME` profile and click on **Connect**.

**20.3.6.3 How to Configure a Shrew Soft VPN Client**

A Shrew Soft VPN Client must be installed and configured on the teleworker device for a secure VPN connection to the communication system.

**Prerequisites**

The administrator of your communication system has set you up as a teleworker in the WBM of OpenScape Business and made the export ZIP file with the teleworker data available to you.

The administrator of your communication system has communicated the PreShared Secret Key for the VPN connection to you.

The Shrew Soft VPN Client is installed on the teleworker device. A download for the Shrew Soft VPN client can be found under <http://www.shrew.net>.

The teleworker device has an existing and active Internet connection.

**Step by Step**

1. Extract the files `shrewsoft_readme.txt` and `shrewsoft_openswan.vpn` and place them in a local directory.
2. Start the **Shrew Soft VPN Client Access Manager** and configure it. Save the entries.
3. Import the file `shrewsoft_openswan.vpn` into the Shrew Soft client.
4. You should then see the connection in the **Shrew Soft Client VPN Access Manager** under **Connect**.

**20.3.6.4 How to Configure an iOS or Android VPN Client**

An L2TP VPN connection must be configured on the teleworker device for a secure VPN connection to the communication system.

**Prerequisites**

The administrator of your communication system has configured you as a teleworker in the WBM of OpenScape Business and has communicated the user name, the password and the PreShared secret key for the VPN connection to you.

The teleworker device has an existing and active connection to the Internet.

### Step by Step

1. Open the **Settings** > **General** > **VPN** menu on the iOS or Android teleworker device.
2. Click on **Add VPN** to add a new VPN connection.
3. Click on the **L2TP** tab.
4. Enter a name for the VPN connection in the **Description** field.
5. Enter the public IP address or the DNS name of the communication system in the **Server** field.
6. Enter the teleworker user name in the **Account** field.
7. Enter the teleworker password in the **Password** field.
8. Enter the PreShared secret key for the VPN tunnel in the **Shared Secret** field.
9. Enable the **For all data** option.
10. Select the **VPN** option in the **Settings** menu.

### 20.3.6.5 How to Configure a Mac OS X VPN Client

An L2TP VPN connection must be configured on the teleworker device for a secure VPN connection to the communication system.

#### Prerequisites

The administrator of your communication system has set you up as a teleworker in the WBM of OpenScape Business and made the export ZIP file with the teleworker data available to you.

The administrator of your communication system has communicated the user name, the password and the PreShared secret key for the VPN connection to you.

The teleworker device has an existing and active connection to the Internet.

### Step by Step

1. Extract the file `.networkConnect` and place it in a local directory.
2. Double-click on the file `.networkConnect`.
3. Click on **VPN (L2TP)**.
4. Select the VPN connection in the **Configuration** field.
5. Enter the public IP address or the DNS name of the communication system in the **Server Address** field.
6. Enter the teleworker user name in the **User Name** field.
7. Set the security settings:
  - a) Click **Authentication Settings**.
  - b) Enter the teleworker password in the **Password** field.
  - c) Enter the PreShared secret key for the VPN tunnel in the **("Shared Secret") Key** field.
  - d) Click **OK**.

8. Click on **More Options** and select the **Send all traffic over VPN connection** check box. Then click **OK**.
9. Click on **Apply**, followed by **Connect**. Once the connection to the OpenScape Business has been established successfully, the connection status will be shown as **Connected**.

## 20.3.7 VPN Services

You can manage services via the Configured Services function. Configured services become active services only on activation.

### 20.3.7.1 VPN - Active Services - How to Display all IPsec Services

A list of all active IPsec services with detailed information can be displayed in the form of a table.

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Security**.
3. Navigate in the menu tree down to **VPN > Services > Active Services**.
4. You can view the relevant details for the active IPsec services under the **Display IPsec Services** tab.

### 20.3.7.2 VPN - Active Services - How to Display a Special IPsec Service

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Security**.
3. Navigate in the menu tree down to **VPN > Services > Active Services**.
4. Click in the menu tree on the special service for which you want to view all the information (**Name of the Service, Source Port, Destination Port, IP Protocol, Associated 'pass' Rule, Associated 'deny' Rule**).

### 20.3.7.3 VPN - Configured Services - How to Display all IPsec Services

A list of all configured IPsec services with detailed information can be displayed in the form of a table.

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Security**.
3. Navigate in the menu tree down to **VPN > Services > Configured Services**.
4. You can view the relevant details for the configured IPsec services under the **Display IPsec Services** tab.

## 20.3.7.4 VPN - Configured Services - How to Edit the IPsec Service

### Prerequisites

You are logged into the WBM with the **Expert** profile.

---

**NOTICE:** Before editing and/or enabling the IPsec service, a backup should be performed. IPsec rules behave like firewall entries and can restrict access to the system. If a situation arises in which you have enabled IPsec and can then no longer access the system, you can reset the communication system with **Reload**.

---

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Security**.
3. Navigate in the menu tree down to **VPN > Services > Configured Services**.
4. Click on the special service that you want to edit in the menu tree.
5. Edit the name of the service under **Name of the Service**.
6. Change the source port under **Source Port**.
7. Change the destination port under **Destination Port**.
8. Change the service (e.g., UDP) under **IP Protocol** den Service.
9. After the entire VPN configuration, the change is applied with **Activate the Configured VPN Tables**.

## 20.3.7.5 VPN - Configured Services - How to Rename the IPsec Service

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Security**.

3. Navigate in the menu tree down to **VPN > Services > Configured Services**.
4. Click on the special service that you want to rename in the menu tree.
5. Edit the name of the service under **Name of the Service**.
6. After the entire VPN configuration, the change is applied with **Activate the Configured VPN Tables**.

### 20.3.7.6 VPN - Configured Services - How to Delete the IPsec Service

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Security**.
3. Navigate in the menu tree down to **VPN > Services > Configured Services**.
4. Click on the special service that you want to delete in the menu tree.
5. After the entire VPN configuration, the change is applied with **Activate the Configured VPN Tables**.

## 20.3.8 VPN tunnel

Tunnel is the term used to describe the transportation of encrypted data packets to a defined endpoint. Active tunnels become configured tunnels when the configuration is enabled. A maximum of 256 tunnels can be set up per gateway.

### 20.3.8.1 VPN - Active Tunnels - How to Display General Tunnel Data

You can view all active tunnels in tabular form with detailed information on them.

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Security**.
3. Navigate in the menu tree to **VPN > Tunnels > Active Tunnels**.
4. Under the **Display General Tunnel Data** tab you can view detailed information on each active tunnel. This includes:
  - **Name of the Tunnel**
  - **State in IP Stack**

- **Endpoint type of the local tunnel**
- **Local Tunnel Endpoint Address**
- **Type of the Remote Tunnel Endpoint**
- **Remote Tunnel Endpoint Address**
- **Suggested Lifetime of the Session Keys**
- **Suggested Lifetime of the Key Exchange Session**
- **Associated Rules: Associated Transmit Rule**
- **Associated Rules: Associated Receive Rule**

### 20.3.8.2 VPN - Active Tunnels - How to Display Rules for all Tunnels

You can have the rules for all active tunnels displayed in a window.

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Security**.
3. Navigate in the menu tree to **VPN > Tunnels > Active Tunnels**.
4. On the **Display Rules for all Tunnels** tab, you will see detailed information on each active tunnel such as
  - **Tunnel Data**
  - **Rule Data**
  - **Source Address**
  - **Destination Address**
  - **Service Data**

### 20.3.8.3 VPN - Configured Tunnels - How to Display General Tunnel Data

You can view all the data for configured tunnels in tabular form with detailed information on them.

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Security**.
3. Navigate in the menu tree to **VPN > Tunnels > Configured Tunnels**.
4. Under the **Display General Tunnel Data** tab you can view detailed information on each configured tunnel. This includes:
  - **Name of the Tunnel**
  - **Endpoint type of the local tunnel**
  - **Local Tunnel Endpoint Address**
  - **Type of the Remote Tunnel Endpoint**

- **Remote Tunnel Endpoint Address**
- **Suggested Lifetime of the Session Keys**
- **Suggested Lifetime of the Key Exchange Session**
- **Associated Rules: Associated Transmit Rule**
- **Associated Rules: Associated Receive Rule**

#### 20.3.8.4 VPN - Configured Tunnels - How to Display Rules for all Tunnels

You can have the rules for all configured tunnels displayed in a window.

##### Prerequisites

You are logged into the WBM with the **Expert** profile.

##### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Security**.
3. Navigate in the menu tree to **VPN > Tunnels > Configured Tunnels**.
4. On the **Display Rules for all Tunnels** tab, you will see detailed information on each configured tunnel such as
  - **Tunnel Data**
  - **Rule Data**
  - **Source Data**
  - **Destination Data**
  - **Service Data**

#### 20.3.8.5 VPN - How to Add a Configured Tunnel

You can add a new IPsec tunnel. A maximum of 256 tunnels can be set up per gateway.

##### Prerequisites

You are logged into the WBM with the **Expert** profile.

##### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Security**.
3. Navigate in the menu tree to **VPN > Tunnels > Configured Tunnels**.
4. The input window for the new tunnel can be found on the **Add Tunnel** tab.
5. Select **Tunnel Data**.
6. Enter the desired name for the new tunnel under **Name-of-the-Tunnel**.

7. In the **Type of the Local Tunnel Endpoint** drop-down list, select the endpoint address type at the sending end of the tunnel; you can specify a host name or a DNS name.
8. Under **Local Tunnel Endpoint Address**, enter the sender address in a format suitable for the endpoint type.
9. In the **Type of the Remote Tunnel Endpoint** drop-down list, select the type of the endpoint address on the receiving end of the tunnel (only the IP address is currently supported).
10. Under **Remote Tunnel Endpoint Address**, enter the recipient address in a format suitable for the endpoint type. In this field, 0.0.0.0 indicates that the tunnel endpoint is unknown. In this case, the tunnel must be configured by the peer (e.g. teleworker).
11. Under **Session Key Handling**, specify the procedure for the key exchange (possible entry: Automatically, using IKE protocol).
12. Select which algorithms (AES or 3DES) may be used under **Suggested Encryption Algorithms**.
13. Select which hash algorithms may be used under **Suggested Hash Algorithms** (MD5, SHA1 or SHA2). The selected algorithms are offered by the initiator of IKE negotiation.
14. Enter the validity period for the session keys to be used under **Suggested Lifetime of the Session Keys**. When this period expires, no more data is exchanged within this session. New session keys are automatically negotiated to replace keys that have become invalid.
15. Enter a validity period under **Suggested Lifetime of the Key Exchange Session**. Once the key exchange session has expired, new keys are automatically negotiated using the IKE protocol.
16. Enter the maximum data volumes for the session keys under **Suggested Data Volume of the Session Keys**. If the data volume is exceeded, new session keys are automatically negotiated using the IKE protocol. If you select **unlimited**, the validity of the session keys will not be limited by the volume of data.
17. Activate the **Key Exchange Data** check box in the upper section of the window.
18. Enter all the key exchange data (**activate 'Perfect Forward Secrecy' and select the VPN Peer Authentication Method (Pre-Shared-Key or Digital signatures)**).

---

**INFO:** If you have selected **Pre-shared keys** as the authentication method, you will need to enter a 20-character pre-shared key (and repeat this).

---

---

**INFO:** If you want to use **Digital signatures** (from a Lightweight CA) as the authentication method in a VPN network with multiple nodes, you will need to complete some additional configuration steps.

---

- a) Create an LWCA certificate at a node.

- b) Export the certificate (.crt) to a file.
  - c) Create and export a certificate revocation list (.crl) to a file.
  - d) Create and export a peer certificate (.p12) that is signed by a CA for every node.
  - e) The CA certificate (.crt), the certificate revocation list (.CRL) and the corresponding peer certificates must be imported into every node.
19. Enter the **Suggested Diffie-Hellman Groups** (DH Group 2, 5 or 14).
  20. After the entire VPN configuration, the change is applied with **Activate the Configured VPN Tables**.

## 20.3.9 VPN rules

Rules define how IP packets are to be handled. The rule action *Pass* means that the IP packet is to be transported further (passed through). The rule action *Deny* means that the IP packet will not be transported further (i.e., will be ignored). You can also select whether or not the IP packet will use an encrypted VPN tunnel.

The communication system can manage 640 rules, of which 6 rules are preset (default rules) and 634 are free for allocation.

### 20.3.9.1 VPN - Active Rules - How to Display Rules

You can have all rules displayed.

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Security**.
3. Navigate in the menu tree to **VPN > Rules > Active Rules**.
4. Click on the **Display Rules** tab. You will then see detailed information on the active rules such as
  - **Priority**
  - **Service**
  - **Rule-Based Action**
  - **Encryption Required**
  - **Rule State**
  - **State in IP Stack**
  - **Source Address**
  - **Destination Address**
  - **Tunnels for Encryption**

### 20.3.9.2 VPN - Active Rules - How to Display Special Rules

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Security**.
3. Navigate in the menu tree to **VPN > Rules > Active Rules**.
4. Click on the desired rule in the menu tree. The **Display Rule** window appears with all the details for this rule (**priority, service, rule-based action, encryption required, rule state, source address, destination address**)

### 20.3.9.3 VPN - Configured Rules - How to Display all Rules

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Security**.
3. Navigate in the menu tree to **VPN > Rules > Configured Rules**.
4. Click on the **Display Rules** tab. You will then see detailed information on the active rules such as
  - **Priority**
  - **Service**
  - **Rule-Based Action**
  - **Encryption Required**
  - **Enable Rule**
  - **Source Address (type and IP address)**
  - **Destination Address (type and IP address)**

### 20.3.9.4 VPN - Configured Rules - How to Add a Rule

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Security**.
3. Navigate in the menu tree to **VPN > Rules > Configured Rules > Add Rule**.
4. Make the settings for the following parameters:
  - **Priority**

- **Service**
  - **Rule-Based Action (PASS, PASS\_INCOMING, PASS\_OUTGOING, DENY)**
  - **Encryption Required**
  - **Rule Status**
  - **Source Address - Type**
  - **Source Address - Address (Lowest IP Address in Range)**
  - **Source Address - Subnet Mask (Highest IP Address in Range)**
  - **Destination Address - Type**
  - **Destination Address - Address (Lowest IP Address in Range)**
  - **Destination Address - Subnet Mask (Highest IP Address in Range)**
  - **Tunnel on Receive Side**
  - **Tunnel on Transmit Side**
5. Click on **Apply**.

### 20.3.9.5 VPN - How to Edit a Rule

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Security**.
3. Navigate in the menu tree to **VPN > Rules > Configured Rules**.
4. Select the rule to be modified in the menu tree.
5. Enter the priority under **Priority**.
6. Enter the service (e.g., DNS) under **Service**.
7. Specify the rule (**PASS, PASS\_INCOMING, PASS\_OUTGOING, DENY**) under **Rule-Based Action**.
8. Enable the **Encryption Required** check box if required.
9. Select the check box **Enable Rule**.
10. Under **Source Address**, enter the **Type** and **IP** address for the edited rule.
11. Under **Destination Address**, enter the **Type** and **IP** address for the edited rule.
12. After the entire VPN configuration, the change is applied with **Activate the Configured VPN Tables**.

### 20.3.9.6 VPN - How to Add a Rule for the Opposite Direction

When an IPSec rule is created for a transmissions in one direction, the rule for the opposite direction should be added immediately thereafter. The function "Add Rule for the Opposite Direction" copies over the entries of the selected rule, while swapping the source

and destination addresses and switching the tunnel assignment accordingly.

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Security**.
3. Navigate in the menu tree to **VPN > Rules > Configured Rules**.
4. Select the rule to be edited in the menu tree.
5. Click on the **Add Rule for Opposite Direction** tab.
6. Click on **Apply**.
7. After the entire VPN configuration, the change is applied with **Activate the Configured VPN Tables**.

## 20.3.9.7 VPN - How to Delete a Rule

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Security**.
3. Navigate in the menu tree to **VPN > Rules > Configured Rules**.
4. Select the rule to be deleted in the menu tree.
5. Click on the **Delete Rule** tab. The selected rule with all data is displayed.
6. Click on **Delete**. You will receive a warning that you are about to delete this rule.
7. After the entire VPN configuration, the change is applied with **Activate the Configured VPN Tables**.

## 20.3.10 PKI Server

The PKI server designates a server that can issue, distribute and verify digital certificates. The certificates issued within a PKI (Public Key Infrastructure) are used to protect communications.

When using certificates (digital signatures), an attempt is made to download the CRL via the PKI URL configured by the PKI server.

### 20.3.10.1 VPN - How to Display the PKI Server

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Security**.
3. Navigate in the menu tree down to **VPN > Public Key Infrastructure (PKI)**.
4. Click on the **Display PKI Servers** tab. The **Name of the PKI Server**, the **PKI Server Type** and the **URL of the PKI Server** are displayed.

## 20.3.10.2 VPN - How to Add a PKI Server

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Security**.
3. Navigate in the menu tree down to **VPN > Public Key Infrastructure (PKI)**.
4. Click on the **Add PKI Server** tab.
5. Enter the **Name of the PKI Server**.
6. Enter the **PKI Server Type** (e.g., LDAP).
7. Enter the **URL of the PKI Server**.
8. Confirm your entries and click **Apply**.

## 20.4 Certificate Handling

Certificate handling (for Secure Sockets Layer, SSL) promotes the reliable administration of the communication system. The data cannot be read or manipulated by unauthorized parties. Certificates are used for authorization. You can generate and administer certificates.

### CRL (Certificate Revocation List)

Administrative access is encrypted over HTTPS using the TLS 1.2 protocol. Certificates are used to authenticate the communication system. By default, a self-signed certificate is used. A customer-specific certificate can be used to enhance security.

SSL supports the following security services:

- Authenticity (the communication partner is who he says he is)
- Trustworthiness (the data cannot be read by a third party)
- Integrity (the data was received in the same condition as it was sent)

These security services demand prior agreement on the security mechanism used and the exchange of cryptographic keys. These two tasks are performed in the course of connection setup.

SSL uses certificates and keys to guarantee secure data transmission.

Certificate Revocation Lists (CRL) are files containing a list of blocked certificates, their serial number, and their blocking data. A CRL list also contains the name of the party who issued the certificate revocation list and the next authentication time.

### **CDP (CRL Distribution Point)**

The CRL Distribution Point (CDP) is the directory (location) where the current versions of the CRLs are located (for example, <http://sectestcal.microsoft.com/ErtEnvoll/SecTestCAL.crl>).

### **System-Specific Information**

Client/server communication in SSL-based administration.

The server uses the certificates generated or imported by the WBM for authentication at the client. Such certificates can be imported into the browser as trusted certificates to avoid warning messages in the browser when connecting to the SSL server.

---

**INFO:** The SSL certificate generation can also be used for SPE.

---

## **20.4.1 Introduction**

### **What are SSL certificates?**

TLS/SSL certificates are used to protect data during communication between servers such as OpenScape Business and web-based clients by means of encryption and to verify the identity of the company belonging to the website so that the user can be sure that he is really communicating with the real server.

OpenScape Business issues itself a temporary ("self-signed") SSL certificate during the initial system installation or upon change of the LAN IP address, but this certificate does not contain sufficient data for identity verification apart from the user's own LAN IP address.

Such a certificate does not comply with current security standards and must be replaced by a trustworthy, individual SSL certificate issued by an official Certificate Authority (CA) as soon as possible after the initial installation of OpenScape Business. This is the only way to meet the minimum standards of current client operating systems and web browsers for secure Internet communication.

CA's usually offer SSL certificates with different trust levels: Domain Validation (DV), Organization Validation (OV) and Extended Validation (EV). For OpenScape Business, domain validated certificates are sufficient. This is usually the cheapest option, with some CA's even free of charge.

### **For which web services does OpenScape Business use the SSL certificate?**

The active SSL certificate is used for administrator access via the Admin Portal as well as for various other web-based applications

(e.g. key programming) and WSI-based UC clients such as myPortal @work, myPortal to go, Application Launcher, myContacts and myPortal for Teams.

### **Where can I get a trusted SSL certificate from?**

To obtain an SSL certificate, you must contact a certification authority. You must verify the domain name used to reach OpenScape Business in order to create a Certificate Signing Request (CSR), which is then sent to the CA for validation.

It should be noted that CA issued, trusted SSL certificates only have a limited validity period of a few months to a few years to ensure that they comply with current security standards. It is important to keep an eye on the expiration date and to renew SSL certificates before the expiration date is reached.

Failure to renew SSL certificates can result in the client environment classifying the website as "insecure" and preventing communication with the server.

Please note that some client environments have special requirements for SSL certificates, which may not be met by every CA. Such special requirements are linked further down in the section „client side considerations“. When selecting your CA, please follow the corresponding instructions.

### **Why has the certificate issue become so important?**

The use of trustworthy, customer or server-specific SSL certificates is extremely important and is increasingly being enforced by the major operating system and browser manufacturers. Security, professionalism, integrity and confidentiality when handling personal data are the key arguments for this.

Due to the increasing use of web-based services and clients, including via the Internet, the permanent use of the temporary, self-signed (and therefore insecure) default SSL certificate of OpenScape Business is out of the question.

In addition, the temporary, self-signed certificate of OSBiz has a multi-year validity, while some client environments have started restricting the certificate validity – sometimes to not more than one year.

Moreover, in many customer installations that were originally set up with older software releases prior to V3R2.1, the validity of these temporary, self-signed certificates expires on January 1, 2024.

The Admin Portal of OpenScape Business provides a range of tools for generating and managing SSL certificates and also supports the system administrator in creating certificate signing requests. The most important functions in this regard are explained below.

## **20.4.2 How to Generate CA Certificates**

### **Prerequisites**

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Security**.
3. Navigate in the menu tree down to **SSL > Certificate Generation**.
4. Click on the **Generate CA Certificate** tab.
5. Specify the **Name of the Certificate**.
6. Enter a serial number also in the field **Serial Number of Certificate**.
7. Select the algorithm under **Type of Signature Algorithm** (**sha256RSA**, **sha512RSA**).
8. Select the public key under **Public Key Length**.
9. Enter the start and end of the validity period in the relevant fields.
10. Then complete the fields **Subject Name** or **Subject Alternative Name**.
11. Enter the **CRL Distribution Point**.
12. Click on **Apply** followed by **OK**.

## 20.4.3 How to Generate Self-Signed Certificates

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Security**.
3. Navigate in the menu tree down to **SSL > Certificate Generation**.
4. Click on the **Generate Self-Signed Certificate** tab in the **Certificate Generation** window.
5. In the field **Certificate Name**, assign a name for the generated certificate.
6. Enter a serial number also in the field **Serial Number of Certificate**.
7. Select the algorithm under **Type of Signature Algorithm**.
8. Select the public key under **Public Key Length**.
9. Enter the start and end of the validity period in the relevant fields.
10. Then complete the fields **Subject Name** or **Subject Alternative Name**.
11. Enter the **CRL Distribution Point**.
12. Click on **Apply** followed by **OK**.

## 20.4.4 How to Generate Certificate Signing Requests (CSR)

Dependent on the certificate authority of your choice, there are different options to create certificate signing requests online (e.g. via a CA's web portal) or offline. The OpenScape Business Admin Portal offers an option to create a CSR for download and transmission to the CA.

### Prerequisites

You are logged into the WBM with the **Expert** profile.

In Generate Certificate Signing Request (CSR) page, the following fields must be filled in order to generate the key and csr files.

General:

**Certificate Request Name:** A name for the CSR which will be used in the name of the file that will be downloaded.

**Type of Signature Algorithm:** Select between sha256RSA and sha512RSA

**Public Key Length:** The only option is 2048

**Country (C):** Use a two letter country code e.g. DE

**Organization (O):** denotes the formal name of the overarching entity or company to which the certificate is assigned.

**Organization Unit (OU):** designates a specific subunit or department within an organization, offering additional granularity to identify the organizational structure.

**Common Name (CN):** a vital identifier, usually representing the domain name for which the certificate is issued, providing a key element for verifying the certificate holder identity.

### Subject Alternative Name (Optional):

The Subject Alternative Name (SAN) extension is a feature of X.509 certificates used in the field of cryptography. X.509 is a standard that defines the format of public-key certificates. The SAN extension allows additional identities, such as host names, IP addresses, or email addresses, to be associated with a single X.509 certificate. This is particularly useful in scenarios where a server may be accessed by different names or addresses.

**Distinguished Name Format:** Information similar to the Subject name such as Country (C), Organization (O), Organization Unit (OU), Common Name (CN) must be filled.

### Other Format:

**Subject Alternative Name Extension:** Option are DNS Name, IP Address, Email Address, Uniform Resource Indicator, Other

**Subject Alternative Name:** The SAN extension helps address limitations in cases where a single common name is insufficient or when there is a need to include multiple identities within a single certificate. This is important for modern web services, where a server might be accessible through multiple domain names or IP addresses.

Here's an example of how the SAN extension might look in a certificate:

Subject Alternative Name:

DNS:www.example.com

DNS:mail.example.com

IP Address:192.168.1.1

Email:admin@example.com

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony Server > Security**.
3. Navigate in the menu tree down to **SSL > Certificate Management > Server Certificates**.
4. In the **Generate Certificate Signing Request (CSR)** tab:
5. Enter the name of the certificate on the **Certificate Request Name** field.
6. Click to select either **sha256RSA** or **sha512RSA** from the **Type of Signature Algorithm** drop-down list.
7. **Public Key Length** is fixed to **2048** characters.
8. Enter the country **Country C**.
9. Enter the organization **Organization O**.
10. Enter the **Organization Unit (OU)**.
11. Enter the **Common Name (CN)**.
12. Click on either **Distinguished Name Format** or **Other Format**, to select the certificate format.
13. Optionally, choose one of the values for **Subject Alternative Name Extension**.
14. Optionally, click on the **Add** button to add a **Subject Alternative Name** in the CSR.
15. Click on **Apply** followed by **OK**.

## 20.4.5 How to Import Server Certificates (PKCS#12)

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony Server > Security**.
3. Navigate in the menu tree down to **SSL > Certificate Management > Server Certificates**.
4. Click on the **Import Server Certificate (PKCS#12)** tab in the **Server Certificates** window.

---

**NOTICE:** If other format is selected, more than one SAN entries is possible to be configured.

---

5. Enter the **Name of the Certificate**.
6. Enter the **Passphrase for decryption**.
7. Under **File with Certificate**, enter the desired certificate file by using the **Choose File** button.
8. Click on **Import Certificate from File** followed by **OK**.

## 20.4.6 How to Import Server Certificates (PEM)

Certificates in PEM format are supported as an alternative. You can do so by importing the certificate and the key file as two separate files.

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Security**.
3. Navigate in the menu tree down to **SSL > Certificate Management > Server Certificates**.
4. Click on the **Import Server Certificate (PKCS#12)** tab in the **Server Certificates** window.

---

**NOTICE:** If other format is selected, more than one SAN entries is possible to be configured.

---

5. Under the **Import Certificate and Key files** section:
6. Enter the **Name of the Certificate**. (You can enter a name of your own choice.)
7. Enter the **Passphrase for decryption**. (You can enter a passphrase of your own choice.)
8. Under **Certificate File**, choose the certificate file by using the **Choose File** button.
9. Under **Key File**, choose the key file by using the **Choose File** button.
10. Click on **Import Certificate and Key** followed by **OK**.

## 20.4.7 How to Display Certificates

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.

2. In the navigation tree, click **Telephony > Security**.
3. Navigate in the menu tree down to **SSL > Certificate Management > Server Certificates**.
4. Click on the required certificate. The **Server Certificates** window appears.
5. Click on the **View Certificate** tab to view the current certificate.

### 20.4.8 How to Delete Certificates

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Security**.
3. Navigate in the menu tree down to **SSL > Certificate Management > Server Certificates**.
4. Click on the required certificate. The **Server Certificates** window appears.
5. Click on the **Delete Certificate** tab. The name of the certificate currently valid appears with a warning that you are about to delete it.
6. Click on **Delete** if you are sure you want to delete the certificate.

### 20.4.9 How to Export Certificates (X.509)

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Security**.
3. Navigate in the menu tree down to **SSL > Certificate Management > Server Certificates**.
4. Click on the required certificate. The **Server Certificates** window appears.
5. Click on the **Export Certificate (X.509)** tab. You can open or save the certificate.

### 20.4.10 How to Import Updated Certificates (X.509)

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

**Step by Step**

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Security**.
3. Navigate in the menu tree down to **SSL > Certificate Management > Server Certificates**.
4. Click on the required certificate. The **Server Certificates** window appears.
5. Click on the **Import Updated Certificate [X.509]** tab. The name of the certificate currently valid appears.
6. Enter the required certificate in the **File with Certificate** field or select **Browse**.
7. Complete your input with **Fingerprint of**.

## 20.4.11 How to Activate Certificates

With this function, you specify the certificate to be use for web-based administration.

**Prerequisites**

You are logged into the WBM with the **Expert** profile.

**Step by Step**

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Security**.
3. Navigate in the menu tree down to **SSL > Certificate Management > Server Certificates**.
4. Click on the required certificate.
5. Click on the **Activate Certificate** tab. A warning appears that this action will interrupt all ongoing HTTP connections.
6. Select the desired system (OpenScape Business, UC Booster Server, UC Booster Card) for which you want to enable the certificate in the **System** drop-down list.

---

**NOTICE:** To work properly, the IP address of the system must be entered in the **Common Name** field in every certificate. Make sure that you enable the correct certificate for the selected system.

---

7. Click on **Activate Now**.

---

**NOTICE:** The imported Server Certificate must be issued directly from a Root CA. Intermediate CAs must not be used.

---

## 20.4.12 Certificate Handling for Booster Server

When initially installing a Booster Server, a certificate is created with the IP address of the booster serving as the common name. The certificate has a 10-year validity period and is issued for the organization "Unify Software and Solutions GmbH & Co. KG," with the organizational unit specified as "Unify."

It is possible to replace the default certificate on the Booster Server by transferring a different certificate through the Web-Based Management (WBM) interface of the system. Once transferred, the new certificate can be activated, providing an alternative security configuration for the Booster Server.

---

**NOTICE:** Similarly, if your system uses UC Booster Card (OCAB) instead, you can choose **UC Booster Card** from the drop-down menu of **step 6**.

---

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony Server > Security**.
3. Navigate in the menu tree down to **SSL > Certificate Management > Server Certificates**.
4. Choose one of the imported certificates.
5. Navigate to the **Activate Certificate** tab.
6. From the system drop-down menu, select **OpenScape Business UC Booster Server**.
7. Click the **Activate Now** button to apply the selected certificate to the Booster Server.

## 20.5 Web Security

The web access filter can be found under Web Security. It allows you to manage client permissions as well as the admin log which keeps track of any access or change to the communication system.

### 20.5.1 Connections to the Web Server

The connections of the clients (e.g., myPortal to go) to the internal web server of the communication system can be either encrypted (HTTPS) or unencrypted (HTTP).

---

**NOTICE:** Unencrypted connections to the web server may allow unauthorized access to sensitive data! For security reasons, it is strongly recommended that only an encrypted connection (HTTPS) be used when working with myPortal to go (Web Edition) over the Internet.

Only an encrypted connection to the web server is available for myPortal to go (App Edition).

---

### 20.5.1.1 How to Configure Connections to the Web Server (UC Suite)

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Security**.
3. Navigate in the menu tree to **Web Access**.
4. Configure the connections to the web server:
  - If you want to enable encrypted connections, select the check box **HTTPS**.
  - If you want to enable unencrypted connections, select the check box **HTTP**.
5. If appropriate, enable **Save login data to device** if you want to allow this function. This causes the login credentials in the web browser of the mobile phone to be saved using cookies.
6. Click on **Save**.

### 20.5.1.2 How to Configure Connections to the Web Server (UC Smart)

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Applications > UC Smart > Basic Settings**.
3. Make sure that UC Smart is **Active**.
4. Configure the connections to the web server:
  - If you want to enable encrypted connections, select the check box **HTTPS**.
  - If you want to enable unencrypted connections, select the check box **HTTP**.
5. Click on **Apply**, followed by **OK**.

## 20.5.2 Admin Log (also called Admin Protocol)

The Admin log enables you to track what changes were made to the communication system and by whom and when.

### 20.5.2.1 How to Load the Admin Log

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance** in the navigation tree.
3. Navigate in the menu tree to **Admin Log > Admin Log Data**.
4. The message "The admin log will be transferred from the system" appears in the **Admin Log Data** window. Please confirm".
5. Click on **Load**.

### 20.5.2.2 How to Change the Admin Log Language

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Telephony > Service**.
3. Navigate in the menu tree to **Admin Log > Configuration**.
4. Set the desired language in the **Edit Configuration** window under **Admin Log Language**.
5. Click on **Apply**.

## 20.6 SQL Security

OpenScape Business stores system configuration data, call data records, user account credentials, UC data etc. in an internal SQL database. Access to the database is protected by login credentials.

Up to SW version V2R2 the used login credentials are protected by a password, which could not be changed by an OpenScape Business administrator. From V2R2 on the password can be changed. The password is machine generated and is not shown to the administrator. For compatibility within multinode scenarios running old SW versions, it is possible to change back a modified password to the "old" value. The SQL access password configuration can be found under SQL Security. The SQL access password configuration can be used both in network and single node environments. The handling for specific single node or multinode scenarios is described with the subsequent chapters.

## 20.6.1 Single node

### SW Upgrade from V2R1 or older

After a SW upgrade from V2R1 the OLD SQL database password is active. The SQL password has to be changed within the new software version by the system administrator using the Administration Portal (WBM).

### Setup of new system

When the date is set up in the system for the first time, a new SQL password will be generated. Only the first time the date and time is set, is when the SQL password is changed automatically.

### Setup of a reloaded "single node" system

After each system reload the OLD SQL database password is active within the system. The SQL password has to be changed within the new software version by the system administrator using the Administration Portal (WBM).

## 20.6.2 Multinode

The single node system is configured and integrated in the network in the known manner. After system setup the new slave node synchronizes its SQL password with the master node. No action is required to adapt the SQL password within the slave node.

### Reload of a V2R2 or higher node within V2R2 or higher Network

After a reload of a network node within the network, the node has to re-configure and integrated again into the network.

### Reload of the Master Node

In case of a master node the SQL password has to be changed by the system administrator using the Administration Portal (WBM). All slave nodes synchronize their SQL password with the new one within the master node. No action is required to change the SQL password within the slave nodes.

### Reload of the Slave Node

In case of a slave node no action is required as the slave node synchronizes its SQL password with the master node.

### New V2R2 or higher slave node within V2R1 Network (not recommended scenario)

The single node system is configured and integrated in the network in the known manner. After system setup the new slave node detects that the master node uses the old SQL password and uses the old SQL password as well. No further action is required to adapt the SQL password within the slave node.

---

**NOTICE:** It is strictly recommended to upgrade the whole network to the latest software version.

---

### **New V2R2 or higher master node within V2R1 Network (not recommended scenario)**

The master node system is configured and integrated in the network in the known manner. After system setup the new master node uses the old SQL password. The system administrator may not change the old password, as the V2R1 slaves are not able to synchronize with a new SQL password in the master node. In this case the node would not work together within the network. In case that system administrator has change the SQL password by hazard he has to switch back to the "default" password within the master node configuration.

---

**NOTICE:** It is strictly recommended to upgrade the whole network to the latest software version.

---

## **20.6.3 How to Configure Passwords to the SQL Database**

### **Prerequisites**

You are logged into the WBM with the **Expert**.

### **Step by Step**

- 1.** In the navigation bar, click on **Expert Mode**.
- 2.** In the navigation tree, click **Telephony Server > Security**.
- 3.** Navigate in the menu tree to **SQL Security**.
- 4.** Configure the passwords to the SQL database:
  - If you want to generate a new password not known to the user, select the box **Generate new**.
  - If you want the default password to be activated, select the box **Activate default**.

---

**NOTICE:** In the landing page notification area, the following message will be displayed if the default sql password is used (or a password generated with the old password generation algorithm):

'Default SQL password is in use. Please consider changing it via Expert mode'

The message is a URL link that leads to the SQL Security page in order to change it.

---

## **20.7 SIP Attack Protection**

The so-called SIP attacks represent a new form of attacks on communications systems via IP telephony. Such attacks may occur

either from the LAN or via the Internet (through badly configured routers). Protection against SIP attacks is provided through password-protected SIP access.

The following rules should be applicable for any SIP subscriber access:

- Active authentication
- A qualified password that
  - is between 8 and 20 characters in length
  - includes one or more uppercase letters (A to Z)
  - includes one or more lowercase letters (A to Z)
  - includes one or more digits (0 to 9),
  - includes one or more special characters (e.g.: %),
  - does not have more than 3 repeated characters
- Definition of a SIP station ID that differs from the station number.

When a new SIP station is set up, authentication is activated by default, and a random password is generated. Since this random password is not known, it must be changed by the administrator.

The relevant settings in the communication system are made using the "Central Telephony" wizard or Manager E.

During system startup, the password list is checked, and an entry is made in the EventLog (Event Viewer) if a SIP station is configured without a password.

---

**INFO:** If the communication system is used as an Internet router, port 5060 must be closed (default setting). For Internet telephony via an ITSP, the communication system opens the relevant ports and keeps them open.

Port 5060 must likewise be closed If an external router or firewall is being used. The communication system is responsible for opening this port (if required).

---

## 21 Networking OpenScape Business

OpenScape Business communication systems can be networked with one another and additionally with the communication systems OpenScape 4000 (HiPath 4000) and OpenScape Voice as well. In a homogeneous OpenScape Business network, subscribers can now use features such as the presence status, voicemail, conferencing and much more in exactly the same way as was originally possible with only a single OpenScape Business communication system.

### Possible Networks:

- Pure voice network of OpenScape Business X
- OpenScape Business X and S OpenScape Business networking (optionally with UC Suite or UC Smart).
- OpenScape Business X with OpenScape 4000 (UC functionality in OpenScape Business only under certain conditions)
- OpenScape Business X with OpenScape Voice (without UC functionality in OpenScape Business)
- Connecting External Auxiliary Equipment to OpenScape Business via SIP Interconnection.
- Networking via ISDN
- OpenScape Business inter-network with central ITSP trunk connection

The communication systems are prepared for networking with the **Networking Configuration** wizard. In this wizard, it must be specified whether a master or slave node is involved. In addition, 16 lines are automatically assigned to route 16 (networking).

All networks that use unified communications features (such as UC Smart or UC Suite, for example) must be based on a closed numbering plan. Networks without unified communications features can be based on an open or closed numbering plan. In order to respond flexibly to future extension requests from customers, it is recommended to always use closed numbering for any newly created internetwork.

---

**INFO:** Configuring an IP network is a complex task and should only be performed by experienced service technicians.

---

It is not possible to set up a pure OpenScape Business X1 internetwork, since an X1 system cannot be a master system, and there always needs to be a master system in the internetwork.

A network of OpenScape Business with the following systems is not supported:

- HiPath 3000 SIP-Q; only TDM networking based on  $S_0/S_{2M}$  with CorNet NQ is supported; see [Networking via ISDN](#),
- HiPath 5000 RSM
- OpenScape Office MX
- OpenScape Office LX

The migration from a HiPath 3000 (including HiPath 5000 RSM) to OpenScape Business is described in the section on [Migration](#).

---

**NOTICE:** For information regarding licensing and upgrading or migrating systems in a network, please see **Network - Licensing** section in [Updates](#) chapter.

---

## 21.1 Network Plan

Before configuring an internetwork, a network plan should first be created after consulting with the customer.

The network plan should include the following data:

- Node ID (node number) and the associated IP addresses
- Dial plan

### 21.1.1 Homogeneous and Heterogeneous Networks

In general, a distinction is made in networking between homogeneous (where all components belong to a single system family) and heterogeneous networks (with different systems).

#### Homogeneous (Native) Network

#### Heterogeneous (Hybrid) Network

A homogeneous (native) network consists of components of the OpenScape Business systems family.

A heterogeneous (hybrid) network consists of components of the OpenScape Business systems family and an OpenScape 4000 or an OpenScape Voice, for example.

#### Overview of all OpenScape Business Nodes in the Network

All OpenScape Business nodes in an internetwork can be displayed via the **Networking** entry in the navigation bar of the WBM. In addition, all the OpenScape Business stations of the internetwork can be displayed sorted by node.

The following information can be displayed:

- **Node ID:** Node ID
- **M / S:** Identification to indicate whether the node is a Master or Slave
- **Net name:** name of the node
- **Type:** type of the node (**OSBiz X:** hardware model, **OSBiz S:** softswitch)
- **OSBiz X / OSBiz S:** IP address of the node, clickable (opens the WBM of the node)
- **Application Server:** IP address of the UC server (UC Booster Card or UC Booster Server)

- **Registration status:** status of the registration
- **Alive:** Displays whether the node is active or not

### 21.1.1.1 How to Display the Overview of all OpenScape Business Nodes

#### Prerequisites

Multiple OpenScape Business communication systems are networked with one another.

#### Step by Step

1. In the navigation bar, click on **Networking**.
2. Click on **Domain View** in the navigation tree. All OpenScape Business nodes in the internetwork are listed.

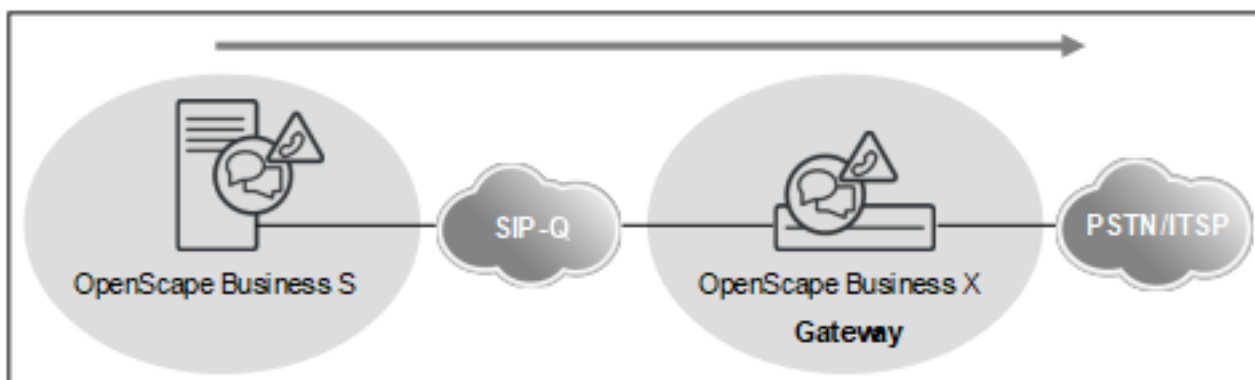

### 21.1.2 Single and Multi-Gateway

In homogeneous OpenScape Business networks, a distinction is made between a single network and multi-gateway network, depending on whether only a single gateway or multiple gateways are used.

#### Single Gateway

#### Multi-Gateway

In the case of a single-gateway network, calls from and to the server are routed via a single gateway. All IP stations that are registered at the server use this single gateway.

- Supported if there are one or more OpenScape Business S systems in the network.
- The IP stations are connected to different communication systems.
- OpenScape Business X is used as a gateway.

In the case of a multi-gateway network, calls are routed via several different OpenScape Business gateways.

- There is only one PSTN Provider and one CO station number per gateway.
- The stations of the different locations are registered at a central system (OpenScape Business S).
- Every station of the OpenScape Business S is assigned a specific gateway (OpenScape Business X).
- There must only be a single OpenScape Business S in the network.
- OpenScape Business and OpenScape Business S are in the same time zone and in the same country (same country code).
- There is only one CO access code network.
- ISDN and analog stations, for example, can be locally set up on the gateways.

## 21.2 Network-wide Features

Network-wide voice features are essentially determined by the SIP-Q networking protocol. Network-wide UC features are determined by the networking of the UC solution (UC Suite or UC Smart) and their UC clients.

### 21.2.1 Network-wide Features of the UC Solutions

The following table provides you with an overview of the network-wide features of both the UC solutions, UC Smart and UC Suite.

UC interworking using both OpenScape 4000 and OpenScape Voice is not possible. In an OpenScape Business internetwork, either UC Smart or UC Suite should be used. Mixed UC solutions are not supported.

| Network-wide UC features                                             | UC Smart       |                | UC Suite                       |                                                    |                                      |
|----------------------------------------------------------------------|----------------|----------------|--------------------------------|----------------------------------------------------|--------------------------------------|
|                                                                      | myPortal @work | myPortal to go | myPortal for Desktop / Outlook | myPortal @work                                     | myPortal to go                       |
| Network-wide visibility of the Presence status (presence management) | x              | x              | x                              | x                                                  | x                                    |
| Change of own presence status via the client                         | x              | x              | x                              | x                                                  | x                                    |
| Change of own presence status via the TUI                            | x              | x              | x                              | x                                                  | x                                    |
| Status-based call forwarding                                         | x              | x              | x                              | Via destinations defined in other UC Suite Clients | Via destinations defined in myPortal |
| Network-wide status display in Favorites                             | x              | x              | x                              | x                                                  | x                                    |
| Network-wide status display in directories                           | x              | x              | x                              | x                                                  | x                                    |
| Network-wide status display in the Journal                           | -              | -              | x                              | -                                                  | -                                    |
| Enable CallMe service                                                | -              | -              | x                              | x                                                  | x                                    |
| Calendar integration (Outlook)                                       | -              | -              | x                              | -                                                  | -                                    |
| Calendar integration (iCal) (only with myPortal for Desktop)         | -              | -              | x                              | -                                                  | -                                    |
| Network-wide display of the call status (free, busy, ringing state)  | x              | x              | x                              | x                                                  | x                                    |
| Creation of network-wide groups                                      | x              | x              | x                              | -                                                  | -                                    |
| Compact display of favorites                                         | -              | -              | x                              | -                                                  | -                                    |
| Conversations                                                        | x              | -              | -                              | x                                                  | -                                    |
| Personal directory                                                   | Local          | Local          | Local                          | Local                                              | Local                                |
| Internal directory                                                   | Local          | Local          | Local                          | Local                                              | Local                                |
| External directory                                                   | -              | -              | x                              | x                                                  | x                                    |

| Network-wide UC features                                      | UC Smart       |                | UC Suite                       |                |                |
|---------------------------------------------------------------|----------------|----------------|--------------------------------|----------------|----------------|
|                                                               | myPortal @work | myPortal to go | myPortal for Desktop / Outlook | myPortal @work | myPortal to go |
| Searching in directories on a network-wide basis              | x              | x              | x                              | x              | x              |
| Access to speed-dial destinations defined in the system (SSD) | Local          | Local          | -                              | Local          | Local          |
| Import/Manage personal contacts (CSV/XML)                     | x              | -              | x                              | -              | -              |
| Access to Outlook Contacts                                    | x              | -              | x                              | -              | -              |
| Import personal contacts (Mac OS) (myPortal for Desktop)      | -              | -              | x                              | -              | -              |
| Integration of external directory server via LDAP             | -              | -              | x                              | -              | -              |

### 21.2.2 Network-wide Voice Features

For networking via the SIP-Q protocol, the following voice features are supported for OpenScape Business and other communication systems.

| Feature                                                     | SIP-Q (IP Network) |
|-------------------------------------------------------------|--------------------|
| Basic call                                                  | Yes                |
| Callback on busy                                            | Yes                |
| Callback on RNA                                             | Yes                |
| Override                                                    | Yes                |
| Call waiting                                                | Yes                |
| Second call                                                 | Yes                |
| Calling Line Identification Presentation (CLIP)             | Yes                |
| Calling Line Identification Restriction (CLIR)              | Yes                |
| Connected Line ID Presentation (COLP)                       | Yes                |
| Connected Line ID Restriction (COLR)                        | Yes                |
| Calling / Connected Name Identification Presentation (CNIP) | Yes                |

| <b>Feature</b>                                             | <b>SIP-Q (IP Network)</b> |
|------------------------------------------------------------|---------------------------|
| Calling / Connected Name Identification Restriction (CNIR) | Yes                       |
| Do Not Disturb                                             | Yes                       |
| Call forwarding                                            | Yes                       |
| Call Forwarding on Busy                                    | Yes                       |
| Call Forwarding on RNA                                     | Yes                       |
| Call Deflection                                            | Yes                       |
| Advice of Charge at Call Setup                             | no                        |
| Advice of Charge during Call                               | Yes                       |
| Advice of Charge at the end of the call                    | Yes                       |
| Path optimization                                          | no                        |
| Rerouting                                                  | no                        |
| Message Waiting Indication / Info                          | Yes                       |
| Trace call                                                 | Yes                       |
| Hold                                                       | Yes                       |
| Toggle/Connect                                             | Yes                       |
| Transfer                                                   | Yes                       |
| Conferencing                                               | Yes                       |
| Automatic Recall                                           | Yes                       |
| Calling for Help                                           | Yes                       |
| Intercept                                                  | Yes                       |
| Private Numbering Plan (PNP)                               | no                        |
| Call pickup                                                | no                        |
| Hunt Group                                                 | Yes                       |
| SPE (except for conferencing and applications)             | Yes                       |

## 21.3 Licensing an Internetwork

For a networked communication system, central licensing can be selected.

All licenses of the individual systems are combined into a network-wide license at the license server. In the internetwork, the licenses can be assigned freely to the individual nodes using the WBM.

For more information, see [Licensing Multiple Communication Systems \(Internetwork\)](#) .

## 21.4 Networking Requirements

To ensure the quality of the voice transmission, the IP networks being used and the communication system must meet certain requirements. The voice quality and voice communication reliability always depend on the network technology in use.

### Network Parameters, LAN and WAN Requirements

| Parameters              | Minimum requireme | Notes                                                                                                                        |
|-------------------------|-------------------|------------------------------------------------------------------------------------------------------------------------------|
| Delay (one way)         | 50 ms             | Higher values degrade the voice quality.                                                                                     |
| Round Trip Delay        | 100 ms            | Higher values degrade the voice quality.                                                                                     |
| Jitter                  | 20 ms             | Higher values degrade the voice quality.                                                                                     |
| Packet Loss             | 3%                | For fax or modem transmissions using G.711, the packet loss should not exceed 0.05% (in the event that no T.38 is possible). |
| Consecutive Packet Loss | 3 with G.711      | Higher values degrade the voice quality.                                                                                     |

### Recommendation for Calculating Bandwidth

- A bandwidth of at least 256 kbps (in both the sending and receiving direction) is required on the internetwork.
- The bandwidth calculation should be based on a maximum of 50% for the voice portion with respect to the total bandwidth. In other words, in the case of a 1 Mbit WAN, for example, a maximum of 500 kbps should be calculated for voice. With the G.711 codec, for example, that would be a maximum of 5 IP trunks.
- Regardless thereof, the network properties with respect to QoS, delay, packet loss, etc., must also be taken into account.

### 21.4.1 LAN Networking Requirements

To ensure the quality of the voice and data transmissions, the IP networks being used and the communication system must meet certain requirements for the LAN.

#### LAN requirements

The data network must be of the Ethernet type:

- The recommended cable is at least a Cat.5 cable (screened/ unshielded multi-element cables characterized for up to 100 MHz for horizontal and building backbone cables as per EN 50288).
- Support for QoS: IEEE. 802.1p, DiffServ (RFC 2474).

- All active LAN ports must support 100 / 1000 MBit/sec. and full duplex communications.

Every communication system must be connected via a switch or a dedicated port of a router. Hubs and repeaters are not supported.

### Payload Connections with RTP (Real-time Transport Protocol) in a LAN Environment

The required bandwidth for voice transmissions in an IP network can be calculated with the help of the following table:

| Codec type | Packet parameters | Sample Rate (ms) | Payload (bytes) | Ethernet packet length (bytes) | Payload packet (overhead in percent) | Ethernet load (incl. header) (kbps) |
|------------|-------------------|------------------|-----------------|--------------------------------|--------------------------------------|-------------------------------------|
| G.711      | 20                | 20               | 160             | 230                            | 44%                                  | 92                                  |
| G.711      | 30                | 30               | 240             | 310                            | 29%                                  | 82.7                                |
| G.711      | 40                | 40               | 320             | 390                            | 22%                                  | 78                                  |
| G.711      | 60                | 60               | 480             | 550                            | 15%                                  | 73.3                                |
| G.729A     | 1                 | 20               | 20              | 90                             | 350%                                 | 36                                  |
| G.729A     | 2                 | 40               | 40              | 110                            | 175%                                 | 22                                  |
| G.729A     | 3                 | 60               | 60              | 130                            | 117%                                 | 17.3                                |
| RTCP       |                   | 5000             |                 | 280                            |                                      | 0.4                                 |

The load in the LAN applies to both the sending and receiving direction.

The calculation includes VLAN tagging in accordance IEEE 802.1q. Without VLAN tagging, the packet length is shorter by 4 bytes.

The overhead is calculated as follows:

| Protocol                  | Bytes |
|---------------------------|-------|
| RTP Header                | 12    |
| UDP Header                | 8     |
| IP Header                 | 20    |
| 802.1Q VLAN Tagging       | 4     |
| MAC (incl. Preamble, FCS) | 26    |
| Total                     | 70    |

Payload transport in a T.38 LAN environment:

|      | Sample Rate (ms) | Payload (bytes) | Ethernet packet length (bytes) | Payload packet (overhead in percent) | Ethernet load (incl. header) (kbps) |
|------|------------------|-----------------|--------------------------------|--------------------------------------|-------------------------------------|
| T.38 | 30               | 169             | 227                            | 34%                                  | 60.5                                |

Payload Connections with SRTP (Real-time Transport Protocol) in a LAN Environment:

| Codec type | Sample Rate (ms) | Payload (bytes) | Ethernet packet length (bytes) | SRTP Ethernet packet length (kbps) | RTP Ethernet packet length (kbps) | Additional bandwidth for SRTP (%) |
|------------|------------------|-----------------|--------------------------------|------------------------------------|-----------------------------------|-----------------------------------|
| G.711      | 20               | 160             | 244                            | 97.6                               | 92                                | 6.1                               |
| G.711      | 30               | 240             | 324                            | 86.4                               | 82.4                              | 4.5                               |
| G.711      | 40               | 320             | 404                            | 80.8                               | 78                                | 3.6                               |
| G.711      | 60               | 480             | 564                            | 75.2                               | 73.3                              | 2.5                               |
| G.729A     | 20               | 20              | 104                            | 41.6                               | 36                                | 15.6                              |
| G.729A     | 40               | 40              | 124                            | 24.8                               | 22                                | 12.7                              |
| G.729A     | 60               | 60              | 144                            | 19.2                               | 17.3                              | 10.8                              |

## 21.4.2 Dial Plan in the Network

The dial plan is an important prerequisite for networking. The complexity of the internetwork configuration depends on the dial plan. OpenScape Business generally supports open and closed numbering in an internetwork. It should be noted, however, that the full scope of UC features can only be used only with closed numbering.

### Closed numbering

In the case of closed numbering, a station in the internetwork is uniquely identified by the station number. Each station in the internetwork can reach another station by directly dialing its station number.

The advantage of closed numbering is that you do not have to dial a node number to reach another station in another networked communication system.

**Table 10: Examples of closed numbering**

|               | Node 1 | Node 2 | Node 3 | Node 4 |
|---------------|--------|--------|--------|--------|
| Phone Numbers | 100    | 200    | 300    | 400    |
|               | 101    | 201    | 301    | 401    |
|               | 102    | 202    | 302    | 402    |
|               | 103    | 203    | 303    | 403    |
|               | 104    | 204    | 304    | 404    |

### Open numbering

In open numbering, a station is uniquely identified by the node number and the station number. Users of different communication systems (nodes) in the internetwork can thus have the same station number.

With open numbering, the station's node number must always be dialed in addition to the phone number. Phone number ranges can be used more than once for this, and multiple phone numbers can be used.

The following UC features are not supported with open numbering:

- UC Smart
- UC Suite
- network-wide CSP (CSTA Service Provider)
- DSS server
- CMD (CSTA Message Dispatcher)

**Table 11: Examples of Open Numbering**

|                           | <b>Node 1</b> | <b>Node 2</b> | <b>Node 3</b> | <b>Node 4</b> |
|---------------------------|---------------|---------------|---------------|---------------|
| Node number (PABX number) | 95            | 96            | 97            | 98            |
| Phone Numbers             | 100           | 100           | 100           | 100           |
|                           | 101           | 101           | 101           | 101           |
|                           | 102           | 102           | 102           | 102           |
|                           | 103           | 103           | 103           | 103           |
|                           | 104           | 104           | 104           | 104           |

#### **21.4.2.1 Dialing Public Phone Numbers in the Network**

Regardless of whether a closed or open numbering system is being used, it makes sense to dial both node and network-internal destinations using public phone numbers (e.g., as a UC client that dials contacts in the fully-qualified format from directories).

### **21.5 Path Optimization (Path Replacement)**

Path optimization (also called path replacement) helps to avoid the dual seizure of IP trunks for networked communication systems.

When multiple OpenScape Business systems are networked, the following problem could occur, for example: First, let us assume that subscriber A calls subscriber B who, in turn, has forwarded all calls to subscriber C. Subscribers A and C are in the same network node, but subscriber B is on a different network node. Consequently, the call with call forwarding initially seizes two trunks between the two network nodes. To avoid this dual seizure, path optimization must be enabled.

---

**INFO:** The system flag for the path optimization must be enabled for all networked OpenScape Business systems.

---

---

**INFO:** It is strongly advised to not use Path Replacement feature in networks where analogue fax stations are used. This limitation will be raised with an upcoming software version.

---

The path optimization is performed:

- Within the OpenScape Business network segment
- After the connection setup (not in the ringing phase!)
- After transfer scenarios
- After call forwarding and CFNA (call forwarding-no answer)

The path optimization is not performed:

- When a ringing group or group call is involved
- For conferences
- If some other feature is enabled when executing the path optimization, the optimization is aborted.
- For inhomogeneous networking, the external systems are configured via the SIP interconnection. In this case, regardless of the configuration of the flag, no path replacement is possible (e.g., OpenScape 4000, OpenScape Voice, external SIP servers).

## 21.5.1 How to Enable or Disable Path Optimization (Path Replacement)

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony** > **Basic Settings** in the navigation tree.
3. In the menu tree, click on **System** > **System Flags**.
4. Select one of the following options:
  - If you want to allow a call pickup for recalls, enable the **Path optimization** check box.
  - If you do not want to allow a call pickup for recalls, clear the **Path optimization** check box.
5. Click on **Apply** followed by **OK**.

## 21.6 Networking Scenarios

There are several scenarios how OpenScape Business systems can be networked with one another and with other communication systems.

- Networking Multiple OpenScape Business X Systems
- Networking OpenScape Business X and OpenScape Business S (Single Gateway)
- Networking OpenScape Business X and OpenScape Business S (Multi-Gateway)
- Networking of OpenScape Business S in a Hosting Environment
- Networking OpenScape Business X and OpenScape Voice
- Networking OpenScape Business X and OpenScape Voice
- Connecting External Auxiliary Equipment to OpenScape Business via SIP Interconnection
- Open Numbering in OpenScape Business X Networks
- Networking via ISDN
- OpenScape Business internetwork with central ITSP trunk connection

Call charge details can only be retrieved per network node, but not across nodes.

### 21.6.1 Dependencies and Restrictions

It is important to note some dependencies and constraints on the possible networking scenarios.

#### Dependencies and Restrictions

- Every system in the internetwork is assigned its own time zone. Consequently, all stations in a system have the same time zone.
- OpenScape Business S multi-gateway networks have only been released within a country (same time zone, same CO access code).
- As a general rule, all OpenScape Business internetworks are configured using wizards. OpenScape Voice and OpenScape 4000 in the internetwork are configured per node in Expert mode.
- The Presence Manager (DSS server functionality = network-wide display of busy states at DSS keys + call pickup) is available in OpenScape Business networks.
- SIP-Q trunks with route 16 (last route) are used to configure homogeneous OpenScape Business communication systems via the **Networking Configuration** wizard. External SIP trunks (SIP interconnections) are used for networking OpenScape 4000, OpenScape Voice or other communication systems; the configuration is performed in Expert mode.
- If the system is configured as a slave or master using the **Networking Configuration** wizard, a check is performed to determine whether lines are assigned to "Networking" route. If not, 16 lines are automatically assigned to the "Networking" route. If the system is removed from the internetwork, these assignments are retained.
- In each node, only ONE voicemail system can be used. As a general rule, different voicemail systems are allowed in an OpenScape Business internetwork:
  - If the UC Suite is used, any other voicemail systems present in the internetwork must be disabled by the administrator.

- A HiPath 3000 internetwork with different voicemail systems can be migrated 1:1 to OpenScape Business.
- For technical reasons, OpenScape Business X1 systems can not be set up as masters. Since a master system is required in each OpenScape Business network, at least one system must be larger than X1.

---

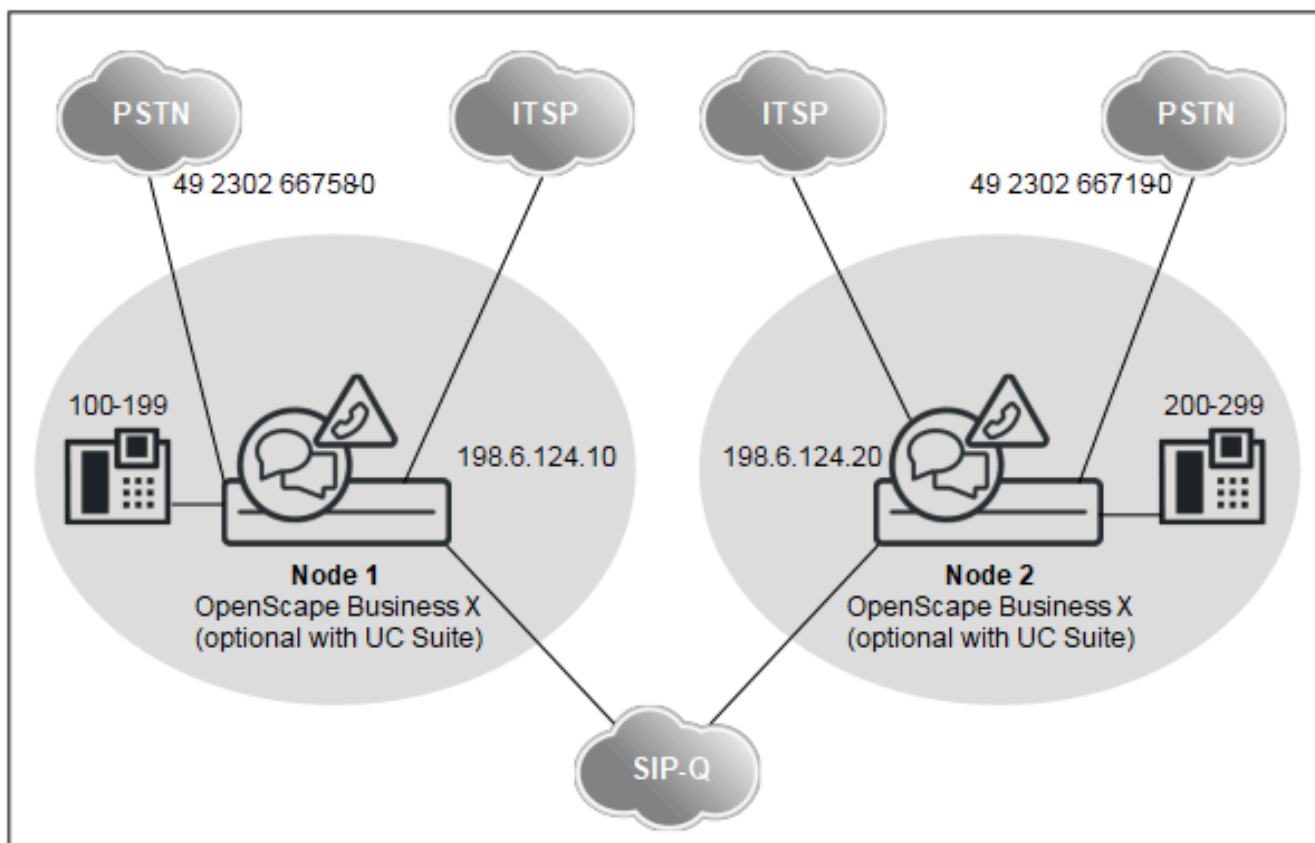

**INFO:** The relevant sales limits may differ from these details (and the following details in the individual scenarios). Please read the notes in the Sales Information.

---

### 21.6.2 Networking Multiple OpenScape Business X Systems

Up to 32 OpenScape Business X communication systems can be networked with each other.

#### Network Data

- With UC solution (UC Smart or UC Suite): Only closed numbering possible
- Without UC solution: Closed or open numbering possible
- Configuration via WBM (wizards) when using closed numbering
- UC Suite functionality based on UC Booster Server or UC Booster Card
- Up to 32 networked systems and 1500 users without UC solution

- Up to 8 networked systems and 1500 users with UC solution

### Network-wide Features

| UC networking                                               | Closed numbering                              | Open numbering |
|-------------------------------------------------------------|-----------------------------------------------|----------------|
| Maximum number of nodes                                     | 8 with UC solution and 32 without UC solution |                |
| Maximum number of stations in a single communication system | Depending on OpenScape Business X             |                |
| Maximum number of stations in the network                   | 1500                                          |                |

| UC networking     | Closed numbering                                                                                       | Open numbering |
|-------------------|--------------------------------------------------------------------------------------------------------|----------------|
| UC Booster Card   | UC Smart: 51 - 150 stations<br>(0 - 50 stations without UC Booster Card)<br>UC Suite: 0 - 150 stations | Not supported  |
| UC Booster Server | UC Smart: from 150 stations<br>UC Suite: from 150 stations                                             | Not supported  |

| Administration                                                      | Closed numbering                              | Open numbering                                |
|---------------------------------------------------------------------|-----------------------------------------------|-----------------------------------------------|
| WBM                                                                 | Network-wide administration using wizards     | Network-wide administration in Expert mode    |
| Manager E                                                           | Network-wide administration for special tasks | Network-wide administration for special tasks |
| UC Suite Administration (for UC Booster Server and UC Booster Card) | Network-wide administration using wizards     | Not supported                                 |
| Mass data import via CSV files (call numbers, DID numbers, names)   | Separately for each node in the internetwork  |                                               |

| Licensing           | Closed numbering                               | Open numbering |
|---------------------|------------------------------------------------|----------------|
| Licensing structure | A networking license is required for each node |                |

### Configuration

This configuration (with closed numbering and UC Suite) shows the steps required to set up networking with the help of an example.

Prerequisites:

- A network plan is available. The network plan was used to ensure that every internal call number in the internetwork is only used once for closed numbering. Different station number lengths are allowed. Only DID station numbers may occur more than once (e.g., the CO station numbers 49 2302 66758 100 and 49 2302 66719 100 have the same DID No. 100).

---

**INFO:** The station numbers may need to be adapted. An open numbering scheme is not implemented!

---

- The IP network has been configured, and all nodes can be mutually pinged successfully
- All nodes have been upgraded to the same software version

Call forwarding across nodes: For incoming calls over IP trunks, which have already been forwarded, no further forwardings to the voicemail box are executed. This is because no unique assignment to the voicemail box can otherwise be made

If cross-node deputy rules (referral extensions) are required, this must be set up via the profiles of the OpenScape Business stations or ringing groups. The corresponding cross-node calls are not signaled as forwarded in this case, but as DSS (direct station selection) calls. Call forwardings of the deputy are therefore forwarded to the voicemail box

**Table 12: Setting up the Location Data for Node 1**

| <b>Node 1</b>             |                        |          |
|---------------------------|------------------------|----------|
| G.-Location Country       |                        | 49       |
| G.-Location Local Network |                        | 2302     |
| G.-Location System        |                        | 66758    |
| International Prefix      |                        | 00       |
| National Prefix           |                        | 0        |
| <b>Routes</b>             |                        |          |
| ISDN                      | Trunk code             | 0        |
| Networking                | 2nd trunk code         | 0        |
| <b>Routing parameters</b> |                        |          |
| Route                     | No. and type, outgoing | RNR type |
| Networking                | Unknown                | Int/DID  |
| ISDN                      | (No change in entry)   | DID      |

The station numbers of all stations outside node 1 are automatically entered in the routing tables. This includes the internal station numbers as well as the DID station numbers, which differ from the respective internal station numbers.

**Table 13: Overview of Entries in the LCR for Node 1**

| Dial Plan       |                   | Routing table |                   |            | Dial Rule       |                       |               |
|-----------------|-------------------|---------------|-------------------|------------|-----------------|-----------------------|---------------|
| Name            | Dialed digits     | Route         | Dedicated Gateway | Gateway ID | Dial Rule       | Procedure             | Type          |
| Node 2 Internat | 0C0049230266719-Z | Networking    | Mandatory         | 2          | D49230266719E3A | Corp. Network         | International |
| Node 2 NAT      | 0C0230266719-Z    |               |                   |            |                 |                       |               |
| Node 2 Stn.     | 0C66719-Z         |               |                   |            |                 |                       |               |
| CO              | 0CZ               | ISDN          | No                |            | A               | Main network supplier | Unknown       |
| Various         | -Z                | Networking    | No                |            | A               | Corp. Network         | Unknown       |

**Table 14: Setting up the Location Data for Node 2**

| Node 2                    |                        |          |
|---------------------------|------------------------|----------|
| G.-Location Country       |                        | 49       |
| G.-Location Local Network |                        | 2302     |
| G.-Location System        |                        | 66719    |
| International Prefix      |                        | 00       |
| National Prefix           |                        | 0        |
| <b>Routes</b>             |                        |          |
| ISDN                      | Trunk code             | 0        |
| Networking                | 2nd trunk code         | 0        |
| <b>Routing parameters</b> |                        |          |
| Route                     | No. and type, outgoing | RNR type |
| Networking                | Unknown                | Int/DID  |
| ISDN                      | (No change in entry)   | DID      |

The station numbers of all stations outside node 2 are automatically entered in the routing tables. This includes the internal station numbers as well as the DID station numbers, which differ from the respective internal station numbers.

Table 15: Overview of Entries in the LCR for Node 2

| Dial Plan          |                   | Routing table |                   |            | Dial Rule       |                             |               |
|--------------------|-------------------|---------------|-------------------|------------|-----------------|-----------------------------|---------------|
| Name               | Dialed digits     | Route         | Dedicated Gateway | Gateway ID | Dial Rule       | Procedure                   | Type          |

| Node 1<br>Stn.     | 0C66758-Z         |               |                   |            |                 |                             |               |
| CO                 | 0CZ               | ISDN          | No                |            | A               | Main<br>network<br>supplier | Unknown       |
| Various            | -Z                | Networking    | No                |            | A               | Corp.<br>Network            | Unknown       |

Procedure to Set up Networking:

- 1) Configure the basic installation for node 1 (master)
- 2) Configuring Networking for Node 1
- 3) Configure the basic installation for node 2 (slave)
- 4) Configuring Networking for Node 2
- 5) Verify the networking function for the master
- 6) Check routes and routing parameters (master)
- 7) Check routes and routing parameters (Trk. Grp. 16) (master)
- 8) Configure LCR for networking (master)
- 9) Check routes and routing parameters (Slave)
- 10) Configure LCR for networking (slave)

### 21.6.2.1 How to Configure the Basic Installation for Node 1 (Master)

For integration in an internetwork, the country code and a node ID must be assigned. The internal station numbers must be uniquely configured throughout the network. The entry of the national and local station numbers is important, since this station number is set in the Trk. Grp. 1 ISDN trunk and used as the location number for normalization.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > Basic Installation**.
3. Click on **Edit** to start the **Basic Installation** wizard.
4. In the **Country Code** field, enter the country code prefix, e.g., 49 for Germany.

5. Enter the **Area Code** and **PABX number**.
6. Select the **Network Integration** check box.
7. In the **Node ID** field for OpenScape Business, enter a node ID that is unique in the internetwork (a "1" for the configuration example).
8. Click on **Execute function**. You are taken to the **Central Functions for Stations** window.
9. Since all internal station numbers must be unique in a network, the standard station numbers must be deleted. Enable the **Delete all station call numbers** radio button.
10. Enable the check box **Delete all station numbers** and click on **OK & Next**. You are taken to the **Change preconfigured call and functional numbers** window.

---

**NOTICE:** The function codes must be unique in the internetwork. Duplicate station numbers are not allowed!

---

11. Adapt the preconfigured station numbers to the station numbers in the network and click **OK & Next**. You can optionally adapt the station numbers manually via the wizard or import a CSV file with the appropriately prepared station numbers.
12. Now configure the IP clients.
13. Edit the settings for a Meet-Me conference. You must enter a code that is unique in the internetwork.
14. Now configure the sending of e-mails.
15. Click on **Finish**.

### 21.6.2.2 How to Configure Networking for Node 1 (Master)

In the next step, the wizard is used to configure the networking.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > Basic Installation**.
3. Click on **Edit** to start the **Networking Configuration** wizard.
4. Select the **Network with OSBiz X / S OSBiz S** setting.
5. Define the node type (**Master**).
6. Under **Node ID**, enter the appropriate node numbers of the associated OpenScape Business systems (in the configuration example, those of the slaves with node ID 2).
7. Under **IP Address**, enter the IP addresses of the associated OpenScape Business systems (in the configuration example, those of the slave with node ID 2).
8. Under **Name**, enter the appropriate type of the subsystem.
9. Enable the **Encryption Required** check box if required.

---

**INFO:** The encryption is based on SPE and does not apply to the applications!

---

---

**NOTICE:** Note that the encryption is not configured by simply enabling the check box. See [Signaling and Payload Encryption \(SPE\)](#) .

---

10. Click on **Finish**.

### 21.6.2.3 How to Configure the Basic Installation for Node 2 (Slave)

For integration in an internetwork, the country code and a node ID must be assigned. The internal station numbers must be uniquely configured throughout the network. The entry of the national and local station numbers is important, since this station number is set in the Trk. Grp. 1 ISDN trunk and used as the location number for normalization.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click on **Wizards > Basic Installation**.
3. In the **Country Code** field, enter the country code prefix, e.g., 49 for Germany.
4. Enter the **Area Code** and **PABX number**.
5. Select the **Network Integration** check box.
6. In the **Node ID** field for OpenScape Business S, enter a node ID that is unique in the internetwork (a "2" for the configuration example).
7. Click on **Execute function**. You are taken to the **Central Functions for Stations** window.
8. Since all internal station numbers must be unique in a network, the standard station numbers must be deleted. Enable the **Delete all station call numbers** radio button.
9. Enable the check box **Delete all station numbers** and click **OK & Next**. You are taken to the **Change preconfigured call and functional numbers** window.

---

**NOTICE:** The function codes must be unique in the internetwork. Duplicate station numbers are not allowed!

---

10. Adapt the preconfigured station numbers to the station numbers in the network and click **OK & Next**. You can optionally adapt the station numbers manually via the wizard or import a CSV file with the appropriately prepared station numbers.
11. Now configure the IP clients.

12. Edit the settings for a Meet-Me conference. You must enter a code that is unique in the internetwork.
13. Now configure the sending of e-mails.
14. Click on **Finish**.

#### 21.6.2.4 How to Configure Networking for Node 2 (Slave)

In the next step, the wizard is used to configure the networking.

##### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

##### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > Basic Installation**.
3. Click on **Edit** to start the **Networking Configuration** wizard.
4. Select the **Network with OSBiz X / S OSBiz S** setting.
5. Under **Node type**, select the check box **This system is a SLAVE node**.
6. Enter the IP address of the master under **IP address**.

---

**INFO:** Note that this action cannot be undone after clicking **OK & Next!**

---

7. The **Registration Status** displays **Status successful** (or a corresponding error message). This completes the wizard.
8. Click on **Finish**.

#### 21.6.2.5 How to Verify the Networking Function for the Master

You can verify the status of the network in general and also the individual station numbers.

##### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

##### Step by Step

1. In the navigation bar, click on **Network**.
2. The status bar shows the **Synchronization status** for the network. Green means that there are no networking problems; red indicates problems in the network.
3. Selecting the **Domain View** tab in the **Network** window shows all available nodes with the **Node ID, Name, System Type, Server Address, Registration Status** and **Availability Status**.
4. Selecting the **Phone Numbers** tab in the **Network** window opens a window with all the relevant details on the following:
  - **Call number**

- **DID**
- **Name**
- **Port Type**
- **Nodes**

### 21.6.2.6 How to Configure Routes and Routing Parameters (ISDN Trunk for the Master)

In the following steps, you will configure the routes for the networking of the master.

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Trunks/Routing**.
3. In the menu tree, click **Route**.
4. In the **Change Route** window, enter a name for the CO trunk in the **Route Name** field, e.g., *Route 1*.
5. Under **Seizure code**, enter 0.
6. Under **Incoming PABX number**, in the **Country code** field, enter the value 49.
7. Under **Incoming PABX number**, in the **Local area code** field, enter the value 2302.
8. Under **Incoming PABX number**, in the **PABX number** field, enter the value 66758.
9. Select the check box **Incoming PABX number** in the **Location number** field.
10. Click on **Apply** followed by **OK**.

### 21.6.2.7 How to Configure Routes and Routing Parameters (Trk. Grp. 16) (Master)

For route 64 (networking), the entry for the 2nd trunk code is mandatory for the master and slave and must be filled in. Route 16 is the default route for networking with OpenScape Business.

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Trunks/Routing**.
3. In the menu tree, click on the last **Route (Route 16)**.
4. In the **Change Route** window, enter a name for the network route in the **Route Name** field, e.g., *Networking*.

5. Do not enter anything for the **Seizure code**.
6. Enter a "0" under **CO code (2nd trunk code)**.
7. The default settings for the routing parameters (No. and type, outgoing, Call number type) can be used.
8. Click on **Apply** followed by **OK**.

### 21.6.2.8 How to Configure Least Cost Routing (LCR) for the Network (Master)

The default entries in index 32, 33 and 34 in the LCR dial plan must be extended with further entries to enable the dialing of station numbers in "international, national and station" formats for calls to node 2. "International" and "National" are always needed. "Local" is only needed for partner nodes that are in the same local network. These entries are used for dialing from applications (e.g., myPortal for Desktop).

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > LCR**.
3. Click on **Dial Plan** in the menu tree.
4. Enter the following values in the free positions after the default values (35 to 37 in this case):

| Dial Plan | Name         | Dialed digits     | Route table |
|-----------|--------------|-------------------|-------------|
| 32        | Standard     | 88CZ              | 1           |
| 33        | IP Network   | -Z                | 13          |
| 34        | CO Internat  | 0C0049-Z          | 14          |
| 35        | Node 2 Inter | 0C0049230266719-Z | 16          |
| 36        | Node 2 NAT   | 0C0230266719-Z    | 16          |
| 37        | Node 2 Stn.  | 0C66719-Z         | 16          |

5. Click on **Apply** followed by **OK**.
6. In the menu tree, click on the associated **Dial Rule** for node 2.
  - a) Under **Rule Name**, enter the value **Node 2**.
  - b) Under **Dial rule format**, enter the value **D49230266719E3A**.
  - c) Select **Corporate Network** as the **Network provider's method of access**.
  - d) Under **Type**, select the item **Country code**.
  - e) Click on **Apply** followed by **OK**.
7. Click on **Routing table** in the menu tree.
8. Click on routing table 16.

- a) Under **Route**, select the item **Networking**.
- b) Under **Dial Rule**, select the item **Node 2**.
- c) Under **min. COS**, select the item **15**.
- d) Under **Warning**, select the item **None**.
- e) Under **Dedicated Gateway**, select the item **Forced**.
- f) Under **GW Node ID**, select the item **2**.
- g) Click on **Apply** followed by **OK**.

### 21.6.2.9 How to Configure Routes and Routing Parameters (Slave)

In the following steps, you will configure the route and routing parameters for the networking of the slave.

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Trunks/Routing**.
3. In the menu tree, click **Route**.
4. In the **Change Route** window, enter a name for the network route in the **Route Name** field, e.g., *Route 1*.
5. Under **Seizure code**, enter 0.
6. Under **Incoming PABX number**, in the **Country code** field, enter the value 49.
7. Under **Incoming PABX number**, in the **Local area code** field, enter the value 2302.
8. Under **Incoming PABX number**, in the **PABX number** field, enter the value 66719.
9. Select the check box **Incoming PABX number** in the **Location number** field.
10. The default settings for the routing parameters (No. and type, outgoing, Call number type) can be used.
11. Click on **Apply** followed by **OK**.

### 21.6.2.10 How to Configure Least Cost Routing (LCR) for the Network (Slave)

The default entries in index 32, 33, 34 and 35 in the LCR dial plan must be extended with further entries to enable the dialing of station numbers in "international, national and station" formats for calls to node 2. "International" and "National" are always needed. "Local" is only needed for partner nodes that are in the same local network. These entries are used for dialing from applications (e.g., myPortal for Desktop).

**Prerequisites**

You are logged into the WBM with the **Expert** profile.

**Step by Step**

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > LCR**.
3. Click on **Dial Plan** in the menu tree.
4. Enter the following values in the free positions after the default values (35 to 37 in this case):

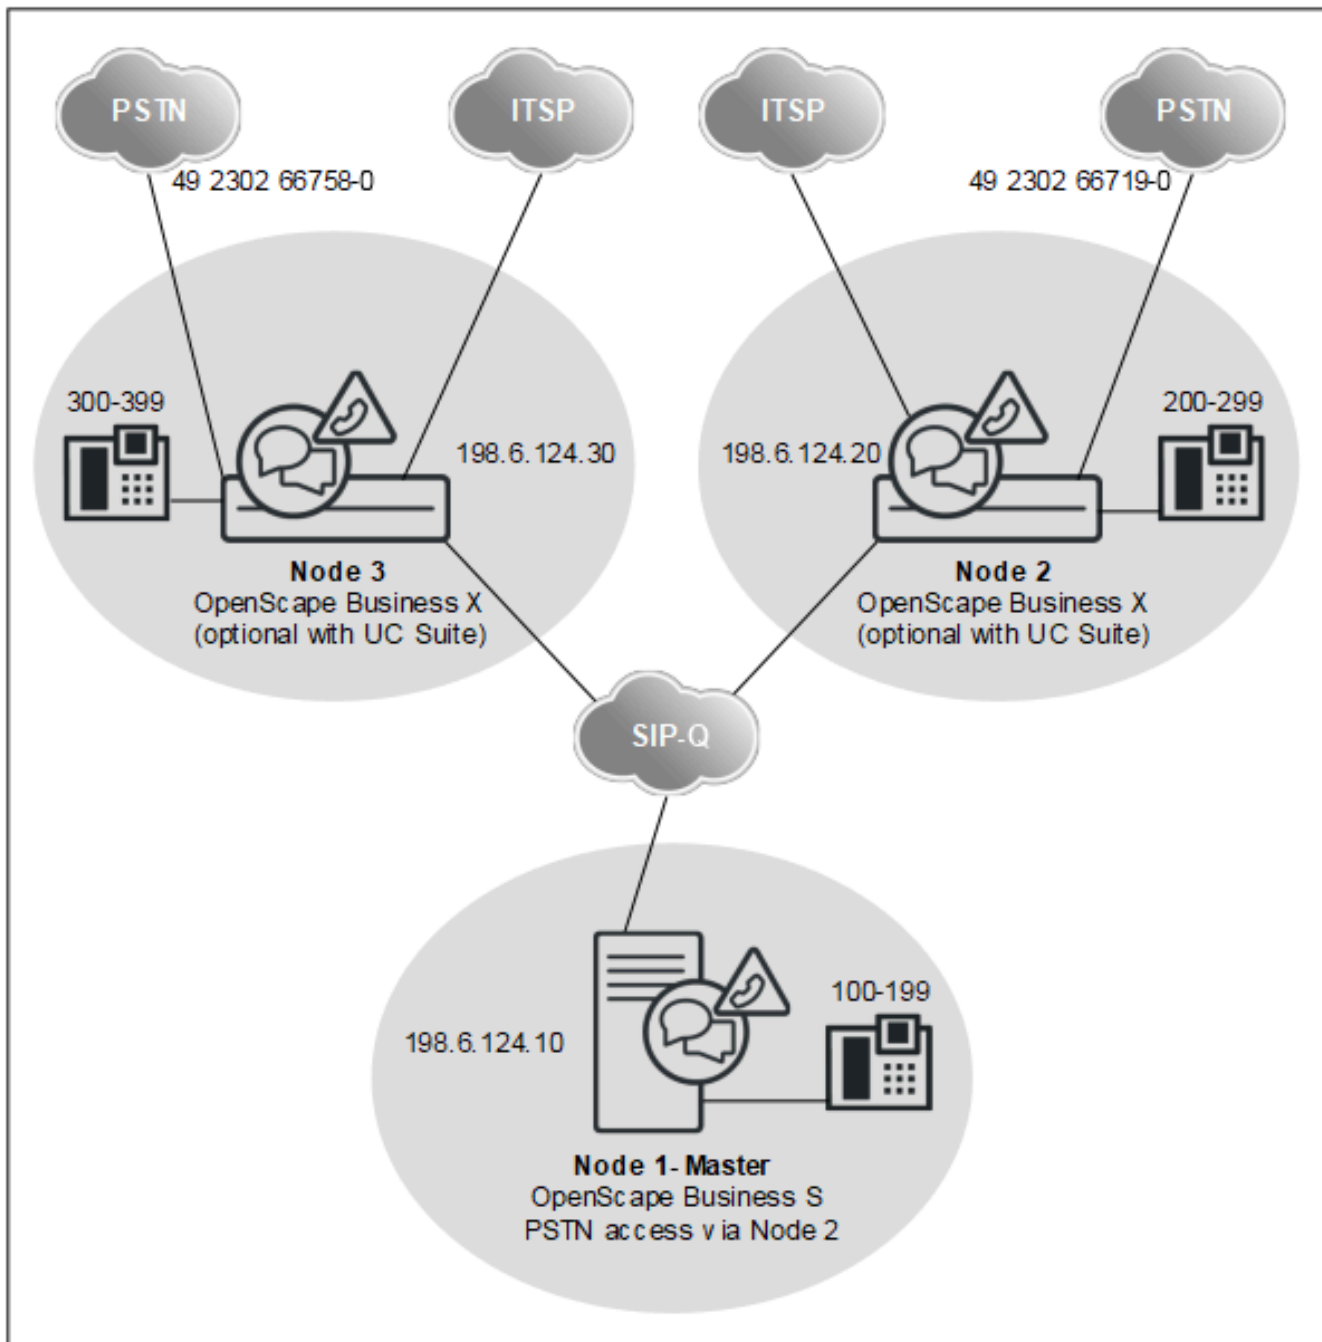

| Dial Plan | Name         | Dialed digits     | Route table |
|-----------|--------------|-------------------|-------------|
| 32        | Standard     | 88CZ              | 1           |
| 33        | IP Network   | -Z                | 13          |
| 34        | CO Internat  | 0C0049-Z          | 14          |
| 36        | Node 1 Inter | 0C0049230266758-Z | 16          |
| 37        | Node 1 NAT   | 0C00230266758-Z   | 16          |
| 38        | Node 1 Stn.  | 0C66758-Z         | 16          |

5. Click on **Apply** followed by **OK**.
6. Click in the menu tree on **Dial Rule** for **Node 2**.
  - a) Under **Rule Name**, enter the value **Node 1**.
  - b) Under **Dial rule format**, enter the value **D49230266758E3A**.
  - c) Select **Corporate Network** as the **Network provider's method of access**.
  - d) Under **Type**, select the item **Country code**.
  - e) Click on **Apply** followed by **OK**.
7. Click on routing table 16.
  - a) Under **Route**, select the item **Networking**.
  - b) Under **Dial Rule**, select the item **Node 1**.
  - c) Under **min. COS**, select the item **15**.
  - d) Under **Warning**, select the item **None**.
  - e) Under **Dedicated Gateway**, select the item **Forced**.
  - f) Under **GW Node ID**, select the item **2**.
  - g) Click on **Apply** followed by **OK**.
8. Click on **Routing table** in the menu tree.

### 21.6.3 Networking OpenScape Business X and OpenScape Business S (Single Gateway)

Up to 32 OpenScape Business X/S communication systems can be networked with each other. Multiple OpenScape Business S systems are allowed in an internetwork. Single Gateway means that all IP stations registered at OpenScape Business S only use ONE gateway to the PSTN or ITSP.

### Network Data

- Closed numbering
- Network-wide voice and UC functionality with UC Suite configuration via WBM (wizards)
- The UC functionality is implemented either through the UC Booster Server or via the UC Booster Card
- Several OpenScape Business S in one internetwork are allowed.
- Up to 32 networked systems and 1500 users without UC solution
- Up to 8 networked systems and 1500 users with UC solution

**Network-wide Features**

| UC networking                                               | Closed numbering                              | Open numbering |
|-------------------------------------------------------------|-----------------------------------------------|----------------|
| Maximum number of nodes                                     | 8 with UC solution and 32 without UC solution |                |
| Maximum number of stations in a single communication system | Depending on OpenScape Business X             |                |
| Maximum number of stations in the network                   | 1500                                          |                |

| UC networking     | Closed numbering                                                                                           | Open numbering |
|-------------------|------------------------------------------------------------------------------------------------------------|----------------|
| UC Booster Card   | UC Smart: 51 - 150 stations<br>(0 - 50 stations without UC Booster Card)<br><br>UC Suite: 0 - 150 stations | Not supported  |
| UC Booster Server | UC Smart: from 150 stations<br>UC Suite: from 150 stations                                                 | Not supported  |

| Administration                                                      | Closed numbering                                                             | Open numbering |
|---------------------------------------------------------------------|------------------------------------------------------------------------------|----------------|
| WBM                                                                 | Network-wide administration using wizards                                    | Not supported  |
| Manager E                                                           | Network-wide administration for special tasks (not for OpenScape Business S) | Not supported  |
| UC Suite Administration (for UC Booster Server and UC Booster Card) | Network-wide administration using wizards                                    | Not supported  |
| Mass data import via CSV files (call numbers, DID numbers, names)   | Separately for each node in the internetwork                                 | Not supported  |

| Licensing           | Closed numbering                               | Open numbering |
|---------------------|------------------------------------------------|----------------|
| Licensing structure | A networking license is required for each node | Not supported  |

**Configuration**

This configuration (with closed numbering and UC Suite) shows the steps required to set up networking with the help of an example.

Prerequisites:

- A network plan is available. The network plan was used to ensure that every internal call number in the internetwork is only used once for closed numbering. Different station number lengths are allowed. Only DID station numbers may occur more than once (e.g., the CO station numbers 49 2302 66758 100 and 49 2302 66719 100 have the same DID No. 100).
- The IP network has been configured, and all nodes can be mutually pinged successfully

Call forwarding across nodes: For incoming calls over IP trunks, which have already been forwarded, no further forwardings to the voicemail box are executed. This is because no unique assignment to the voicemail box can otherwise be made

If cross-node deputy rules (referral extensions) are required, this must be set up via the profiles of the OpenScape Business stations or ringing groups. The corresponding cross-node calls are not signaled as forwarded in this case, but as DSS (direct station selection) calls. Call forwardings of the deputy are therefore forwarded to the voicemail box.

In an internetwork in which the activation period is being used, the CLA of OpenScape Business S must always as be used as the central CLA!

Due to the different amounts of the upper limits, two different activation period files are required for OpenScape Business and OpenScape Business S. The activation period file for OpenScape Business S includes the OpenScape Business base in addition to the S base for networking scenarios.

In this scenario, whenever an OpenScape Business requests a license from a CLA of the OpenScape Business S during the activation period, the limits of the OpenScape Business S are used.

By contrast, if the CLA of the OpenScape Business were to be used instead, NO activation period would be granted to any requesting OpenScape Business S, since no basis for OpenScape Business S is included in this file.

**Table 16: Setting up the Location Data for Node 1, OpenScape Business S**

| Node 1                    |                        |          |
|---------------------------|------------------------|----------|
| G.-Location Country       |                        | 49       |
| G.-Location Local Network |                        | 2302     |
| G.-Location System        |                        | 66719    |
| International Prefix      |                        | 00       |
| National Prefix           |                        | 0        |
| <b>Routes</b>             |                        |          |
| Trk. Grp 1                | Trunk code             | 0        |
| Networking                | 2nd trunk code         | 0        |
| <b>Routing parameters</b> |                        |          |
| Route                     | No. and type, outgoing | RNR type |
| Networking                | Unknown                | Int/DID  |
| ISDN                      | (No change in entry)   | DID      |

The station numbers of all stations outside node 1 are automatically entered in the routing tables. This includes the internal station

numbers as well as the DID station numbers, which differ from the respective internal station numbers.

| CO                 | 0CZ                | ISDN          | No                |            | A               | Main<br>network<br>supplier | Unknown       |
| Various            | -Z                 | Networking    | No                |            | A               | Corp.<br>Network            | Unknown       |

Procedure to Set up Networking:

- 1)** Configure the basic installation for node 1 (master)
- 2)** Configuring Networking for Node 1
- 3)** Configure the basic installation for node 2 (slave)
- 4)** Configuring Networking for Node 2
- 5)** Configure the basic installation for node 3 (slave)
- 6)** Configure networking for node 3 (slave)
- 7)** Verify the networking function for the master
- 8)** Configure LCR for networking (node 1, master)
- 9)** Configure LCR for networking (node 2)
- 10)** Configure routes and routing parameters (node 3)
- 11)** Configure routes and routing parameters (Trk. Grp. 16) (Node 3)
- 12)** Configure LCR for networking (node 3)

### 21.6.3.1 How to Configure the Basic Installation for Node 1 (Master)

For integration in an internetwork, the country code and a node ID must be assigned. The internal station numbers must be uniquely configured throughout the network. The entry of the national and local station numbers is important, since this station number is set

in the Trk. Grp. 1 ISDN trunk and used as the location number for normalization.

### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click on **Wizards > Basic Installation**.
3. In the **Country Code** field, enter the country code prefix, e.g., 49 for Germany.
4. Enter the **Area Code** and **PABX number**.
5. Select the **Network Integration** check box.
6. In the **Node ID** field, assign a unique node ID in the internetwork for OpenScape Business S. The node ID must be between "1" and "100" (select "1" for the configuration example).
7. Click on **Execute function**. You are taken to the **Central Functions for Stations** window.
8. Since all internal station numbers must be unique in a network, the standard station numbers must be deleted. Enable the **Delete all station call numbers** radio button.
9. Enable the check box **Delete all station numbers** and click **OK & Next**. You are taken to the **Change preconfigured call and functional numbers** window.

---

**NOTICE:** The function codes must be unique in the internetwork. Duplicate station numbers are not allowed!

---

10. Adapt the preconfigured station numbers to the station numbers in the network and click **OK & Next**. You can optionally adapt the station numbers manually via the wizard or import a CSV file with the appropriately prepared station numbers.
11. Import the IP clients.
12. Now configure the Internet telephony.
13. Edit the settings for a Meet-Me conference. You must enter a code that is unique in the internetwork.
14. Now configure the sending of e-mails.
15. Click on **OK & Next**.
16. Click on **Finish**.

### 21.6.3.2 How to Configure Networking for Node 1 (Master)

In the next step, the Network Configuration wizard is used to configure the networking for node 1 (master).

### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

**Step by Step**

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > Basic Installation**.
3. Click on **Edit** to start the **Networking Configuration** wizard.
4. Select the **Network with OSBiz X / S OSBiz S** setting.
5. Define the node type (**Master**).
6. Under **Node ID**, enter the appropriate node numbers of the associated OpenScape Business systems (in the configuration example, those of the slaves with node ID 2).
7. Under **IP Address**, enter the IP addresses of the associated OpenScape Business systems (in the configuration example, those of the slaves with node IDs 2 and 3).
8. Select the check box **Gateway**.
9. Under **Name**, enter the type of system.
10. Under **Type**, enter the type of the subsystem.
11. Enable the **Encryption Required** check box if required.

---

**INFO:** The encryption is based on SPE and does not apply to the applications!

---

---

**NOTICE:** Note that the encryption is not configured by simply enabling the check box. See [Signaling and Payload Encryption \(SPE\)](#) .

---

12. Click on **Finish**.

### 21.6.3.3 How to Configure the Basic Installation for Node 2 (Slave)

For integration in an internetwork, the country code and a node ID must be assigned. The internal station numbers must be uniquely configured throughout the network. The entry of the national and local station numbers is important, since this station number is set in the Trk. Grp. 1 ISDN trunk and used as the location number for normalization.

**Prerequisites**

You are logged on to the WBM with the **Advanced** profile.

**Step by Step**

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click on **Wizards > Basic Installation**.
3. In the **Country Code** field, enter the country code prefix, e.g., 49 for Germany.
4. Enter the **Area Code** and **PABX number**.
5. Select the **Network Integration** check box.
6. In the **Node ID** field for an OpenScape Business, enter a node ID that is unique in the internetwork (a "2" and a "3" for the configuration example).

7. Click on **Execute function**. You are taken to the **Central Functions for Stations** window.
8. Since all internal station numbers must be unique in a network, the standard station numbers must be deleted. Enable the **Delete all station call numbers** radio button.
9. Enable the check box **Delete all station numbers** and click **OK & Next**. You are taken to the **Change preconfigured call and functional numbers** window.

---

**NOTICE:** The function codes must be unique in the internetwork. Duplicate station numbers are not allowed!

---

10. Adapt the preconfigured station numbers to the station numbers in the network and click **OK & Next**. You can optionally adapt the station numbers manually via the wizard or import a CSV file with the appropriately prepared station numbers.
11. Now configure the ISDN and analog stations.
12. Edit the settings for a Meet-Me conference. You must enter a code that is unique in the internetwork.
13. Now configure the sending of e-mails.
14. Click on **OK & Next**.
15. Click on **Finish**.

### 21.6.3.4 How to Configure Networking for Node 2 (Slave)

In the next step, the Network Configuration wizard is used to configure the networking of node 2.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > Basic Installation**.
3. Click on **Edit** to start the **Networking Configuration** wizard.
4. Select the **Network with OSBiz X / S OSBiz S** setting.
5. Under **Node type**, select the check box **This system is a SLAVE node**.
6. **Enter the IP address of the MASTER node** (in the configuration example, the IP address of node 1).

---

**INFO:** Note that this action cannot be undone after clicking **OK & Next**!

---

7. The **Registration Status** displays **Status successful** (or a corresponding error message). This completes the wizard.
8. Click on **Finish**.

### 21.6.3.5 How to Configure the Basic Installation for Node 3 (Slave)

For integration in an internetwork, the country code and a node ID must be assigned. The internal station numbers must be uniquely configured throughout the network. The entry of the national and local station numbers is important, since this station number is set in the Trk. Grp. 1 ISDN trunk and used as the location number for normalization.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click on **Wizards > Basic Installation**.
3. In the **Country Code** field, enter the country code prefix, e.g., 49 for Germany.
4. Enter the **Area Code** and **PABX number**. (identical to the assigned gateway system).
5. Select the **Network Integration** check box.
6. In the **Node ID** field for OpenScape Business, enter a node ID that is unique in the internetwork (a "3" for the configuration example).
7. Click on **Execute function**. You are taken to the **Central Functions for Stations** window.
8. Since all internal station numbers must be unique in a network, the standard station numbers must be deleted. Enable the **Delete all station call numbers** radio button.
9. Enable the check box **Delete all station numbers** and click **OK & Next**. You are taken to the **Change preconfigured call and functional numbers** window.

---

**NOTICE:** The function codes must be unique in the internetwork. Duplicate station numbers are not allowed!

---

10. Adapt the preconfigured station numbers to the station numbers in the network and click **OK & Next**. You can optionally adapt the station numbers manually via the wizard or import a CSV file with the appropriately prepared station numbers.
11. Now configure the ISDN and analog stations.
12. Edit the settings for a Meet-Me conference. You must enter a code that is unique in the internetwork.
13. Now configure the sending of e-mails.
14. Click on **OK & Next**.
15. Click on **Finish**.

### 21.6.3.6 How to Verify the Networking Function for the Master

You can verify the status of the network in general and also the individual station numbers.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Network**.
2. The status bar shows the **Synchronization status** for the network. Green means that there are no networking problems; red indicates problems in the network.
3. Selecting the **Domain View** tab in the **Network** window shows all available nodes with the **Node ID**, **Name**, **System Type**, **Server Address**, **Registration Status** and **Availability Status**.
4. Selecting the **Phone Numbers** tab in the **Network** window opens a window with all the relevant details on the following:
  - **Call number**
  - **DID**
  - **Name**
  - **Port Type**
  - **Nodes**

### 21.6.3.7 Configure networking for node 3 (slave)

In the next step, the Network Configuration wizard is used to configure the networking for node 3.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards** > **Basic Installation**.
3. Click on **Edit** to start the **Networking Configuration** wizard.
4. Select the **Network with OSBiz X / S OSBiz S** setting.
5. Under **Node type**, select the check box **This system is a SLAVE node**.
6. **Enter the IP address of the MASTER node** (in the configuration example, the IP address of node 1).

---

**INFO:** Note that this action cannot be undone after clicking **OK & Next!**

---

7. The **Registration Status** displays **Status successful** (or a corresponding error message). This completes the wizard.
8. Click on **Finish**.

### 21.6.3.8 How to Configure Least Cost Routing (LCR) for the Network (Node 3, Slave)

The default entries in index 32, 33, 34 and 35 in the LCR dial plan must be extended with further entries to enable the dialing of station numbers in "international, national and station" formats for calls to nodes 1 and 2. "International" and "National" are always needed. "Local" is only needed for partner nodes that are in the same local network. The entries 36, 37 and 39 for interworking with node 1 (station numbers 100 > 199) and the entries 39, 40 and 41 for interworking with node 2 (station numbers 200 > 299) must be extended. These entries are used for dialing from applications (e.g., myPortal for Desktop).

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > LCR**.
3. Click on **Dial Plan** in the menu tree.
4. Enter the following values in the free positions after the default values (35 to 40 in this case):

| Dial Plan | Name         | Dialed digits      | Route table |
|-----------|--------------|--------------------|-------------|
| 31        | Appl-Suite   | -371               | 12          |
| 32        | Standard     | 88CZ               | 1           |
| 33        | IP Network   | -Z                 | 13          |
| 34        | CO Internat  | 0C0049-Z           | 14          |
| 36        | Node 1 Inter | 0C0049230266719-1Z | 15          |
| 37        | Node 1 NAT   | 0C0230266719-1Z    | 16          |
| 38        | Node 1 Stn.  | 0C66719-1Z         | 16          |
| 39        | Node 2 Inter | 0C0049230266719-2Z | 17          |
| 40        | Node 2 NAT   | 0C0230266719-2Z    | 17          |
| 41        | Node 2 Stn.  | 0C66719-2Z         | 17          |

5. Click on **Apply** followed by **OK**.
6. In the menu tree, click on the associated **Dial Rule** for nodes 1 and 2.
  - a) Under **Rule Name**, enter the value **Node 1 + 2**.
  - b) Under **Dial rule format**, enter the value **D49230266719E3A**.
  - c) Select **Corporate Network** as the **Network provider's method of access**.
  - d) Under **Type**, select the item **Country code**.
  - e) Click on **Apply** followed by **OK**.

7. Click on **Routing table** in the menu tree to configure routing table 16 for networking and to assign it directly to node 1.
8. Click on routing table 16.
  - a) Under **Route**, select the item **Networking**.
  - b) Under **Dial Rule**, select the item **Nodes 1 + 2**.
  - c) Under **min. COS**, select the item **15**.
  - d) Under **Warning**, select the item **None**.
  - e) Under **Dedicated Gateway**, select the item **Forced**.
  - f) Under **GW Node ID**, select the item **1**.
  - g) Click on **Apply** followed by **OK**.
9. Click on **Routing table** in the menu tree to configure routing table 17 for networking and to assign it directly to node 2.
10. Click on routing table 17.
  - a) Under **Route**, select the item **Networking**.
  - b) Under **Dial Rule**, select the item **Nodes 1 + 2**.
  - c) Under **min. COS**, select the item **15**.
  - d) Under **Warning**, select the item **None**.
  - e) Under **Dedicated Gateway**, select the item **Forced**.
  - f) Under **GW Node ID**, select the item **2**.
  - g) Click on **Apply** followed by **OK**.

### 21.6.3.9 How to Configure LCR for Networking (Node 2)

The default entries in index 32, 33, 34 and 35 in the LCR dial plan must be extended with further entries to enable the dialing of station numbers in "international, national and station" formats for calls to nodes 1 and 3. "International" and "National" are always needed. "Local" is only needed for partner nodes that are in the same local network. The entries 36, 37 and 38 for interworking with node 1 (station numbers 100 > 199) and the entries 39, 40 and 41 for interworking with node 3 (station numbers 300 > 399) must be extended. These entries are used for dialing from applications (e.g., myPortal for Desktop).

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > LCR**.
3. Click on **Dial Plan** in the menu tree.
4. Enter the following values in the free positions after the default values (35 to 40 in this case):

| Dial Plan | Name       | Dialed digits | Route table |
|-----------|------------|---------------|-------------|
| 31        | Appl-Suite | -271          | 12          |
| 32        | Standard   | 88CZ          | 1           |

| Dial Plan | Name         | Dialed digits      | Route table |
|-----------|--------------|--------------------|-------------|
| 33        | IP Network   | -Z                 | 13          |
| 34        | CO Internat  | 0C0049-Z           | 14          |
| 36        | Node 1 Inter | 0C0049230266719-1Z | 16          |
| 37        | Node 1 NAT   | 0C0230266719-1Z    | 16          |
| 38        | Node 1 Stn.  | 0C66719-1Z         | 16          |
| 39        | Node 3 Inter | 0C0049230266758-3Z | 17          |
| 40        | Node 3 NAT   | 0C0230266758-3Z    | 17          |
| 41        | Node 3 Stn.  | 0C66758-3Z         | 17          |

5. Click on **Apply** followed by **OK**.
6. Click on **Routing table** in the menu tree.
7. In the menu tree, click on the associated **Dial Rule** for node 1.
  - a) Under **Rule Name**, enter the value **Node 1**.
  - b) Under **Dial rule format**, enter the value **D49230266719E3A**.
  - c) Select **Corporate Network** as the **Network provider's method of access**.
  - d) Under **Type**, select the item **Country code**.
  - e) Click on **Apply** followed by **OK**.
8. Click on routing table 16 to configure it for node 1 networking.
  - a) Under **Route**, select the item **Networking**.
  - b) Under **Dial Rule**, select the item **Node 1**.
  - c) Under **min. COS**, select the item **1**.
  - d) Under **Warning**, select the item **None**.
  - e) Under **Dedicated Gateway**, select the item **Forced**.
  - f) Under **GW Node ID**, select the item **1**.
  - g) Click on **Apply** followed by **OK**.
9. In the menu tree, click on the associated **Dial Rule** for node 3.
  - a) Under **Rule Name**, enter the value **Node 3**.
  - b) Under **Dial rule format**, enter the value **D49230266758E3A**.
  - c) Select **Corporate Network** as the **Network provider's method of access**.
  - d) Under **Type**, select the item **Country code**.
  - e) Click on **Apply** followed by **OK**.
10. Click on **Routing table** in the menu tree.
11. Click on routing table 17 to configure it for node 3 networking.
  - a) Under **Route**, select the item **Networking**.
  - b) Under **Dial Rule**, select the item **Node 3**.
  - c) Under **min. COS**, select the item **1**.
  - d) Under **Warning**, select the item **None**.
  - e) Under **Dedicated Gateway**, select the item **Forced**.
  - f) Under **GW Node ID**, select the item **3**.
  - g) Click on **Apply** followed by **OK**.

### 21.6.3.10 How to Configure Routes and Routing Parameters (Node 1, Master)

In node 1, the settings for the CO trunk must be configured with respect to the location number, seizure code and routing parameters. The PABX number for defining the gateway location must be entered here. These entries are used for dialing from applications such as myPortal, for example.

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Trunks/Routing**.
3. In the menu tree, click **Route**.
4. In the **Change Route** window, enter a name for the CO trunk in the **Route Name** field, e.g., *Route 1*.
5. Under **Seizure code**, enter 0.
6. Under **Incoming PABX number**, in the **Country code** field, enter the value 49.
7. Under **Incoming PABX number**, in the **Local area code** field, enter the value 2302.
8. Under **Incoming PABX number**, in the **PABX number** field, enter the value 66719.
9. Select the check box **Incoming PABX number** in the **Location number** field.
10. The default settings for the routing parameters (No. and type, outgoing, Call number type) can be used.
11. Click on **Apply** followed by **OK**.

### 21.6.3.11 How to Configure Routes and Routing Parameters (Trk. Grp. 16, Node 1)

For route 64 (networking), the entry for the 2nd trunk code is mandatory for the master and slave and must be filled in.

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Trunks/Routing**.
3. In the menu tree, click on the last **Route (Route 16)**.
4. In the **Change Route** window, enter a name for the network route in the **Route Name** field, e.g., *Networking*.
5. Do not enter anything for the **Seizure code**.

6. Enter a "0" under **CO code (2nd trunk code)**.
7. The default settings for the routing parameters (No. and type, outgoing, Call number type) can be used.
8. Click on **Apply** followed by **OK**.

### 21.6.3.12 How to Configure Least Cost Routing (LCR) for the Network (Node 1)

The default entries in index 32, 33, 34 and 35 in the LCR dial plan must be extended with further entries to enable the dialing of station numbers in "international, national and station" formats for calls to nodes 2 and 3. "International" and "National" are always needed. "Local" is only needed for partner nodes that are in the same local network. These entries are used for dialing from applications (e.g., myPortal for Desktop).

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > LCR**.
3. Click on **Dial Plan** in the menu tree.
4. Enter the following values in the free positions after the default values (35 to 40 in this case):

| Dial Plan | Name         | Dialed digits                  | Route table |
|-----------|--------------|--------------------------------|-------------|
| 16        | Standard     | 0CZ                            | 1           |
| 17        | Standard     | 0C1Z                           | 1           |
| 18        | Standard     | 0CNZ                           | 1           |
| 32        | Standard     | 88CZ                           | 1           |
| 33        | IP Network   | -Z                             | 13          |
| 34        | CO Internat  | 0C0049-Z                       | 14          |
| 36        | Node 2 Inter | 0C0049230266719- <del>28</del> |             |
| 37        | Node 2 NAT   | 0C0230266719-2Z                | 16          |
| 38        | Node 2 Stn.  | 0C66719-2Z                     | 16          |
| 39        | Node 3 Inter | 0C0049230266758- <del>32</del> |             |
| 40        | Node 3 NAT   | 0C0230266758-3Z                | 17          |
| 41        | Node 3 Stn.  | 0C66758-3Z                     | 17          |

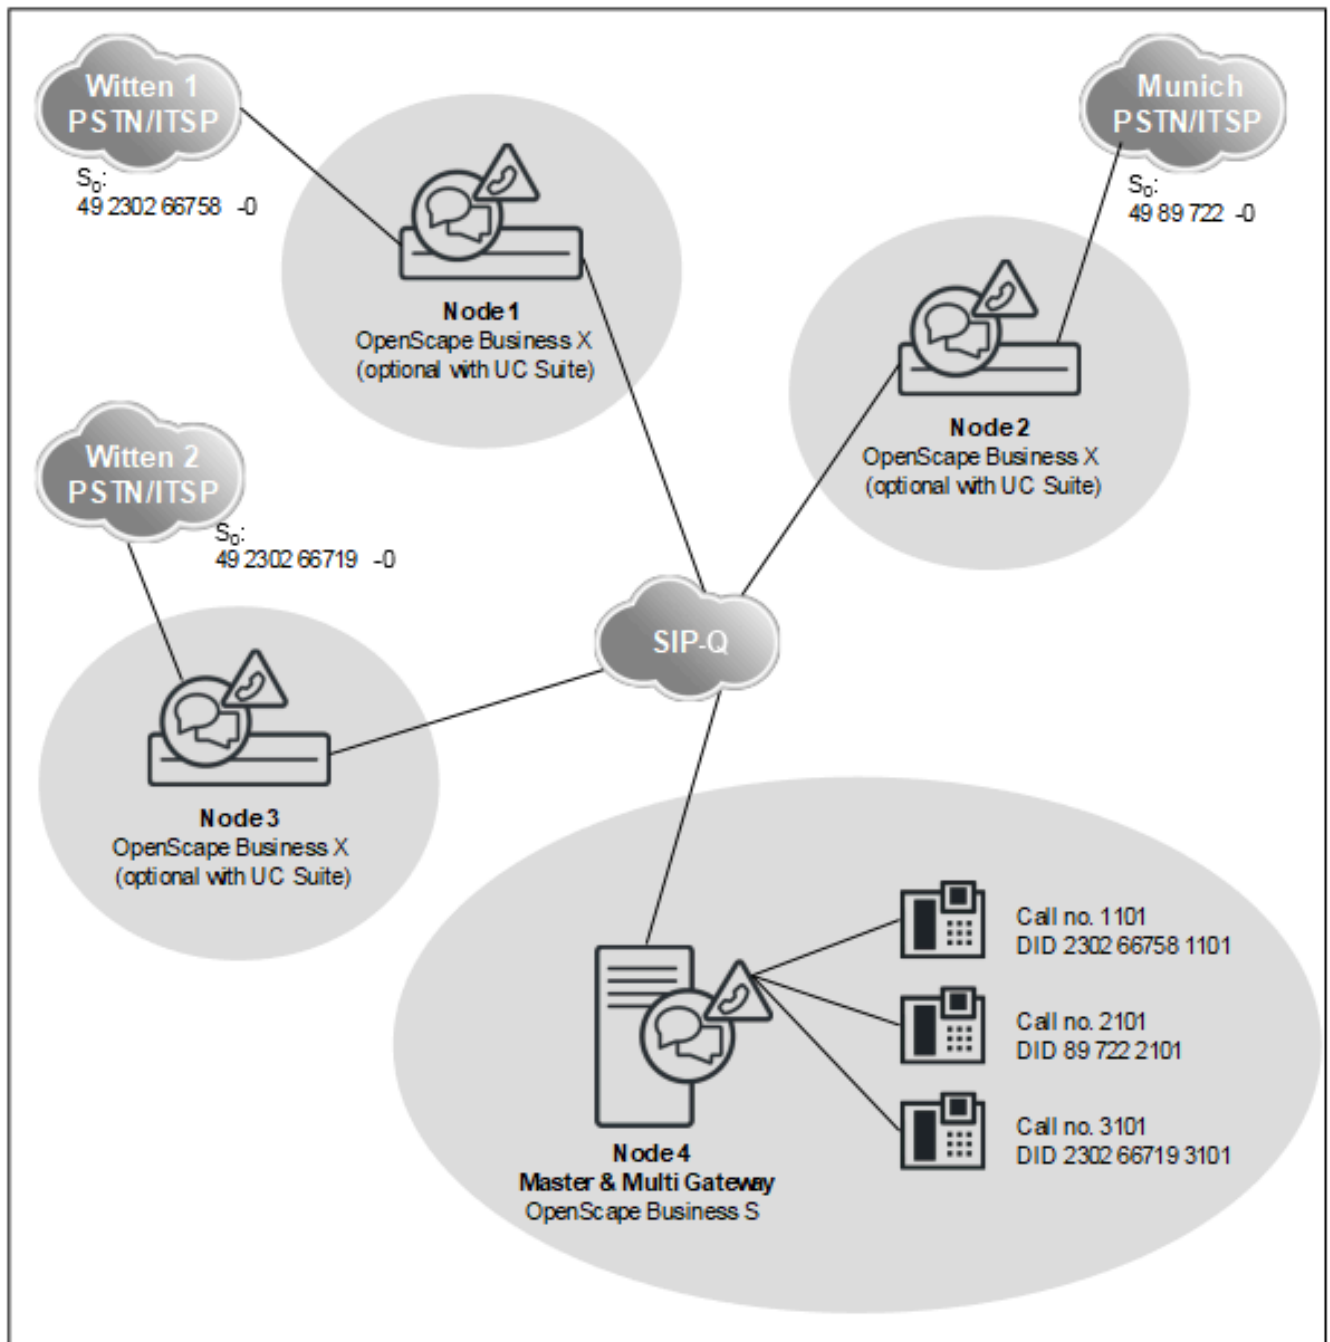

5. Click on **Apply** followed by **OK**.
6. In the menu tree, click on the associated **Dial Rule** for node 2.
  - a) Under **Rule Name**, enter the value **Node 2**.
  - b) Under **Dial rule format**, enter the value **D49230266719E3A**.

- c) Select **Corporate Network** as the **Network provider's method of access**.
- d) Under **Type**, select the item **Country code**.
- e) Click on **Apply** followed by **OK**.
- 7. Click on **Routing table** in the menu tree.
- 8. Click on routing table 16 to configure it for node 2 networking.
  - a) Under **Route**, select the item **Networking**.
  - b) Under **Dial Rule**, select the item **Node 2**.
  - c) Under **min. COS**, select the item **1**.
  - d) Under **Warning**, select the item **None**.
  - e) Under **Dedicated Gateway**, select the item **Forced**.
  - f) Under **GW Node ID**, select the item **2**.
  - g) Click on **Apply** followed by **OK**.
- 9. In the menu tree, click on the associated **Dial Rule** for node 3.
  - a) Under **Rule Name**, enter the value **Node 3**.
  - b) Under **Dial rule format**, enter the value **D49230266719E1A**.
  - c) Select **Corporate Network** as the **Network provider's method of access**.
  - d) Under **Type**, select the item **Country code**.
  - e) Click on **Apply** followed by **OK**.
- 10. Click on **Routing table** in the menu tree.
- 11. Click on routing table 17 to configure it for node 3 networking.
  - a) Under **Route**, select the item **Networking**.
  - b) Under **Dial Rule**, select the item **Node 3**.
  - c) Under **min. COS**, select the item **1**.
  - d) Under **Warning**, select the item **None**.
  - e) Under **Dedicated Gateway**, select the item **Forced**.
  - f) Under **GW Node ID**, select the item **3**.
  - g) Click on **Apply** followed by **OK**.
- 12. Click on **Routing table** in the menu tree.

### 21.6.4 Networking OpenScape Business X and OpenScape Business S (Multi-Gateway)

Up to 32 OpenScape Business X and OpenScape Business S communication systems can be networked with one another. Multi-gateway means that every IP station registered at OpenScape Business S is assigned to exactly one specific gateway.

## Network Data

- Closed numbering
- Network-wide voice and UC functionality with UC Suite configuration via WBM (wizards)
- The UC functionality is implemented either through the UC Booster Server or via the UC Booster Card
- Only one OpenScape Business S in the internetwork is allowed.
- All systems must have the same country code
- All systems must be located in the same time zone
- Only one CO access code (e.g., 0) must exist for the entire network.

## Networking OpenScape Business

- Up to 32 networked systems and 1500 users without UC solution
- Up to 8 networked systems and 1500 users with UC solution

### Network-wide Features

| UC networking                                               | Closed numbering                              | Open numbering |
|-------------------------------------------------------------|-----------------------------------------------|----------------|
| Maximum number of nodes                                     | 8 with UC solution and 32 without UC solution |                |
| Maximum number of stations in a single communication system | Depending on OpenScape Business X             |                |
| Maximum number of stations in the network                   | 1500                                          |                |

| UC networking     | Closed numbering                                                                                       | Open numbering |
|-------------------|--------------------------------------------------------------------------------------------------------|----------------|
| UC Booster Card   | UC Smart: 51 - 150 stations<br>(0 - 50 stations without UC Booster Card)<br>UC Suite: 0 - 150 stations | Not supported  |
| UC Booster Server | UC Smart: from 150 stations<br>UC Suite: from 150 stations                                             | Not supported  |

| Administration                                                      | Closed numbering                                                             | Open numbering |
|---------------------------------------------------------------------|------------------------------------------------------------------------------|----------------|
| WBM                                                                 | Network-wide administration using wizards                                    | Not supported  |
| Manager E                                                           | Network-wide administration for special tasks (not for OpenScape Business S) | Not supported  |
| UC Suite Administration (for UC Booster Server and UC Booster Card) | Network-wide administration using wizards                                    | Not supported  |
| Mass data import via CSV files (call numbers, DID numbers, names)   | Separately for each node in the internetwork                                 | Not supported  |

| Licensing           | Closed numbering                               | Open numbering |
|---------------------|------------------------------------------------|----------------|
| Licensing structure | A networking license is required for each node | Not supported  |

### Configuration

This configuration (with closed numbering and UC Suite) shows the steps required to set up a multi-gateway network with the help of an example.

Prerequisites:

- A network plan is available. The network plan was used to ensure that every internal call number in the internetwork is only used once for closed numbering. Different station number lengths are allowed. Only DID station numbers may occur more than once

- The IP network has been configured, and all nodes can be mutually pinged successfully
- All nodes have been upgraded to the same software version

Call forwarding across nodes: For incoming calls over IP trunks, which have already been forwarded, no further forwardings to the voicemail box are executed. This is because no unique assignment to the voicemail box can otherwise be made

If cross-node deputy rules (referral extensions) are required, this must be set up via the profiles of the OpenScape Business stations or ringing groups. The corresponding cross-node calls are not signaled as forwarded in this case, but as DSS (direct station selection) calls. Call forwardings of the deputy are therefore forwarded to the voicemail box

**Table 22: Setting up the Location Data for Node 1**

| Node 1                    |                        |          |
|---------------------------|------------------------|----------|
| G.-Location Country       |                        | 49       |
| G.-Location Local Network |                        | 2302     |
| G.-Location System        |                        | 66758    |
| International Prefix      |                        | 00       |

| CO                 | 0CZ                 | Networking    | MULTI-GATEWAY     | 1          | E1A             | Main<br>network<br>supplier | Unknown       |

Procedure to Set up Networking:

- 1)** Configure the basic installation for node 4 (master)
- 2)** Configure networking for node 4 (master)
- 3)** Configure the basic installation for node 1 (slave)
- 4)** Configure networking for node 1 (slave)
- 5)** Configure the basic installation for node 2 (slave)
- 6)** Configure networking for node 2 (slave)
- 7)** Configure the basic installation for node 3 (slave)
- 8)** Configure networking for node 3 (slave)
- 9)** Verify the networking function for the master
- 10)** Configure a multi-gateway for node 4 (master)
- 11)** Configure routes and routing parameters (node 1, slave)
- 12)** Configure LCR for networking (node 1, slave)
- 13)** Configure routes and routing parameters (node 2, slave)
- 14)** Configure LCR for networking (node 2, slave)
- 15)** Configure routes and routing parameters (node 3, slave)
- 16)** Configure LCR for networking (node 3, slave)
- 17)** Configure routes and routing parameters (node 4, master)
- 18)** Configure LCR for networking (node 4, master)

### 21.6.4.1 How to Configure the Basic Installation for Node 4 (OpenScape Business S, Master)

For integration in an internetwork, the country code and a node ID must be assigned. The internal station numbers must be uniquely configured throughout the network. The entry of the national and local station numbers is important, since this station number is set in the Trk. Grp. 1 ISDN trunk and used as the location number for normalization.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click on **Wizards > Basic Installation**.
3. In the **Country Code** field, enter the country code prefix, e.g., 49 for Germany.
4. Do not make any entries in the **Area Code** and **PABX number** fields!
5. Select the **Network Integration** check box.
6. In the **Node ID** field, assign a unique node ID in the internetwork for OpenScape Business S. The node ID must be between "1" and "100" (a "1" was assigned for the configuration example).
7. Click on **Execute function**. You are taken to the **Central Functions for Stations** window.
8. Since all internal station numbers must be unique in a network, the standard station numbers must be deleted. Enable the **Delete all station call numbers** radio button.
9. Enable the check box **Delete all station numbers** and click **OK & Next**. You are taken to the **Change preconfigured call and functional numbers** window.

---

**NOTICE:** The function codes must be unique in the internetwork. Duplicate station numbers are not allowed!

---

10. Adapt the preconfigured station numbers to the station numbers in the network and click **OK & Next**. You can optionally adapt the station numbers manually via the wizard or import a CSV file with the appropriately prepared station numbers.
11. Now configure the IP clients.
12. Configure the IP clients.
13. Edit the settings for a Meet-Me conference. You must enter a code that is unique in the internetwork.
14. Now configure the sending of e-mails.
15. Click on **Finish**.

### 21.6.4.2 How to Configure the Networking for Node 4 (Master)

In the next step, the Network Configuration wizard is used to configure the networking for node 3.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > Basic Installation**.
3. Click on **Edit** to start the **Networking Configuration** wizard.
4. Select the **Network with OSBiz X / S OSBiz S** setting.
5. Select the **This system is the MASTER node** check box.
6. Under **Node ID**, enter the corresponding node numbers of the associated OpenScape Business systems (in the configuration example, those of the slaves with node IDs 1, 2 and 3).
7. Under **IP Address**, enter the IP addresses of the associated OpenScape Business systems (in the configuration example, those of the slaves with node IDs 1, 2 and 3).
8. Select the check box **Gateway**.
9. Under **Name**, enter the type of system (for example: Slave 1).
10. Under **Type**, enter the type of the subsystem.
11. Enable the **Encryption Required** check box if required.

---

**INFO:** The encryption is based on SPE and does not apply to the applications!

---

---

**NOTICE:** Note that the encryption is not configured by simply enabling the check box. See [Signaling and Payload Encryption \(SPE\)](#) .

---

12. Click on **Finish**.

### 21.6.4.3 How to Configure the Basic Installation for Node 1 (Slave)

For integration in an internetwork, the country code and a node ID must be assigned. The internal station numbers must be uniquely configured throughout the network. The entry of the national and local station numbers is important, since this station number is set in the Trk. Grp. 1 ISDN trunk and used as the location number for normalization.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.

2. In the navigation tree, click on **Wizards > Basic Installation**.
3. In the **Country Code** field, enter the country code prefix, e.g., 49 for Germany.
4. Enter the **Area Code** and **PABX number**.
5. Select the **Network Integration** check box.
6. In the **Node ID** field for OpenScape Business S, enter a node ID that is unique in the internetwork (a "1" for the configuration example).
7. Click on **Execute function**. You are taken to the **Central Functions for Stations** window.
8. Since all station numbers must be unique in a network, the standard station numbers must be deleted. Enable the **Delete all station call numbers** radio button.
9. Enable the check box **Delete all station numbers** and click **OK & Next**. You are taken to the **Change preconfigured call and functional numbers** window.

---

**NOTICE:** The function codes must be unique in the internetwork. Duplicate station numbers are not allowed!

---

10. Adapt the preconfigured station numbers to the station numbers in the network and click **OK & Next**. You can optionally adapt the station numbers manually via the wizard or import a CSV file with the appropriately prepared station numbers.
11. Now configure the ISDN and analog stations.
12. Edit the settings for a Meet-Me conference. You must enter a code that is unique in the internetwork.
13. Now configure the sending of e-mails.
14. Click on **Finish**.

#### 21.6.4.4 How to Configure Networking for Node 1 (Slave)

In the next step, the wizard is used to configure the networking.

##### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

##### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > Basic Installation**.
3. Click on **Edit** to start the **Networking Configuration** wizard.
4. Select the **Network with OSBiz X / S OSBiz S** setting.
5. **Enter the IP address of the MASTER node** (The OpenScape Business is configured as a slave node and the corresponding IP address of the master node (the OpenScape Business S) is entered. The master and multi-gateway are always assigned to the same system, which is OpenScape Business S in the configuration example).

---

**INFO:** Note that this action cannot be undone after clicking **OK & Next!**

---

6. The **Registration Status** displays **Status successful** (or a corresponding error message). This completes the wizard.
7. Click on **Finish**.

### 21.6.4.5 How to Configure the Basic Installation for Node 2 (Slave)

For integration in an internetwork, the country code and a node ID must be assigned. The internal station numbers must be uniquely configured throughout the network. The entry of the national and local station numbers is important, since this station number is set in the Trk. Grp. 1 ISDN trunk and used as the location number for normalization.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click on **Wizards > Basic Installation**.
3. In the **Country Code** field, enter the country code prefix, e.g., 49 for Germany.
4. Enter the **Area Code** and **PABX number**.
5. Select the **Network Integration** check box.
6. In the **Node ID** field for OpenScape Business S, enter a node ID that is unique in the internetwork (a "2" for the configuration example).
7. Click on **Execute function**. You are taken to the **Central Functions for Stations** window.
8. Since all internal station numbers must be unique in a network, the standard station numbers must be deleted. Enable the **Delete all station call numbers** radio button.
9. Enable the check box **Delete all station numbers** and click **OK & Next**. You are taken to the **Change preconfigured call and functional numbers** window.

---

**NOTICE:** The function codes must be unique in the internetwork. Duplicate station numbers are not allowed!

---

10. Adapt the preconfigured station numbers to the station numbers in the network and click **OK & Next**. You can optionally adapt the station numbers manually via the wizard or import a CSV file with the appropriately prepared station numbers.
11. Now configure the ISDN and analog stations.
12. Edit the settings for a Meet-Me conference. You must enter a code that is unique in the internetwork.

**13.** Now configure the sending of e-mails.

**14.** Click on **Finish**.

#### 21.6.4.6 How to Configure Networking for Node 2 (Slave)

In the next step, the Network Configuration wizard is used to configure the networking of node 2.

##### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

##### Step by Step

- 1.** In the navigation bar, click on **Setup**.
- 2.** In the navigation tree, click **Wizards > Basic Installation**.
- 3.** Click on **Edit** to start the **Networking Configuration** wizard.
- 4.** Select the **Network with OSBiz X / S OSBiz S** setting.
- 5.** Under **Node type** , select the check box **This system is a SLAVE node**.
- 6.** **Enter the IP address of the MASTER node** (The OpenScape Business is configured as a slave node and the corresponding IP address of the master node (the OpenScape Business S) is entered. The master and multi-gateway are always assigned to the same system, which is OpenScape Business S in the configuration example).

---

**INFO:** Note that this action cannot be undone after clicking **OK & Next!**

---

- 7.** The **Registration Status** displays **Status successful** (or a corresponding error message). This completes the wizard.
- 8.** Click on **Finish**.

#### 21.6.4.7 How to Configure the Basic Installation for Node 3 (Slave)

For integration in an internetwork, the country code and a node ID must be assigned. The internal station numbers must be uniquely configured throughout the network. The entry of the national and local station numbers is important, since this station number is set in the Trk. Grp. 1 ISDN trunk and used as the location number for normalization.

##### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

##### Step by Step

- 1.** In the navigation bar, click on **Setup**.
- 2.** In the navigation tree, click on **Wizards > Basic Installation**.

3. In the **Country Code** field, enter the country code prefix, e.g., 49 for Germany.
4. Enter the **Area Code** and **PABX number**.
5. Select the **Network Integration** check box.
6. In the **Node ID** field for OpenScape Business, enter a node ID that is unique in the internetwork (a "3" for the configuration example).
7. Click on **Execute function**. You are taken to the **Central Functions for Stations** window.
8. Since all internal station numbers must be unique in a network, the standard station numbers must be deleted. Enable the **Delete all station call numbers** radio button.
9. Enable the check box **Delete all station numbers** and click **OK & Next**. You are taken to the **Change preconfigured call and functional numbers** window.

---

**NOTICE:** The function codes must be unique in the internetwork. Duplicate station numbers are not allowed!

---

10. Adapt the preconfigured station numbers to the station numbers in the network and click **OK & Next**. You can optionally adapt the station numbers manually via the wizard or import a CSV file with the appropriately prepared station numbers.
11. Now configure the ISDN and analog stations.
12. Edit the settings for a Meet-Me conference. You must enter a code that is unique in the internetwork.
13. Now configure the sending of e-mails.
14. Click on **Finish**.

### 21.6.4.8 How to Configure Networking for Node 3 (Slave)

In the next step, the Network Configuration wizard is used to configure the networking for node 3.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > Basic Installation**.
3. Click on **Edit** to start the **Networking Configuration** wizard.
4. Select the **Network with OSBiz X / S OSBiz S** setting.
5. Under **Node type**, select the check box **This system is a SLAVE node**.
6. **Enter the IP address of the MASTER node** (The OpenScape Business is configured as a slave node and the corresponding IP address of the master node (the OpenScape Business S) is entered. The master and multi-

location are always assigned to the same system, which is OpenScape Business S in the configuration example).

---

**INFO:** Note that this action cannot be undone after clicking **OK & Next!**

---

7. The **Registration Status** displays **Status successful** (or a corresponding error message). This completes the wizard.
8. Click on **Finish**.

#### 21.6.4.9 How to Verify the Networking Function for the Master

You can verify the status of the network in general and also the individual station numbers.

##### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

##### Step by Step

1. In the navigation bar, click on **Network**.
2. The status bar shows the **Synchronization status** for the network. Green means that there are no networking problems; red indicates problems in the network.
3. Selecting the **Domain View** tab in the **Network** window shows all available nodes with the **Node ID, Name, System Type, Server Address, Registration Status** and **Availability Status**.
4. Selecting the **Phone Numbers** tab in the **Network** window opens a window with all the relevant details on the following:
  - **Call number**
  - **DID**
  - **Name**
  - **Port Type**
  - **Nodes**

#### 21.6.4.10 How to Configure a Multi-Gateway for Node 4 (Master)

The setup of the internetwork as a multi-gateway network is performed at the master node.

##### Prerequisites

You are logged into the WBM with the **Expert** profile.

##### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click on **Wizards > Networking Configuration**.
3. Under **Network Configuration**, select the setting **Multi-Location setup**. The assignment of stations to the location is specified in

the **Multi-Location setup** window. The assignment of the call numbers to the node ID is used for the outbound trunk seizure in the assigned location nodes, for example.

4. Enter the following assignments under **Multi-Location setup** for the configuration example (all telephones are registered at OpenScape Business S):

| Phone number | Name    | Node ID          |
|--------------|---------|------------------|
| 1101         | 1101KN1 | 1-Slave Witten1  |
| 1102         | 1102KN1 | 1-Slave Witten1  |
| 1103         | 1103KN1 | 1-Slave Witten1  |
| 2101         | 2101KN2 | 2-Slave Munich   |
| 2102         | 2102KN2 | 2-Slave Munich   |
| 2103         | 2103KN2 | 2-Slave Munich   |
| 3101         | 3101KN3 | 3-Slave Witten 2 |
| 3102         | 3102KN3 | 3-Slave Witten 2 |
| 3103         | 3103KN3 | 3-Slave Witten 2 |

5. Click on **Finish**.

#### 21.6.4.11 How to Configure Routes and Routing Parameters (Node 1, Slave)

In the following steps, you will configure the route and routing parameters for the networking of the slave.

##### Prerequisites

You are logged into the WBM with the **Expert** profile.

##### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Trunks/Routing**.
3. In the menu tree, click **Route**.
4. In the **Change Route** window, enter a name for the CO trunk in the **Route Name** field, e.g., `Route 1`.
5. Under **Seizure code**, enter 0.
6. Under **Incoming PABX number**, in the **Country code** field, enter the value 49.
7. Under **Incoming PABX number**, in the **Local area code** field, enter the value 2302.
8. Under **Incoming PABX number**, in the **PABX number** field, enter the value 66758.
9. Select the check box **Incoming PABX number** in the **Location number** field.
10. The default settings for the routing parameters (No. and type, outgoing, Call number type) can be used.

11. Click on **Apply** followed by **OK**.

### 21.6.4.12 How to Configure Least Cost Routing (LCR) for the Network (Node 1, Slave)

The default entries in index 32, 33, 34 and 35 in the LCR dial plan must be extended with further entries to enable the dialing of station numbers in the "international, national and station" formats for calls to nodes 2 and 3 and to the multi-gateway node 4. "International" and "National" are always needed. "Local" is only needed for partner nodes that are in the same local network.

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > LCR**.
3. Click on **Dial Plan** in the menu tree.
4. Enter the following values in the free positions after the default values (36 to 43 in this case):

| Dial Plan | Name         | Dialed digits     | Route table |
|-----------|--------------|-------------------|-------------|
| 31        | Appl-Suite   | -171              | 12          |
| 32        | Standard     | 88CZ              | 1           |
| 33        | IP Network   | -Z                | 13          |
| 34        | CO Internat  | 0C0049-Z          | 14          |
| 36        | Node 2 Inter | 0C004989722-Z     | 16          |
| 37        | Node 2 NAT   | 0C089722-Z        | 16          |
| 38        | Node 3 Inter | 0C0049230266719-Z | 17          |
| 39        | Node 3 NAT   | 0C0230266719-Z    | 17          |
| 40        | Node 3 Stn.  | 0C66719-Z         | 17          |
| 41        | Node 4 Inter | 0C0049230266758-Z | 18          |
| 42        | Node 4 NAT   | 0C0230266758-Z    | 18          |
| 43        | Node 4 Stn.  | 0C66758-Z         | 18          |
| 44        |              |                   | -           |

5. Click on **Apply** followed by **OK**.
6. In the menu tree, click on the associated **Dial Rule** for node 2.
  - a) Under **Rule Name**, enter the value **Node 2**.
  - b) Under **Dial rule format**, enter the value **D4989722E3A**.
  - c) Select **Corporate Network** as the **Network provider's method of access**.

- d) Under **Type**, select the item **Country code**.
- e) Click on **Apply** followed by **OK**.
- 7. Click on **Routing table** in the menu tree to configure routing table 16 for networking and to directly assign it to node 2.
  - a) Click on routing table 16.
  - b) Under **Route**, select the item **Networking**.
  - c) Under **Dial Rule**, select the item **Node 2**.
  - d) Under **min. COS**, select the item **15**.
  - e) Under **Warning**, select the item **None**.
  - f) Under **Dedicated Gateway**, select the item **Forced**.
  - g) Under **GW Node ID**, select the item **2**.
  - h) Click on **Apply** followed by **OK**.
- 8. In the menu tree, click on the associated **Dial Rule** for node 3.
  - a) Under **Rule Name**, enter the value **Node 3**.
  - b) Under **Dial rule format**, enter the value **D49230266719E3A**.
  - c) Select **Corporate Network** as the **Network provider's method of access**.
  - d) Under **Type**, select the item **Country code**.
  - e) Click on **Apply** followed by **OK**.
- 9. Click on **Routing table** in the menu tree to configure routing table 17 for networking and to directly assign it to node 3.
  - a) Click on routing table 17.
  - b) Under **Route**, select the item **Networking**.
  - c) Under **Dial Rule**, select the item **Node 3**.
  - d) Under **min. COS**, select the item **15**.
  - e) Under **Warning**, select the item **None**.
  - f) Under **Dedicated Gateway**, select the item **Forced**.
  - g) Under **GW Node ID**, select the item **3**.
  - h) Click on **Apply** followed by **OK**.
- 10. In the menu tree, click on the associated **Dial Rule** for node 4.
  - a) Under **Rule Name**, enter the value **Node 4**.
  - b) Under **Dial rule format**, enter the value **D230266758E3A**.
  - c) Select **Corporate Network** as the **Network provider's method of access**.
  - d) Under **Type**, select the item **National**.
  - e) Click on **Apply** followed by **OK**.
- 11. Click on **Routing table** in the menu tree to configure routing table 18 for networking and to directly assign it to node 4.
  - a) Click on routing table 18.
  - b) Under **Route**, select the item **Networking**.
  - c) Under **Dial Rule**, select the item **Node 4**.
  - d) Under **min. COS**, select the item **15**.
  - e) Under **Warning**, select the item **None**.
  - f) Click on **Apply** followed by **OK**.

### 21.6.4.13 How to Configure Routes and Routing Parameters (Node 2, Slave)

In the following steps, you will configure the route and routing parameters for the networking of the slave.

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Trunks/Routing**.
3. In the menu tree, click **Route**.
4. In the **Change Route** window, enter a name for the CO trunk in the **Route Name** field, e.g., `Route 1`.
5. Under **Seizure code**, enter 0.
6. Under **Incoming PABX number**, in the **Country code** field, enter the value 49.
7. Under **Incoming PABX number**, in the **Local area code** field, enter the value 89.
8. Under **Incoming PABX number**, in the **PABX number** field, enter the value 722.
9. Select the check box **Incoming PABX number** in the **Location number** field.
10. The default settings for the routing parameters (No. and type, outgoing, Call number type) can be used.
11. Click on **Apply** followed by **OK**.

### 21.6.4.14 How to Configure Least Cost Routing (LCR) for the Network (Node 2, Slave)

The default entries in index 32, 33, 34 and 35 in the LCR dial plan must be extended with further entries to enable the dialing of station numbers in "international, national and station" formats for calls to nodes 1 and 2. "International" and "National" are always needed. "Local" is only needed for partner nodes that are in the same local network. The entries 36, 37 and 38 for interworking with node 1 (station numbers 100 > 199) and the entries 39, 40 and 41 for interworking with node 3 (station numbers 300 > 399) must be extended. These entries are used for dialing from applications (e.g., myPortal for Desktop).

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > LCR**.

3. Click on **Dial Plan** in the menu tree.
4. Enter the following values in the free positions after the default values (36 to 43 in this case):

| Dial Plan | Name         | Dialed digits     | Route table |
|-----------|--------------|-------------------|-------------|
| 31        | Appl-Suite   | -171              | 12          |
| 32        | Standard     | 88CZ              | 1           |
| 33        | IP Network   | -Z                | 13          |
| 34        | CO Internat  | 0C0049-Z          | 14          |
| 36        | Node 1 Inter | 0C0049230266758-Z | 16          |
| 37        | Node 1 NAT   | 0C0230266758-Z    | 16          |
| 38        | Node 3 Inter | 0C0049230266719-Z | 17          |
| 39        | Node 3 NAT   | 0C0230266719-Z    | 17          |
| 40        | Node 3 Stn.  | 0C66719-Z         | 17          |
| 41        | Node 4 Inter | 0C004989722-Z     | 18          |
| 42        | Node 4 NAT   | 0C089722-Z        | 18          |
| 43        | Node 4 Stn.  | 0C722-Z           | 18          |
| 44        |              |                   | -           |

5. Click on **Apply** followed by **OK**.
6. In the menu tree, click on the associated **Dial Rule** for node 1.
  - a) Under **Rule Name**, enter the value **Node 1**.
  - b) Under **Dial rule format**, enter the value **D49230266758E3A**.
  - c) Select **Corporate Network** as the **Network provider's method of access**.
  - d) Under **Type**, select the item **Country code**.
  - e) Click on **Apply** followed by **OK**.
7. Click on **Routing table** in the menu tree to configure routing table 16 for networking and to assign it directly to node 1.
  - a) Click on routing table 16.
  - b) Under **Route**, select the item **Networking**.
  - c) Under **Dial Rule**, select the item **Node 1**.
  - d) Under **min. COS**, select the item **15**.
  - e) Under **Warning**, select the item **None**.
  - f) Under **Dedicated Gateway**, select the item **Forced**.
  - g) Under **GW Node ID**, select the item **1**.
  - h) Click on **Apply** followed by **OK**.
8. In the menu tree, click on the associated **Dial Rule** for node 3.
  - a) Under **Rule Name**, enter the value **Node 3**.
  - b) Under **Dial rule format**, enter the value **D49230266719E3A**.

- c) Select **Corporate Network** as the **Network provider's method of access**.
- d) Under **Type**, select the item **Country code**.
- e) Click on **Apply** followed by **OK**.
- 9. Click on **Routing table** in the menu tree to configure routing table 17 for networking and to directly assign it to node 3.
  - a) Click on routing table 17.
  - b) Under **Route**, select the item **Networking**.
  - c) Under **Dial Rule**, select the item **Node 3 Direct**.
  - d) Under **min. COS**, select the item **15**.
  - e) Under **Warning**, select the item **None**.
  - f) Under **Dedicated Gateway**, select the item **Forced**.
  - g) Under **GW Node ID**, select the item **3**.
  - h) Click on **Apply** followed by **OK**.
- 10. In the menu tree, click on the associated **Dial Rule** for node 4.
  - a) Under **Rule Name**, enter the value **Node 4**.
  - b) Under **Dial rule format**, enter the value **D89722E3A**.
  - c) Select **Corporate Network** as the **Network provider's method of access**.
  - d) Under **Type**, select the item **Local area code**.
  - e) Click on **Apply** followed by **OK**.
- 11. Click on **Routing table** in the menu tree to configure routing table 18 for networking and to directly assign it to node 4.
  - a) Click on routing table 18.
  - b) Under **Route**, select the item **Networking**.
  - c) Under **Dial Rule**, select the item **Node 4**.
  - d) Under **min. COS**, select the item **15**.
  - e) Under **Warning**, select the item **None**.
  - f) Click on **Apply** followed by **OK**.

### 21.6.4.15 How to Configure Routes and Routing Parameters (Node 3, Slave)

In the following steps, you will configure the route and routing parameters for the networking of the slave.

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Trunks/Routing**.
3. In the menu tree, click **Route**.
4. In the **Change Route** window, enter a name for the CO trunk in the **Route Name** field, e.g., *Route 1*.
5. Under **Seizure code**, enter 0.
6. Under **Incoming PABX number**, in the **Country code** field, enter the value 49.

7. Under **Incoming PABX number**, in the **Local area code** field, enter the value 2302.
8. Under **Incoming PABX number**, in the **PABX number** field, enter the value 66719.
9. Select the check box **Incoming PABX number** in the **Location number** field.
10. The default settings for the routing parameters (No. and type, outgoing, Call number type) can be used.
11. Click on **Apply** followed by **OK**.

#### 21.6.4.16 How to Configure Least Cost Routing (LCR) for the Network (Node 3, Slave)

The default entries in index 32, 33, 34 and 35 in the LCR dial plan must be extended with further entries to enable the dialing of station numbers in "international, national and station" formats for calls to nodes 1 and 2. "International" and "National" are always needed. "Local" is only needed for partner nodes that are in the same local network. These entries are used for dialing from applications (e.g., myPortal for Desktop).

##### Prerequisites

You are logged into the WBM with the **Expert** profile.

##### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > LCR**.
3. Click on **Dial Plan** in the menu tree.
4. Enter the following values:

| Dial Plan | Name         | Dialed digits     | Route table |
|-----------|--------------|-------------------|-------------|
| 31        | Appl-Suite   | -171              | 12          |
| 32        | Standard     | 88CZ              | 1           |
| 33        | IP Network   | -Z                | 13          |
| 34        | CO Internat  | 0C0049-Z          | 14          |
| 36        | Node 1 Inter | 0C0049230266758-Z | 16          |
| 37        | Node 1 NAT   | 0C00230266758-Z   | 16          |
| 38        | Node 1 Stn.  | 0C66758-Z         | 16          |
| 39        | Node 2 Inter | 0C004989722-Z     | 17          |
| 40        | Node 2 NAT   | 0C0089722-Z       | 17          |
| 41        | Node 4 Inter | 0C0049230266719-Z | 18          |
| 42        | Node 4 NAT   | 0C0230266719-Z    | 18          |

| Dial Plan | Name        | Dialed digits | Route table |
|-----------|-------------|---------------|-------------|
| 43        | Node 4 Stn. | 0C66719-Z     | 18          |
| 44        |             |               | -           |

5. Click on **Apply** followed by **OK**.
6. In the menu tree, click on the associated **Dial Rule** for node 1.
  - a) Under **Rule Name**, enter the value **Node 1**.
  - b) Under **Dial rule format**, enter the value **D49230266758E3A**.
  - c) Select **Corporate Network** as the **Network provider's method of access**.
  - d) Under **Type**, select the item **Country code**.
  - e) Click on **Apply** followed by **OK**.
7. Click on **Routing table** in the menu tree to configure routing table 16 for networking and to assign it directly to node 1.
  - a) Click on routing table 16.
  - b) Under **Route**, select the item **Networking**.
  - c) Under **Dial Rule**, select the item **Node 1**.
  - d) Under **min. COS**, select the item **15**.
  - e) Under **Warning**, select the item **None**.
  - f) Under **Dedicated Gateway**, select the item **Forced**.
  - g) Under **GW Node ID**, select the item **1**.
  - h) Click on **Apply** followed by **OK**.
8. In the menu tree, click on the associated **Dial Rule** for node 2.
  - a) Under **Rule Name**, enter the value **Node 2**.
  - b) Under **Dial rule format**, enter the value **D4989722E3A**.
  - c) Select **Corporate Network** as the **Network provider's method of access**.
  - d) Under **Type**, select the item **Country code**.
  - e) Click on **Apply** followed by **OK**.
9. Click on **Routing table** in the menu tree to configure routing table 17 for networking and to assign it directly to node 2.
  - a) Click on routing table 17.
  - b) Under **Route**, select the item **Networking**.
  - c) Under **Dial Rule**, select the item **Node 2**.
  - d) Under **min. COS**, select the item **15**.
  - e) Under **Warning**, select the item **None**.
  - f) Under **Dedicated Gateway**, select the item **Forced**.
  - g) Under **GW Node ID**, select the item **2**.
  - h) Click on **Apply** followed by **OK**.
10. In the menu tree, click on the associated **Dial Rule** for node 4.
  - a) Under **Rule Name**, enter the value **Node 4**.
  - b) Under **Dial rule format**, enter the value **D230266719E3A**.
  - c) Select **Corporate Network** as the **Network provider's method of access**.
  - d) Under **Type**, select the item **Local area code**.
  - e) Click on **Apply** followed by **OK**.

11. Click on **Routing table** in the menu tree to configure routing table 18 for networking and to directly assign it to node 4.
  - a) Click on routing table 18.
  - b) Under **Route**, select the item **Networking**.
  - c) Under **Dial Rule**, select the item **Node 4**.
  - d) Under **min. COS**, select the item **15**.
  - e) Under **Warning**, select the item **None**.
  - f) Click on **Apply** followed by **OK**.

### 21.6.4.17 How to Configure Routes and Routing Parameters (Node 4, Master)

In the following steps, you will configure the route and routing parameters for the networking of the slave.

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > Trunks/Routing**.
3. In the menu tree, click **Route**.
4. In the **Change Route** window, enter a name for the CO trunk in the **Route Name** field, e.g., `Route 1`.
5. Under **Seizure code**, enter 0.
6. Under **Incoming PABX number**, in the **Country code** field, enter the value 49.
7. Do not make any entries in the **Local area code** and **PABX number** fields.
8. Select the check box **Incoming PABX number** in the **Location number** field.
9. The default settings for the routing parameters (No. and type, outgoing, Call number type) can be used.
10. Click on **Apply** followed by **OK**.

### 21.6.4.18 How to Configure Least Cost Routing (LCR) for the Network (Node 4, Master)

The default entries in index 32, 33, 34 and 35 in the LCR dial plan must be extended with further entries to enable the dialing of station numbers in "international, national and station" formats for calls to nodes 1 and 2. "International" and "National" are always needed. "Local" is only needed for partner nodes that are in the same local network. These entries are used for dialing from applications (e.g., myPortal for Desktop).

**Prerequisites**

You are logged into the WBM with the **Expert** profile.

**Step by Step**

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > LCR**.
3. Click on **Dial Plan** in the menu tree.
4. Enter the following values in the free positions after the default values (36 to 43 in this case):

| Dial Plan | Name                 | Dialed digits     | Route table |
|-----------|----------------------|-------------------|-------------|
| 1         | Calling for Help     | 0C112             | 19          |
| 2         | Calling for Help     | 0C110             | 19          |
| 3         | Teleworking          | 0C0137Z           | 19          |
| 4         | Teleworking          | 0C0138Z           | 19          |
| 5         | Premium Services     | 0C0900Z           | 19          |
| 6         | Information service  | 0C118Z            | 19          |
| 7         | Special phone number | 0C116116          | 19          |
| 16        | Standard             | 0CZ               | 19          |
| 17        | Standard             | 0C1Z              | 19          |
| 18        | Standard             | 0CNZ              | 19          |
| 31        | Appl-Suite           | -471              | 12          |
| 32        | Standard             | 88CZ              | 1           |
| 33        | IP Network           | -Z                | 13          |
| 34        | CO Internat          | 0C0049-Z          | 15          |
| 36        | Node 1 Inter         | 0C0049230266758-Z | 16          |
| 37        | Node 1 NAT           | 0C0230266758-Z    | 16          |
| 38        | Node 1 Stn.          | 0C66758-Z         | 16          |
| 39        | Node 2 Inter         | 0C004989722-Z     | 17          |
| 40        | Node 2 NAT           | 0C089722-Z        | 17          |
| 41        | Node 3 Inter         | 0C0049230266719-Z | 18          |
| 42        | Node 3 NAT           | 0C0230266719-Z    | 18          |
| 43        | Node 3 Stn.          | 0C66719-Z         | 18          |
| 44        |                      |                   | -           |

5. Click on **Apply** followed by **OK**.
6. In the menu tree, click on the associated **Dial Rule** for node 1.
  - a) Under **Rule Name**, enter the value **Node 1**.

- b) Under **Dial rule format**, enter the value **D49230266758E3A**.
- c) Select **Corporate Network** as the **Network provider's method of access**.
- d) Under **Type**, select the item **Country code**.
- e) Click on **Apply** followed by **OK**.
- 7. Click on **Routing table** in the menu tree to configure routing table 16 for networking and to assign it directly to node 1.
  - a) Click on routing table 16.
  - b) Under **Route**, select the item **Networking**.
  - c) Under **Dial Rule**, select the item **Node 1**.
  - d) Under **min. COS**, select the item **15**.
  - e) Under **Warning**, select the item **None**.
  - f) Under **Dedicated Gateway**, select the item **Forced**.
  - g) Under **GW Node ID**, select the item **1**.
  - h) Click on **Apply** followed by **OK**.
- 8. In the menu tree, click on the associated **Dial Rule** for node 2.
  - a) Under **Rule Name**, enter the value **Node 2**.
  - b) Under **Dial rule format**, enter the value **D4989722E3A**.
  - c) Select **Corporate Network** as the **Network provider's method of access**.
  - d) Under **Type**, select the item **Country code**.
  - e) Click on **Apply** followed by **OK**.
- 9. Click on **Routing table** in the menu tree to configure routing table 17 for networking and to assign it directly to node 2.
  - a) Click on routing table 17.
  - b) Under **Route**, select the item **Networking**.
  - c) Under **Dial Rule**, select the item **Node 2**.
  - d) Under **min. COS**, select the item **15**.
  - e) Under **Warning**, select the item **None**.
  - f) Under **Dedicated Gateway**, select the item **Forced**.
  - g) Under **GW Node ID**, select the item **2**.
  - h) Click on **Apply** followed by **OK**.
- 10. In the menu tree, click on the associated **Dial Rule** for node 3.
  - a) Under **Rule Name**, enter the value **Node 3**.
  - b) Under **Dial rule format**, enter the value **D230266719E3A**.
  - c) Select **Corporate Network** as the **Network provider's method of access**.
  - d) Under **Type**, select the item **Country code**.
  - e) Click on **Apply** followed by **OK**.
- 11. Click on **Routing table** in the menu tree to configure routing table 18 for networking and to directly assign it to node 3.
  - a) Click on routing table 18.
  - b) Under **Route**, select the item **Networking**.
  - c) Under **Dial Rule**, select the item **Node 3**.
  - d) Under **min. COS**, select the item **15**.
  - e) Under **Warning**, select the item **None**.
  - f) Under **Dedicated Gateway**, select the item **Forced**.
  - g) Under **GW Node ID**, select the item **3**.

- h) Click on **Apply** followed by **OK**.
- 12.** In the menu tree, click on the associated **Dial Rule** for trunk calls. This is the predefined dial rule "Gateway Call".
  - a) Under **Rule Name**, enter the value **Gateway Call**.
  - b) Under **Dial rule format**, enter the value **E1A**.
  - c) Select **Corporate Network** as the **Network provider's method of access**.
  - d) Under **Type**, select the item **Unknown**.
  - e) Click on **Apply** followed by **OK**.
- 13.** Click on **Routing table** in the menu tree to configure the route table 19 for the breakout of the slave. Using the multi-gateway entry, the association of the subscriber to the node is determined, and the breakout occurs at that node.
- 14.** Click on routing table 19.
  - a) Under **Route**, select the item **Networking**.
  - b) Under **Dial Rule**, select the item **Gateway Call**.
  - c) Under **min. COS**, select the item **15**.
  - d) Under **Warning**, select the item **None**.
  - e) Under **Dedicated Gateway**, select the item **Multi-Gateway**.
  - f) Under **GW Node ID**, select the item **1**.
  - g) Click on **Apply** followed by **OK**.

## 21.6.5 Networking OpenScape Business in Hosting Environments

In an environment with multiple locations (hosting environment), each site can be assigned a route, and each route can be assigned an ITSP registration. A maximum of 8 ITSP registrations can be managed. One registration per ITSP is possible or even multiple registrations at one ITSP. Each ITSP registration can be assigned an area code, and multiple subscribers can then be assigned to it. The connection between the subscribers at the different sites and the communication system occurs via a VPN or MPLS. If the sites are located in different countries, a separate OpenScape Business S must be used for each country (Scenario 1a). If all sites are located within one country, a single OpenScape Business S can be used (Scenario 1b).

Both scenarios can also be implemented with the OpenScape Business X hardware models (e.g., for smaller configurations). The TDM components can be additionally used at one site.

The following hosting scenarios are described here in general. The following variations can be implemented:

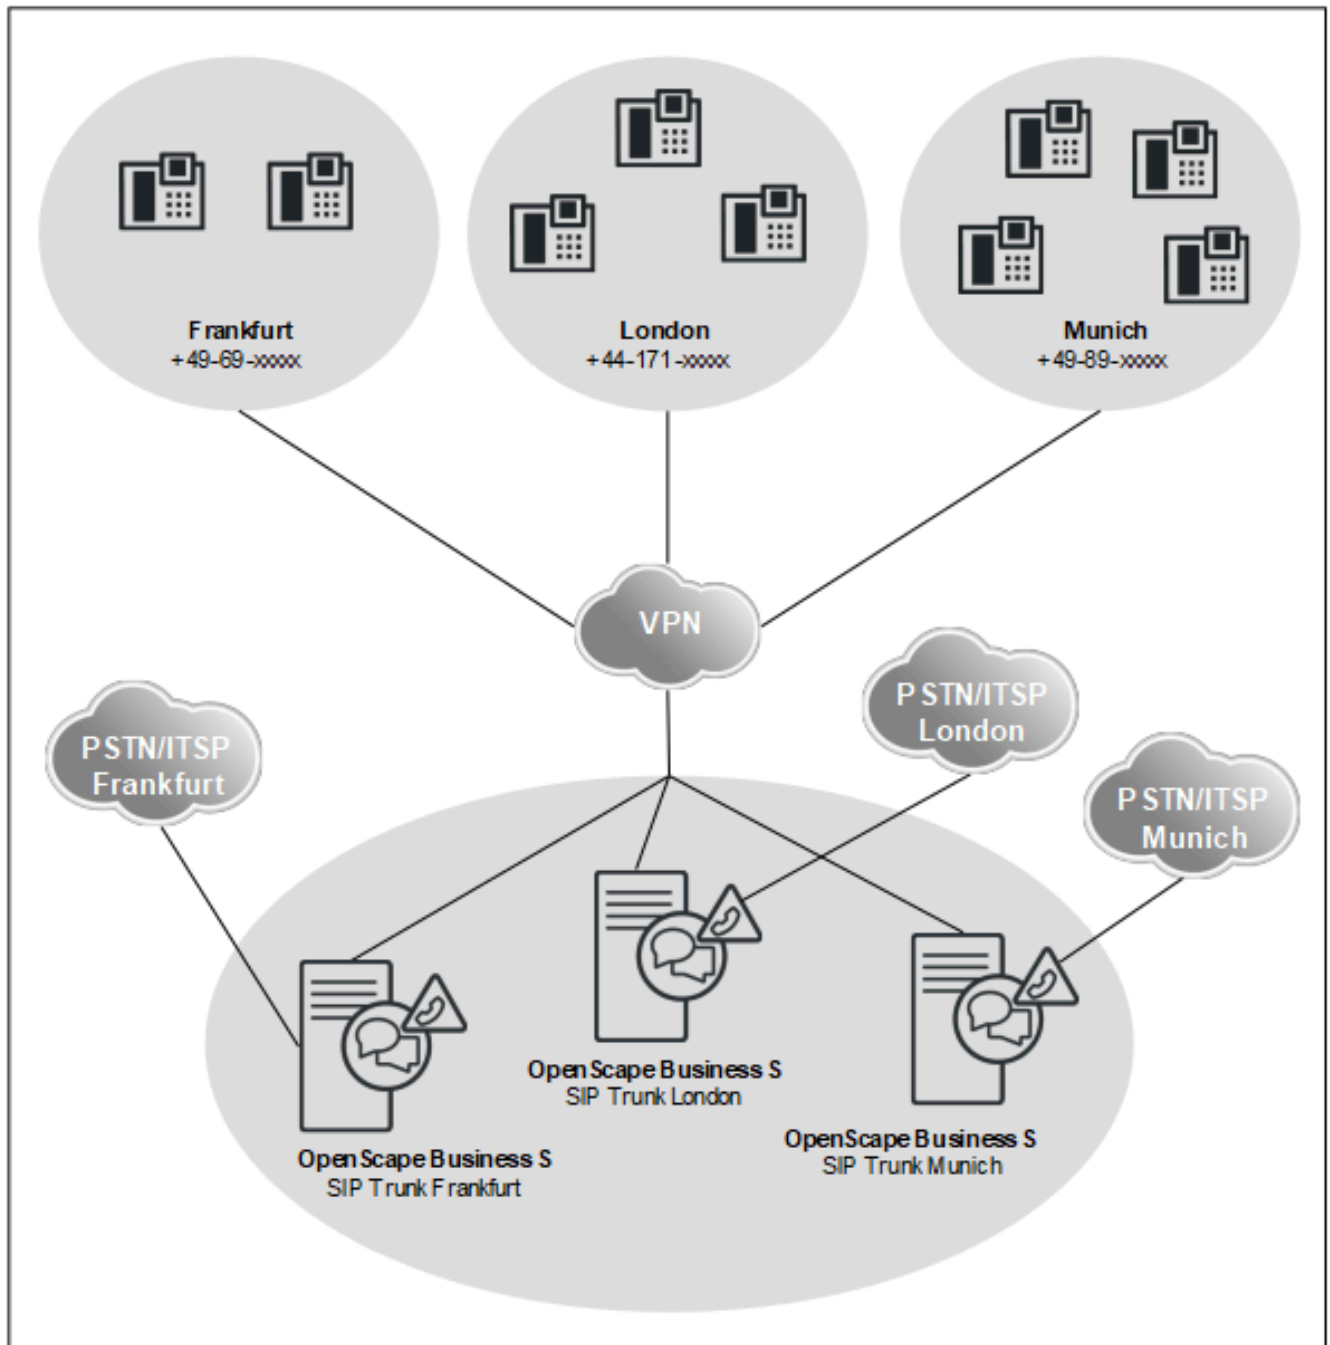

- Use of OpenScape Business S and OpenScape Business X in the Data Center of the customer or at the hoster
- OpenScape Business S on dedicated server hardware or virtualized
- This requires a VPN or MPLS infrastructure, especially for multiple customer sites (no site-specific NAT router for Internet access)
- Up to 8 ITSP per system and country, MSN or DID provider

## Networking OpenScape Business

- Up to 8 site area codes per system and country, assigned to up to 8 customer sites (multi-site)
- Multi-site scenarios combined with classic networking (Voice and UC)
- Multi-site with more than 8 locations feasible in networks (multi-site networked n times)
- Transnational multi-site (multi-site networked n times) feasible in networks
- Networking scenarios with ISDN gateways fully integratable
- The technical prerequisite is the ability to use DID phone numbers for both ISDN providers as well as SIP providers.

## Scenario a: Hosting with an OpenScape Business S per Site

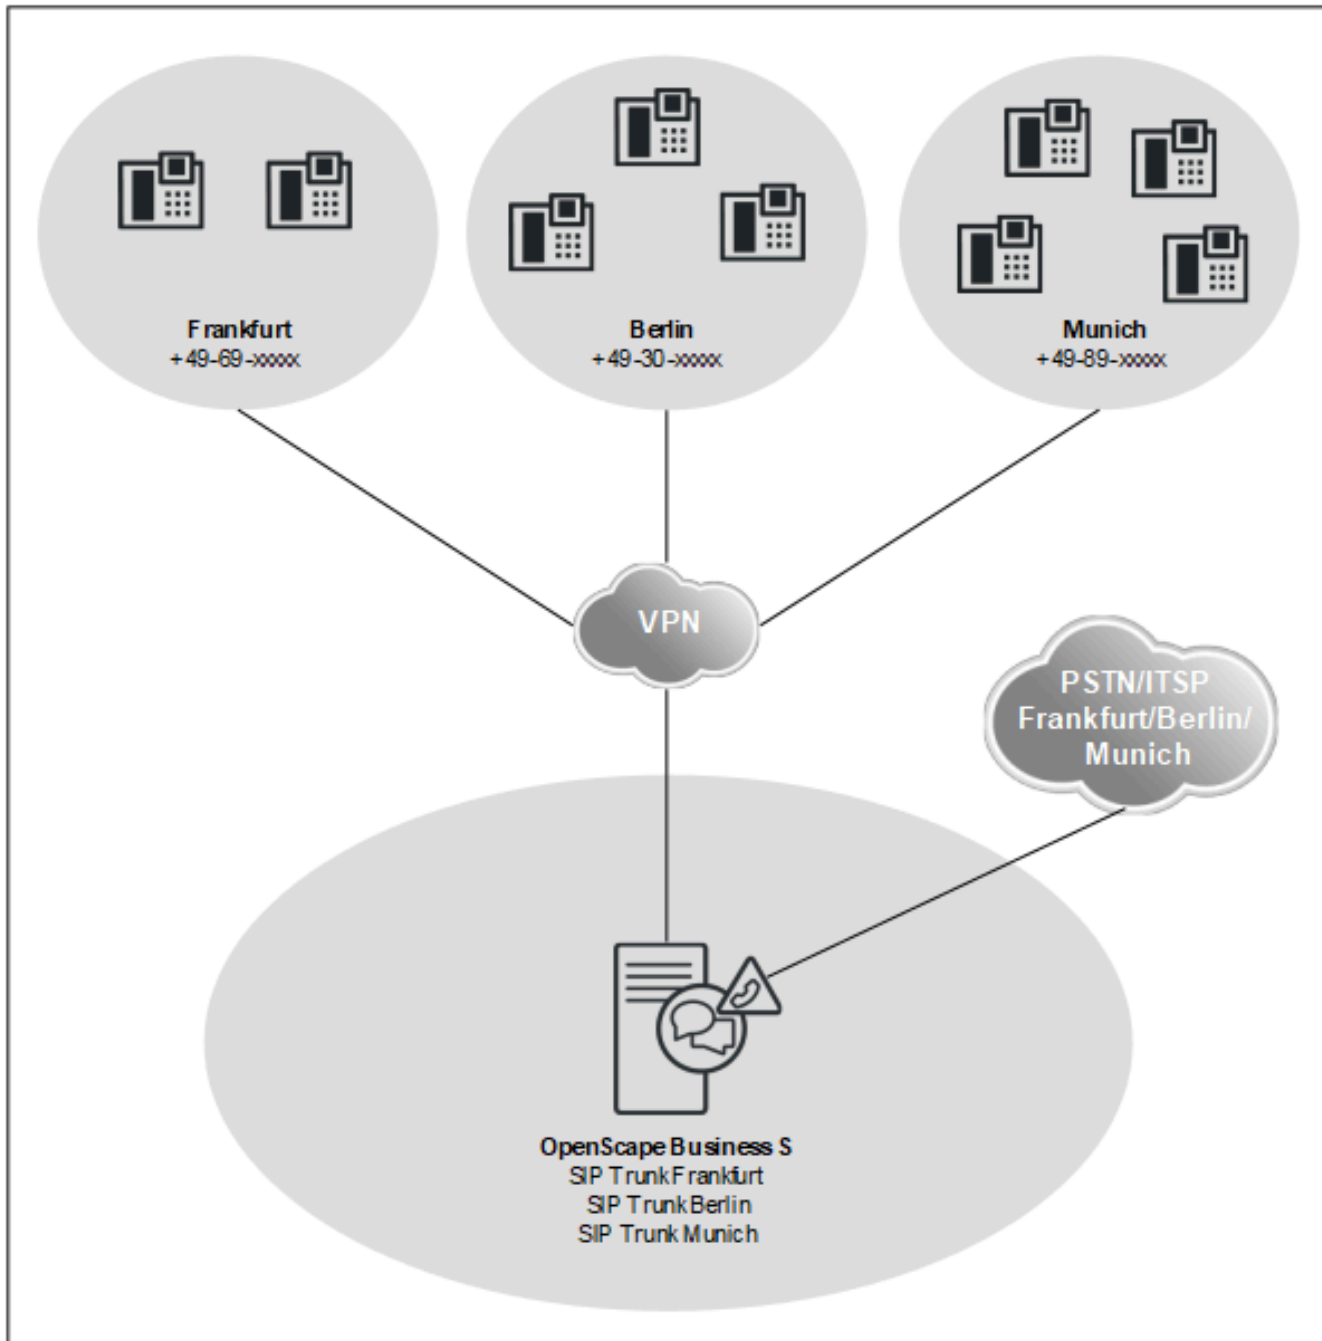

## Network Data

- A customer within a VPN or MPLS.
- One OpenScape Business S per site.
- The sites may be distributed within a country or across multiple countries.
- Up to 1000 users and 180 SIP trunks per OpenScape Business S.
- OpenScape Business networking is optional, up to a total of 1500 users. Larger configurations are possible within the framework of project-specific releases.

### Scenario b: Hosting with OpenScape Business S for Multiple Sites

#### Network Data

- A customer within a VPN or MPLS.
- One OpenScape Business S for all sites.
- All sites located within only one country.
- Up to 8 sites with different site prefixes
- Up to 8 SIP providers per OpenScape Business S.
- One SIP provider per site.
- Up to 1000 users and 180 SIP trunks.

- OpenScape Business networking with multiple OpenScape Business S within a VPN is optional (OS Biz S 1 in country 1, OS Biz S 2 in country 2, etc.), up to a total of 1500 users. Larger configurations are possible within the framework of project-specific releases.
- A configuration example can be found at the Unify Experts wiki on the Internet under *ITSP Configuration Guide*,

### 21.6.6 Networking OpenScape Business X and OpenScape 4000

Networking of OpenScape Business X with OpenScape 4000 can take two different forms. First, with direct addressing between the OpenScape Business nodes (Scenario 4a), and second, with the routing of all connections via OpenScape 4000 (Scenario 4b).

---

**NOTICE:** A configuration example for networking with OpenScape Voice can be found in the Unify Experts wiki at [http://wiki.unify.com/wiki/How\\_to\\_collection\\_and\\_tutorials\\_for\\_OpenScape\\_Business](http://wiki.unify.com/wiki/How_to_collection_and_tutorials_for_OpenScape_Business)

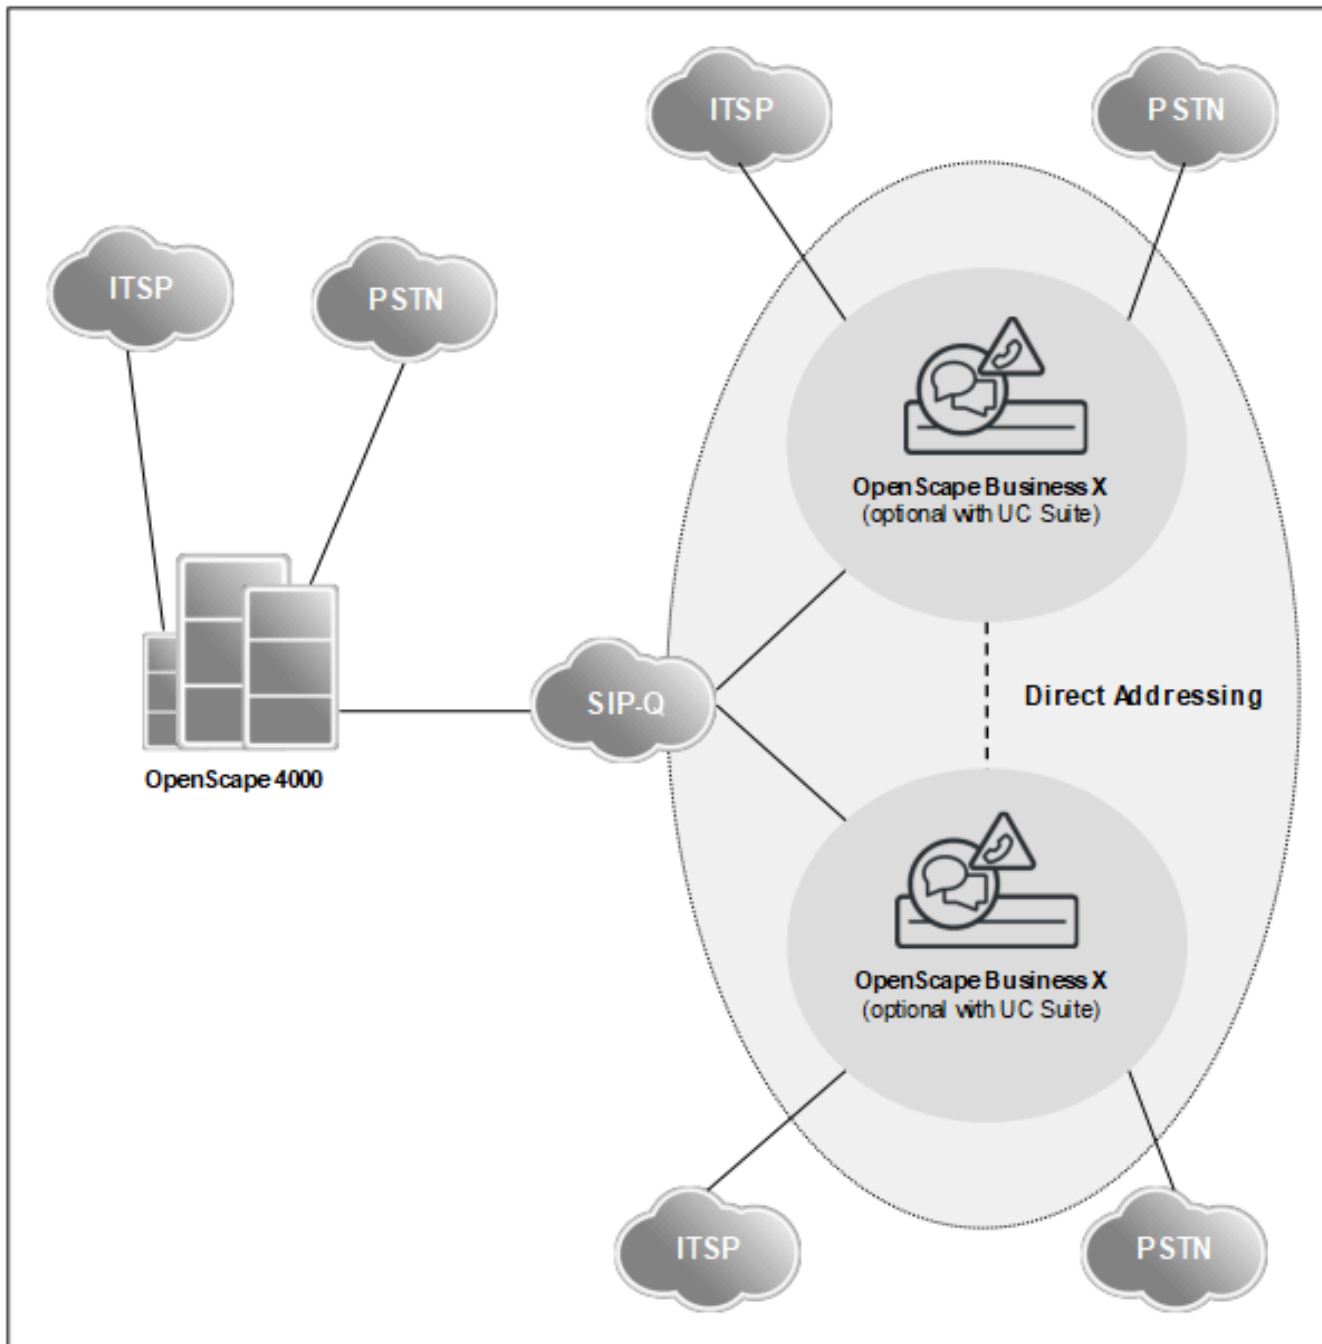

---

### Scenario a: Internet work with OpenScape 4000 and Direct Addressing Between the OpenScape Business X Nodes

#### Network Data

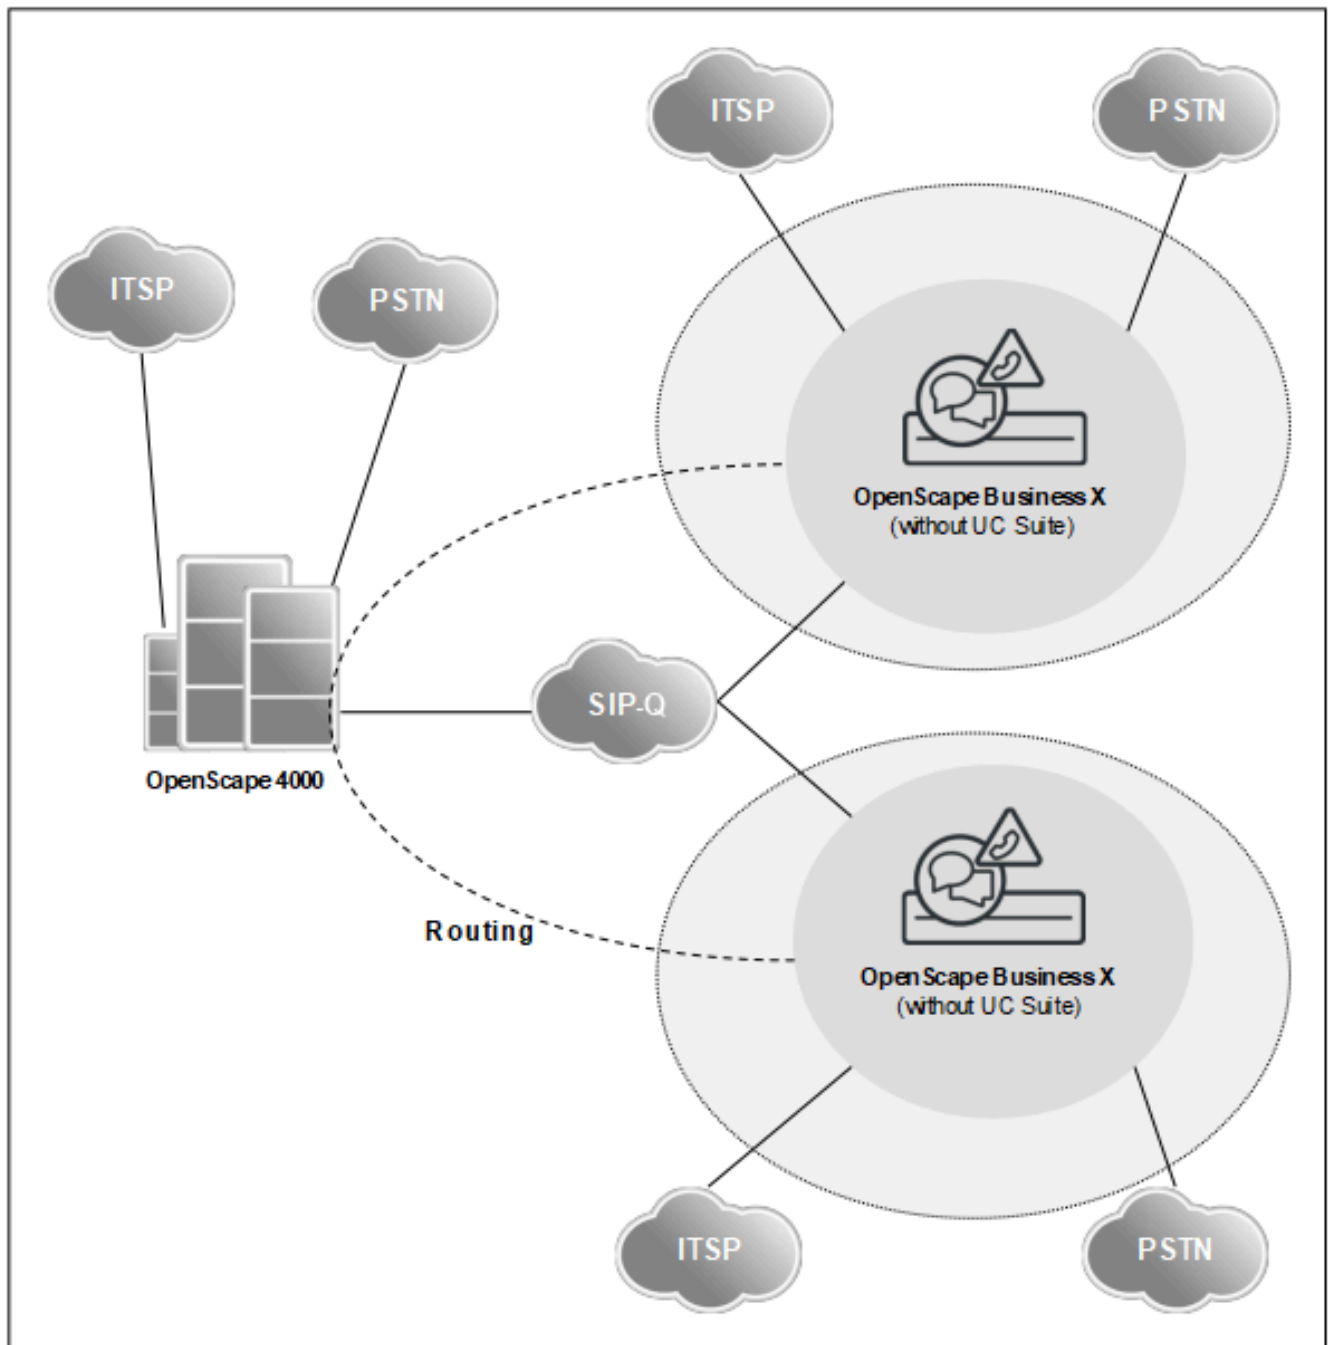

### Scenario b: Internet work with OpenScape 4000 and Routing of all Connections via OpenScape 4000

#### Network Data

- Closed numbering within the OpenScape Business internetwork
- Network-wide voice and UC functionality within the OpenScape Business internetwork

- Configuring the OpenScape Business internetwork with the Networking wizard
- Configuring the OpenScape 4000 network components in Expert mode
- The Small Remote Site (SRS) concept is not supported
- UC functionality via the UC Booster Server or the UC Booster Card is optional.
- OpenScape Business S can be integrated in single or multi-gateway mode.

- Open numbering
- Network-wide voice functionality

- Every call to another node is routed via OpenScape 4000
- No UC solution in OpenScape Business because the internetwork uses open numbering
- The Small Remote Site (SRS) concept is not supported
- The configuration must be done in Expert mode for each node

### Network-wide Features

| Expansion                                 | Closed numbering within the OpenScape Business internetwork (scenario 4a) | Open numbering (scenario 4b) |
|-------------------------------------------|---------------------------------------------------------------------------|------------------------------|
| Maximum number of nodes                   | 100 (32 released, depending on OpenScape 4000)                            |                              |
| Maximum number of stations per system     | Depending on the OpenScape Business X model                               |                              |
| Maximum number of stations in the network | 1500 for the OpenScape Business network segment                           | Depending on OpenScape 4000  |
| Voice networking                          | SIP-Q                                                                     |                              |

| UC networking        | Closed Numbering (Scenario 4a)                                                                         | Open numbering (scenario 4b) |
|----------------------|--------------------------------------------------------------------------------------------------------|------------------------------|
|                      | Network-wide functionality within OpenScape Business                                                   | Not supported                |
| UC Booster Card      | UC Smart: 51 - 150 stations<br>(0 - 50 stations without UC Booster Card)<br>UC Suite: 0 - 150 stations | Not supported                |
| UC Booster Server    | UC Smart: from 150 stations<br>UC Suite: from 150 stations                                             | Not supported                |
| OpenScape Business S | Supported                                                                                              | Not supported                |

| Administration                                                    | Closed Numbering (Scenario 4a)                                                                                           | Open numbering (scenario 4b)               |
|-------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|--------------------------------------------|
|                                                                   | WBM with wizards for OpenScape Business nodes; OpenScape 4000 is administered via the Expert mode of OpenScape Business. | Network-wide administration in Expert mode |
| WBM                                                               | WBM with wizards                                                                                                         | WBM with Expert mode                       |
| Manager E                                                         | Not recommended                                                                                                          | Not recommended                            |
| UC Suite administration                                           | WBM with wizards for OpenScape Business nodes                                                                            | Not supported                              |
| Mass data import via CSV files (call numbers, DID numbers, names) | Separately for each node in the internetwork                                                                             |                                            |

| <b>Licensing</b>    | <b>Closed Numbering (Scenario 4a)</b>                     | <b>Open numbering (scenario 4b)</b> |
|---------------------|-----------------------------------------------------------|-------------------------------------|
| Licensing structure | A network license is required for each OpenScape Business |                                     |

| <b>myPortal for Desktop / myPortal for Outlook (UC Suite)</b> | <b>Closed Numbering (Scenario 4a)</b>                                                                    | <b>Open numbering (scenario 4b)</b> |
|---------------------------------------------------------------|----------------------------------------------------------------------------------------------------------|-------------------------------------|
|                                                               | Network-wide with UC functionality via UC Booster Server, UC Booster Card or OpenScape Business S        | Not supported                       |
| Instant Messaging                                             | Network-wide, within the OpenScape Business internetwork                                                 | Not supported                       |
| Voicemail                                                     | Subscribers use their local voicemail system; there is no central voicemail for the entire internetwork. | Not supported                       |

| Telephony                                                                                    | Closed Numbering (Scenario 4a)                                                                             | Open numbering (scenario 4b) |
|----------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------|------------------------------|
| SIP Provider (ITSP)                                                                          | Local                                                                                                      | Local                        |
| PSTN Provider                                                                                | Local; network nodes without a PSTN provider of their own are reached via SIP-Q or the associated gateway. |                              |
| Survivability (redundancy in the event of an internetwork or OpenScape Business S breakdown) | Is supported between OpenScape Business X and OpenScape Business S                                         | Not supported                |

| Telephony                                | Closed Numbering (Scenario 4a)                           | Open numbering (scenario 4b) |
|------------------------------------------|----------------------------------------------------------|------------------------------|
| Dial a public number in the own node     | Supported                                                |                              |
| Dial a public number in a networked node | Network-wide, within the OpenScape Business internetwork |                              |

| Mobility                                 | Closed Numbering (Scenario 4a)                                                                                                     | Open numbering (scenario 4b) |
|------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| Desk Sharing                             | Within a node; network-wide, within the OpenScape Business internetwork (with DLS)                                                 | Not supported                |
| Mobility with DTMF control of the system | Local (not supported for OpenScape Business S)                                                                                     | Local                        |
| myPortal to go (Web Edition), UC Suite   | Network-wide presence status and directories (requires a UC Booster Server, UC Booster Card or OpenScape Business S for each node) | Not supported                |
| myPortal to go (Web Edition), UC Smart   | Local, not for UC Booster Server, UC Booster Card and OpenScape Business S                                                         | Not supported                |

| Other functionalities                  | Closed Numbering (Scenario 4a)                                                                                  | Open numbering (scenario 4b)                                                                 |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
| Signaling and Payload Encryption (SPE) | Not supported in OpenScape 4000 / OpenScape Business networks. Not supported for UC connections and conferences | Not supported in OpenScape 4000 / OpenScape Business networks. Not supported for conferences |
| DSS server                             | Network-wide, within the OpenScape Business internetwork                                                        | Not supported                                                                                |
| Call Pickup                            | Not supported                                                                                                   | Not supported                                                                                |

### 21.6.7 Networking OpenScape Business X and OpenScape Voice

OpenScape Business X can be networked with OpenScape Voice.

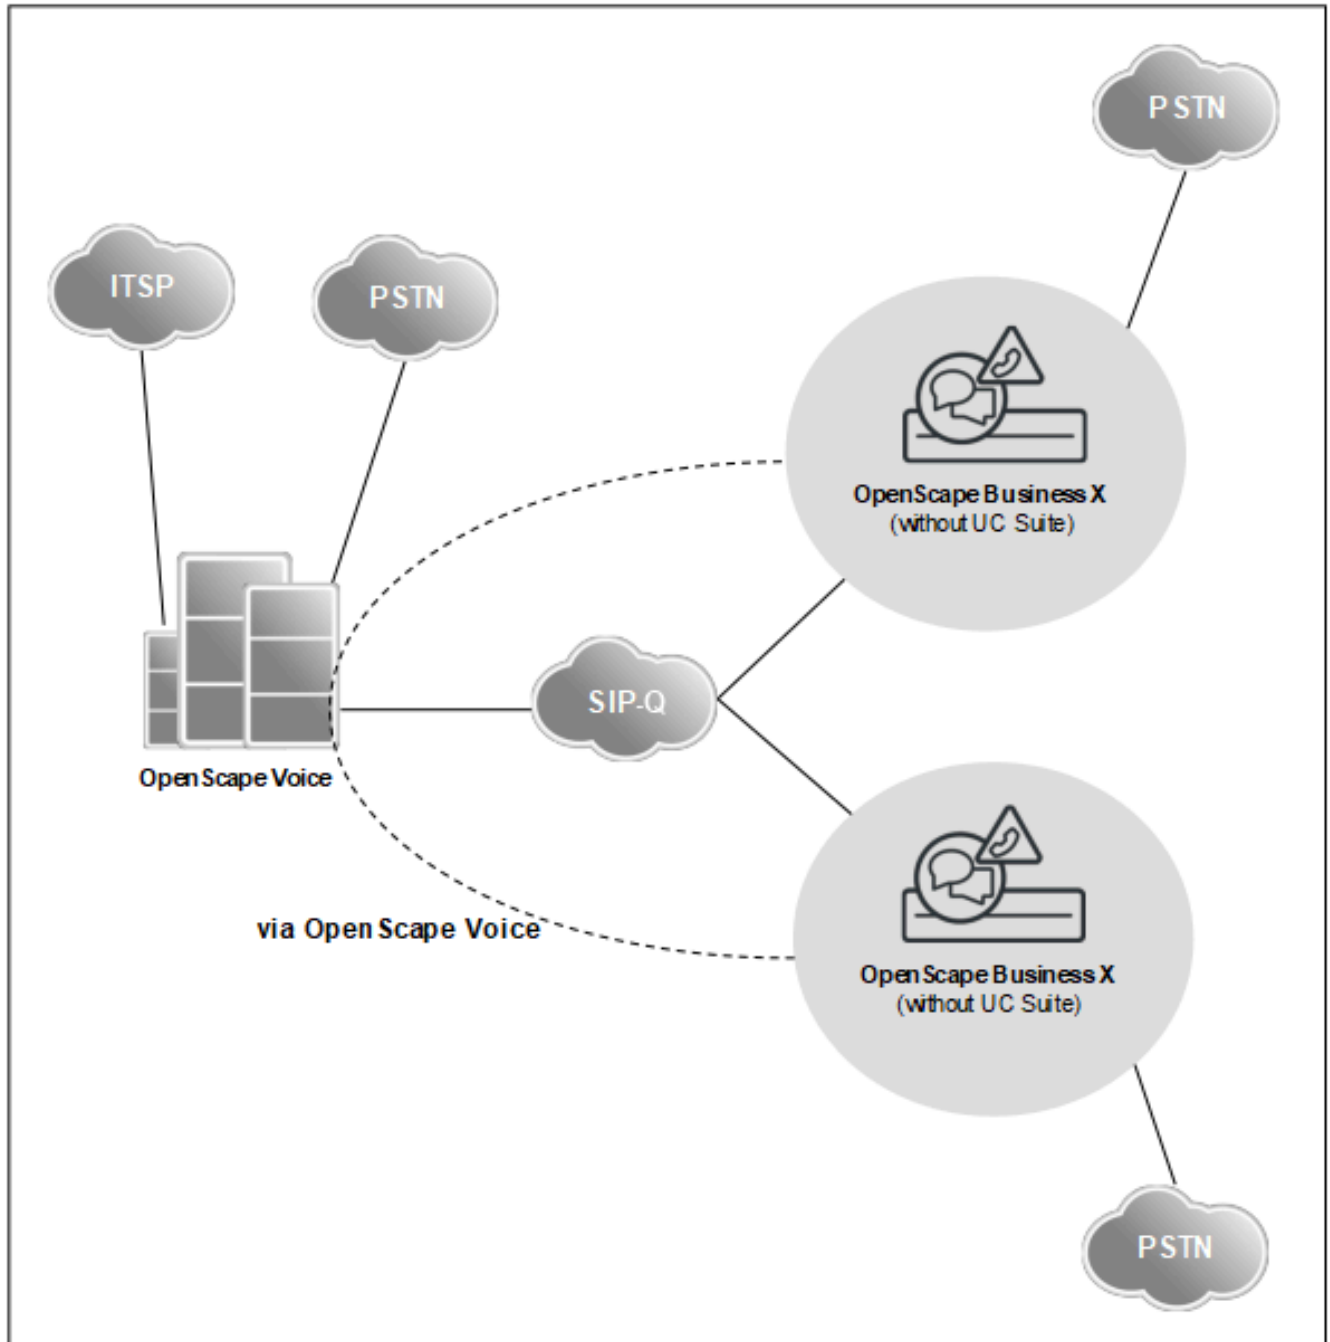

---

**NOTICE:** A configuration example for networking with OpenScape Voice can be found in the Unify

Experts wiki at [http://wiki.unify.com/wiki/How\\_to\\_collection\\_and\\_tutorials\\_for\\_OpenScape\\_Business](http://wiki.unify.com/wiki/How_to_collection_and_tutorials_for_OpenScape_Business)

### Network Data

- OpenScape Business X provides network-wide voice and gateway functionality for OpenScape Voice.
- One or more OpenScape Business X systems can be used as a gateway for digital Central Offices (ISDN, T1, CAS)
- The following devices can be operated at OpenScape Business X gateways: digital / analog / DECT / IP (HFA)

- UC is generally not supported by OpenScape Business X in this networking scenario.
- Each call from one node to another is routed through OpenScape Voice.
- The configuration of each node occurs in Expert mode.
- The OpenScape Voice dial plan is based on E.164, which explains why neither open nor closed numbering is available.

### Network-wide Features

| Maximum configuration                                             |                                                                                                                        |
|-------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------|
| Maximum number of nodes                                           | Depending on OpenScape Voice                                                                                           |
| Maximum number of stations in a single communication system       | Depending on OpenScape Business X                                                                                      |
| Maximum number of stations in the network                         | Depending on OpenScape Voice                                                                                           |
| Administration                                                    |                                                                                                                        |
| WBM                                                               | The Networking wizard cannot be used. OpenScape Voice is administered per node via the OpenScape Business expert mode. |
| Manager E                                                         | Not recommended                                                                                                        |
| UC Administration                                                 | UC is not relevant in connection with OpenScape Voice                                                                  |
| Mass data import via CSV files (call numbers, DID numbers, names) | Separately for each of the nodes in the OpenScape Business internetwork                                                |
| Licensing                                                         |                                                                                                                        |
| Licensing structure                                               | Each node individually; a network license is required for each OpenScape Business node                                 |

### Restrictions and Notes on the Features

- The connection of analog CO trunks at OpenScape Business gateways is released **only** for Brazil (due to the support for line reversal and backward release of analog CO trunks in Brazilian COs).
- A network of OpenScape Business gateways with one another or with systems other than OpenScape Voice is not supported. The networking of the OpenScape Business gateways with OpenScape Voice must occur through a star-shaped network structure.
- Path replacement (route optimization) via SIP-Q is not supported for the devices connected to an OpenScape Business gateway.
- To avoid poor voice quality on transit line connections, the G.711 voice codec should be used. The G.729 codec is not recommended, since transit line connections can be caused by features such as conferencing and call forwarding. This is because path replacement (i.e., route optimization) is not supported.
- No cross-system support between OpenScape Voice and OpenScape Business gateways is available for features such as call pickup groups, group calls and hunt groups. The groups may

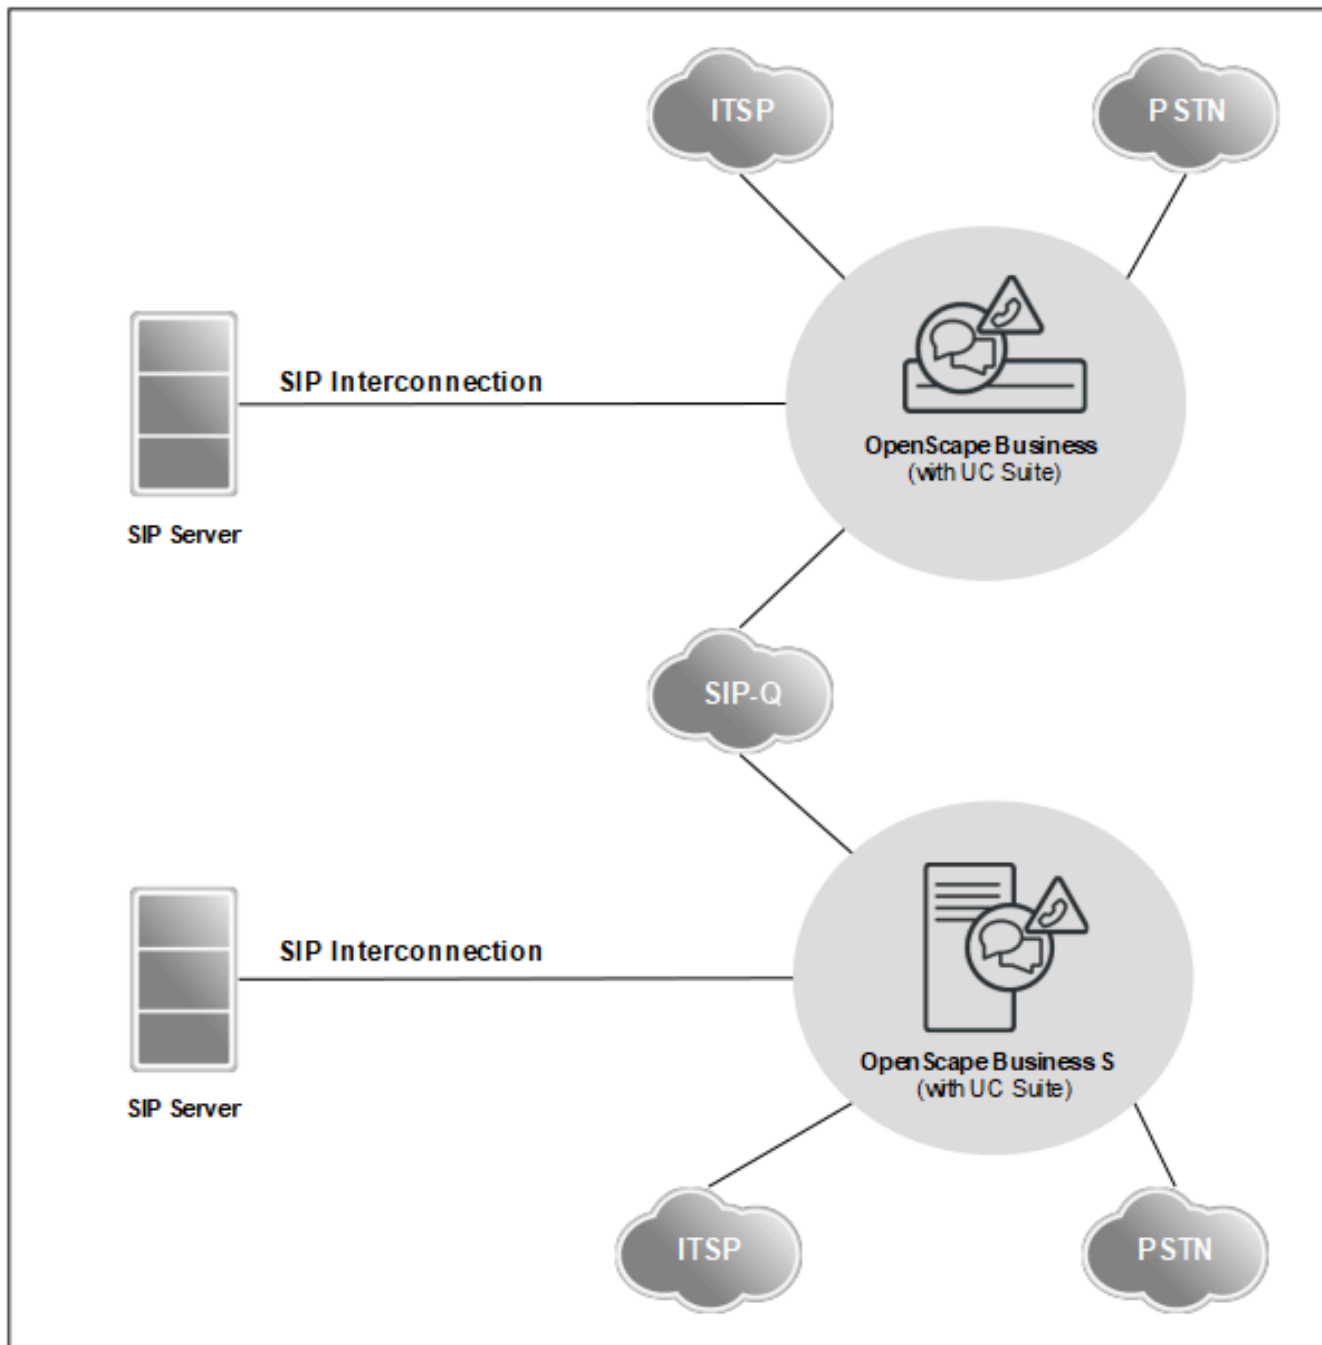

include only subscribers of either OpenScape Voice or OpenScape Business, but not both.

- Encryption (SPE) between OpenScape Voice and OpenScape Business gateways is supported. The connection between OpenScape Voice and OpenScape Business must be made by means of the TLS encryption protocol. SRTP (SDS) is not supported in a network with OpenScape Voice V7R1.
- Networking is supported only with the E.164 numbering plan.
- The following applies to the IP stations (HFA) connected to OpenScape Business gateways: For each active OpenScape Business/OpenScape Voice connection, two B channels per HFA device are required (one B channel per TDM device). The need for these additional DSP resources should be reviewed and taken into consideration.

### **21.6.8 Connecting External Auxiliary Equipment to OpenScape Business via SIP Interconnection**

External auxiliary equipment can be connected to OpenScape Business via SIP Interconnection, e.g., to use applications such as OpenScape Alarm Server, OpenScape 4000, OpenScape Voice or other certified SIP servers.

### Prerequisites

- Only certified applications may be connected, for example, OScAR.
- An external SIP server can be connected via the Native SIP or SIP-Q protocol.
- A maximum of two SIP-Q routes (one is required for UC Suite, if present) and a maximum of 10 Native SIP routes (of which up to 8 Native SIP routes can be used for ITSP) are available.

### Additional information can be found in the

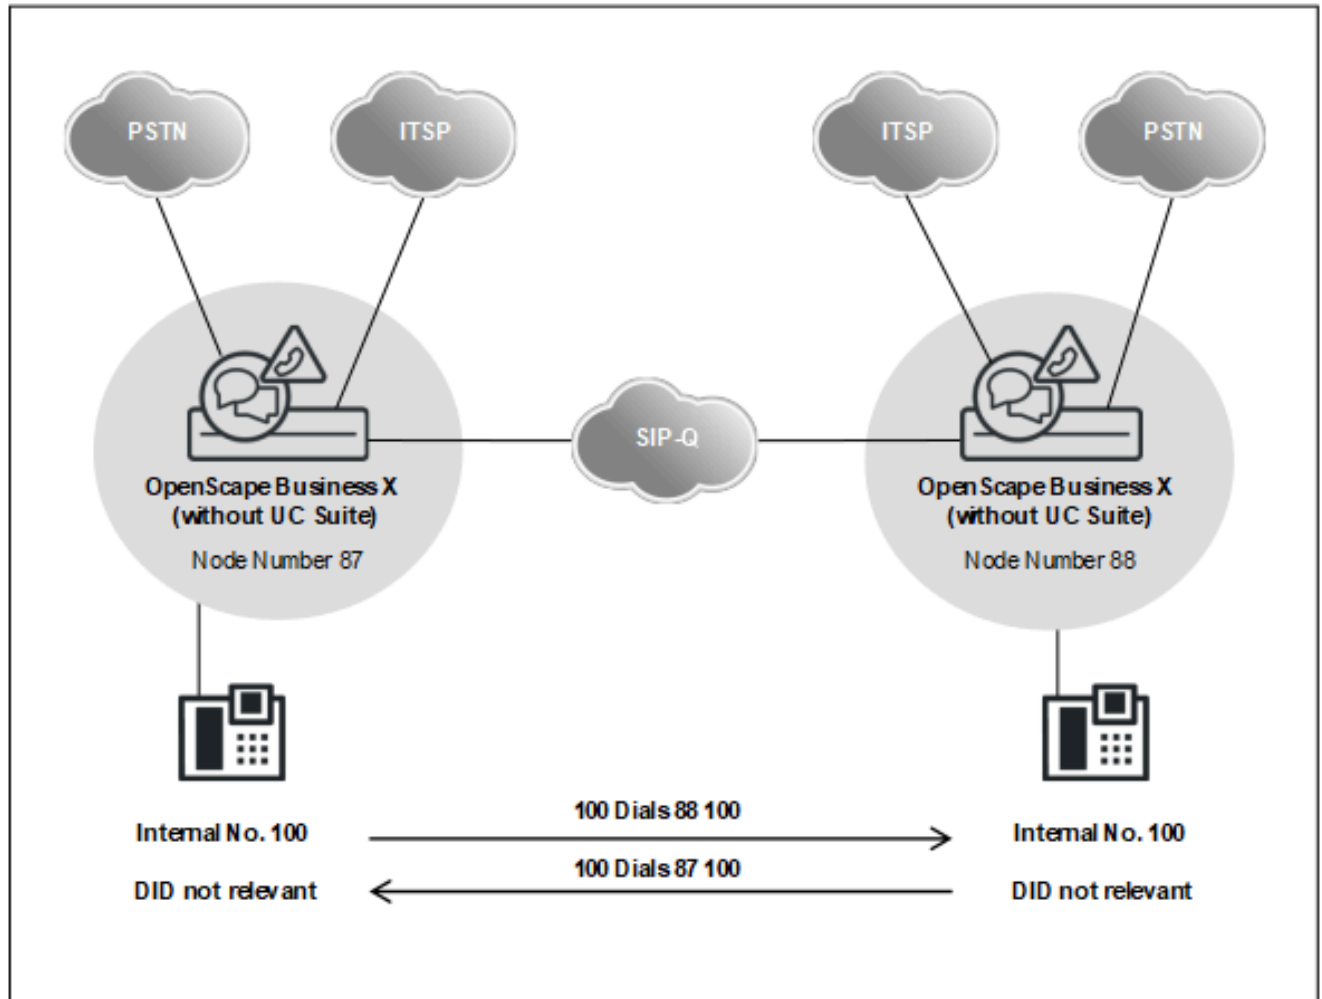

- Expert wiki for telephones, communication systems and UC:

<http://wiki.unify.com>

## 21.6.9 Open Numbering in OpenScape Business X Networks

A internetwork with open numbering can be set up by networking two (or more) communication systems whose numbering schemes overlap one another (i.e., not unique throughout the internetwork).

### Network Data

- Network-wide voice networking via OpenScape Business.
- UC features are not supported.
- Every call within a node occurs with an internal call number.
- Every call to another node occurs with a node number (plus an internal number).
- Each node must be configured in Expert mode. The Networking wizard is disabled once a node number for open numbering has been configured.
- Outside line access to the PSTN or ITSP is possible from each node.

**NOTICE:** In case of a network-wide extension on UC functionality, it is necessary to change from open to closed numbering in order to adapt the

internal numbers. Thus, the open numbering must be disabled, while the node number must be deleted and subsequently added as a prefix (for example, extended internal number 87100 instead of 100 and 88100 instead of 100).

Differences:

- The selection of participants in their own node is made with the extended internal number.
- The internal number and the DID number may differ if necessary, but the DID numbers must not be changed.

### 21.6.9.1 How to Configure Open Numbering

#### Configuring Open Numbering

- 1) Use the **Open numbering** system flag to enable open numbering for the communication system
- 2) Enter the number of your own node (e.g., "87")

#### Configuring Nodes (Routing)

- 1) The destination nodes are addressed via Voice Gateway > Networking > Nodes > Routing (e.g., "88")
- 2) In an open numbering scheme, the **Networking** wizard cannot be used; this is prevented by the **Open numbering** system flag.

#### Configure LCR

- 1) Assign the "Node 2 open Num" dial rule to the node number and select the associated routing table.

| Dial Plan        |                 |               |               |                          |                                     |                          |  |
|------------------|-----------------|---------------|---------------|--------------------------|-------------------------------------|--------------------------|--|
| Change Dial Plan |                 |               |               |                          |                                     |                          |  |
| Dial Plan        | Name            | Dialed digits | Routing Table | Acc. code                | Classes of service                  | Emergency                |  |
| 56               | Standard        | 861CZ         | 20 →          | <input type="checkbox"/> | <input checked="" type="checkbox"/> | <input type="checkbox"/> |  |
| 57               | Standard        | 861C0-Z       | 20 →          | <input type="checkbox"/> | <input checked="" type="checkbox"/> | <input type="checkbox"/> |  |
| 58               | Standard        | 861C1Z        | 20 →          | <input type="checkbox"/> | <input checked="" type="checkbox"/> | <input type="checkbox"/> |  |

## 21.6.10 Networking via ISDN

OpenScape Business systems can be networked with one another as well as with HiPath 3000 and OpenScape 4000 communication

systems via digital trunks. Both  $S_0$  as well as  $S_{2M}$  lines can be used for the connection.

### Networking with HiPath 3000

The existing HiPath 3000 network is (initially) left intact. The expansion of the network occurs with OpenScape Business. HiPath 3000 nodes can be gradually migrated into the OpenScape Business network as required.

Every cross-network call that traverses the HiPath 3000/OpenScape Business is conducted via suitable TDM gateways ( $S_0$  or  $S_{2M}$  with CorNet NQ protocol, possibly QSIG as a vendor-independent protocol).

The following constraints apply:

- Separate licensing for HiPath 3000 / OpenScape Business
- Separate administration for HiPath 3000 / OpenScape Business
- Recommendation: closed numbering in the overall network. Open numbering could potentially result in erratic behavior with CLIP and for journal entries / caller lists.
- Recommendation: use only the G.711 codec to ensure good voice quality in the overall network.
- The number of B-channels must be determined by taking the expected call volume into account.
- OpenScape Business requires a Networking license in any case.

### Connection of External Systems via QSIG

The following must be noted when connecting external systems with the QSIG protocol:

- Check the QSIG variants of the external systems involved for compatibility (QSIG V1, also called QSIG as per the ECMA Standard, and QSIG V2, also called QSIG as per the ISO Standard)
- Compare the feature sets of the relevant systems. This should help to determine to what extent the theoretically expected scope of functionality, i.e., the intersection of both feature sets, corresponds to the customer's wishes.
- Furthermore, to guarantee the expected functionality, an on-site test of the connection is recommended. In particular, interworking with other networking and PBX protocols must be taken into account.

---

#### NOTICE:

QSIG trunk group should be configured as PABX route type in OpenScape Business system. Therefore, calls coming from QSIG network will be considered as internal and will follow internal CDL.

---

### 21.6.11 OpenScape Business internetwork with central ITSP trunk connection

A pure OpenScape Business internetwork can be implemented with a central DID-capable ITSP trunk connection instead of ISDN.

### Networking with Central DID-capable ITSP Trunk connection

The following must be observed when planning customer networks:

- **One** central ITSP trunk connection for the entire OpenScape Business network.
- Registration at exactly one local network, i.e., all nodes in the network use exactly one Central Office number, e.g., 0049 89 7007-XXXXX.
- For emergency calls, the networked nodes can use their own trunk connections for outbound calls in cases where the central ITSP access fails. Under certain circumstances, a correct caller identification to the outside may not be possible in this case.

Emergency calls, for example, may not be delivered correctly. Incoming accessibility via this local connection is also subject to restrictions. For these reasons, local connections are not recommended, though not prevented technically.

- For the same reason, additional ISDN connections are not recommended (though technically not prevented) at the central node.
- All digit analysis and call routing rules for standalone OpenScape Business systems and networks apply. The station number assignment of the ITSP CO numbers occurs exclusively via the DID configuration of the station in this case (and not via the mapping table; see Configuring an ITSP in section 9.2 and the Unify Experts wiki on the Internet).

## 21.7 Central Intercept Position in the Internetwork (Not for U.S.)

OpenScape Business allows incoming calls that cannot be assigned to a station or answered to be diverted to a defined intercept position in the internetwork to ensure that no calls are lost.

If the central intercept position in the internetwork is configured using ISDN, then the functionality is identical to the functionality without networking.

In conjunction with an ITSP Central Office, the central intercept position is subject to some restrictions, since every node essentially has its own ITSP:

- The ITSP intercept criteria apply only to each respective node.
- The intercepts "on RNA", "on Device Busy", "on Incomplete", "on Invalid", and "on Unanswered Recall" work.
- The intercept types "on Invalid" and "on Incomplete" do not work with the ITSP.
- Incomplete or invalid telephone numbers are returned to the ITSP with a busy signal.

If a central intercept position is to be used in an internetwork, virtual stations must be configured in each node. These virtual stations are permanently diverted via the internetwork to the myAttendant user.

Example for an ITSP CO: ITSP PABX number is 0211-23456789 + ITSP DID number; the number 0211-23456789-0 is publicly announced as the central number of the communication system.

- Station 100 is myAttendant with its own ITSP DID number 100 and a virtual station 199 with the ITSP DID number "0".
- In the ITSP mapping list of each node, the ITSP DID number "0" is assigned to the own virtual station.
- Under **Incoming Calls/Call Forwarding**, the virtual stations are referred to station 100.

First destination: own virtual station

Second destination: station 100 in the destination node

Call time 5 seconds

For better identification of calls, it is recommended that the virtual stations of all nodes be provided with their call number (DID) and a name (e.g., company) via the myAttendant application (under **Setup/myAttendant/DIDs**). This enables a more detailed identification of the caller in the **Active Calls** window of myAttendant.

### 21.7.1 How to Configure a Central Intercept Position in the Multi-Gateway Internetwork

This configuration example shows you how to set up a central intercept position in the multi-gateway internetwork via the upstream OpenScape Business gateways. All calls which are received at a node and which meet the intercept criteria must be routed to OpenScape Business S, where the central AutoAttendant is located.

#### Prerequisites

OpenScape Business S is the master (all HFA and SIP stations are logged in here).

Multiple OpenScape BusinessX systems have been set up as slave nodes (with PSTN or ITSP as the outside line). The nodes may be at the same location or at different locations (with different prefixes).

#### Step by Step

1. Set up a virtual station at the OpenScape Business.
  - a) Set up a virtual station with the name "Intercept 22 System2"
2. Set up a central intercept position with intercept criteria at the OpenScape Business.
  - a) **Expert mode**
  - b) **Basic Setup > System > Intercept/Attendant/Hotline**
  - c) Select virtual station 22 under **Intercept position** for **Day and night**.
  - d) Enter the following parameters for station 22 under **Intercept position** for **Intercept**:

|                       |                      |
|-----------------------|----------------------|
| Name                  | Intercept 22 System2 |
| Direct inward dialing | xxxxxxx22            |
| Device type           | Virtual              |
  - e) Activate the entered parameters under **Intercept position** for **Intercept**.
  - f) Set up the virtual station under **Intercept position** for **Lock Code**.
3. Set up the call forwarding OpenScape Business.
  - a) Set up the call forwarding of the virtual station 22 via the internetwork to OpenScape Business S.
  - b) **Expert mode**
  - c) **Incoming Calls > Call Forwarding**
  - d) Select virtual station 22
  - e) Proceed with **Edit Call Forwarding**

- f) Then go to: **External destination** (enter the station numbers for the AutoAttendant queues, e.g., 7410)
  - g) **Route** = Select network (the AutoAttendant queue station number 7410 must be specifically routed in the LCR by bypassing the -Z default rule 33).
- 4. Configure the routes for OpenScape Business.**
- The AutoAttendant queue station number 7410 must be specifically routed in the LCR by bypassing the -Z default rule 33.

|                                 |                                                                             |
|---------------------------------|-----------------------------------------------------------------------------|
| Under <b>Dial Plan</b> :        | Configure the <b>Name</b> (VSL Queue Pilot)                                 |
|                                 | Enter the station number (7410) under <b>Dialed digits</b>                  |
|                                 | Select <b>Routing Table</b> (XX)                                            |
| Under <b>Routing Table XX</b> : | Select <b>Route</b> = Network                                               |
|                                 | <b>Assign</b> Dial Rule                                                     |
|                                 | Under <b>Dedicated Gateway</b> , select the entry <b>Mandatory</b>          |
|                                 | Enter the <b>GW Node ID</b> of the OpenScape Business S.                    |
| Under <b>Dial Rule</b> :        | Enter the <b>Rule Name</b>                                                  |
|                                 | Under <b>Dial rule format</b> , enter D7410 (Queue Pilot Number)            |
|                                 | Under <b>Network provider's method of access</b> , select Corporate Network |
|                                 | <b>Type</b> : Select Unknown                                                |

- 5. Set up a queue at OpenScape Business S.**
- a) Set up a queue (Queue Pilot) with a CCV, e.g., **Dial By Extension, Dial By Name, Process after digits.**
- 6. Set up call forwarding at OpenScape Business S.**
- a) Set up call forwarding of the Queue Pilot 7410 in OpenScape Business S.
  - b) **Expert mode**
  - c) **Incoming Calls > Call Forwarding**
  - d) Select Queue Pilot 7410
  - e) Proceed with **Edit Call Forwarding**
  - f) First go to: **External destination** (enter the station numbers for the AutoAttendant queues, e.g., 7410)
  - g) Then go to: select the **Voicemail box**

## 21.8 Presence Manager

Presence Manager enables the subscriber states "Free", "Busy" and "Ring" to be signaled throughout the network at the LEDs of the HFA telephones. This requires closed numbering and at least one UC Booster Server at the master node of the internetwork or an

OpenScape Business S as the master node. A network license is required for each node.

In the idle state, the corresponding LED is off; in the busy state, it is constantly on, and in the ringing state, the LED flashes. In the ringing state, the call involved can be picked by pressing the corresponding button.

Call processing states can only be signaled for a station if the Presence Manager can set a CSTA monitor point on the relevant station.

The keys are configured by the user. When station numbers are programmed on the telephone itself, no distinction is drawn between internal and network-wide numbers.

The Presence Manager is a service and has no user interface. No settings need be made, as all data is automatically obtained through data synchronization.

Groups are not supported by Presence Manager. LED signaling is not performed and call pickup is not possible. MULAPs, however, are not supported by Presence Manager.

Presence Manager does not actively support any SIP and S<sub>0</sub> phones.

## 21.9 Synchronization Status in the Internetwork

In an internetwork, the synchronization status is displayed in the Admin Portal, and the registration status of each node is indicated by colored buttons. The display of the synchronization status applies to network nodes of the communication system, but not to OpenScape 4000 and OpenScape Voice nodes.

### Display of the Synchronization Status

| Display                                                                        | Color  | Meaning for the master                                              | Meaning for the slave                                                                                                                                                        |
|--------------------------------------------------------------------------------|--------|---------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Synchronization status<br>(display on the home<br>page of the Admin<br>Portal) | Red    | -                                                                   | The IP address of the master node is configured, but the slave system could not register. The slave tries to register with the master at cyclical intervals.                 |
|                                                                                | Yellow | -                                                                   | The slave is registered with the master, but the call numbers are not consistent in the internetwork. This may occur after a backup/restore or after the first registration. |
|                                                                                | Green  | If a node is configured as the master, the status appears as green. |                                                                                                                                                                              |

| Display                                                                                 | Color | Meaning for the master                                                                                                                                                    | Meaning for the slave                                         |
|-----------------------------------------------------------------------------------------|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------|
| Registration status of the individual nodes (displayed in the Network>Node View dialog) | Red   | The slave is configured, but the system has never registered.                                                                                                             | The slave is configured, but the system has never registered. |
|                                                                                         | Green | The system is registered.                                                                                                                                                 | The system is registered.                                     |
| Alive (displayed in the dialog Network>Node View)                                       | Red   | Node-specific view of the internetwork: all nodes that are marked in red cannot be reached. The reasons may be network problems or a failure in the communication system. |                                                               |
|                                                                                         | Green | The (external) node can be reached via the network. The own node is always shown in green.                                                                                |                                                               |

### 21.9.1 Manual Synchronization in the Internetwork

If the automatic synchronization of the configured call numbers and names (internal or DID numbers) has not been completed in the other systems of an internetwork, a manual synchronization can be initiated. This manual synchronization in the internetwork only works in homogeneous networks.

#### Master

#### Slave

The synchronization process only transfers changes in the configuration.

If the status indicator in the Admin Portal appears as "red", the Synchronization button can be pressed to try and manually synchronize the data with the master.

In cases where already configured systems in the network can no longer make calls, the potential cause for the problem must be found elsewhere. If the Alive status of individual nodes appears as "red", this indicates network problems or other reasons why the node cannot be reached in the network. In such cases, activating the Synchronization button will not improve the situation.

When activated on the master node, the slave nodes are requested to update the phone numbers and names of the system from the master.

When activated on a slave node, the station numbers and names of the system are updated on the master. At the same time, the slave node is registered again at the master node.

### 21.9.2 How to Start Synchronization Manually

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

### Step by Step

1. Click on **Service Center** in the navigation bar.
2. Click **Restart / Reload** in the navigation tree.
3. Activate the **Sync Network** button to start the manual synchronization.

## 21.10 Survivability

Survivability is a feature within a network of OpenScape Business nodes. If an OpenScape Business node fails or cannot be reached due to network errors, the system telephones (HFA) logged in at the OpenScape Business node can log in at the other OpenScape Business node of the network instead. The phone numbers of the system telephones are retained after the new login. This provides continuity for basic telephony; however, the features of applications such as myPortal, voicemail and CTI will be temporarily unavailable.

The screenshot shows the 'Expert mode - Telephony Server' interface. On the left is a navigation tree with options like 'System Clients', 'SIP Clients', 'Deskshare User', 'Virtual Stations', 'UC Applications', 'Profiles/Templates', 'DDI Extensions', 'Mobility User', 'Circuit User', 'SIP User', 'Trusted External User', 'Stations Overview', and 'Key Programming'. The main area displays a table titled 'IP Clients' with columns: Callino, DID, First Name, Last Name, Display, Type, Clip/Lin, Active, Fax Callino, and F. The table lists various clients, including System Clients (e.g., netw\_0\_s600, netw\_1\_s601) and Deskshare Users (e.g., netw\_3\_voip\_603, netw\_4\_voip\_604). A search bar is located at the top left of the table. At the bottom, there are 'Apply', 'Undo', and 'Help' buttons.

When the OpenScape Business node that failed can be securely accessed again, the system telephones automatically revert to the OpenScape Business node.

The time for switching to the standby gateway can last up to 30 minutes.

If the OpenScape Business node fails, an attempt is first made to reach it again for a fixed time period (10 minutes; cannot be changed). It is only when this time has expired that the system telephones intended for this purpose are registered at the standby gateway. The current statuses of the registered phones can be viewed in **Expert Mode > Diagnosis Logs**.

The survivability settings are configured at the system telephones. If the OpenScape Business node fails, the phones will initially try to reach it again several times. A time-out or how often the phone tries to log in again can be configured via the "System Redundancy" setting on the Administration menu of the telephones. The default setting for the timeout is 30 seconds with one retry. After that, the telephones register at the standby gateway. The automatic registration back at the OpenScape Business node must also be configured at the system telephones.

The following prerequisites must be satisfied for survivability:

- A sufficient number of free IP ports must be available at the standby gateway for the system phones connected to the OpenScape Business node that need to be "saved" when a network node fails.
- For these free ports on the standby gateway, stations must be set up without a name and phone number.

Page 1 of 81

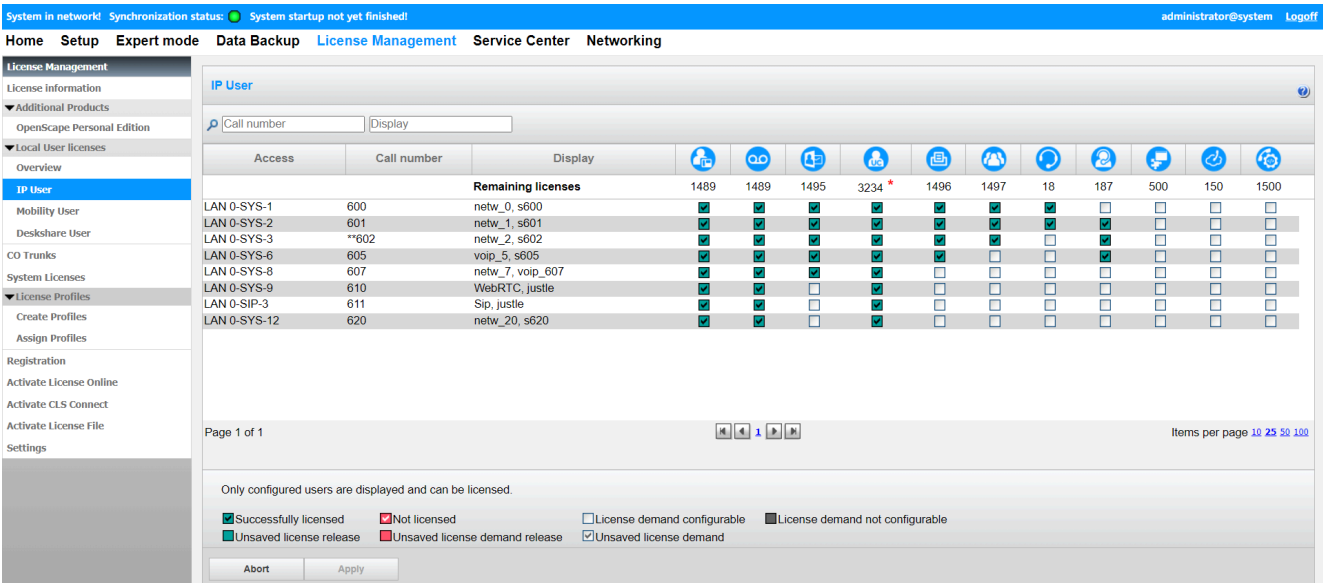

Apply Undo Help

- The stations must be configured as system phones (system clients) and have a Fallback user license. If Fallback licenses are not available in the activated license file, IP user licenses can be used instead. In the event of survivability, the stations can only use telephony features.

**NOTICE:** During the downtime of the master node HFA redundancy clients call numbers conflict until the master node is up and running again.

**NOTICE:** If the system has Fallback user licenses assigned, then IP user licenses cannot be used in case of an event of failure.

Networking OpenScape Business  
Removing a Node from the Internetwork

21.10.1 How to Configure Survivability

Prerequisites

You are logged into the WBM with the **Expert** profile.

Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Navigate in the menu tree to **Stations > IP Clients**. In the case of an OpenScape Business master system, the **Secondary Gateway** window appears.
3. Under **Node ID**, select the OpenScape Business to which OpenScape Business S users are to be transferred in the event of an emergency.
4. Select the **Emergency** check box for the emergency station.
5. The entries for **Emergency Call no** and **Call no DID** are preset and can be adapted if required.
6. Click on **Apply** followed by **OK**.

21.11 Removing a Node from the Internetwork

If a node is to be removed from the internetwork, it must first be ensured that the node is no longer available in the network configuration. Otherwise, the node will independently attempt to register itself again in the network and master node will try to synchronize data.

Procedure

The deletion of a node occurs via the Networking wizard, where all nodes involved must always be removed.

- Interrupt all paths (routing) to the nodes to be removed
- Administration of the internetwork
- Enter "No network" for the slave node involved in the networking wizard of the slave node.
- Remove the slave node from the registration list in the networking wizard of the master node.

If a node is not removed properly, data will continue to be transferred from one OpenScape Business to another and thus produce inconsistencies in the internal directory, i.e., the users will not appear in the user directory and will therefore be unable to use myPortal for Desktop.

## 22 Auxiliary Equipment

Auxiliary equipment consists of external devices (such as an announcement device or an entrance telephone with door opener) that are connected to the interfaces of the communication system.

### 22.1 Analog Announcement Device

An analog announcement device can be connected to an a/b interface to play custom announcements (e.g., for the central AutoAttendant or as a replacement for music on hold).

---

**NOTICE:** Before using announcements or music from other sources, make sure that you do not infringe on any copyrights.

---

Up to 16 announcement sources (e.g., media servers, announcement players or analog announcement devices) can be configured for each communication system.

The following types of announcement devices can be used:

- Announcement devices that always start at the beginning of the message when activated (such as greeting messages).
- Continuous playback devices (e.g., for music on hold)

The announcement device must behave like a station, i.e., announce itself, play the announcement and switch the call (enter consultation hold, dial and hang up).

#### Announcements Types

The following types of announcement are available:

- Greeting announcement (announcement prior to answer)

A greeting announcement can be played to callers prior to answering their calls.

- AutoAttendant

When the AutoAttendant is enabled, music and/or further announcements can be played to callers if they cannot be switched immediately.

- DTMF DID

When DTMF direct inward dialing is enabled, an announcement lets callers know that they can use DID to dial another extension. During the announcement, a code receiver detects if the caller uses suffix dialing and then forwards the call to the number dialed.

#### Alternatives to the A/B Interface (SLA Boards)

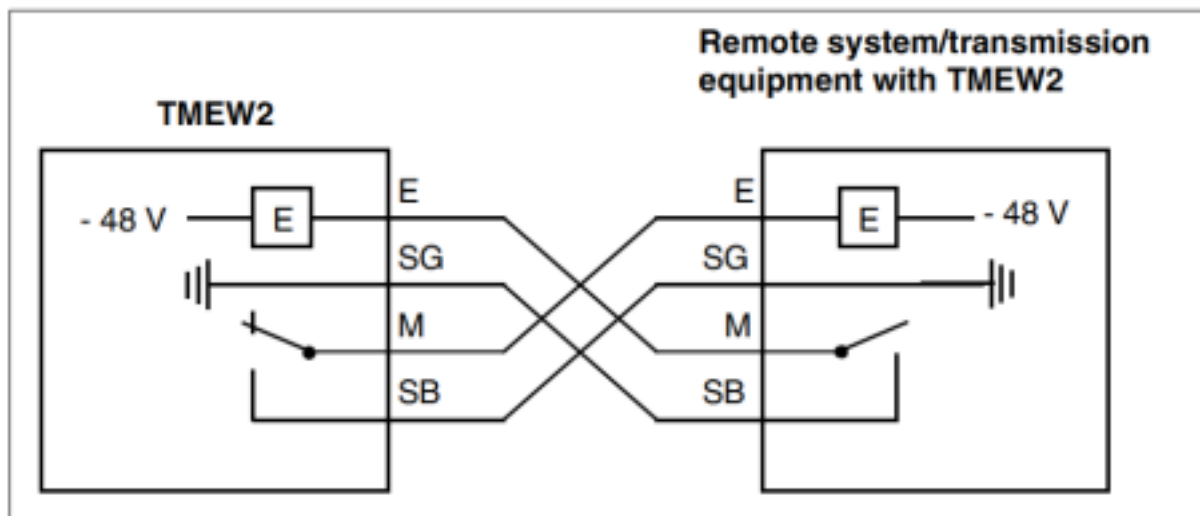

- OpenScape Business X8: TMEW2 board
- OpenScape Business X5: Optional STRB Board
- OpenScape Business X3: Optional STRBR Board

### Announcement Delay Time

The announcement delay time is the time (0 - 600 s, configurable) which must elapse before a waiting call is forwarded to an announcement device.

### Announcement Device - Genius

The TMEW2 board may be installed on interface type 2 for connecting the Genius announcement device. A description of the TMEW2 board and the assignment of SIVAPAC connectors on the backplane when connecting the Genius announcement device can be found in the Service Documentation, Hardware Installation, Chapter "Boards".

The configuration of the Genius announcement device is performed in Manager E via **System View > Settings > Auxiliary Equipment > Announcement**.

## 22.1.1 How to Add an Analog Announcement Device

### Prerequisites

Your announcement device is connected to an analog interface.

You are logged on to the WBM with the **Advanced** profile.

### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > Telephones / Stations**.
3. Click on **Edit** to start the **Analog Terminals** wizard. A list of all analog stations appears.
4. Enter the names and phone numbers in the row of the announcement device.
5. If necessary, make additional settings in the row of the announcement device.
6. Click on **OK & Next** followed by **Finish**.

## 22.1.2 How to Change the Announcement Delay Time

The configuration is done in Manager E (see also the online help for Manager E):

### Step by Step

In the **System View** under the **Settings > System Parameters > Time Parameters** menu: In the **Delay for announcement prior to answer** entry in the table, set the **Base** and **Multiplication factor** of the announcement delay to suit your needs (default: 100ms x 20).

## 22.2 Entrance Telephone and Door Opener

Entrance telephones (ET) are offered in a wide range of options from several different manufacturers today. The available connection options are essential for the operation and functionality of each ET. The Doorline a/b T01-T04, which is similar to other door openers by Behnke, Keil, 2n EntryCom, Auerswald, etc., is described here as an example.

### 22.2.1 DoorLine a/b T01-T04

The door opener DoorLine a/b T01-T04 is connected to an analog port. Equipped with 1 to 4 bell buttons (depending on model), several independent residential and commercial areas can be reached. The DoorLine a/b T01-T04 can not only be operated from any phone, but also provides the connection for the power supply of the door opener.

Due to the 2-wire a/b technology, the DoorLine a/b T01-T04 can be quickly and easily mounted. To synchronize with the communication system, the dialing method can be set, and the voice channel can be matched. The door is opened via the code of the Doorline (e.g., #9). A special interface module such as the Doorline M02, M03, M06 and M06/1 is no longer necessary.

**NOTICE:** No further setting is required in OpenScape Business for this entrance telephone/door opener. For security reasons, it is recommended that the extension be configured with "no trunk access" or with "outward-restricted" trunk access.

### 22.2.1.1 How to Configure the Station Port of the DoorLine a/b T01-T04

The configuration is done in Manager E (see also the online help for Manager E):

#### Step by Step

1. Under **System view**, in the **Settings > Set up station > Stations** menu, select the type **Standard** for the station port.
2. Under **Station view**, on the **Flags** tab, enable the flag **Call waiting rejection on** for the station port.
3. Under **System view**, in the **Settings > System Parameters** menu, on the **Flags** tab, enable the flag **DTMF automatic**.

### 22.2.1.2 How To Configure the Extension for the Doorline a/b T01-T04

The configuration is done in Manager E (see also the online help for Manager E):

#### Step by Step

1. Under **Station view**, on the **Flags** tab, enable the flag **Call waiting rejection on** for the extension.
2. Under **Station view**, on the **Flags** tab, enable the flag **Missed Calls List** for the extension.

### 22.2.2 DoorCom Analog

DoorCom® Analog is a universal entrance telephone adapter box for Siedle entrance telephones (such as the Vario TLM 612).

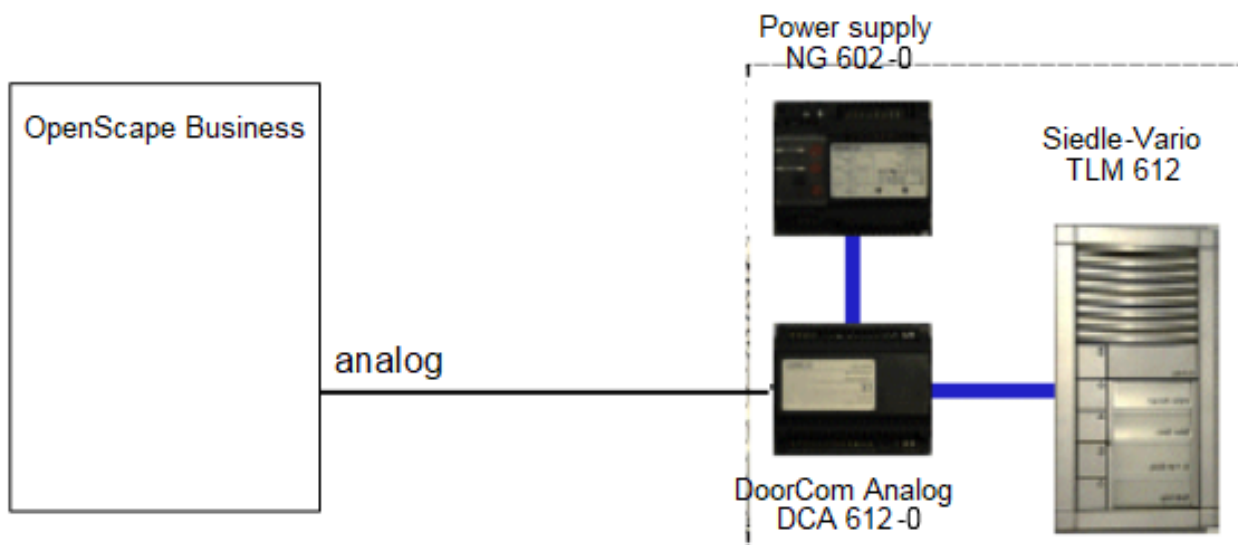

The DoorCom® Analog is connected to an analog port of the communication system. It behaves like an analog telephone with DTMF dialing, DTMF detection and DTMF control. It can be operated with DTMF signals.

DoorCom Analog can function only in combination with the following components:

- DoorCom Analog DCA 612-0
- Siedle-Vario TLM 612 entrance telephone
- Switching remote control interface DCSF 600

For the voice connection of an internal user to the entrance telephone. Without this module, it is not possible to call back to the entrance telephone, for example, if a call was unintentionally cleared down by the entrance telephone.

- Power supply NG 602-0

Device control features (open doors, select entrance telephone, etc.) can be programmed on the procedure keys of a phone. The programmed DTMF signal sequence is then sent to the entrance telephone/door opener.

---

**NOTICE:** No further setting is required in OpenScape Business for this entrance telephone/door opener. For security reasons, it is recommended that the extension be configured with "no trunk access" or with "outward-restricted" trunk access.

---

### 22.2.2.1 How to Configure the Station Port of the DoorCom Analog

The configuration is done in Manager E (see also the online help for Manager E):

#### Step by Step

1. Under **System view**, in the **Settings > Set up station > Stations** menu, select the type **Standard** for the station port.
2. Under **Station view**, on the **Flags** tab, enable the flag **Call waiting rejection on** for the station port.
3. Under **System view**, in the **Settings > System Parameters** menu, on the **Flags** tab, enable the flag **DTMF automatic**.

### 22.2.2.2 How to Configure DoorCom Analog Extensions

The configuration is done in Manager E (see also the online help for Manager E):

#### Step by Step

1. Under **Station view**, on the **Flags** tab, enable the flag **Call waiting rejection on** for the extension.
2. Under **Station view**, on the **Flags** tab, enable the flag **Missed Calls List** for the extension.

### 22.2.3 Entrance Telephone with Amplifier (TFE-S)

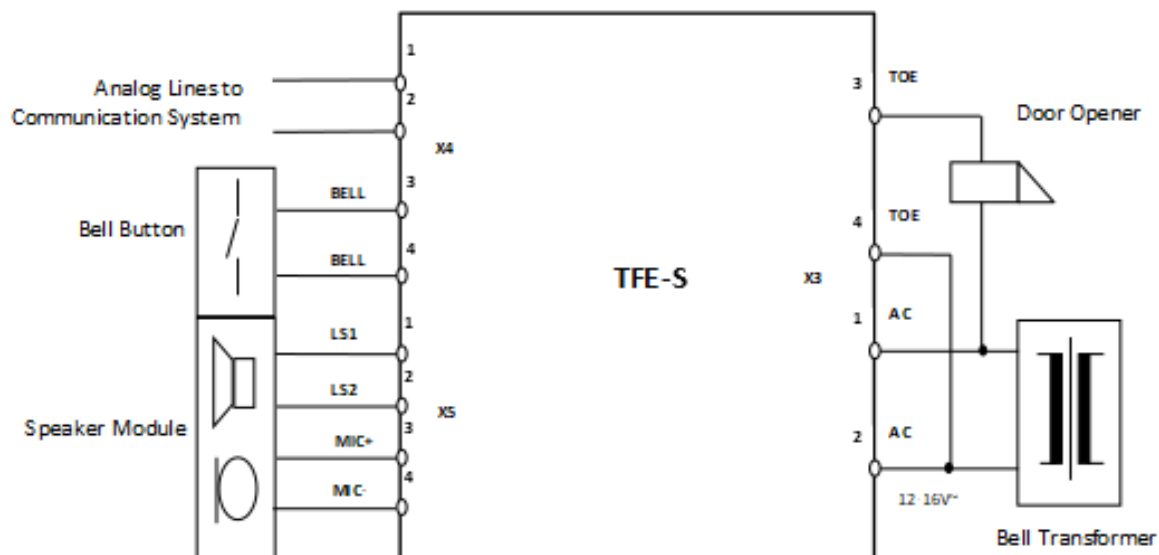

The TFE-S module (S30122-K7696-T313) connects an analog interface of the communication system with an entrance telephone, a door opener and a doorbell button. Control occurs via the communication system.

This makes it possible to connect to passive entrance telephones, which are comparable with the following types:

- From the company Siedle (TLM511-01, 611-01)
- From the company Rito (5760)
- From the company Grothe (TS6216)

## Auxiliary Equipment

The amplification can be adjusted manually. The TFE-S module requires its own power supply.

### Technical Data

| Parameters                   | Value                               |
|------------------------------|-------------------------------------|
| Power supply                 | Bell transformer 12V - 16V AC, 50Hz |
| Current draw                 | Max. 150 mA                         |
| OpenScape Business interface | Analog station                      |
| Dimensions                   | 100mm x 160mm (5.7" x 9.1")         |
| Ambient temperature          | 0°C to + 45°C                       |

### Functional description

Doorbell activation is signaled as a call at the phone of any configured station (ring destination). A voice connection to the entrance telephone is set up when the subscriber accepts the call. Additionally, the subscriber can also activate the door opener on his or her phone.

The call is intercepted if the entrance telephone ring destination is not reachable. If the intercept destination is busy, a system search is performed across all system phones.

---

**INFO:** The night service is ignored when signaling a door call.

---

---

**INFO:** System speed dialing at the entrance telephone is not possible.

---

### Configuration Options

The following configuration options are available:

- **Door opener:**  
The door opener is configured via an a/b (T/R) interface and the entrance telephone must be connected via an adapter. The subscriber can then open the door by simply pressing a button on the phone during the connection with the ring destination.
- **DTMF:**  
This setting specifies whether the door opener is activated by a DTMF transmitter (DTMF: dual-tone multifrequency), that is, if the ring destination can open the door with DTMF suffix-dialing.
- **Call Forwarding (CF):**  
This specifies whether the call from the entrance telephone should be forwarded to an external call forwarding destination.

### 22.2.3.1 How to Configure the Entrance Telephone

The **Door Opener** wizard can be used to specify which subscribers are allowed to operate the door opener. You can configure up to ten entrance phones.

#### Prerequisites

You are logged in at the WBM.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click on **Wizards > Central Telephony**.
3. Click on **Edit** to start the **Door Opener** wizard. The **Edit Door Opener** window appears.
4. Select one or more **Stations**.
5. Enter the **Destination**.
6. Select the relevant functions such as **Door Opener**, **DTMF** and **FWD** in the check box.
7. Click on **OK & Next** followed by **Finish**.
8. Follow steps 1 to 7 to configure each entrance phone.

### 22.2.4 Loudspeakers

Speakers can be connected to the communication system via an amplifier.

The following options are available for connecting an amplifier, including the loudspeaker:

- **Connection of the amplifier at an analog station interface**  
A level adjustment of the amplifier may be required for this.

- **Connection of the amplifier to the entrance telephone module TFE-S**

An active amplifier / sound system can be connected via the TFE-S module. The amplifier input is connected to the speaker output of the TFE-S module.

Furthermore, a contact of the STRB board may still be required to turn on the amplifier or switch through the input signal (noise suppression).

### 22.2.4.1 How to Configure the Analog Station Interface for a Loudspeaker

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Telephony > Stations**.
3. In the menu tree, click on **Stations > Analog Stations**.
4. Select the desired analog station (e.g., 3011).
5. Edit the data of the analog station as needed on the **Edit station parameters** tab.
6. Select the item **Loudspeaker** in the **Extension Type** drop-down list.
7. Click on **Apply**.

### 22.2.4.2 How to Configure the Analog Station Interface for Connecting an Amplifier to the TFE-S Module

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click on **Wizards > Central Telephony**.

3. Click on **Edit** to start the **Door Opener** wizard. The **Edit Door Opener** window appears.
4. Select a **Station**.
5. Select the **Destination**.
6. Click on **OK & Next** followed by **Finish**.

## 22.3 Relays

Actuators are control outputs which are activated or deactivated by control signals from the communication system. They cause a change in the state of the connected equipment and support functions for monitoring, alerting, control and regulation. They are mainly used in security and building management systems (e.g., for door openers).

Actuators are contained in optional control relay modules. All control relay modules include four control outputs (actuators).

Possible control relay modules:

- REALS (OpenScape Business X8)
- STRB (OpenScape Business X3W/X5W)
- STRBR (OpenScape Business X3R/X5R)

The detailed description of these boards, including the assignments, can be found in the Service Documentation in the section on "Boards".

Actuators can be controlled in one of the following ways:

- from the phone by entering codes
- from the system phone by pressing a key
- remotely via a CO trunk (DISA) by the station assigned to the relay function
- remotely via the "Associated Services" feature

Actuators can be enabled or disabled using the following functions:

---

**NOTICE:** The control codes can be found the "Expert Mode" section.

---

- **No function**

The actuator is either not operational or entered as a common ringer/night bell (under "Settings" - "Incoming calls" - "Call destination lists").

- **Manual on/off**

The actuator can be activated or deactivated via a key or via the "Activate/deactivate selected switch" code. This function can be assigned to a station, a group or all stations.

- **Auto off on timeout**

The actuator acts as a time switch and can be activated or deactivated via a key or via the "Activate/deactivate selected switch" code. This function can be assigned to a station, a group or all stations. If a value greater than 0 is entered for the switching

time, the actuator is deactivated only when the switching time has elapsed.

- **Door opener**

The actuator acts as a door opener and can be activated or deactivated via a key or via the "Activate/deactivate selected switch" code. This function can be assigned to a station, a group or all stations. If a value greater than 0 is entered for the switching time, the actuator is deactivated only when the switching time has elapsed. The text "Door opener" appears on the display of all associated telephones. Example for the switching time multiplication factor:  $30 \times 100\text{ms} = 3 \text{ sec}$

- **Speaker amplifier**

The actuator is activated when a connection is set up to the entrance telephone/door opener/loudspeaker. It is deactivated as soon as the connection is interrupted. This makes it possible to control an entrance telephone amplifier so that it is only activated when required. An entrance telephone or the loudspeaker port must be allocated to this function.

- **Busy indication**

The actuator is activated when the associated station leaves the idle state (i.e., goes off-hook or activates the loudspeaker or receives an incoming call). The actuator is deactivated once the associated station re-enters the idle state. The actuator can also be directly activated via a key or via the "Activate/deactivate selected switch" code. In this case, the status of the associated station is ignored and the actuator can only be deactivated via a key or a code. A specific station must be allocated to this function. Example - Door busy indicator: If the Executive is on the phone, the door busy indicator lights up to show that he or she does not want to be disturbed.

- **Music On Hold**

The actuator is activated if at least one station or a line in the communication system is not in the idle state. In this case, an announcement device or a CD player is activated. The actuator is deactivated if all stations and lines in the communication system are in the idle state. This function can only be assigned to all stations and must only be used once in the communication system. The value for the switching time must be greater than 0 (for example,  $600 \times 100\text{ms} = 60 \text{ sec}$ ). The actuator remains active and plays music until the switching time has elapsed or until it is disabled by a control signal.

- **Secondary bell**

The actuator is activated for the allocated station if that station is being called. The actuator is deactivated when the called party answers or the call is terminated. The actuator is not clocked. A specific station must be allocated to this function. If a value greater than 0 is entered for the switching time, shutdown can be delayed. The switching time is a multiple of 3 seconds.

- **Call charge pulse**

The actuator is clocked in accordance with the number for the allocated station on the basis of the incoming call charge pulses or call charge signals. A specific station must be allocated to this

function. The switching time is 150 ms pulse and 150 ms break and cannot be changed.

- **Station active**

The actuator is activated when the associated station is active (off-hook or loudspeaker activated). The actuator is deactivated once the associated station re-enters the idle state. A specific station must be allocated to this function.

#### **Actuator Names**

Any names (up to 16 characters) can be assigned to the actuators.

## **22.3.1 How to Configure an Actuator**

#### **Prerequisites**

A control relay module has been inserted.

The configuration is done in Manager E (see also the online help for Manager E):

#### **Step by Step**

1. **System View**, menu **Settings > Auxiliary Equipment > Actuators**: under **Actuator list**, select the actuator to be configured.
2. **System View**, menu **Settings > Auxiliary Equipment > Actuators**: under **Actuator type**, select the actuator function.
3. **System View**, menu **Settings > Auxiliary Equipment > Actuators**: in the **Actuator name** field, enter a name of your choice for the actuator (up to 16 characters).
4. If the function is to be assigned a station, a group or all stations, select the phone number of the station or the group phone number from the **Call number** list in the **Assigned station** area.  
**None** must be selected for all stations.
5. If the function requires a switching time, enter the factor with which the displayed value is to be multiplied in the **Factor** field in the **Switching time** area.

Possible display values: 100 ms and 3 s.

## **22.4 Sensors**

Sensors are control inputs and detect a change in the state of the connected device. You can enable or disable functions of the communication system and thus support functions for monitoring, alerting, control and regulation. They are mainly used in security and building management systems (e.g., for temperature control or motion detection).

Sensors are contained in optional control relay modules. All control relay modules include four control inputs.

Possible control relay modules:

- REALS (OpenScape Business X8)
- STRB (OpenScape Business X3W/X5W)
- STRBR (OpenScape Business X3R/X5R)

The detailed description of these boards, including the assignments, can be found in the Service Documentation in the section on "Boards".

Sensors can enable or disable the following functions:

---

**NOTICE:** The control codes can be found the "Expert Mode" section.

---

- Call signaling on telephones
- Display message on system telephones
- Turning an announcement device on or off
- Answering machine control
- Automatic dialing with a predefined telephone number (internal phone number, group number or external destination call number)
- Activation of the following services for a STN (with code + STN):
  - Actuator on/off
  - Do not disturb
  - Call forwarding on/off
  - Codelock on/off
  - Send message texts
  - Withdraw message texts
  - Night service on/off
  - Ring transfer on/off
- Direct activation of the following services (only with station number):
  - Actuator on/off
  - Use speed dialing system
- Error signaling - The following are possible:
  - Output of a programmable error message (sensor name, max. 10 characters: for example, Temp Alarm) on the display of a specific system telephone (no acoustic signaling)
  - Display of calls on a specific system telephone with error message during call (destination call number)
  - Error entry in error history (entry in error memory = activated)

### Destination Call Number

An associated analog port is programmable for the sensors. This port is called by the system once a setup signal has been received. The calling party then overrides this connection. A recorded announcement can be activated via an answering machine connected to this port, which informs the dialed station of the response of the sensor. An analog port programmed in this way cannot be contacted from the outside. If an external call number has been programmed for a sensor, but an analog port has not, the external connection will be established but an audible signal in relation to the response of the

sensor is not transmitted. However, if necessary, the called STN can identify the origin of the call on the basis of the call number (CLIP).

### **Message Texts Box Control Data**

Input of the control string with a maximum of 24 characters for the Phonemail system (mailbox call number). If the connection has been established, the control string is transmitted to the recorded announcement port. If a recorded announcement port is not available, the control string is transmitted to the destination.

## 23 Application Connectivity

Application connectivity is supported by the system, e.g., with CSTA, TAPI and Application Launcher.

### 23.1 CSTA

The CSTA interface enables high-performance CTI, Contact Center and Unified Communications applications, etc., to be connected to OpenScape Business.

CSTA uses the Transmission Control Protocol (TCP). A permanent connection is set up. Data packet loss is detected and automatically corrected.

#### Standards

The implemented CSTA protocol is based on:

- ECMA 269 Services for Computer Supported Telecommunications Applications (CSTA) Phase III
- ECMA-285ASN.1 for Computer Supported Telecommunications Applications (CSTA) Phase III
- Specific extensions

#### Prerequisites

The use of CSTA requires either UC Booster (Card or Server) or OpenScape Business S for the system connected with CSTA applications. The login credentials for CSTA applications must be configured in the system to enable the CSTA interface automatically. External CSTA applications must use these credentials for their access.

#### Features

CSTA provides the following features:

- Access via Ethernet LAN (TCP/IP)
- CSTA Phase III, ASN.1 encoding
- Support for the CSTA XML protocol for certified applications
- Wide range of supported system telephones
- Network-wide monitoring and control of all resources
- Multiplexing for monitor points

#### Supported Devices

In addition to the phones supported by the system, CSTA supports the following devices:

- ITSP

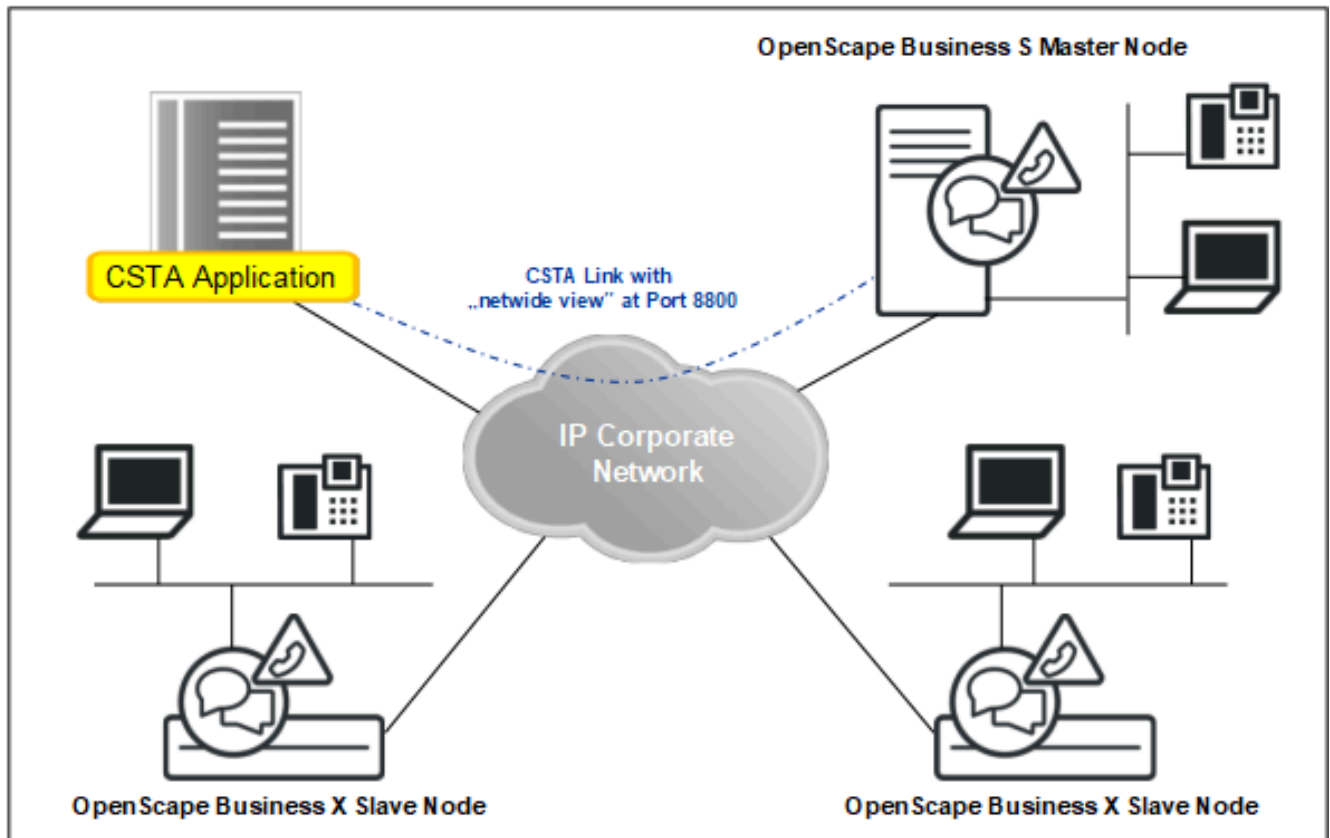

This makes it possible for Call Center applications to be used with SIP trunks

- ISDN
- Analog CO trunks
- Virtual stations

- UCD groups
- MULAPs

**NOTICE:** For details on features and supported devices, please refer to the CSTA Interface Manual.

### Connection for network-wide view

### Ports

The following port numbers are available by default:

| Port | Port number | Usage                                                                                                     |
|------|-------------|-----------------------------------------------------------------------------------------------------------|
| CSP  | 8800        | any CSTA application                                                                                      |
| CMD  | 8900        | reserved for TAPI 120 clients; regardless of the number of clients, exactly one logical CSTA link is used |

External CSTA applications and TAPI 120 Service Providers must use the IP address of the UC Server or of the system with the appropriate port number in order to set up the connection. The relevant IP address is displayed in the WBM under Application Selection.

### CSTA Links

By default, a CSTA link of the CSP port is available for external CSTA applications. Three other CSTA links are assigned by default to the following integrated CSTA applications or services:

- CMD (CSTA Message Dispatcher) for TAPI 120 clients at the CMD port
- DSS (Direct Station Server)
- UC Suite

If these CSTA applications or services are not needed, the corresponding CSTA links can be assigned to external CSTA applications if required.

---

**NOTICE:** A CSTA link provides the TDS service only to local devices. Customers should have a CSTA link to each node on which it is required to provide the TDS Service.

---

In General, CSTA applications can be connected to an OpenScape Business system via CSP, via LAS (a system component) or via PCC (an LDH component).

---

**NOTICE:** If an application is connected via CSP, it is also required to setup the credentials against CSP.

---

More particular:

- UC Suite, OSCC, TAPI 170 and 3rd Party (external) applications are connected via CSP

The connection of 3rd party (external) CSTA applications that require trunk information can only be done in UC Suite mode or by querying the trunk monitoring points themselves via CSTA, in their own application.

- Circuit and NGTC are connected via PCC
- UC Smart is connected via LAS

### Plus Products

The following flags are always enabled in the system:

- Always transmit area code with phone number
- Enhanced CSTA-CAUSE handling
- CSTA CSP signaling
- MULAP monitoring

---

[Supported Phones](#) on page 99

## 23.1.1 How to Change the Port Number for CSTA

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony** > **Basic Settings** in the navigation tree.
3. In the menu tree, click **Basic Settings** > **Port Management**.
4. Enter the desired port number in the row for **CSP** in the input field of the **Port number** column.
5. Click on **Apply** followed by **OK**.
6. Restart the system.

---

### Related concepts

[OpenScape Business TAPI 120](#) on page 1140

## 23.1.2 How to Enable or Disable the CMD for the Use of TAPI 120

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Middleware**.
3. Click on **Middleware** > **CSTA Message Dispatcher (CMD)** in the menu tree.
4. Click on the **Settings - CSTA Message Dispatcher (CMD)** tab.
5. Select one of the following options:
  - If you want to enable the CMD, select the check box **Service will be started automatically** in the **Activation** area.
  - If you want to disable the CMD, clear the check box **Service will be started automatically** in the **Activation** area.
6. Select one of the following options:
  - If you want to use auto registration for clients, select the check box **Client auto registration enabled** in the **Auto Registration** area.
  - If you do not want to use auto registration for clients, clear the check box **Client auto registration enabled** in the **Auto Registration** area.
7. Click on **Apply**.

---

[OpenScape Business TAPI 120](#) on page 1140

### 23.1.3 How to Enable or Disable the DSS Server for the Use of Network-Wide DSS Keys

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Middleware**.
3. Click on **Middleware > DSS Server** in the menu tree.
4. Click on the **Settings - DSS Server** tab.
5. Select one of the following options:
  - If you want to enable the DSS server, select the check box **Service will be started automatically** in the **Activation** area.
  - If you want to disable the DSS server, clear the check box **Service will be started automatically** in the **Activation** area.
6. Click on **Apply**.

### 23.1.4 How to Activate or Deactivate the CSP

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Middleware**.
3. Click on **Middleware > CSTA Message Dispatcher (CMD)** in the menu tree.
4. Click on the **Settings - CSTA Service Provider (CSP)** tab.
5. Select one of the following options:
  - If you want to enable the CSP, select the check box **Service will be started automatically** in the **Activation** area. Enter a CSTA user ID and a CSTA user password as well so that an application can use CSTA.
  - If you want to disable the CSP, clear the check box **Service will be started automatically** in the **Activation** area.

---

**NOTICE:** If CSP is disabled, TAPI 120 (via CMD), TAPI 170, DSS Server and UC Suite will not work!

---

6. Click on **Apply**.

## 23.1.5 How to Enable or Disable the Media Extension Bridge

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Middleware**.
3. In the menu tree, click on **Middleware > Media Extension Bridge (MEB)**.
4. Click on the **Settings - Media Extension Bridge (MEB)** tab.
5. Select one of the following options:
  - If you want to use the Media Extension Bridge, select the check box **Service will be started automatically** in the **Activation** area.
  - If you want to release this CSTA link, clear the check box **Service will be started automatically** in the **Activation** area.
6. Click on **Apply**.

## 23.2 OpenScape Business TAPI 120/170

OpenScape Business TAPI 120 and OpenScape Business TAPI 170, in addition to CallBridge Collection, are two TAPI Service Providers (TSPs) that are optimized for the system architecture and network topology of OpenScape Business. These TSPs provide the Microsoft TAPI interface to TAPI-based applications for the connection to the OpenScape Business communication system.

The connection to OpenScape Business takes place exclusively via the LAN. Additional hardware and software components such as the CSTA Message Dispatcher (CMD) or CSTA Service Provider (CSP) are no longer required for operation with OpenScape Business. The licensing is station based and does not distinguish between OpenScape Business TAPI 120 or TAPI 170 stations. The licensing requirement begins with the first TAPI station.

The choice of the appropriate TAPI Service Provider essentially depends on the number of client PCs to be connected with TAPI applications as well as the existing IT infrastructure and the telephones used.

### • CallBridge Collection

is used as a traditional first-party TAPI Service Provider on system telephones that have a LAN or USB interface. It is suitable for installations with just a few PCs. A LAN is not necessary for the operation of the CallBridge Collection. The CallBridge Collection is installed on each PC that is running a TAPI application. Analog, Cordless and system telephones without USB/IP interfaces are not supported.

TAPI connections via the CallBridge Collection are not licensed.

- **OpenScape Business TAPI 120**

is used as the preferred first-party TAPI Service Provider in Microsoft networks with or without a domain controller when analog, Cordless and system telephones without USB/IP interface are also to be operated in conjunction with the TAPI application. The TAPI 120 Service Provider is installed on each PC client that is running a TAPI application.

TAPI connections via OpenScape Business TAPI 120 are subject to licensing within OpenScape Business. To connect to OpenScape Business, depending on the operating mode or connection type, one CSTA link or a link to the Web Services Interface is required, regardless of how many TAPI 120 clients are being operated. The scope of functionality on the TAPI side depends on the operating mode and type of connection.

- **OpenScape Business TAPI 170**

is a classic "third-party" TAPI Service Provider. It is installed on a server on the LAN and connected centrally to the OpenScape Business System. TAPI 170 can be used as an alternative to TAPI 120 if there is a domain controller in the Microsoft network. When using the so-called remote TAPI function, it is not necessary to install the TAPI Service Provider on the client PCs. This offers significant time savings in installations with many client PCs. Please note, however, that the use of OpenScape Business TAPI 170 is mandatory in the following constellations:

- Connection of TAPI stations to networked OpenScape Business systems when the TAPI stations are located in different nodes.
- Connection to TAPI applications running on a terminal server.
- Connection to server-based TAPI applications.

TAPI connections via OpenScape Business TAPI 170 are subject to licensing within OpenScape Business. To connect to OpenScape Business, one CSTA link is required, regardless of how many TAPI 170 stations are being operated.

### 23.2.1 OpenScape Business TAPI 120

OpenScape Business TAPI 120 is a first party telephony service provider that supports the Microsoft TAPI V2.1 functionality. OpenScape Business TAPI 120 enables Windows-based CTI applications to monitor and control a system telephone connected to OpenScape Business.

OpenScape Business TAPI 120 can be alternatively connected to OpenScape Business via the CSTA interface (CSTA mode) or the Web Services Interface (UC Smart mode). A mixed operation using both interfaces to the system is not possible. If a UC Booster Card is plugged into the OpenScape Business system or if a UC Booster Server has been enabled, TAPI 120 can only be operated in the CSTA mode. The system requirements, the maximum number of TAPI stations and the scope of functionality on the TAPI side depend on the operating modes.

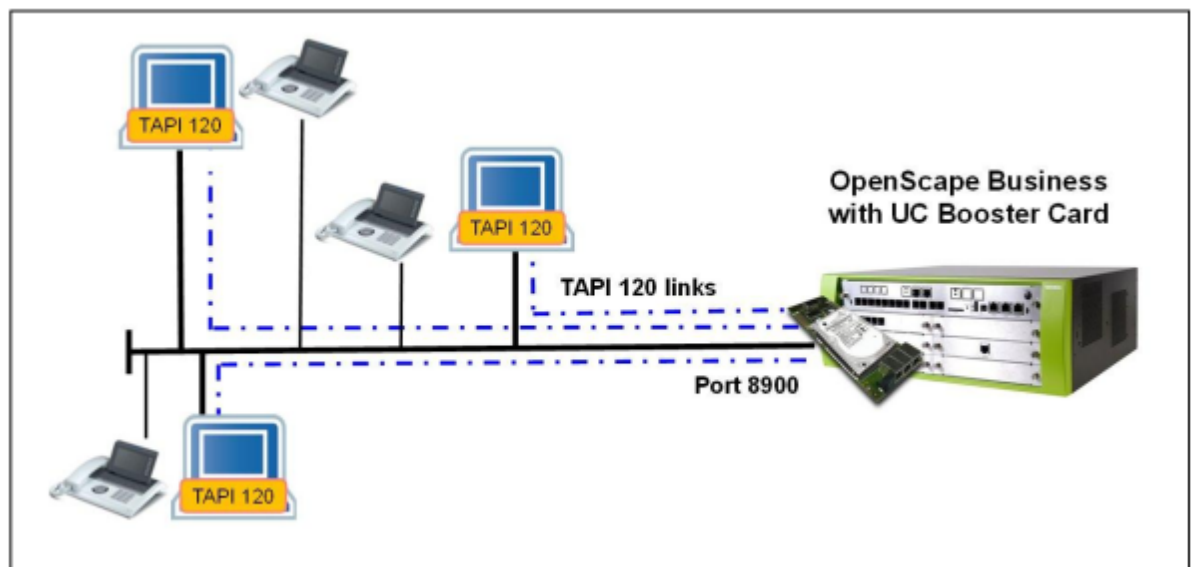

### OpenScape Business TAPI 120 Connections

The OpenScape Business TAPI 120 software is installed on a Microsoft Windows client PC. The connection to the OpenScape Business System is made via LAN. A physical connection between the Windows PC and the phone is not required.

- **TAPI 120 CSTA mode**

All TAPI 120 client PCs are connected to the same CSTA link of OpenScape Business. OpenScape Business internally multiplexes all TAPI 120 connections.

TAPI 120 in CSTA mode supports OpenScape Business X3/X5/X8 and OpenScape Business S.

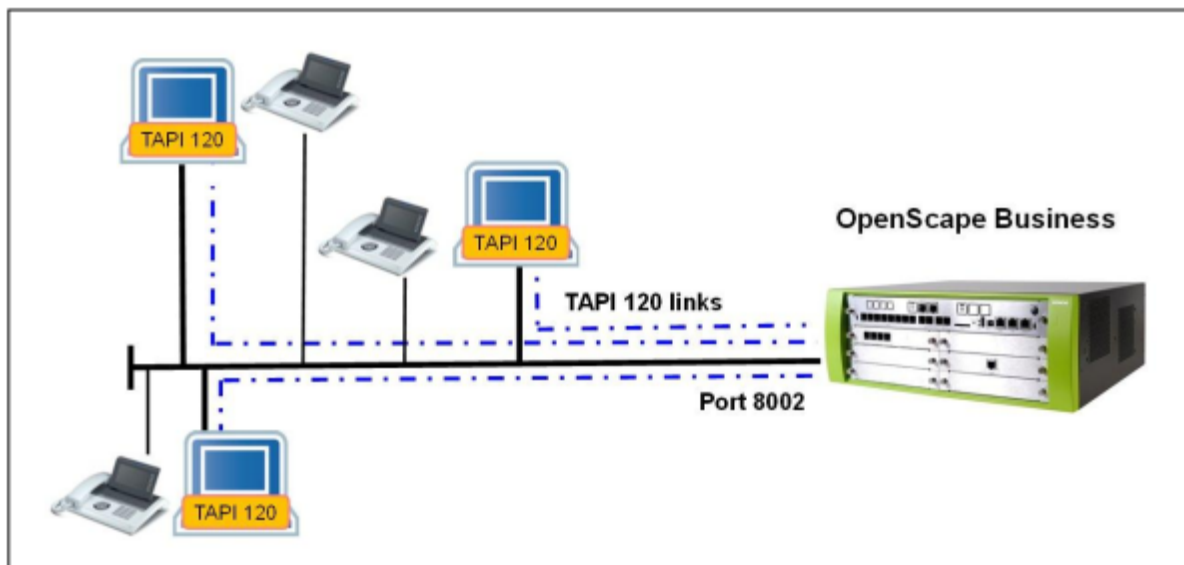

**Figure 11: TAPI 120 in CSTA Mode with OpenScape Business X5R and UC Booster Card**

- **TAPI 120 UC Smart mode**

All TAPI 120 client PCs are connected to the mainboard of OpenScape Business via the LAN and Web Server interface. OpenScape Business internally multiplexes all TAPI 120 connections.

TAPI 120 in CSTA mode supports OpenScape Business X1/X3/X5/X8.

**Figure 12: TAPI 120 in UC Smart Mode with OpenScape Business X5R**

### Features

The following features are supported:

| Feature                                                                                              | TAPI 120 CSTA | TAPI 120 UC Smart |
|------------------------------------------------------------------------------------------------------|---------------|-------------------|
| Central first-party TAPI Service Provider connected via a LAN                                        | X             | X                 |
| Compatible with the Microsoft TAPI 2.1 Standard                                                      | X             | X                 |
| Connection to standalone OpenScape Business system                                                   | X             | X                 |
| Support for the OpenScape Business CTI firewall                                                      | X             | -                 |
| <b>Features supported via TAPI</b>                                                                   |               |                   |

| Manual dialing / DTMF suffix dialing                                                                 | X             | X                 |
| Release existing calls                                                                               | X             | X                 |
| Set up consultation call to internal and external parties                                            | X             | X                 |

| Feature                                                                                            | TAPI 120 CSTA | TAPI 120 UC Smart |
|----------------------------------------------------------------------------------------------------|---------------|-------------------|
| Alternate (toggle/connect)                                                                         | X             | X                 |
| Screened call transfer                                                                             | X             | X                 |
| Screened call transfer with subsequent dialing of the consultation destination (one-step transfer) | X             | X                 |
| Unscreened call transfer (blind transfer)                                                          | X             | -                 |
| Set and delete call forwarding                                                                     | X             | X                 |
| Set and clear DND                                                                                  | X             | X                 |
| Initiate conference                                                                                | X             | -                 |
| Expand conference                                                                                  | X             | -                 |
| Forward incoming call                                                                              | X             | -                 |
| Directed pickup (call pickup)                                                                      | X             | -                 |
| Group signaling and group pickup                                                                   | X             | -                 |
| Park existing calls                                                                                | X             | -                 |
| Resume parked calls                                                                                | X             | -                 |
| Place existing calls on hold manually                                                              | X             | -                 |
| Resume calls placed on hold manually                                                               | X             | -                 |
| Set callback                                                                                       | X             | -                 |
| Support for code-driven functions                                                                  | X             | -                 |
| Call-related data exchange between TAPI applications                                               | X             | -                 |
| Control of keys on system telephones (HFA)                                                         | X             | -                 |
| Control of microphone gain on system telephones (HFA)                                              | X             | -                 |
| Control/select use of handset/loudspeaker/headset for system telephones (HFA)                      | X             | -                 |
| Control volume of handset/loudspeaker/headset/keyboard on system telephones (HFA)                  | X             | -                 |
| Access to optiPoint/OpenStage displays and LEDs (with limitation to 50 active displays per system) | X             | -                 |

### Maximum Values

The maximum number of TAPI 120 client PCs that can be connected to OpenScape Business depends on the model (see [Expansion Levels Available through Sales](#)).

### Released Operating Systems

The currently released operating systems for the Microsoft Windows Server, the Terminal Server and the remote client PC are listed in the latest Sales Information.

Only Microsoft Windows operating systems can be used in conjunction with TAPI 120.

For installations on terminal servers, OpenScape Business TAPI 170 must be used instead of OpenScape Business TAPI 120.

### Licensing

The use of OpenScape Business TAPI 120 is licensed on a subscriber basis. The TAPI licenses are managed within the OpenScape Business system and can be used for both modes of TAPI 120. When using the MULAP feature, a TAPI license is required for each station within the MULAP.

---

**NOTICE:** No UC User licenses are required for TAPI 120 in UC Smart mode.

---

### Software Provisioning

The OpenScape Business TAPI 120 software is supplied on a separate data medium. It is not part of the OpenScape Business system software.

### Hardware Requirements

The PC must comply with at least the system requirements specified by Microsoft for the operating system used as well as the requirements of the TAPI application. In addition, an Ethernet LAN interface is required.

- For TAPI 120 CSTA  
One CSTA link of OpenScape Business is required, regardless of how many TAPI 120 clients are connected. An OpenScape UC Business Booster (Card or Server) is mandatory for this purpose.
- For TAPI 120 UC Smart  
The Web Services interface is required. There must be no OpenScape UC Business Booster (Card or Server) present in/at the system.

### Supported Devices

The supported devices as well as the supported features on these devices depend on the CSTA or the WSI functionality of the OpenScape Business system being used. This information is contained in the OpenScape Business Sales Information.

### Default IP Port / IP Address Occupied by TAPI 120

In the TAPI 120 CSTA operating mode, the CSTA link to OpenScape Business occupies IP port 8900.

In the TAPI 120 UC Smart operating mode, the WSI link to OpenScape Business occupies IP port 8802 for an encrypted connection (HTTPS) or 8801 for an unencrypted connection (HTTP).

In the TAPI 120 configuration, the IP address of the OpenScape Business system must be entered in accordance with the operating mode. This IP address is displayed in the WBM under **Application Selection**.

## 23.2.2 OpenScape Business TAPI 170

OpenScape Business TAPI 170 is a third party telephony service provider that supports the Microsoft TAPI V2.1 functionality. TAPI 170 enables Microsoft Windows-based CTI applications to concurrently monitor and control telephones connected to OpenScape Business.

#### Features

OpenScape Business TAPI 170 provides the following features:

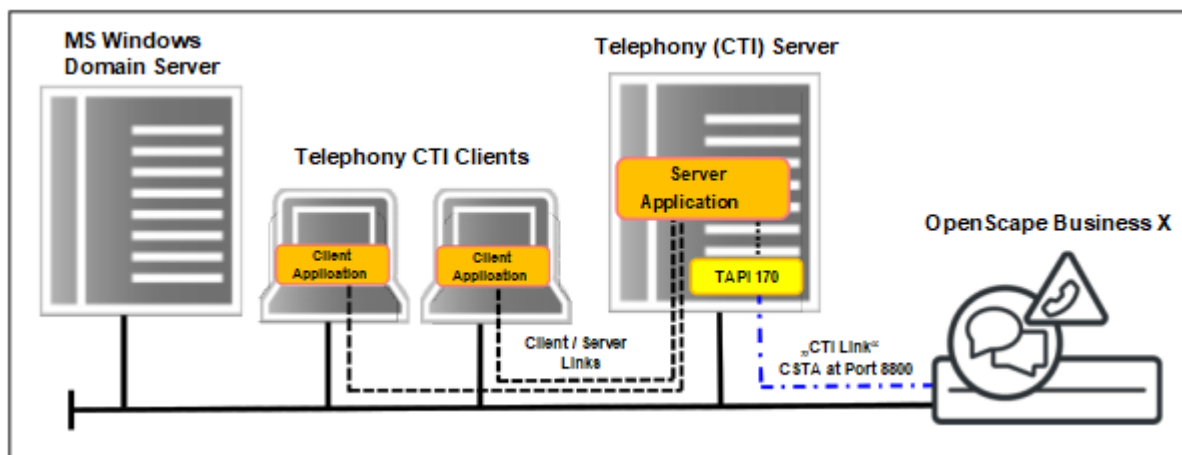

- Centrally connected third-party TAPI Service Provider
- Compatible with the Microsoft TAPI 2.1 Standard
- Telephony functions are available on each connected PC client via the TAPI 2.1 client/server architecture
- No additional TSP client software is required
- Supported telephony features:
  - Selection or dialing of incoming/outgoing calls from the PC
  - Transmission of incoming call number, if signaled
  - Consultation and transfer
  - Toggle/Connect
  - Conferencing
  - Call forwarding
  - Forwarding callers
  - Answering a call through the application
  - Initiating a call through the application
  - Blind/Supervised transfer (also called "transfer before answer / consultation transfer")
  - Transmission of feature codes
  - Monitoring of the phone (call states, failure, etc.)
  - Provision of an ACD interface
  - Monitoring/access to keypad for system telephones (HFA)
  - Control of display/LED for system telephones (HFA)
  - Connection to standalone and networked OpenScape Business systems
  - Support for MULAP members/station numbers

### OpenScape Business TAPI 170 Connections

The OpenScape Business TAPI 170 software is installed on a Microsoft Windows server on the network. The connection to OpenScape Business occurs via a CSTA link. A physical connection between the Windows PC and the phone is not required. OpenScape Business TAPI 170 can be set up in different operating modes on standalone systems or in the OpenScape Business network. The TAPI server and clients must be managed by the same network domain controller.

- **Connecting Server-based TAPI Applications to OpenScape Business using TAPI 170**

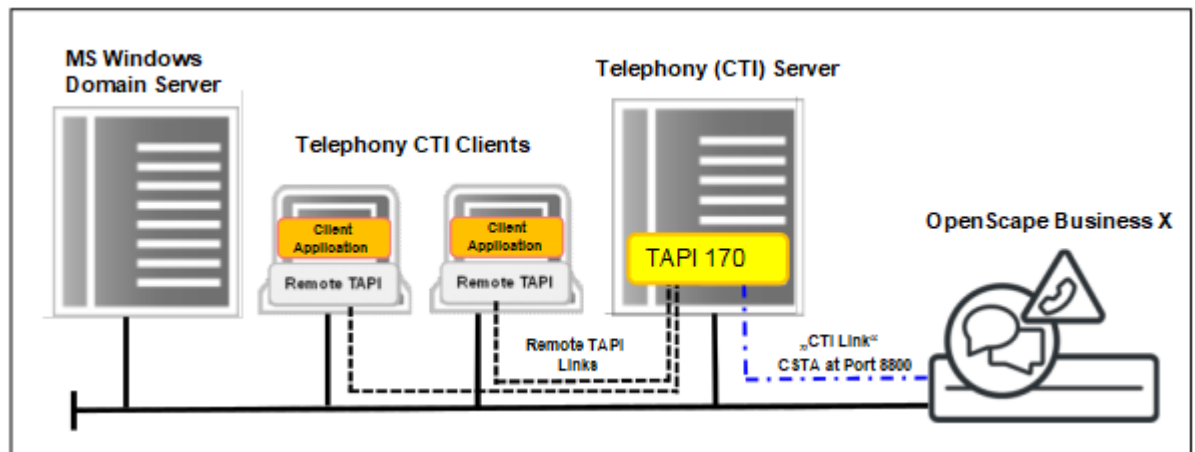

The server applications and the TAPI 170 software are installed on the so-called "Telephony Server" in the network. The server applications provide their associated clients in the network with telephony features for the stations that are configured within OpenScape Business TAPI 170. The TAPI 170 software is connected to the CSTA interface of OpenScape Business over the LAN. For this connection, one CSTA link of OpenScape Business as well as one TAPI license for each configured TAPI station are required.

**Figure 13: Server-Based TAPI Application via TAPI 170 to OpenScape Business**

- **Connecting Client-based TAPI Applications to OpenScape Business using TAPI 170 with the "Remote TAPI" Function**

In this scenario, the OpenScape Business TAPI 170 software is installed on a server on the network. On the client PCs with the TAPI applications, the so-called "Remote TAPI" function is enabled, via which the TAPI application on the client communicates with the TAPI 170 software on the server. No TAPI 170 software needs to be installed on the client for this purpose. The TAPI 170 software is connected to the CSTA interface of OpenScape Business over the LAN. For this connection, one CSTA link of OpenScape Business as well as one TAPI license for each configured TAPI station are required.

**Figure 14: Client-Based TAPI Application via "Remote TAPI" to OpenScape Business**

- **Connecting Terminal Server-based TAPI Applications to OpenScape Business using TAPI 170**

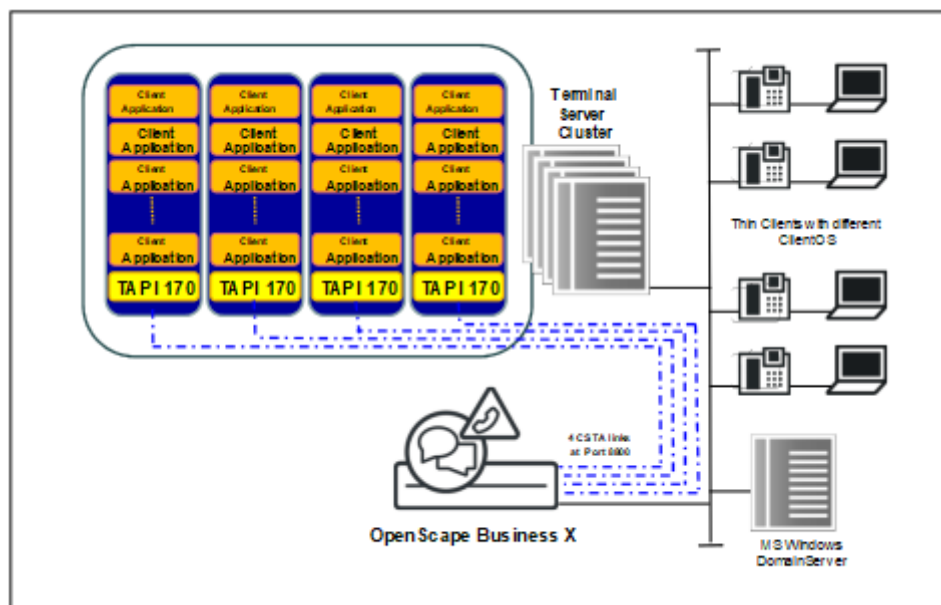

In this scenario, the client-based TAPI applications are installed on one or more terminal servers. In this case, the TAPI 170 software is also installed on the terminal server. In the case of a cluster consisting of multiple terminal servers, the TAPI 170 software must be installed on each terminal server in the cluster. Each instance of the installed TAPI 170 software is connected to OpenScape Business over the LAN. For each instance of the TAPI 170 software installed on a terminal server, one CSTA link of OpenScape Business is required. In addition, a TAPI license is also required for each configured TAPI station.

The maximum possible number of OpenScape Business TAPI 170 servers in conjunction with OpenScape Business must not be exceeded.

---

**NOTICE:** The number of terminal servers that can be operated in the cluster is limited to the number of free CSTA links available within OpenScape Business for connecting the TAPI 170 software. The maximum number of possible connections is reduced if the CSTA links of OpenScape Business are used by other CSTA applications.

---

**Figure 15: Client-Based TAPI Applications on Terminal Server to OpenScape Business**

- **Connecting TAPI 170 to Networked OpenScape Business Systems**

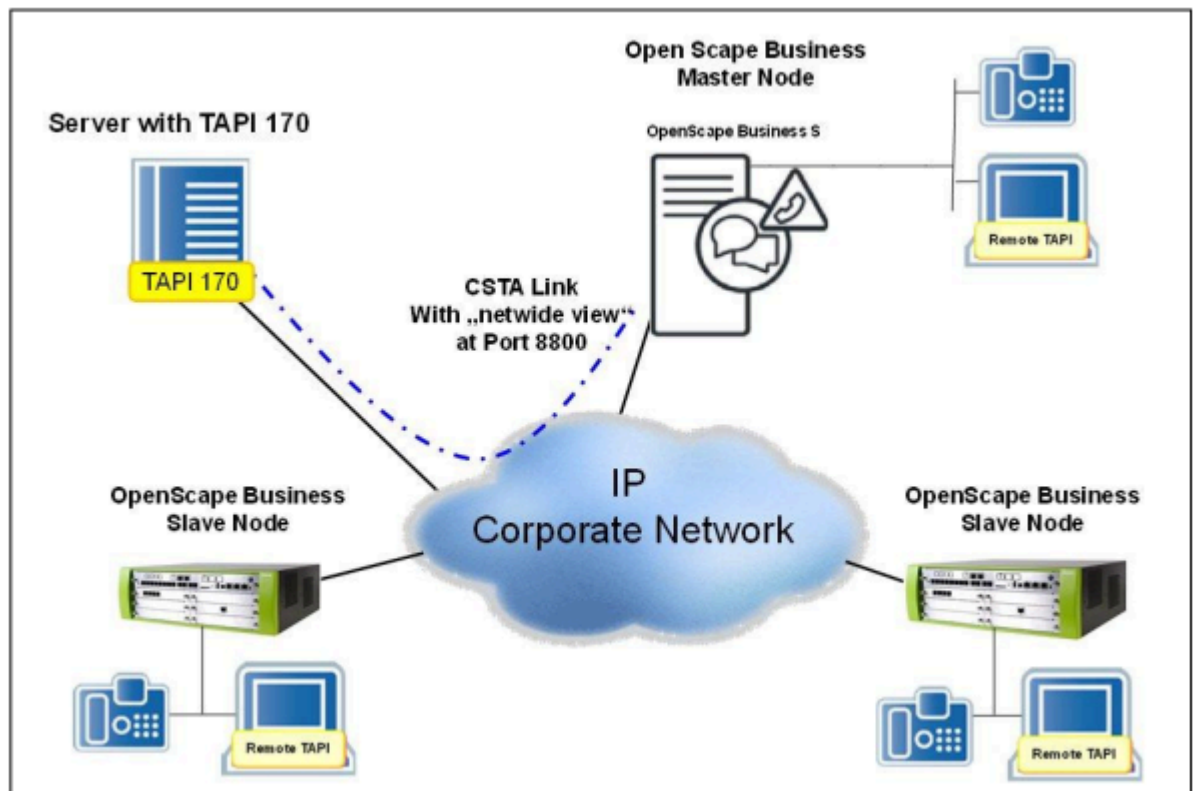

For networked OpenScape Business systems, the TAPI 170 software is installed on one server, which is connected via the LAN to the CSTA interface of the master node. This connection is independent of the previously mentioned operating modes of the TAPI 170 Service Provider (remote TAPI or server-based connection). To implement this connection, one CSTA link of the OpenScape Business master node as well as one TAPI license for each configured TAPI station are required.

---

**NOTICE:** Via the master node, the TAPI 170 receives network-wide access to all stations in the network. If the TAPI 170 is connected to a slave node instead of the master node, TAPI 170 can access only the stations of the slave node. When using multiple TAPI 170 in a terminal server cluster, one CSTA link to the master node is required for each TAPI 170.

---

**Figure 16: Connecting TAPI 170 to Networked OpenScape Business Systems**

### Capacity Limits

The maximum number of TAPI 170 client PCs that can be connected to OpenScape Business depends on the model. More information on this can be found in section 1.3.9.4

### Released Operating Systems

The currently released operating systems for the Microsoft Windows Server, the Terminal Server and the remote client PC are listed in the latest Sales Information.

Only Microsoft Windows operating systems can be used in conjunction with TAPI 170.

In addition to the license for the server operating system, the Microsoft licensing model requires Microsoft device or User CALs corresponding to the number required for the planned expansion. These CALs are not included in the delivery of OpenScape Business TAPI 170 and must be purchased separately. Under certain conditions specified by Microsoft, a "Windows Server for embedded systems" with the so-called "embedded Telco license" can be used for OpenScape Business TAPI 170.

### Licensing

The use of OpenScape Business TAPI 170 is licensed on a subscriber basis. The licenses are managed within the OpenScape Business

system. When using the MULAP feature, a TAPI license is required for each station within the MULAP.

#### Software Provisioning

The OpenScape Business TAPI 170 software is supplied on a separate data medium. It is not part of the OpenScape Business system software.

#### Hardware Requirements

In order to connect to OpenScape Business TAPI 170, one CSTA link of OpenScape Office is required, regardless of how many TAPI 170 clients are connected. This also applies to networked OpenScape Business systems.

The PC must comply with at least the system requirements specified by Microsoft for the operating system used, provided that no further software applications other than TAPI 170 are being operated. In addition, an Ethernet LAN interface is required.

#### Supported Devices

The supported devices as well as the supported features on these devices depend on the CSTA or the WSI functionality of the OpenScape Business system being used. This information is contained in the OpenScape Business Sales Information.

## 23.3 Web Services Interface

The integrated web services interface enables the monitoring and control of telephony resources in a system with UC users.

#### Features

The web services interface provides the following features:

- Access via Ethernet LAN (TCP/IP)
- Support for HTTP and HTTPS
- Support for individual systems
- User-oriented, clearly structured functions for:
  - Call control
  - Device control
  - Monitoring devices
  - Directories
  - Journals of users
  - Presence status of users

---

**NOTICE:** Depending on the WSI (Web Services Interface) client type, station flag Associated Services must be activated in order to enable execution of some of the WSI commands.

---

### **Web Server WebSessions**

The number of available web server sessions is common to all relevant applications (e.g., myPortal to go, Application Launcher, optiClient Attendant (Server) and optiClient BLF).

### **Internal Monitor Points**

The internal monitor points are independent of the monitor points of the CSTA interface. If several applications monitor the same UC user via the web services interface, only a single internal monitor point is used by the web server for this purpose.

### **Ports**

The following port numbers are available:

| Port | Protocol           |
|------|--------------------|
| 8801 | HTTP (unencrypted) |
| 8802 | HTTPS (encrypted)  |

## **23.4 Open Directory Service**

Open Directory Service is an open, integrated metadirectory service that can be accessed by several different types of clients, applications and communication devices in a company. The Open Directory Service performs two functions: it enables additional contact data from external data sources to be integrated in the directories of the system, while also making the directories available to clients, communication devices and applications.

Open Directory Service runs as a separate service based on OpenLDAP. Firewalls must be open for port 389. Open Directory Service is disabled by default.

### **Internal Data Sources**

The following internal data sources are available by default in the Open Directory Service:

- External directory
- Internal directory
- Central speed-dial numbers

For these internal data sources, the field names are permanently mapped to the data schema of the Open Directory Service.

These internal data sources cannot be deleted or modified.

### **External Data Sources**

As an administrator, you can integrate contact information from the following types of databases as data sources for read-only access via ODBC.

- Data sources with built in drivers (Microsoft SQL Server, PostgreSQL, Sybase, SQL Server).

- Data sources without built in drivers, require an installed and configured ODBC Bridge Server on the ODS client (downloadable via the WBM under **Service Center > Software**).

---

**NOTICE:** For a successful connectivity, it is necessary to define a value (the value can be different from the name of the data source, but the field cannot be empty) in the **Description** field. In case of ODBC bridge data source for Access, Firebird, Excel and Oracle, please add the name of the data source, "access", "firebird", "excel", "oracle" respectively, as the value of the **Description** field.

---

Maximum number of different types of databases: 3

Maximum number of external data sources: 4

Make sure that the Open Directory Service is authorized to access the external data source. Contact the responsible database administrator in advance to ensure that this is the case. A separate user may need to be added in the external data source for access by the system.

External data sources can be used in the context of both directory searches and the resolution of call numbers into names.

You can configure direct access to a database table from an external data source or a custom SQL query for the data source.

Any column which serves as an ID must contain unique and not null/not empty values. Use the UNIQUE or PRIMARY KEY property to ensure that this is the case.

In cases where external databases are integrated, the following restrictions apply:

- The special characters ' [ ] ' " are not supported by the ODS in table names and column names.
- The column types "nchar" and "nvarchar" are not supported by the ODS.
- The intermediate blank space characters (at least in the last 4-5 digits) are not supported by the ODS for phone data.

### Custom SQL Queries for External Data Sources

Custom SQL queries also support related tables, e.g.:

```
SELECT * FROM users LEFT OUTER JOIN phonenumbers ON
users.id = phonenumbers.uid;
```

The data structure must be of the type 1:1 or n:1, i.e., each record can have only a single row.

Access via custom SQL queries can sometimes run much slower than direct access to a database table.

Custom SQL queries with potential security risks are not executed, for example:

- Modifying data
- Stopping the SQL server
- Running programs via the SQL server

- Changing user rights

Custom SQL queries with the following SQL commands are therefore not executed:

- CHECKPOINT
- CLOSE
- CLUSTER
- COMMIT
- COPY
- CREATE
- DEALLOCTAE
- DECLARE
- DELETE
- DISCARD
- DO
- DROP
- END
- EXECUTE
- EXPLAIN
- FETCH
- GRANT
- INSERT
- LOAD
- LOCK
- MOVE
- PREPARE
- REASSIGN OWNED
- REINDEX
- RELEASE SAVEPOINT
- RESET
- REVOKE
- SAVEPOINT
- SECURITY LABEL
- SELECT INTO
- SET
- SHOW
- START TRANSACTION
- TRUNCATE
- UNLISTEN
- UPDATE
- VACUUM
- VALUES

### **Field Mapping for Data Sources**

For these data sources, you can customize the mapping of field names to the data schema of the Open Directory Service. You can assign each field in the data schema of the Open Directory Service to no more than one field of the external data source. However, you can assign a field of the external data source to multiple fields in the data schema of the Open Directory Service.

### LDAP Data Output Mappings

An LDAP data output mapping determines which of the fields in the data schema of the Open Directory Service are to be output via LDAP, e.g., for specific LDAP clients or for different groups of subscribers who do not want to see all the details, but only a defined subset.

The LDAP data output mapping **web** is available by default and cannot be deleted or changed. All fields of the data schema in the Open Directory Service are permanently assigned to the LDAP output in it. You can also configure other LDAP data output mappings.

LDAP clients can access a specific LDAP data output mapping via the dc parameter in the LDAP login, for example: `dc=web`.

### Normalization of Phone Numbers in the Canonical Format

For each data source, you can configure the normalization of phone numbers in the canonical format. During this process, blanks, parentheses, hyphens and commas are removed. This is required to correctly identify the caller's name and for desktop dialing. You should not skip the normalization, unless the phone numbers used in the data source are already present in canonical format. You can have the normalization-related values such as the area code, etc., entered automatically from the system. If the external data source is located at a different site than the system, you may need to adjust these values.

### Status of Data Sources

The status display under **OpenDirectory > Data Sources** has the following significance:

| Color  | Status                                                                  |
|--------|-------------------------------------------------------------------------|
| green  | active                                                                  |
| red    | ODBC and LDAP is not OK, wrong configuration or data source unavailable |
| yellow | LDAP not ok: restart the Open Directory Service                         |
| gray   | Configuration incomplete                                                |

### Provision of directories

The following types of clients, communication devices and applications can use the directories provided by the Open Directory Service:

- UC Clients
- Application Launcher
- System Directory
- OpenStage with local LDAP support
- DECT IP phones (via LDAP)
- SIP phones (via LDAP)
- Applications, e.g., CRM Suites such as Microsoft Dynamics CRM (via LDAP, ODBC or OpenLDAP CSV export)

Open Directory Service can identify in the search results the data source from which a hit is obtained.

---

## 23.4.1 How to Enable or Disable the Open Directory Service

**Prerequisites**

You are logged into the WBM with the **Expert** profile.

**Step by Step**

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Applications > Open Directory Service**.
3. Click on **Open Directory > Basic Settings** in the menu tree.
4. Select one of the following options:
  - If you want to enable the Open Directory Service, select the **Active** check box.
  - If you want to disable the Open Directory Service, clear the **Active** check box.
5. Click on **Save**.
6. Click on **OK**.
7. Click on **OK**.

## 23.4.2 How to Restart the Open Directory Service

**Prerequisites**

You are logged into the WBM with the **Expert** profile.

Open Directory Service is enabled.

**Step by Step**

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Applications > Open Directory Service**.
3. Click on **Open Directory > Maintenance** in the menu tree.
4. Click on **Restart**.
5. Click on **OK**.

## 23.4.3 How to Configure the Password for Access to the Open Directory Service

**Prerequisites**

You are logged into the WBM with the **Expert** profile.

Follow these steps to set the password with which clients, communication devices and applications can access the Open Directory Service.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Applications > Open Directory Service**.
3. Click on **Open Directory > Basic Settings** in the menu tree.
4. Enter the desired **Password**.
5. Click on **Save**.
6. Click on **OK**.

## 23.4.4 How to Configure the ODBC to ODBC Bridge Server

### Prerequisites

The ODBC Bridge Server was downloaded from the WBM under **Service Center > Software** and installed on a Windows PC (32 bit or 64 bit) with data sources that can access relational or non relational databases. The ODBC Bridge Server is required for ODBC drivers to access the data source.

---

#### NOTICE:

Due to recent Windows 10 / Windows Server updates by Microsoft, the ODBC interface of the operating system has been changed and therefore only 32-bit drivers are supported by the ODBC to ODBC Bridge. It is strongly recommended to use 32bit ODBC drivers to connect to ODBC data sources for time being.

This is a temporary restriction.

---

The data source must be configured as a DSN on the ODS client via the ODBC data source administration.

The user name and password of the data source are known.

The configuration of the ODBC Bridge Server is described here for the English user interface. The configuration can, of course, also be performed using a different interface language (**Server Manager > Language** tab).

### Step by Step

1. Right click on the ODBC Bridge Server icon in the tray bar and select the menu item **Settings**.
2. Define the general server settings:
  - a) Click on the **Server Settings** tab.
  - b) Under **Connection Settings**, select the IP address under which the ODBC Bridge Server is to be accessible to the ODBC client

(OpenScape Business) from the **Network Interface** drop-down list.

This IP address must be entered for the ODS configuration in the WBM of OpenScape Business.

- c) Under **Port**, enter the port through which the queries of the ODBC client (OpenScape Business) are to be received.

This port must be entered for the ODS configuration in the WBM of OpenScape Business.

- d) If the service is stopped, you can activate the **Service Status** by setting it to **On** under **Service Control**, or by selecting **Start service** in the tray bar.
- e) If the service is connected, you can disable the **Service Status** by setting it to **Off** or by selecting **Stop service** in the tray bar.
- f) Under **Network Settings**, you can enable the encryption by setting it to **On**.
- g) Under **Network Settings**, enter the maximum number of simultaneous connections to ODBC clients (minimum: 1, maximum: 20) in the **Max Connections** field.
- h) Click **Save Settings**.

---

**NOTICE:** After saving the settings, a service restart is required.

---

**3. Create a user for the ODBC client access to the data source:**

- a) Click on the **Role Management** tab.
- b) Click **Add User**.
- c) Assign a user name for the ODBC client in the **Username** field.
- d) Enter a password for the ODBC client in the **Password** and the **Re-Enter Password** fields.

The same user details must be entered for the ODS configuration in the WBM of OpenScape Business.

- e) Select the DSN to which the ODBC client should have access, by checking the box under the **Access** column.
- f) Enter the **DB Username** and **Password** if required.
- g) Click **Save Settings**.

**4. Click on the **Monitoring** tab to monitor the connections. The following details are displayed:**

- The installed ODBC drivers' names and versions.
- The name and the IP address of the ODS client, the last active connection time and the total active connection time.
- The available ODBC datasources (via the **Open Windows Datasource Administrator** link).

**5. Click on the **Logs** tab to enable the creation of log files and set which trace levels should be logged:**

- a) Enable logging by setting it to **On**.
- b) Select the **Log Level: Everything** for all logs, **Normal** for service logs or only **Warnings and Errors**.
- c) Select the log type from the drop-down list. You can select to view the logs folder or the log console.

**6. Click on the **Appearance** tab to change the appearance:**

- a) Select a theme (dark or light).
- b) Select a style.
- c) Set the desired language.
- d) Select whether the service should run automatically on startup.
- e) Select whether the service can be minimized to tray.
7. Click on the **About** tab to view the service details and the available updates.

---

**NOTICE:** If a new version is available, click **Install** to run the update.

---

8. Select **Exit** in the tray bar, to close the service configuration.

### 23.4.5 How to Add an External Data Source for the Open Directory Service

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

The access data of the external database is available.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Applications > Open Directory Service**.
3. Click on **Data Sources** in the menu tree.
4. Click **Add**.
5. Click on the **Database** tab.
6. Enter the **Name** of the data source.
7. Enter a **Description** for the data source.
8. If you want to add an SQL database:
  - a) Select the type **PostgreSQL** or **Microsoft SQL Server**, **Sybase SQL** from the **ODBC Driver** drop-down list.
  - b) Enter the IPv4 address of the database under **Database Server Address**.
  - c) Specify the **Database Server Port**.
  - d) Enter the **Database Name** in the correct case.
  - e) Enter the **Database login** in the correct case.
  - f) Enter the **Database password** in the correct case.
  - g) If you selected the type **ODBC Bridge** in the **ODBC Driver** drop-down list, enter the TDS protocol version in the **TDS Protocol Version** field.
9. If you want to add a non-SQL database:
  - a) Select the type **ODBC Bridge** from the **ODBC Driver** drop-down list.
  - b) Enter the IPv4 address of the database in the **ODBC Bridge Server Address** field.
  - c) Enter the **ODBC Bridge Server Port**.

- d) Enter the correct case-sensitive **ODBC Bridge Server Login**.
- e) Enter the correct case-sensitive **ODBC Bridge Server Password**.
- f) Enter the **Database Name** in the correct case.
- g) Enter the **Database login** in the correct case.
- h) Enter the **Database password** in the correct case.
- 10.** Click on **Check database access** to test the access.
- 11.** Click **Save**.
- 12.** Click on the **Data Access** tab.
- 13.** If you want to use a database table:
  - a) Click on **Simple selection - access one table**.
  - b) Click on **Query database tables** and select the desired table in the **Database tables** list.

---

**NOTICE:** This functionality is not supported for some datasources (e.g. Oracle). If so please provide the table name manually.

---

- c) Click on **Preview database table** and navigate through the records in the preview with the aid of the appropriate buttons.
- 14.** If you want to use a custom SQL query:
  - a) Click on **Self-defined SQL query**.
  - b) Enter the SQL query in the **Define SQL query** field.

---

**NOTICE:** When defining a new datasource with an SQL statement you should formulate the query in a way that ensures that the record IDs will be constant. You have to utilize the ID attributes included in the respective tables instead of computing IDs when the query runs. Please avoid any statement such as "SELECT ROW\_NUMBER() OVER As ID" that creates IDs when the query is executed and that will deliver different IDs depending on sorting and amount of records. In case of uniting tables with overlapping ID ranges with UNION ALL, mitigate the risk of duplicate IDs by incrementing the existing table IDs with a different number for each table to be united (eg "SELECT (table2.ID +1000) AS ID").

---

- c) Click on **Preview query results** and navigate through the records in the preview with the aid of the appropriate buttons.
- 15.** Click on the **Field mappings** tab.

---

**NOTICE:** All columns of the selected table and all columns returned by the custom SQL queries are available for field mappings.

---

- 16.** Click on **Add Field Mapping**.
- 17.** Select the field of each external data source in the drop-down list on the left and then select the corresponding field to be mapped

in the data schema of the Open Directory Service via the drop-down list on the right in the same row. For verification purposes, a preview of the relevant records appears on the right, which you can navigate by using the appropriate buttons.

---

**NOTICE:** The **Unique Identifier** field must be mapped to a field in the external data source that is unique.

---

18. If you want to remove a row of field assignments, click on the Trash icon on the left.
19. Click on the **Number conversion** tab.
  - a) Select the **Active** check box.
  - b) Click on **Query System Settings**.
  - c) If the external database is located at a different site than the system Enter the **Country Code, Local Area CodeCentral Office Number, National Prefix, Maximum internal number length**
  - d) Select one of the following options:
    - If you want to remove any dial-out prefix (CO code) that may be present in the external data source, select the **Remove dialout prefix** check box.
    - If you do not want to remove the dial-out prefix, clear the **Remove dialout prefix** check box.
20. Click **Save**.
21. Click **OK**.

### Next steps

Restart the Open Directory Service for the change to take effect.  
Preview the LDAP search result.

## 23.4.6 How to Preview LDAP Search Results for the Open Directory Service

### Prerequisites

You are logged into the WBM with the **Expert** profile.

Follow these steps to check whether an LDAP search result of the Open Directory Service returns records in the desired form and with the correct number format.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Applications > Open Directory Service**.
3. Click in the menu tree under **Open Directory > Data Sources** on the desired data source.
4. Click on the **LDAP test** tab.

5. Click on **Run test**. The preview of the search result will appear under **LDAP Search Result**.

---

**NOTICE:** Default response limit of OpenLDAP is 500 entries. Open Directory Service (ODS) backend engine also imposes a limit of 500 entries for each datasource.

LDAP test functionality of Open Directory Service (ODS) performs a search query which reaches the limit of 500 entries. The purpose of the LDAP test option is not the retrieval of the results but to validate that LDAP connectivity is proper.

Therefore, if more than 500 records exist, additions and modifications to LDAP data may not be reflected over the WBM after executing an LDAP Test.

---

## 23.4.7 How to Delete an External Data Source for the Open Directory Service

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Applications > Open Directory Service**.
3. Click on **Open Directory > Data Sources** in the menu tree.
4. Click on the relevant data source in the workspace.
5. Click on **Delete**.
6. Click on **OK**.

### Next steps

Restart the Open Directory Service for the change to take effect.

## 23.5 Active Directory Integration Service

Active Directory is a Microsoft directory service for domain networks. With the offered Active Directory Integration Service, OpenScape Business can read the Active Directory database and synchronize users to its own user database to simplify user administration and reduce configuration efforts.

### Prerequisites

For the Active Directory Integration Service synchronization to take place, the following prerequisites must be satisfied:

- There is Active Directory Microsoft Server deployed by the customer

- The Active Directory is used as a single point of configuration for employee data, and especially user data. The following fields will be mapped between Active Directory and OpenScape Business:
  - first name
  - last name
  - display name
- Only this Active Directory is used to add, change, or delete data of employees.
- All Active Directory changes are expected to automatically take effect on the communication system as well.

### Synchronization

The unique ID of OpenScape Business users used for the synchronization is the DID number. This number is synchronized with the telephoneNumber field of the AD (Active Directory).

Every change done in the Active Directory of the company is immediately synchronized to OpenScape Business. This means that every new user added to AD will also be added to OpenScape Business and an IP user license will be assigned to that user.

Any change done in AD to already synchronized users is reflected immediately to OpenScape Business users.

If a synchronized user is deleted from AD, the firstName, sn and displayName of the user will be cleared also from OpenScape Business, and the IP user license is released. However, the DID number and internal call number is not deleted from OpenScape Business and remains available to be assigned to another user.

---

**NOTICE:** Access to the Active Directory Service is read-only. This means that synchronization of user data is done only from Active Directory to OpenScape Business. Changes in OpenScape Business user info are not synchronized back to Active Directory and will be overwritten by Active Directory data with next synchronization.

---

### Field Mapping

You can customize the mapping of field names to the data schema of the Active Directory Service. In this way, you can control the way fields in OpenScape Business are updated from Active Directory data.

The default mapping of fields is given in the following table:

| OpenScape Business field | Active Directory field |
|--------------------------|------------------------|
| first name               | firstName              |
| last name                | sn                     |
| display name             | displayName            |
| DID                      | telephoneNumber        |

### Normalization of DID numbers

The gateway location data of the OpenScape Business system is used to convert the DID number of a user into canonical number format.

It is required the format of telephoneNumber in Active Directory to be in canonical format also, so that automatic synchronization is possible.

## 23.5.1 How to Configure the Active Directory Service

### Prerequisites

You are logged into the WBM.

### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click on **Wizards > Central Telephony**.
3. Click on **Edit** to start the **Active Directory Integration Service** wizard.
4. Click on the **Active** check box to activate the Active Directory Integration Service.
5. Set the **IP address** of the Active Directory server, the **Username** and **Password** for a valid user.

The **Username** requested here is not an OpenScape Business user name, but an ActiveDirectory username that must be given in X.500 Directory Specification format. In this format, users are defined with the following nodes:

|           |                     |
|-----------|---------------------|
| <b>CN</b> | Common Name         |
| <b>OU</b> | Organizational Unit |
| <b>DC</b> | Domain Component    |

The username is described from the more specific information on the left to the most general on the right. Each piece of information is given in the form of pairs separated with an equal sign (=).

An example of a username would be

`CN=John.doe,OU=Administrators,DC=SomeCompany.`

6. Click on **Fetch DNs** to fetch the available DNs and select one of them as a root base namingContext.

If there any problem with the user credentials, you will see an error `Authentication error! Please check your credentials.`

7. Edit the **Container** and **Filter** fields, if it is needed.

The default value for container is `cn=Users` and for filter is `(&(objectCategory=person)(objectClass=user))`

8. Click on **Fetch data**.

The first 1000 entries of AD will be shown, ordered by `lastname(sn)`.

9. Click on a user to check the details.
10. Click on **OK & Next** to go to the **Field Mapping** screen.
11. Make the necessary edits in the field mapping values.

The values on the left column are the OpenScape Business database schema, and the values set on the right column correspond to the Active Directory attributes.

**Telephone Number** will be used to match the OpenScape Business DID number.

12. Click on **Finish** to complete the Active Directory Integration

## 23.6 Application Launcher

Application Launcher is a Java-based Windows application for the call-related control of applications running on the client PCs of UC Suite users and myAgent users. Application Launcher could typically be used to automatically open the contact form in a CRM system for each respective caller, for example.

Application Launcher provides the following features:

- Obtaining call-related information on a phone number (e.g., phone number, name of the caller, customer ID) from either the Open Directory Service or from system directories
- Launching Windows applications or web applications for incoming and outgoing calls
- Transfer of call-related information to Windows applications or web applications
- Automatic operation in the background for incoming calls
- Optional, configurable screen pops for incoming calls with call-related information and buttons for user actions
- Caller list with call function
- Preview functions for testing during configuration
- System configuration profile for simple transfer of the configuration settings of the first configured client to all other clients

### 23.6.1 Prerequisites for Application Launcher

In order to use Application Launcher, the client PC of the individual user must be equipped with the appropriate hardware and software.

Local administrator rights on the client PC are required for the installation, but not for automatic updates.

#### Operating System

Application Launcher can be used in combination with the following operating systems:

- Microsoft Windows 10 / 8.1 / 8 / 7 (both 32-bit or 64-bit are possible)
- Microsoft Windows Vista (32 bit)

---

**INFO:** The used operating system always requires the latest version of all available updates (Service Packs and patches).

---

### Windows Update

The PCs always need the current status of all available updates, including Service Packs.

### Additional Software

Oracle Java 8 or higher or alternatively OpenJDK 8 (see **Service Center > Software**)

### Web Services for Mobile Phones

Web services for mobile phones has been enabled in the system for the system connection. The ports configured in the system must be open in the firewalls on the LAN and the client PCs.

### Open Directory Service (optional)

If Application Launcher is to use the data from the Open Directory Service, the Open Directory Service must be configured in the system. The port configured for this in the system must be open in the firewalls on the LAN and the client PCs.

---

### Related concepts

[Configuring myPortal to go and Mobility Entry](#) on page 931

[Open Directory Service](#) on page 1151

## 23.6.2 Profile with Configuration Data for Application Launcher

A profile with configuration data for Application Launcher enables the easy and fast configuration of Application Launcher on all client PCs.

The profile contains all the configuration data, except for the system connection and the user data. As soon as Application Launcher has been fully configured for an initial user, as an administrator, you can make that profile with the Application Launcher configuration data available in the communication system. All other users can then perform the configuration of Application Launcher by importing this profile.

### 23.6.2.1 How to Provide a Profile with Configuration Data for Application Launcher

#### Prerequisites

Application Launcher is a fully configured for a user.

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click in the navigation tree on **Applications > OpenScape Application Launcher**.
3. Click on **Browse** and select the following file: c:  
  \Documents and Settings\<Windows User Name>  
  \Application Data\Tray\_Tool\profile.xml.
4. Click on **Open**.
5. Click on **Load**.

### Next steps

All users can import this profile in Application Launcher and thus perform the configuration.

## 23.7 Circuit

It is possible for OpenScape Business users to make phone calls via the Circuit client. This functionality is available both from the Circuit client and through the device. To do that, you must configure the Circuit connectivity with OpenScape Business and add the Circuit users.

The available Circuit functionality includes:

- Make/answer calls
- Clear/reject calls
- Hold/retrieve calls
- Unattended/attended call transfer
- Pull/Push call
- Conference call
- Busy in a conversation information
- DTMF support
- Consultation call
- Swap call (alternate)
- Call forwarding
- Snooze interworking
- Camp on
- Alternative number
- Call routing
- Circuit Teams

---

**NOTICE:** In order to update the status of an OpenScape Business user when it is changed from Circuit, the flag **OpenScape Business Extended telephony features**, under **Circuit labs**, needs to be activated.

---

**NOTICE:** Regarding the camp on functionality, the camp on rejection setting must be the same for all

MULAP members, otherwise Client GUI, call journal etc. might have misleading information.

---

## 23.7.1 How to Configure the Circuit Connectivity

### Prerequisites

You have entered the value **Upstream up to (Kbps)** under **Setup > Wizards > Network/Internet > Internet Configuration**, in order to conduct simultaneous calls. For example, enter '256' for 2 simultaneous calls.

### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > Circuit**.
3. Click on **Edit** next to **Circuit Connectivity**, to configure the basic connectivity settings.
4. Select the **Enable Circuit** checkbox to activate the Circuit connectivity.
5. Select the **Enhanced feature interworking** checkbox to enable additional functionality.

When this checkbox is enabled and there are Circuit Users at User Instance, a pop prompt appears with the following info: "Please execute 'Update CTI' at Circuit User Instance menu." See [How to Update Circuit Users](#).

This functionality is available to the Circuit client, and offers transfer of a call, putting a call on hold and retrieving it again, and getting information of a call forwarded (the original calling party and the user that forwarded the call to you).

---

**NOTICE:** To use the Circuit client with a deskphone, you need to create a team group and include them both. See [How to Add a Team Configuration / Team Group](#)

---

6. Under **Circuit Domain Credentials**, enter the following details:
  - a) Select the **Domain** from the available drop-down list.

The following options are available:

- de.circuit.com
- us.yourcircuit.com
- eu.yourcircuit.com
- Custom

---

**NOTICE:** In case Custom is selected, complete the **Custom Domain** field.

---

- b) In case checkbox **Use Circuit API-Key** is selected:

Insert the Api Key which is generated for your tenant.

7. Under **Simultaneous Circuit Calls**, select the number of simultaneous Circuit calls from the available drop-down list. This number depends on the upstream value previously configured.

---

**NOTICE:** If the call quality deteriorates, the number of simultaneous calls must be reduced.

---

8. Click **OK & Next**.
9. Click **Execute function** to proceed with the automatic configuration.

The system adds the trunks to Circuit, completes the UTC configuration and checks the connectivity.

10. When the function is executed, click **OK & Next**.
11. Click **Finish**.

---

**NOTICE:** It is suggested to save the configuration data, by selecting **Data Backup > Backup - Immediate** from the main menu.

---

## 23.7.2 How to Manage Circuit Users

### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > Circuit**.
3. Click on **Edit** next to **Circuit User Instance**.

A list with the configured Circuit users appears for the specific system.

### 23.7.2.1 How to Add Circuit Users

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > Circuit**.
3. Click on **Edit** next to **Circuit User Instance**.
4. Click on **Add** next to **New Circuit User**.
5. At the **Circuit User Allocation** page, enter the following details:
  - a) The **trunk access code + Circuit user call number**.
  - b) The Circuit user call number.
  - c) The Circuit user DID.
  - d) The Circuit User. The available users are displayed as icons.
  - e) The Circuit user **Name** is filled automatically.
  - f) Search a Circuit user by **Name** or **E-mail**.
  - g) Select a Circuit User.

There are three types of icons for Circuit users:

Available licensed users, who are active displayed in green color.

Non available, non licensed who are not active displayed in greyed out green color.

Non available, licensed users but already configured with a number inCircuit who are not active displayed in greyed out green color in redframe.

**6. Click OK & Next.**

**7. Repeat steps 4- 6 to add more Circuit users.**

### 23.7.2.2 How to setup Circuit Voicemail number

#### Prerequisites

The Circuit Voicemail number must be part of the "Circuit User Allocation" numbering plan (see [How to Add Circuit Users](#) on page 1168).

#### Step by Step

- 1. In the navigation bar, click on Setup.**
- 2. In the navigation tree, click Wizards > Circuit.**
- 3. Click on Edit next to Circuit User Instance.**
- 4. Under Circuit Voicemail Allocation, enter the Circuit Voicemail number in the field.**
- 5. Click Execute function to proceed with the automatic Voicemail Allocation.**

### 23.7.2.3 How to Edit Circuit User Details

#### Step by Step

- 1. In the navigation bar, click on Setup.**
- 2. In the navigation tree, click Wizards > Circuit.**
- 3. Click on Edit next to Circuit User Instance.**
- 4. Click on Edit next to the corresponding Circuit user.**
- 5. You can edit the following details:**
  - a) The **trunk access code + Circuit user call number.**
  - b) The Circuit user call number.
  - c) The Circuit user DID.
  - d) The Circuit user **Name.**

---

**NOTICE:** The Selected Circuit User field which contains the e-mail address of the user is not editable.

---

**6. Click OK & Next.**

### 23.7.2.4 How to Update Circuit Users

When **Enhance feature interworking** checkbox is activated, the existing Circuit users need to be updated, so that the extra functionality is available.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > Circuit**.
3. Click on **Edit** next to **Circuit User Instance**.
4. Click on **Update CTI** button.

After successful update of user, you see the message `Circuit Users have been updated successfully`.

### 23.7.2.5 How to setup Alternative number and Call routing for Circuit interworking

In order for the Alternative number and Call routing functionalities of Circuit to be supported by OpenScape Business, you need to do the following setting in Expert mode.

#### Step by Step

1. In **Expert mode**, click **Telephony > Incoming Calls > Call Forwarding**.
2. Click on the **Call dest. list - Definition** tab.
3. Under **Edit Call Forwarding** do the following configurations.
  - a) As **Target 1** select `* Called station`.
  - b) As **Target 2** select `** User defined`.
  - c) As **Target 3** select `External destination`.
  - d) In **Route** select **Circuit** and fill in the Circuit Voicemail number as **External destination**.

## 23.8 myPortal for Teams overview

myPortal for Teams plugin is used to integrate Microsoft Teams application with OpenScape Business.

myPortal for Teams requires new OpenScape Business V3 Mainboard or OpenScape Business S system and it is supported with software release V3R1 FR2 and later releases.

With myPortal for Teams you can:

- Filter and manage your call history.
- View and search contacts.
- Organise contacts in favorite groups.
- Email contacts.
- Select a controlled device (available for MULAP users).

- Start a call.
- Answer, reject or deflect a call.
- Place a call on hold.
- Transfer a call.
- Make a consultation call.
- Alternate between calls.
- Make an attended transfer.

---

**NOTICE:** Search for contacts in external directories, such as LDAP, is not available.

---

---

**NOTICE:** VoIP functionality is not supported for myPortal for Teams.

---

## 23.8.1 How to configure myPortal for Teams

### Prerequisites

- Official and trusted Microsoft certificate to be imported in OpenScape Business WBM
- Microsoft application ID which needs to be generated before configuring myPortal for Teams

### Step by Step

1. Navigate to **Setup > Cloud Services**.
2. Click Edit next to **Microsoft Teams Client-Plugin**.
3. The domain name and port number in the **URL** field are already filled in.

The domain name is the domain of your OpenScape Business system.

The default value for the port number is 8805. You can change the domain ID and port number if you want.

4. Enter the **Application ID**,

The Application ID is generated by the administrator of the Microsoft Azure portal.

5. Click **OK & Download**.

The plugin is downloaded as a zip file. The downloaded file is a customized plugin based on your system configuration.

---

### NOTICE:

Microsoft Teams tab prevents loading web content from a server that uses self-signed certificates. This is a security aspect and the use of self-signed certificates is essentially an unsafe practice as this interface is exposed to the internet.

Therefore, a Microsoft Trusted certificate must be installed in the system. For more information, refer to chapter [How to Import Server Certificates \(PKCS#12\)](#) on page 1010.

---

## 23.8.2 How to upload myPortal for Teams to Teams store

### Prerequisites

You must have administration rights to Microsoft Teams application.

### Step by Step

1. Click on **Apps** in the left navigation of the Microsoft Teams application.
2. Click on **Upload a custom app** and select **Upload for my org**.  
Select the file that you have downloaded from WBM and upload it.

### Next steps

Once myPortal for Teams plugin is uploaded, it is available for the users to add it in their Microsoft Teams application.

## 23.9 Unify Phone

It is possible for OpenScape Business users to make phone calls via the Unify Phone client. This functionality is available both from the Unify Phone client and through the device. To do that, you must configure the Unify Phone connectivity with OpenScape Business and add the Unify Phone users.

The available Unify Phone functionality includes:

- Make/answer calls
- Clear/reject calls
- Hold/retrieve calls
- Pull/Push call
- DTMF support
- Swap call (alternate)
- Call forwarding
- Alternative number
- Call routing

Beside the features mentioned above, no other features are released especially features codes.

## 23.9.1 How to Configure the Unify Phone Connectivity

### Prerequisites

You have entered the value **Upstream up to (Kbps)** under **Setup > Wizards > Basic Installation > Basic Installation > Upstream of your internet connection**, in order to conduct simultaneous calls. For example, enter '256' for 2 simultaneous calls.

### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > Cloud Services**.
3. Click on **Edit** next to **Unify Phone Connectivity**, to configure the basic connectivity settings.
4. Select the **Enable Unify Phone** checkbox to activate the Unify Phone connectivity.

---

**NOTICE:** Unify Phone connectivity and Circuit connectivity cannot be both active at the same time.

---

5. Under **Unify Phone Domain Credentials**, enter the following details:
  - a) Select the **Domain** from the available drop-down list.

The following options are available:

    - phoneapp.unify.com
    - Custom
  - b) Enter the API Key which is generated for your tenant in **Unify Phone API-Key** field.
6. Under **Simultaneous Unify Phone Calls**, select the number of simultaneous Unify Phone calls from the available drop-down list. This number depends on the upstream value previously configured.

---

**NOTICE:** If the call quality deteriorates, the number of simultaneous calls must be reduced.

---

7. Click **OK & Next**.
8. Click **Execute function** on the pop-up to create a SIP trunk for Unify Phone.
9. Click **OK & Next** followed by **Finish**.

---

**NOTICE:** It is suggested to save the configuration data, by selecting **Data Backup > Backup - Immediate** from the main menu.

---

### Next steps

It is recommended not to create a dummy Native SIP Server Trunk User for Unify Phone Cloud under **Expert mode > Telephony Server > Native SIP Server Trunk**. Otherwise you will not be able to complete the Unify Phone wizard configuration.

If you want to disable the Unify Phone connectivity, you first need to delete any Unify Phone users as described in [How to Delete Unify Phone Users](#) on page 1175.

---

**NOTICE:** It is vital to delete active Unify Phone users prior to e.g. system migrations, to avoid critical discrepancies between the OpenScape Business database and the cloud database.

---

## 23.9.2 How to Manage Unify Phone Users

### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > Cloud Services**.
3. Click on **Edit** next to **Unify Phone user instance**.

A list with the configured Unify Phone users appears for the specific system.

### 23.9.2.1 How to Add Unify Phone Users

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > Cloud Services**.
3. Click on **Edit** next to **Unify Phone user instance**.
4. Click on **Add** next to **New Unify Phone User**.
5. At the **Unify Phone User Allocation** page, do the following:
  - a) Complete the **Trunk access code + Unify Phone user call number**.
  - b) Enter the **Unify Phone User callno**.
  - c) Enter the **Unify Phone User DID**.

The available users are displayed as icons.

- d) The Unify Phone user **Name** is filled in automatically.
- e) Search a Unify Phone user by **Name** or **E-mail**.
- f) Select a Unify Phone User.

There are three types of icons for Unify Phone users:

Available users who are active, displayed in green color.

Non available users who are not active, displayed in grayed out green color.

Non available users but already configured with a number in Unify Phone who are not active, displayed in green color in red frame.

**6. Click **OK & Next**.**

**7. Repeat steps 4-6 to add more Unify Phone users.**

#### Next steps

Assign licenses to Unify Phone users as described in [How to License Subscribers \(Standalone\)](#) on page 297 or [How to License Subscribers \(Internetwork\)](#) on page 308.

When integrating the Unify Phone user into a team (MULAP), note the following:

- Only one IP or TDM desk phone can be included in the team with the Unify Phone user. The routing function in Unify Phone is used to determine which end device should be used to signal an incoming call.
- The desk phone in the team with Unify Phone can still be controlled by external applications via TAPI, WSI or CSTA.
- Cordless subscribers are not approved in connection with Unify Phone.

### 23.9.2.2 How to Edit Unify Phone User Details

#### Step by Step

- 1. In the navigation bar, click on **Setup**.**
- 2. In the navigation tree, click **Wizards > Cloud Services**.**
- 3. Click on **Edit** next to the corresponding Unify Phone user.**
- 4. You can edit the following details:**
  - a) The **trunk access code + Unify Phone user call number**.**
  - b) The **Unify Phone user call number**.**
  - c) The **Unify Phone user DID**.**
  - d) The Unify Phone user **Name**.**

---

**NOTICE:** The Selected Unify Phone User field which contains the e-mail address of the user is not editable.

---

**5. Click **OK & Next**.**

Although possible, it is not recommended to edit the Unify Phone user call number via **Expert mode > Station > Trusted External User**. Otherwise, the call number will not be synchronized with Unify phone and the user will not be able to make or receive phone calls on the Unify Phone client.

### 23.9.2.3 How to Delete Unify Phone Users

There are scenarios where deleting Unify Phone users from your OpenScape Business system is absolutely necessary. For example:

- When migrating from a test lab system to a real/live system.
- When replacing a mainboard from V2 H/W to V3 H/W or due to H/W failures.

When Unify Phone users are deleted from your system, the users are not removed from the Unify Phone tenant they belong to.

The users still exist but they do no longer have a phone number assigned to them.

### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > Cloud Services**.
3. Click on **Edit** next to **Unify Phone user instance**.
4. Click on **Edit** next to the corresponding Unify Phone user.
5. Click on **Delete**.
6. Repeat steps 1-5 to delete more Unify Phone users.

---

**NOTICE:** If a new system is set up via cloning or data restore (migration), where the original system had a Unify Phone connector access configured, it must be ensured that any discrepancies between the UP cloud state and that of the OSBiz database will be avoided. For this reason, it is essential to remove any UP users if needed and then disable the Unify Phone connector before cloning/backing up the original system.

---

### 23.9.2.4 How to prepare Alternative number and Call routing for Unify Phone interworking

In order for the Alternative number and Call routing functionality of Unify Phone to be supported by OpenScape Business, you need to do the following setting in Expert mode.

#### Step by Step

1. In **Expert mode**, click **Telephony Server > Incoming Calls > Call Forwarding**.
2. Click on the **Call dest. list - Definition** tab.
3. Under **Edit Call Forwarding** do the following configurations:
  - a) As **Target 1** select \* Called station.
  - b) As **Target 2** select \*\* User defined.
  - c) As **Target 3** select Number of Voicemail (optional).

## 24 Accounting

Accounting includes the collection of call data and account codes, the transmission and display of connection data, cost control and accounting tools.

### 24.1 Connection Data

Connection data includes the collection of call data and account codes.

#### 24.1.1 Connection Data Recording

The system can log the connection data of used lines.

For every completed connection and/or every incoming connection, a connection data record is created. A separate connection data record is stored for each new connection segment (for example, as a result of transferring or forwarding to another subscriber). Internal connections are not logged.

The administrator can enable the following options for recording connection data:

- Recording on or off
- Connection duration
- Currency amounts or call charge units:

Call charge units are converted into currency amounts based on the configurable call charge factor (currency amount per call charge unit).

- Decimal format

Divides the currency amount by 100 to display 6 cents as 0.06, for example

- Suppress last four digits of destination numbers
- Log incoming connections
- Outgoing calls without connection:

For example, this gives the calling party proof that the destination station did not accept the attempted call (marked with the connection duration 00:00:00). This option applies to ISDN connections and to all subscribers.

- Connection protocol

Start logging on beginning the call

- Log MSN
- Output LCR number outgoing or dialed number incoming

– outgoing:

the actual call number which is sent by LCR to the PSTN

– incoming:

the originally dialed internal number

If call charges accrue before the call is set up (as occurs in Austria, for instance), these are recorded, irrespective of whether or not logging of outgoing calls without connection is enabled.

The system takes connections via QSIG trunks into account only if a trunk code has been configured for them.

No logging occurs for:

- premature termination of the call attempt
- unauthorized connections (LCR, Denied lists).

---

### Related concepts

[Account codes](#) on page 1182

## 24.1.1.1 How to Enable or Disable Connection Data Recording

The **Call Detail Recording** wizard can be used to activate the recording of connection data.

### Prerequisites

You are logged in at the WBM.

### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click on **Wizards > Central Telephony**.
3. Click on **Edit** to start the **Call Detail Recording** wizard.
4. Select one of the following options:
  - If you want to enable connection data recording, enable the check box **Activate Call Charge Recording**.
  - If you want to disable connection data recording, disable the check box **Activate Call Charge Recording**.
5. Click on **OK & Next** followed by **Finish**.

## 24.1.1.2 How to Activate or Deactivate Logging of the Connection Duration

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony > Basic Settings** in the navigation tree.
3. In the menu tree, click **Basic Settings > Call Charges > Call Charges - Output Format**.
4. Select one of the following options:
  - If you want to activate the function, select the check box **Call Duration**.

- If you want to deactivate the function, clear the check box **Call Duration**.
5. Click on **Apply** followed by **OK**.

### 24.1.1.3 How to Configure the Logging of Currency Amounts or Call Charge Units

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony** > **Basic Settings** in the navigation tree.
3. In the menu tree, click **Basic Settings** > **Call Charges** > **Call Charges - Output Format**.
4. Select one of the following options:
  - If you want the system to log currency amounts, enable the check box **Display amounts instead of units**.
  - If you want the system to log call charge units, clear the check box **Display amounts instead of units**.
5. Click on **Apply**, followed by **OK**.

### 24.1.1.4 How to Configure Call Charge Factors, Currency and Computing Accuracy

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony** > **Basic Settings** in the navigation tree.
3. In the menu tree, click **Basic Settings** > **Call Charges** > **Call Charges - Factors**.
4. For each relevant route, enter the appropriate values in the **Multiplier** and **Multi-ISDN** fields.
5. Enter the appropriate value in the **Currency** field at the lower end of the form.
6. For each relevant route with the QSIG protocol, select one of the following options in accordance with the connected communication system:
  - If currency amounts are to be received and sent, select the **Charges** (Currency Amount) check box.
  - If call charge units are to be received and sent, clear the **Charges** (Currency Amount) check box.
7. In each row with a route with the QSIG Protocol which receives and sends call charge units, enter a blank under **Currency**.

8. From the **Computing accuracy** drop-down list, select the entry **No decimal digit, 1 decimal digit, 2 decimal digits, 3 decimal digits** or **Via call charge pulse**.
9. Click on **Apply**, followed by **OK**.

### 24.1.1.5 How to Activate or Deactivate the Logging of the Last Four Digits

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony** > **Basic Settings** in the navigation tree.
3. In the menu tree, click **Basic Settings** > **Call Charges** > **Call Charges - Output Format**.
4. Select one of the following options:
  - If you want to activate the function, select the check box **Last 4 digits suppressed**.
  - If you want to deactivate the function, clear the check box **Last 4 digits suppressed**.
5. Click on **Apply** followed by **OK**.

### 24.1.1.6 How to Enable or Disable Outgoing Call Logging without a Connection

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony** > **Basic Settings** in the navigation tree.
3. In the menu tree, click **Basic Settings** > **Call Charges** > **Call Charges - Output Format**.
4. Select one of the following options:
  - If you want to activate the function, select the check box **Outgoing without connection**.
  - If you want to deactivate the function, clear the check box **Outgoing without connection**.
5. Click on **Apply** followed by **OK**.

### 24.1.1.7 How to Enable or Disable the Logging of Incoming Calls

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

**Step by Step**

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony > Basic Settings** in the navigation tree.
3. In the menu tree, click **Basic Settings > Call Charges > Call Charges - Output Format**.
4. Select one of the following options:
  - If you want to activate the function, select the check box **Log incoming calls**.
  - If you want to deactivate the function, clear the check box **Log incoming calls**.
5. Click on **Apply** followed by **OK**.

**24.1.1.8 How to Activate or Deactivate the Connection Log****Prerequisites**

You are logged into the WBM with the **Expert** profile.

**Step by Step**

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony > Basic Settings** in the navigation tree.
3. In the menu tree, click **Basic Settings > Call Charges > Call Charges - Output Format**.
4. Select one of the following options:
  - If you want to activate the function, select the check box **On Ringing**.
  - If you want to deactivate the function, clear the check box **On Ringing**.
5. Click on **Apply** followed by **OK**.

**24.1.1.9 How to Activate or Deactivate MSN Logging****Prerequisites**

You are logged into the WBM with the **Expert** profile.

**Step by Step**

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony > Basic Settings** in the navigation tree.
3. In the menu tree, click **Basic Settings > Call Charges > Call Charges - Output Format**.
4. Select one of the following options:
  - If you want to activate the function, select the check box **Output MSN**.
  - If you want to deactivate the function, clear the check box **Output MSN**.
5. Click on **Apply** followed by **OK**.

### 24.1.1.10 How to Activate or Deactivate the Decimal Format

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony > Basic Settings** in the navigation tree.
3. In the menu tree, click **Basic Settings > Call Charges > Call Charges - Output Format**.
4. Select one of the following options:
  - If you want to activate the function, select the check box **Decimal format**.
  - If you want to deactivate the function, clear the check box **Decimal format**.
5. Click on **Apply** followed by **OK**.

### 24.1.2 Account codes

Account codes (ACCT) can be used to assign connection data and charges to specific projects. For this purpose, the system logs the account codes entered by users on their phones in the relevant connection data records.

ACCT is used in combination with connection data recording and is available to all subscribers.

The subscriber can enter an ACCT at the phone before or after dialing. It is not possible to dial from a client with ACCT enabled.

An ACCT entered during a conference with external stations is assigned to all participating connections and trunks.

The administrator can set whether an ACCT should be saved for redialing.

The personal directory (also called a phonebook) can save the code for the ACCT feature + an ACCT + a phone number together in one entry:

#### ACCT Input Procedure

The administrator defines the ACCT input procedure in the LCR dial plan:

- **Mandatory**

The ACCT must be entered before setting up the connection (before or after seizing a route).
- **Optional**

The ACCT may optionally be entered before setting up the connection. IP phone clients support input during a call, including incoming calls.

### ACCT Checking Procedure

The system can check the validity of an ACCT entered for the following types:

- List verification  
Only predefined ACCTs are valid. After a valid ACCT has been entered, the subscriber can immediately continue dialing. The system rejects an invalid ACCT. "Incorrect entry" appears on the display and a negative confirmation tone is output.
- Check number of characters  
All ACCTs that are theoretically possible with the configured number of digits are valid. After a valid ACCT has been entered by the subscriber, he or she can immediately continue dialing.
- No Check  
The validity of the ACCT is not checked. ACCTs with less than 11 digits must be separated from the other digits dialed by the subscriber with "#". For ISDN phones, this variant always requires a 11-digit account code; otherwise, no dialing occurs.

If the subscriber determines during a connection that the assigned ACCT is not correct, he or she can enter some other ACCT. The system will overwrite the currently set account code. Connection data recording creates a connection data record after each segment. Therefore, previously completed connection segments will be identified with the old account code number.

---

#### Related concepts

[Connection Data Recording](#) on page 1177

### 24.1.2.1 How to Configure Account Codes

The **Call Detail Recording** wizard can be configured to record call charges.

#### Prerequisites

You are logged in at the WBM.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click on **Wizards > Central Telephony**.
3. Click on **Edit** to start the **Call Detail Recording** wizard.
4. Enter the account codes in the input fields of the **Account codes** area with the method described by the wizard.
5. Click on **OK & Next** followed by **Finish**.

### 24.1.2.2 How to Configure an Account Code Checking Procedure

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony** > **Basic Settings** in the navigation tree.
3. In the menu tree, click **Basic Settings** > **Call Charges** > **Call Charges - Account Codes**.
4. In the row of the respective account code list in the **Checking procedure** drop-down list, select the desired entry: **No check**, **List check** or **Check number of characters**.
  - a) Select the desired value from the **Characters to be checked** drop-down list.
5. Click on **Apply**, followed by **OK**.

### 24.1.2.3 How to Activate or Deactivate Number Redial with ACCT

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony** > **Basic Settings** in the navigation tree.
3. In the menu tree, click **Basic Settings** > **System** > **System Flags**.
4. Select one of the following options:
  - If you want to activate the function, select the check box **No. redial with a/c code**.
  - If you want to deactivate the function, clear the check box **No. redial with a/c code**.
5. Click on **Apply**, followed by **OK**.

## 24.2 Displaying and Transmitting Connection Data

The display and transmission of connection data includes different ways of displaying connection data on system phones and file transfer methods.

### 24.2.1 Call-Charge Display with Currency (not for U.S.)

The system can display the currency amount transmitted for the current external connection by the network provider on the display of the telephone.

The network provider must support the transfer of currency amounts with the Advice Of Charge (AOC-D or AOC-S) feature. The system aggregates the amounts of the relevant call charge units.

The currency amount can basically be transferred at the following times:

- on starting the call and possibly during the call (AOC-S)
- during the call (AOC-D)

The administrator can avoid inaccuracies in recording connection data via the "Computing accuracy" parameter. The computing accuracy determines:

- the number of decimal digits for evaluating the connection data (minimum currency amount)
- the maximum total of cumulative currency amounts.

The preset computing accuracy must equal to or higher than the computing accuracy used for ISDN. If the maximum of three decimal places is insufficient, the system automatically rounds up the number to the next unit. Possible values for computing accuracy:

| Computing accuracy                                   | Minimum currency amount | Maximum currency amount |
|------------------------------------------------------|-------------------------|-------------------------|
| No decimal digits                                    | 1                       | around 4.3 billion      |
| 1 decimal digit                                      | 0.1                     | around 430 million      |
| 2 decimal digits (e.g., for Euro)                    | 0.01                    | around 43 million       |
| 3 decimal digits (e.g., for British pounds sterling) | 0.001                   | about 4.3 million       |

### 24.2.1.1 How to Configure the Call-Charge Display with Currency

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony** > **Basic Settings** in the navigation tree.
3. In the menu tree, click **Basic Settings** > **Call Charges** > **Call Charges - Factors**.
4. For each desired route, from the **Advice of charge** drop-down list, select the entry **Interim**, **Final**, **Interim final** or **No charges**.
5. Select the number of decimal places to be taken into account in the **Computing accuracy** drop-down list at the bottom end of the form.
6. Click on **Apply**, followed by **OK**.

### 24.2.2 Displaying the Connection Charges on the Phone

The system can display information about the cost of an existing external connection on the phone display as a currency amount.

The system aggregates the amounts of the relevant call charge units. The currency amount is calculated from the call charge units and the configured call charge factor. The service provider must support the Advice Of Charge (AOC) feature.

The connection charges information can be transmitted at the following times:

- On starting the call and possibly during the call (AOC-S)
- During the call (AOC-D)
- At the end of the call (AOC-E)

At the end of the call, the display shows the final charges for the completed call for about 5 seconds, provided the subscriber has not started some other action.

Connection charges for the current connection are always displayed when toggling.

For an unsuccessful blind transfer, the overall amount is displayed and charged.

A subscriber to whom a call is transferred will only see and be charged for the relevant amount from that point in time during the call.

### 24.2.3 Displaying the Connection Duration on the Phone

The system can show the duration of outgoing and incoming external connections on the phone's display.

The format is HH:MM:SS.

If the connection duration display is disabled, the connection charges information of the PSTN is shown on the phone's display instead.

If there is no connection charges information available, the display shows the caller's number (if known).

#### 24.2.3.1 How to Activate or Deactivate the Connection Duration Display

##### Prerequisites

You are logged into the WBM with the **Expert** profile.

##### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony** > **Basic Settings** in the navigation tree.
3. In the menu tree, click **Basic Settings** > **System** > **Display**.
4. Select one of the following options:
  - If you want to activate the function, select the check box **Call timer display**.
  - If you want to deactivate the function, clear the check box **Call timer display**.
5. Click on **Apply**, followed by **OK**.

## 24.2.4 Transmission of Connection Data

The system can transmit connection data in a file using HTTPS.

The transmitted file can then be evaluated with a suitable program.

A continuous output of the connection data is only possible via CSTA.

The administrator can choose between the following formats for the connection data (ASCII 8-bit):

- Compressed format
- Uncompressed format

### Compressed format, Standard

A connection data record in compressed format contains the following fields, delimited by |, and each connection data record is terminated with CRLF:

| Field position | Length  | Description                                                                                                                       |
|----------------|---------|-----------------------------------------------------------------------------------------------------------------------------------|
| 1              | 8       | Date (at end of call)                                                                                                             |
| 2              | 8       | Time (at end of call)                                                                                                             |
| 3              | 3       | Number of seized trunk                                                                                                            |
| 4              | 16      | Internal station number                                                                                                           |
| 5              | 8       | Alert time for incoming connection                                                                                                |
| 6              | 8       | Duration of the connection                                                                                                        |
| 7              | Max. 25 | Dialed or received external station number                                                                                        |

```

**Compressed format, USA-specific**

A connection data record in compressed format contains the following fields, delimited by |, and each connection data record is terminated with CRLF:

| Field position | Length  | Description                                                                                                                       |
|----------------|---------|-----------------------------------------------------------------------------------------------------------------------------------|
| 1              | 8       | Date (at end of call)                                                                                                             |
| 2              | 8       | Time (at end of call)                                                                                                             |
| 3              | 3       | Number of seized trunk                                                                                                            |
| 4              | 16      | Internal station number                                                                                                           |
| 5              | 8       | Alert time for incoming connection                                                                                                |
| 6              | 8       | Duration of the connection                                                                                                        |
| 7              | Max. 25 | Dialed or received external station number                                                                                        |
| 8              | 11      | Call charge unit/Amount                                                                                                           |
| 9              | 2       | Additional information (such as incoming call, outgoing call, transferred connection, conference, DISA, connection setup charges) |
| 10             | Max. 11 | Acc. code                                                                                                                         |
| 11             | Max. 11 | Only for a point-to-multipoint connection: used MSN                                                                               |
| 12             | 6       | LCR access code, CO access code                                                                                                   |
| 13             | 2       | LCR route used, dial rule                                                                                                         |
| 14             | 2       | PRI Nodal Service                                                                                                                 |
| 15             | 1       | PRI WATS band                                                                                                                     |
| 16             | 3       | PRI CIC                                                                                                                           |
| 17             | 25      | Dialed or received call number (optional)                                                                                         |

---

**NOTICE:** In *HKEY\_LOCAL\_MACHINE\SOFTWARE* registry keys for *Accounting Tool*, the value of the **DateFormat DWORD** should be set to 1 for North America date format (MM.DD.YY). The default value is 0 and corresponds to European/Latin America date format (DD.MM.YY).

---

---

**NOTICE:** Data record of Accounting manager in compressed format are separated by the delimiter |. This can be configured only through Manager E.

---

### Uncompressed format

The uncompressed format is suitable for printing. In addition, a header and form feed are output. A connection data record in compressed format contains the following fields, delimited by |:

| Field position | Character position, Length | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1              | 1-8 (8)                    | Date at end of connection: DD.MM.YY<br>(DD = day: value range 01 ... 31, MM = month: value range 01 ... 12, YY = year: value range 00 ... 99)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 2              | 9-16 (8)                   | Time at the end of a connection segment or an unanswered incoming call: hh:mm:ss a<br>(hh = hours: value range 00 ... 23, mm = minutes: value range 00 ... 59, ss = seconds: value range 00 ... 59)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 3              | 17-19 (3)                  | Trunk: trunk number<br>Value range 1 ... 250                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 4              | 20-35 (16)                 | Station: Internal station number<br><br>For unanswered calls, this is the last station called (e.g., a hunt group, call forwarding, call forwarding—no answer). For group calls, this is the last station entered. For answered calls, the station that accepted the call is shown. A programmed SNO prefix (with networking only) is not output.<br><br>If the internal numbering was converted to a maximum 7-digit numbering plan, the converted station number is output.<br><br>The internal station number may be preceded by a max. 7-digit node number. If the total resulting from the node number and the station number is greater than seven, only the last seven digits of the number are output. |
| 5              | 36-40 (5)                  | Call duration of an incoming connection: mm:ss<br>(mm = minutes: value range 00 - 59, ss = seconds: value range 00 - 59)<br><br>The display occurs for all incoming calls, provided the output of the ring duration has been configured in the system. If a counter overflow occurs (duration > 59:59), "59:59" is output. A change in date or time during system operation can result in this situation.<br><br>In the case of an incoming call to a busy station, the ring duration is "00:00".                                                                                                                                                                                                              |
| 6              | 41-48 (8)                  | Duration of the connection or connection segment: hh:mm:ss<br>(hh = hours: value range 00 ... 23, mm = minutes: value range 00 ... 59, ss = seconds: value range 00 ... 59)<br><br>If a connection has not been established for an incoming call, 8 blanks are output here. If a counter overflow occurs (duration > 23:59:59), "23:59:59" is output.                                                                                                                                                                                                                                                                                                                                                          |

### Communication Sequence

The transfer of connection data can be requested (download request), whereupon the system responds accordingly (download response).

Subsequently, the deletion of connection data can be requested (delete request), whereupon the system responds accordingly (download response).

### Download Request - Definition

Example:

```
https://192.148.108.151/management/portlet/?portlet=
hipath-
accountingdownload::HiPathAccountingDownloadPortlet&
entity=accounting&action=delete&username=xbert@system&
password=not4u;-)
```

### Delete Response - Definition

| Response Code | Meaning |
|---------------|---------|
| SC_OK(200)    | Success |

| Response Code                 | Meaning                                      |
|-------------------------------|----------------------------------------------|
| SC_BAD_REQUEST(400)           | Missing parameter in request                 |
| SC_UNAUTHORIZED(401)          | Login failure or wrong user name or password |
| SC_INTERNAL_SERVER_ERROR(500) | Internal error                               |

### Related concepts

[Accounting Tools](#) on page 1196

## 24.2.4.1 How to Select the Format

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony** > **Basic Settings** in the navigation tree.
3. In the menu tree, click **Basic Settings** > **Call Charges** > **Call Charges - Output Format**.
4. Select one of the following options:
  - To select the compressed format, enable the check box **Compressed Output**.
  - To select the uncompressed format, clear the check box **Compressed Output**.
5. Click on **Apply**, followed by **OK**.

## 24.2.4.2 How to Enable or Disable Transmission of Connection Data via HTTPS

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony** > **Basic Settings** in the navigation tree.
3. In the menu tree, click **Basic Settings** > **Call Charges** > **Call Charges - Output Format**.
4. Select one of the following options in the **Output** drop-down list:
  - If you want to enable the feature, select the item **HTTPS**.
  - If you want to disable the feature, select the item **None**.
5. Click on **Apply**, followed by **OK**.

## 24.3 Cost control

Cost control includes the features Expensive Connection Route Advisory and Toll Fraud Monitoring.

### 24.3.1 Expensive Connection Route Advisory

If the telephone is currently unable to reach a call destination via the least-cost routing path, it can notify the subscriber of the use of an expensive connection path via an advisory signal.

The subscriber can thus decide whether or not to conduct the call at that time despite the expensive connection path. The advisory signal may occur as follows:

- Text in the display
- Tone
- Text in the display and tone

The system issues an advisory message for the expensive connection path if a corresponding warning has been configured in the routing table and if the system is not using the route of index 1 of the routing table.

The advisory message is only displayed on the screen if no name is configured for the associated dial rule. If a name is configured, it is displayed.

#### 24.3.1.1 How to Configure an Expensive Connection Route Advisory

##### Prerequisites

You are logged into the WBM with the **Expert** profile.

##### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click **Telephony > LCR**.
3. Click **Routing > LCR > Routing table** and then on the appropriate routing table.
4. For every expensive connection route (**Route** column), select the desired entry from the **Warning** drop-down list: **Tone**, **Display** or **Display + Tone**.
5. Click on **Apply**, followed by **OK**.

### 24.3.2 Toll Fraud Monitoring

The system can monitor connections to detect possible occurrences of toll fraud. Monitoring is performed for connections that arrive via a trunk and then leave via a trunk.

The first station signals when the configured connection duration is exceeded and thus enables you to disconnect the call if required. As

an administrator, you can configure whether or after what connection duration such a connection is to be signaled.

### 24.3.2.1 How to Enable or Disable Toll Fraud Monitoring

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony** > **Basic Settings** in the navigation tree.
3. In the menu tree, click **Basic Settings** > **System** > **Time Parameters**.
4. Select one of the following options:
  - If you want to enable Toll Fraud Monitoring, select the desired entry for **Timer for Toll Fraud Monitoring** in the **Base** drop-down list and enter a value other than 255 in the **Factor** field. **Base** \* **Factor** is the connection duration after which a potentially fraudulent connection is signaled.
  - To disable Toll Fraud Monitoring, enter the value 255 for **Timer for Toll Fraud Monitoring** in the **Factor** field.
5. Click on **Apply**, followed by **OK**.

## 24.4 Accounting Tools

Accounting tools are provided by Accounting Manager and Teledata Office.

---

#### Related concepts

[Service Center – Documents](#) on page 118

[Transmission of Connection Data](#) on page 1187

### 24.4.1 Accounting Manager

Accounting Manager is a Windows application for retrieving connection data via HTTPS and evaluating this data using tables and graphics.

Accounting Manager ships with its own documentation. Accounting Manager retrieves connection data from the individual network nodes. You can also use Accounting Manager to test the Connection Data interface. You can download Accounting Manager in the **Service Center** of the WBM. Accounting Manager requires local administration rights and the activation of TLS 1.2 in Microsoft Internet Explorer.

## **24.4.2 Teledata Office**

Teledata Office is a Windows application for analyzing connection data.

## 25 Maintenance

The system offers several maintenance options. This includes changing the telephony settings, backing up and restoring the configuration data, updating the software with updates and upgrades and restarting/reloading functions. In addition, appropriate functions for status identification, monitoring and maintenance are available. Remote access to the system is possible via different Remote Services.

### Maintaining the UC Booster Server

If a UC Booster Server is being operated in addition to the communication system, several maintenance options are offered by UC Booster Server as well. The maintain the UC Booster Server, the administrator does not specify the IP address of the communication system when calling the WBM, but the IP address of the Linux server.

## 25.1 Telephony Configuration

The communication system offers various configuration options for telephony, e.g., date and time, SNTP, customized display, and Music on Hold.

### 25.1.1 Date and Time

The communication system features a system clock with date and time. This system time is shown in myPortal for Desktop and on every terminal's display.

You can define the basic system time or synchronize it as follows:

- via a time server using SNTP
- via an ISDN trunk through an outgoing call
- by a manual setting

System-specific settings are not possible for the system time after activating an SNTP server.

If ever an SNTP server cannot be reached and HFA system phones use a different time source than the system, the time displayed on the phones may differ from the system time.

A system time manually set after system startup is always overwritten by ISDN time information the first time an outgoing ISDN call is made, provided the network provider transmits this information. If the difference between the system time manually set and the ISDN time information in a live system is between 2 and 70 minutes, the ISDN time information is applied. Otherwise, the system time manually set is maintained.

The administrator can select one of the following formats to display the date on the terminal. The format is additionally dependent on the type of phone:

| Date format    | OpenStage    | OptiPoint 410,<br>OptiPoint 420 |
|----------------|--------------|---------------------------------|
| Europe         | Tue 20.11.07 | 20. NOV 07                      |
| USA            | Tue 11/20/07 | Tue NOV 20.07                   |
| International1 | Tue 20.11.07 | Tue 20 NOV 07                   |
| International2 | Tue 20.11.07 | TUE 20.11.07                    |

If you inadvertently set a date before 2007 as an administrator, you will subsequently no longer be able to access the WBM. This will only be possible after a restart, which resets the date to 01.01.2007.

### 25.1.1.1 How to Configure the Date and Time Manually

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

Perform the following steps if the system does not obtain the date and time via digital trunks or via SNTP.

#### Step by Step

1. In the navigation bar, click **Expert Mode**.
2. In the navigation area, click **Telephony Server** > **Basic Settings**.
3. Click **Basic Settings** > **Date and Time** > **Date and Time** in the menu tree.
4. Enter the **Date and Time**.
5. Click on **Apply**.
6. Click on **Log Out**.
7. Log into the WBM again.

### 25.1.1.2 How to Set the Time Zone

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click **Expert Mode**.
2. In the navigation area, click **Telephony Server** > **Basic Settings**.
3. Click **Basic Settings** > **Date and Time** > **Timezone Settings** in the menu tree.
4. Select the **Time Zone** in the drop-down list.
5. Click on **Apply**.
6. Log into the WBM again.

### 25.1.1.3 How to Configure the Date Format

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click **Expert Mode**.
2. In the navigation area, click **Telephony Server** > **Basic Settings**.
3. In the menu tree, click **Basic Settings** > **System** > **Display**.
4. Select the date format from the **Date format** drop-down list.
5. Click on **Apply**.

### 25.1.2 SNTP

Over SNTP, you can synchronize the date and time of your systems with NTP time servers on a network-wide basis.

SNTP (Simple Network Time Protocol) is a simplified version of NTP (Network Time Protocol), a standard for synchronizing date and time via packet-based communication networks. Your system needs a connection to an NTP server to synchronize date and time. This connection can occur in your local network or on the Internet. A number of different NTP servers are available on the Internet; you can select one that is located in your time zone. Note the conditions of use for the relevant server and, if necessary, request permission.

#### 25.1.2.1 How to Obtain the Date and Time from an SNTP Server

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click **Expert Mode**.
2. Click on **Telephony** > **Basic Settings** in the navigation tree.
3. Click **Basic Settings** > **Date and Time** > **SNTP Settings** in the menu tree.
4. Enter the **IP Address / DNS Name of External Time Server**, e.g., `0.de.pool.ntp.org`.
5. Select the item **enabled** in the **Operating State of SNTP Server** drop-down list.
6. In the **Poll Interval for External Time Server** drop-down list, select the desired time interval for retrieving the correct date and time from the SNTP server.
7. Click on **Apply**.
8. Log into the WBM again.

## 25.1.3 Telephone Logos

System telephones with a display may show the logo as a background of the Telephony User Interface (TUI).

As an administrator, you can import, assign or delete phone logos for system telephones with a display. Different types of system telephones may use different phone logos.

---

### Related concepts

[Updating System Telephones](#) on page 1232

### 25.1.3.1 How to Load a Phone Logo into the System

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

The image file with the phone logo meets the following prerequisites::

| Phone                                                                        | Format         | Color                                                              |
|------------------------------------------------------------------------------|----------------|--------------------------------------------------------------------|
| OpenStage 40                                                                 | 112 x 32, BMP  | monochrome                                                         |
| OpenStage 60<br>OpenStage 80                                                 | 240 x 71, JPEG | monochrome or color                                                |
| OpenScape Desk<br>Phone CP 400<br>OpenScape Desk<br>Phone CP 400T            | 112 x 32, BMP  | monochrome                                                         |
| OpenScape<br>Desk Phone CP<br>600/700/700X<br>OpenScape Desk<br>Phone CP 710 | 220 x 70, PNG  | 24-bit with alpha<br>(transparency)                                |
| OpenScape Desk<br>Phone CP 600E                                              | 220 x 70, PNG  | 24-bit with alpha<br>(transparency) or 256<br>greyscale with alpha |

You have access to the image file with the phone logo in the file system of the administration PC.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance > Software Image** in the navigation tree.
3. Click on **Phone Image Logos > Load** in the menu tree.
4. Click **Browse** to select an appropriate image file.
5. Click **Load**.

### 25.1.3.2 How to Deploy a Phone Logo to System Telephones

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance > Software Image** in the navigation tree.
3. Click on **Phone Image Logos > Deploy** in the menu tree.
4. Select the check box **Deploy** in the row of the phone logo to be deployed.
5. Select the desired system telephone type in the **Deploy to Workpoints with Selected Device Type** drop-down list.
6. Click on **Apply**.

### 25.1.3.3 How to Delete a Phone Logo

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

You have access to the image file with the phone logo in the file system of the administration PC.

To delete a phone logo from the communication system, perform the following steps:

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance > Software Image** in the navigation tree.
3. Click on **Phone Image Logos > Load** in the menu tree.
4. Select the check box **Delete** in the row of the phone logo to be deleted.
5. If you want to delete more phone logos, repeat the previous step.
6. Click on **Delete**. All marked phone logos will be deleted from the communication system.

### 25.1.4 Customized Display

A customized display enables the company name, for example, to be displayed on system phones in the idle state.

Only the right portion (max. 18 characters) of the second display line, which displays "OpenScape" by default, can be changed. The text lines up with the left part of the date if the length of the text allows it:

```
16:30 FR 29.FEB 08 123456 Post Office Hotel>
```

### 25.1.4.1 How to Change the Customer-Specific Display (System Name)

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony** > **Basic Settings** in the navigation tree.
3. Click **Basic Settings** > **Gateway** in the menu tree.
4. Enter the name to be displayed in the **System Name** field.

---

**NOTICE:** Do not use any characters other than A-Z, a-z and 0-9.

---

5. Click on **Apply** followed by **OK**.

### 25.1.5 Multilingual Text Output

The language for display messages can be selected system-wide or for a specific station only.

Available languages: Bulgarian, Catalan, Chinese, Czech, Danish, Dutch, English (UK), English (US), Estonian, Finnish, French, German, Greek, Hungarian, Italian, Latvian, Lithuanian, Macedonian, Norwegian, Polish, Portuguese, Romanian, Russian, Serbian, Serbo-Croatian, Slovak, Slovenian, Spanish, Swedish, German (Telekom), Turkish.

You set the language when you enter the country initialization code during system booting.

---

#### Related concepts

[Configuring Stations](#) on page 427

#### Related tasks

[How to Configure IP and SIP Stations](#) on page 182

### 25.1.6 Flexible Menus

Flexible menus allow you to customize the menu items shown on the display of system telephones.

As an administrator, you can select the menu items to be shown or hidden individually.

#### 25.1.6.1 How to Edit the Flexible Menu

##### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony** > **Basic Settings** in the navigation tree.
3. In the menu tree, click **Basic Settings** > **System** > **Flexible menu**.
4. Edit the **Masking list** as follows:
  - To hide a menu item, enable its check box.
  - To show a menu item, enable its check box.
5. Click on **Apply** followed by **OK**.

## 25.1.7 Music on Hold

The communication system can play back Music on Hold (MOH) to waiting subscribers during switching operations. Callers hear MOH while in the hold state, parked state or transfer state. This also applies to callers in the call distribution queue.

The system can import Music On Hold from the following sources:

- Music On Hold
- EXMR  
See Installing OpenScape Business X1/X1W, Service Documentation or Installing OpenScape Business X3/X5/X8, Service Documentation.
- MUSIC plugin module  
See Installing OpenScape Business X1/X1W, Service Documentation or Installing OpenScape Business X3/X5/X8, Service Documentation.
- MPPI USB EXM module (only for OpenScape Business X3/X5)  
See Installing OpenScape Business X3/X5/X8, Service Documentation.

### Audio Files

The administrator can transfer audio files for the internal Music on Hold from the PC to the communication system for use as an alternative internal Music on Hold.

---

**NOTICE:** Before using announcements or music from other sources, make sure that you do not infringe on any copyrights.

---

---

**IMPORTANT:** If the station on hold is an IP workpoint client or an IP trunk, the internal MOH is used. External MOH is not intended for IP.

---

The audio files must be available as `wave` files with the following properties:

- 16 bit PCM

- Mono or stereo
- Possible sample rates: 8 / 22.05 / 24 / 32 / 40 / 44.1 or 48 kHz.
- Maximum length for the audio file name: 30 characters

Recommended: **16 bit PCM - Mono - 8 kHz, length approx 2 min**

### Music On Hold

Different Music on Hold can be configured for the day and night service.

---

**NOTICE:** For UC Suite there is no distinction between day and night files. The **MoH Day File** is used.

---

The administrator can configure the following functions:

- Music on hold with ringing tone (ringback):  
The subscriber on hold first hears the MOH melody during the consultation. After the party on hold is transferred to the destination, the ring tone is heard instead of the music on hold.
- Music on hold without ringing tone (ringback):  
The held party will hear MOH until the called party answers the call.
- No music on hold:  
The held party hears nothing (silence). The caller hears the ringback tone in the event of an unscreened transfer for an external call.

## 25.1.7.1 How to Import Internal Music On Hold

The **Music on Hold / Announcements** wizard can be used to import audio files as internal Music on Hold in the communication system.

### Prerequisites

You are logged in at the WBM.

The audio files to be imported are available as WAVE files in the required format.

---

**NOTICE:** Before using announcements or music, make sure that you do not infringe on any copyrights.

---

---

**NOTICE:** For UC Suite there is no distinction between day and night files. The **MoH Day File** is used.

---

### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click on **Wizards > Central Telephony**.
3. Click **Edit** to start the **Music on Hold / Announcements** wizard.

4. Go to **MoH Day File** for the day service or **MoH Night File** for the night service and click on **Browse**.
5. Select an audio file and click **Open**. The path to the audio file is displayed at **MoH Day File** and/or **MoH Night File**.
6. Click on **Load**.
7. Confirm the message with **OK** and click **OK & Next**.
8. Click **Finish**.

### 25.1.7.2 How to Configure the Music on Hold Functionality

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

The maximum length for the Music on Hold file name is 30 characters.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click on **Telephony > Auxiliary Equipment** in the navigation tree.
3. Click on **Auxiliary Equipment > Announcements / Music On Hold** in the menu tree.
4. In the **Music On Hold** area under the **Type of MOH** drop-down list, select the item **No Music On Hold**, **MOH without ringing tone** or **MOH with ringing tone**.
5. Click on **Apply**, followed by **OK**.

### 25.1.7.3 How to Change the Music on Hold Functionality for Each CON Group

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click on **Telephony> Auxiliary Equipment** in the navigation tree.
3. Click on **Auxiliary Equipment > Announcements / Music on Hold** in the menu tree.
4. Click on the **Edit Music On Hold** tab.
5. Select the desired music on hold from the Audio File drop-down list in the relevant row of the traffic restriction group.
6. If a CON group does not have any music on hold assigned to it, the internal music on hold is used for the group
7. Enter a Description in the row of the corresponding traffic restriction group.
8. Click **Apply**.
9. Click **OK**.

---

**NOTICE:** This functionality is applicable only to OpenScape Business S systems and is not supported in OpenScape Business X.

---

## 25.1.8 Announcements

The communication system allows on-hold announcements to be played for callers before answering a call and also when using call distribution and DTMF direct inward dialing. You can also replace the MOH melody in certain situations by an announcement, for example, if a party is placed on hold or if a subscriber is busy or being routed.

The system can import announcements from the following sources:

- Internal announcements
- Announcement Player (only with UC Booster functionality)

The announcement player is an internal software program that is available together with the UC Booster functionality (UC Booster Card or UC Booster Server). On calling a subscriber, the announcement player first plays the desired announcement and then sets up the connection to the subscriber. Manager E is required for the configuration.

- Analog Announcement Device

See the section on Auxiliary Equipment - Analog Announcement Device in the OpenScape Business Administrator Documentation.

- MPPI USB EXM module (only for OpenScape Business X3/X5)

See Installing OpenScape Business X3/X5/X8, Service Documentation.

The administrator can configure announcements for single (start/stop) or continuous playback.

---

**NOTICE:** In embedded systems continuous mode is not supported.

---

An external announcement device must behave like a station, i.e., announce itself, play the announcement and switch the call (enter consultation hold, dial and hang up).

### Audio Files

The administrator can transfer audio files with announcements from the PC to the communication system.

---

**NOTICE:** Before using announcements or music from other sources, make sure that you do not infringe on any copyrights.

---

The audio files must be available as `Wave` files with the following properties:

- 16 bit PCM
- Mono or stereo
- Possible sample rates: 8 / 22.05 / 24 / 32 / 40 / 44.1 or 48 kHz.
- Maximum length for the audio file name: 30 characters

Recommended: **16 bit PCM - Mono - 8 kHz, length approx 2 min**

### 25.1.8.1 How to Configure Announcements (UC Smart)

The configuration is done in Manager E according to the following basic procedure (see also the online help for Manager E):

#### Step by Step

1. Go to **System View**, menu **Settings > Set up station > Station** and set the **Type** to **Standard** for the desired port of the voicemail box (UC Smart). It is recommended to use the last ports for this purpose.
2. Remove the desired port from the hunt group of the voicemail box (UC Smart) under **System View**, menu **Settings > Incoming calls > Groups/Hunt groups**.
3. Assign a voicemail box to the call number of the corresponding port under **System View**, menu **Settings > Auxiliary Equipment > EVM**.
4. Select a greeting and import the announcement under **Maintenance > Announcement > Announcement equipment**.
5. Select single or repeated playback under **System View**, menu **Settings > Auxiliary Equipment > Announcement**, area **Announcement equipment**.

### 25.1.8.2 How to Configure Announcements (UC Suite)

The **Music on Hold / Announcements** wizard can be used to transfer audio files to the communication system and configure them as announcements.

#### Prerequisites

You are logged in at the WBM.

The audio files to be loaded are available as PCM files with the following properties: 8 kHz, 16 bit, Mono. The maximum length for the audio file name is 30 characters.

---

**INFO:** Before using announcements or music, make sure that you do not infringe on any copyrights.

---

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > Central Telephony**.

3. Click on **Edit** to start the **Music on Hold / Announcements** wizard.
4. Skip the selection of the Music on Hold files and click on **OK & Next**.
5. To transfer an audio file to the communication system, proceed as follows:
  - a) Click on **Browse**.
  - b) Select an audio file.
  - c) Click on **Open**.
  - d) Click on **Load**.
  - e) Confirm the message with **OK**.
  - f) If you want to transfer more audio files to the system, repeat these steps.
6. Click on **OK & Next**.
7. Select an announcement from the **Wave File** drop-down list.
8. Select the type of playback from the **Mode** drop-down list.
9. Click on **OK & Next** followed by **Finish**.

### 25.1.8.3 How to Configure the Announcement Player (only with UC Booster)

#### Prerequisites

The Manager E is started.

The audio files to be loaded are available as PCM files with the following properties: 8 kHz, 16 bit, Mono. The maximum length for the audio file name is 30 characters.

---

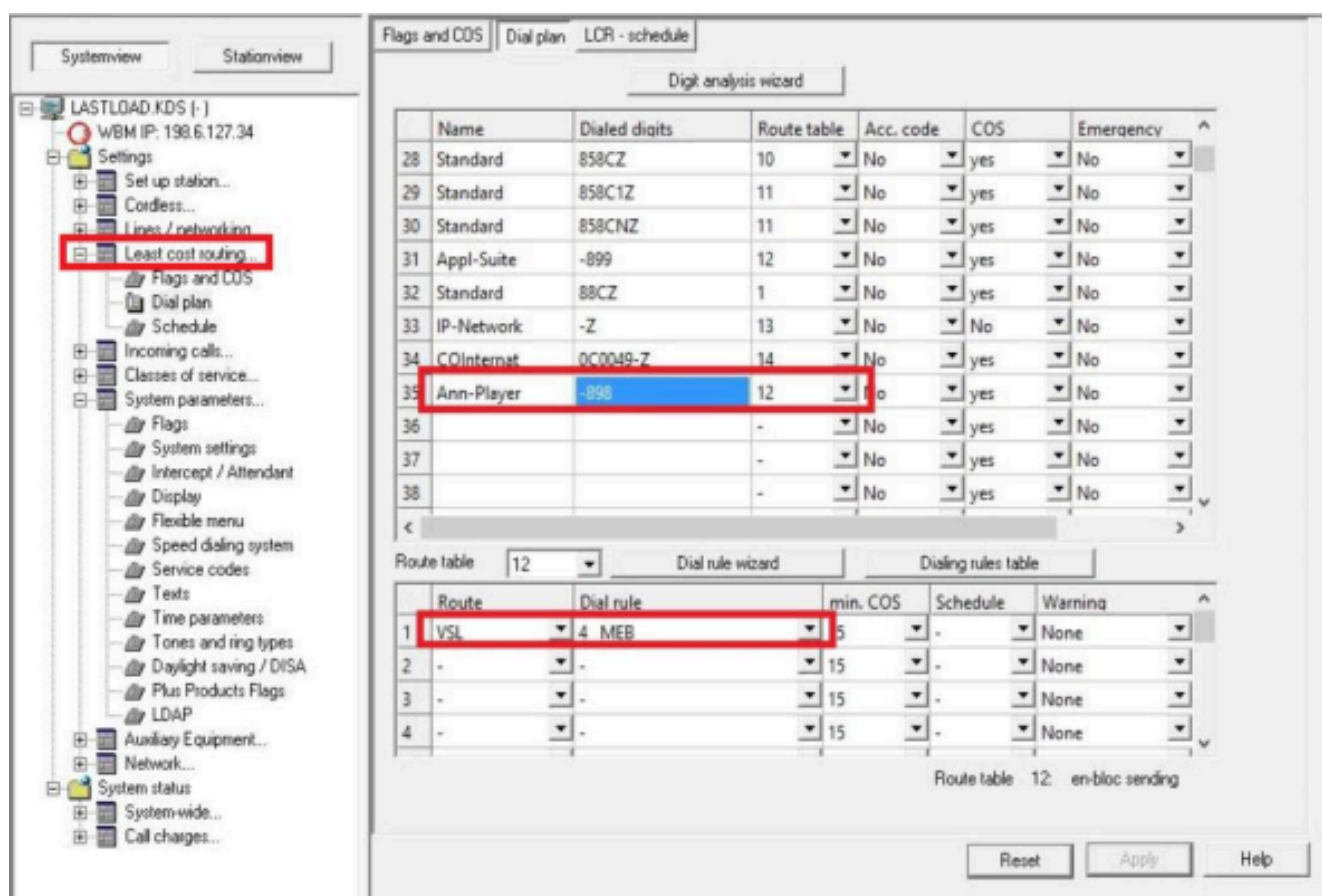

**INFO:** Before using announcements or music, make sure that you do not infringe on any copyrights.

---

#### Step by Step

1. Download the CDB of the communication system into Manager E (see [How to Load the CDB into Manager E](#)).
2. Click in the system view on **Settings > System Parameters**.
3. Click on the **System Settings** tab.
4. In the **AP Access Callnumber** area, click on **Set AP access**.
5. Under **Route**, select the entry **UC Suite** or **VSL** and enter the call number for the announcement player (e.g., 898) under **Call no..** This call number must then be specified in the call forwarding. After completing this, confirm with **OK**.
6. Click on **Apply**.
7. Click in the system view on **Settings > Least Cost Routing**.
8. Click on the **Dial Plan** tab.
9. Check the list item **Ann-Player**:

## Maintenance

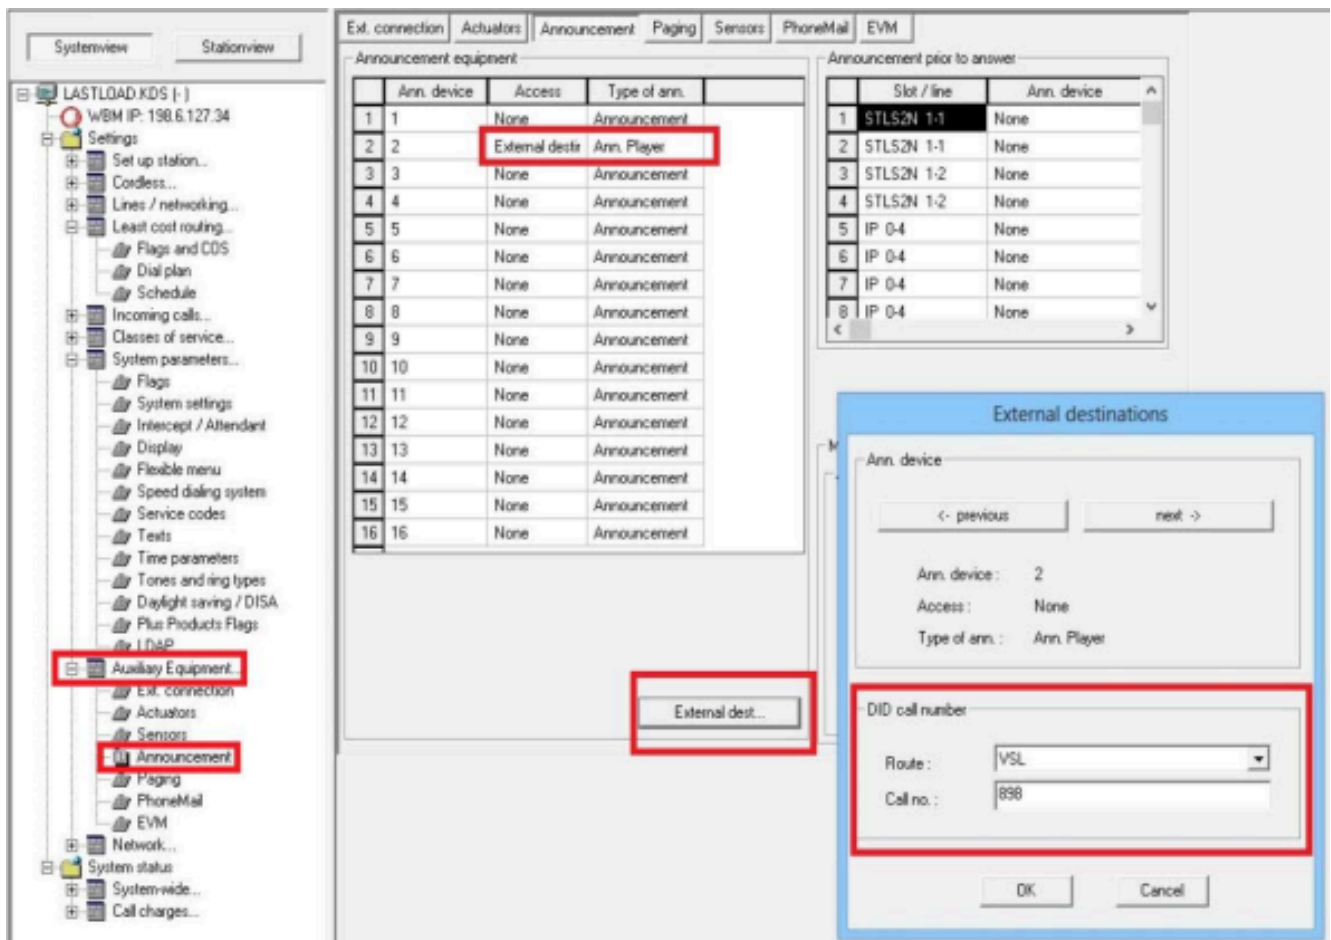

a) For the name **Ann-Player**, under **Dialed digits**, there should be a minus sign followed by the previously entered call number (e.g., -898).

b) The associated **Routing Table** must be set to 12 with the entries **UC Suite** or **VSL** for **Route** and **MEB** for **Dial Rule**.

**10.** Click in the system view on **Settings > Auxiliary Equipment**.

**11.** Click on the **Announcement** tab.

**12.** Set the announcement player as an external destination:

- Select in a list item from 2 (row 1 must not be changed - it is used for the internal Music on Hold) under **Access** the entry **External destination** and under **Type of ann.** the entry **Announcement Player**.
- If you want to set up further announcements, repeat the previous step and edit more list entries.
- Click on the **External destinations** button.
- Under **Route**, select the entry **UC Suite** and enter the call number for the announcement player (e.g., 898) under **Call no.** After completing this, confirm with **OK**.

**13.** Click on **Apply**.

**14.** Save the CDB back to the communication system.

**15.** Log into the WBM with the **Expert** profile.

**16.** In the navigation bar, click on **Setup**.

**17.** In the navigation tree, click on **Wizards > Central Telephony**.

**18.** Click on **Edit** to start the **Music on Hold / Announcements** wizard.

**19.** Skip the selection of the Music on Hold files and click on **OK & Next**.

**20.** To transfer an audio file to the communication system, proceed as follows:

- Click on **Browse**.
- Select an audio file.

- c) Click on **Open**.
- d) Click on **Load**.
- e) Confirm the message with **OK**.
- f) If you want to transfer more audio files to the system, repeat these steps.

**21.** Click on **OK & Next**.

**22.** For the access **External destination**, select an announcement in the **Wave File** drop-down list and then select the type of playback from the **Mode** drop-down list.

---

**NOTICE:** In embedded systems continuous mode is not supported.

---

**23.** If you want to set up more announcements, repeat the previous step.

**24.** Click on **OK & Next** followed by **Finish**.

**25.** In the navigation bar, click on **Expert Mode**.

**26.** In the navigation tree, click **Middleware**.

**27.** Navigate in the menu tree to **Middleware > Announcement Player**.

**28.** Click on the **Announcement player settings** tab.

**29.** Select the check box **Service will be started automatically**.

**30.** Click on **Apply**.

**31.** In the navigation tree, click on **Telephony > Incoming Calls**.

**32.** Navigate in the menu tree to **Incoming Calls > Call Forwarding**.

**33.** Click on the **Call dest. list - Definition** tab.

**34.** Select a free call destination list (e.g., call destination list 1).

**35.** Under **Target 1**, select one of the configured announcements (e.g., #802 Ans). Displaying all entries may take some time.

**36.** Under **Target 2**, select the entry **Called station**.

**37.** Click on **Apply** followed by **OK**.

**38.** Click on the **Call dest. list - Assignment** tab.

**39.** In the row of the desired subscriber, select the previously-defined call destination list (e.g., call dest. list 1) in the **Day**, **Night** and **Internal** drop-down lists.

**40.** Repeat the previous step for the other subscribers.

On calling a subscriber to whom call destination list 1 is assigned, the announcement player first plays the configured announcement and then sets up the connection to the subscriber.

**41.** Click on **Apply**.

### 25.1.9 User to User Signaling

The communication system enables the transparent transmission of messages between stations (user to user signaling, UUS). UUS1 is supported for information exchange in control messages for connection setup and cleardown.

In the case of a point-to-multipoint connection, it is important to ensure that only one device transmits a message to an incoming call.

### 25.1.10 Voice Channel Signaling Security

The communication system offers a security mechanism that can be set up by the administrator to prevent undesirable tone injections into the voice channel. No override is possible for a connection protected by this method. Every station configured as a Fax device automatically has this signaling security mechanism.

Recalls are deferred until the extension is free again.

Stations on-hold always have signaling security.

### 25.1.11 Time Parameters

The communication system offers the administrator options for setting various time parameters such as the "length of callback" or the "timer for automatic redial".

The time parameters are preset in the communication system and should normally not be changed.

### 25.1.12 Controlling Centrex Features

To control Centrex features, the dial tones for \* and # must be transmitted to the ISDN and ITSP.

As an administrator, you can activate or deactivate this feature.

The input of a code must occur in the dialing state (e.g., after entering the trunk code). The input always begins with \* or #, followed by a digit or digit combination, and ends with #.

#### 25.1.12.1 How to Enable or Disable the Control of Centrex Features

##### Prerequisites

You are logged into the WBM with the **Expert** profile.

##### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Telephony** > **Basic Settings** in the navigation tree.
3. Navigate in the menu tree to **System** > **System Flags**.
4. Select one of the following options:
  - If you want to enable the control of Centrex features, select the check box **Transparent dialing of \* and # on trunk interfaces**.

- If you want to disable the control of Centrex features, clear the check box **Transparent dialing of \* and # on trunk interfaces**.
5. Click on **Apply** followed by **OK**.

## 25.2 Backup and Restore

The communication system's configuration data can be backed up and restored.

The configuration data is saved in a backup set. Every backup creates a separate backup set. Backups can be created manually immediately or scheduled for automatic execution at specific times.

---

**NOTICE:** It is strongly recommended to regularly back up the configuration data as backup sets.

When updating to a new minor release, it is necessary to create a new backup set.

Every backup is encrypted using a system specific key.

An encrypted backup set can only be used for the restore of the system that has encrypted the backup.

---

Different backup media can be used to store the backup sets (such as USB media, network drives or the hard disk of the UC Booster Card, for example).

Depending on the system configuration, the use of the communication system and the type of backup medium involved, a backup or restore may take a long time - in some cases for systems with the UC Suite, up to three hours. This process should not be terminated manually or by a system reboot.

Aborting a data recovery may lead to an inconsistent system configuration in which an error-free operation of the system is not guaranteed. An aborted recovery should always be repeated until it is completed successfully. Otherwise, a complete reconfiguration of the system may be necessary. If the recovery fails repeatedly, please contact the Service Support and make sure in the meantime that your backup is not overwritten by new backups. To do this, the automatic data backup must be temporarily disabled.

### **Backup Sets for Diagnostic Purposes**

"Smaller" backup sets containing diagnostic data for Service Support can be created for diagnostic purposes. In contrast to normal backup sets, significantly smaller data amounts are produced for this purpose and can thus be easily sent with an e-mail, for example. Diagnostics backup sets include, among other things, the configuration data of the communication system and the installed UC solution. Voicemails, fax messages and announcements are not included.

### **"Hard Disk" Backup Directory (Only for UC Booster Card)**

If a UC Booster Card is installed, the configuration data of the communication system can be saved in a separate partition on the hard disk of the UC Booster Card in the backup directory. This backup directory is already provided as the standard archive "Hard Disk".

### Backing up the Configuration Data of the UC Booster Server

If a UC Booster Server is being operated in addition to the communication system, then the configuration data of the UC Booster Server must also be backed up when backing up the configuration data of the system. Backing up the data of the UC Booster Server is basically identical to backing up the data of the communication system; the only difference is that the administrator does not specify the IP address of the communication system when calling the WBM, but the IP address of the Linux server.

## 25.2.1 Backup Sets

The configuration data of the communication system is saved in a backup set.

In addition to backup set, a text file associated with the backup set must also be saved. It contains information about the date and time of the backup and under which software version the backup was performed. The text file is necessary for the recovery of the backup set.

If the number of backup sets saved exceeds the set value, the oldest backup sets are deleted.

### Backup Set Data

The following data for a backup set is presented:

- **Archive name:** Name of the backup set
- **Size:** Size of the backup set in bytes
- **Date:** Date on which the backup set was created.
- **Comment:** Comment that was specified when creating the backup set (optional).

Backup sets that have been grayed out cannot be restored.

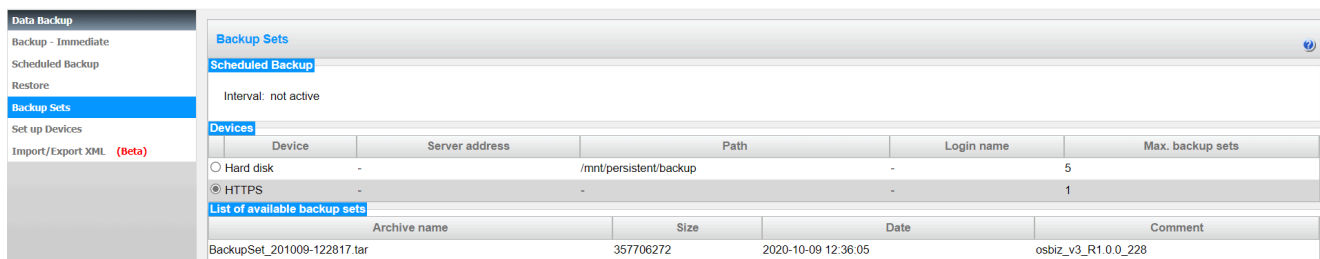

### 25.2.1.1 How to Display Backup Sets

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. Click on **Data Backup** in the navigation bar.
2. Click **Backup Sets** in the navigation tree.
3. Activate the backup medium containing the backup set you want to have displayed in the **Devices** area. A list of all backup sets available on this medium appears.

### 25.2.1.2 How to Delete Backup Sets

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. Click on **Backup and Restore** in the navigation bar.
2. Click **Backup Sets** in the navigation tree.
3. Activate the backup medium containing the backup set you want to have displayed in the **Devices** area. A list of all backup sets available on this medium appears.
4. Select the check box of the backup set you want to delete and click **Delete**. The backup set is deleted.

### 25.2.2 Backup Media

The backup sets are stored on the selected backup media.

The following backup media can be used for the backup:

- Inserted USB storage device
- Network drive
- Client PC using HTTP (only possible with immediate backup)
- Hard disk of the UC Booster Card
- FTP/FTPS servers

For every backup medium, the maximum number of backup sets to be stored in the directory can be specified.

#### USB Storage Device

To use a USB storage device (e.g., a USB hard disk or flash drive) for backup, the USB device must be plugged into the USB server port of the communication system. In addition, the USB device must be formatted with FAT-32. Due to filesystem limitation, the maximum size of the backup set cannot exceed 4 GB. In such cases, alternate backup media must be selected. USB media formatted with NTFS are read-only. Note that if multiple partitions exist, only the first partition can be used for the backup!

A bootable USB device is not supported.

With OpenScape Business S and OpenScape UC Booster Server, the USB device is plugged into the USB port of the Linux server.

### FTP/FTPS servers and network drives

FTP/FTPS servers and network drives can be added, edited or deleted as new media. FTP/FTPS servers and network drives may also be specified more than once if different directories on them are used. TLS 1.2 is supported as the encrypted file transfer protocol (FTPS).

In order to back up the configuration data, the user must have write permission for the root directory of an FTP/FTPS server. To back up to a network drive, users only need write permission for the desired directory.

If the transmission speed to the FTPS server is too low, there may be a malfunction in the backup. If this occurs, the backup must be restarted.

For FTPS, certificates up to 2048 bits are supported. These certificates are required for authentication at the FTPS server.

## 25.2.2.1 How to Add a Backup Medium

### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

### Step by Step

1. Click on **Data Backup** in the navigation bar.
2. Click **Set up Devices** in the navigation tree.
3. Click on **Add**.

| Edit Devices     |               |
|------------------|---------------|
| Device           | Network drive |
| Server address   | 192.168.1.20  |
| Path             | backup        |
| Login name       | admin_user    |
| Password         | ****          |
| Max. backup sets | 5             |

4. Select the desired backup medium from the drop-down list in the **Device** column.
  - If you want to save to an FTP/FTPS server, select **(S)FTP**.
  - If you want to save to a network drive, select **Network drive**.

---

**NOTICE:** The supported Samba version is SMB2.

---

5. Enter the host name or the IP address of the medium under **Server Address**.
6. Enter the path in which the backup set is to be stored under **Directory**.
7. If you want to save to an FTP/FTPS server, enter the **User name** and **Password** for accessing the FTP/FTPS server.

---

**NOTICE:** The accepted characters for the password field are: 0-9 A-Z a-z ~ ! @ # \$ % ^ \_ - + = ? / , . :

The maximum allowed password length is 64 characters.

---

8. If you want to save to a network drive, enter the **Login Name** and **Password** for accessing the network drive.

---

**NOTICE:** By default, an empty domain is used for authentication. In case you want to provide the domain then use a forward slash (/) character as separator in the **Login name** field. For example: domain/user.

---

9. Under **max. Backup Sets**, enter the maximum number of backup sets that are to be stored in the directory.
10. Click on **OK & Next**. The new backup medium created appears in the list of available backup media.
11. Click **Backup Sets** in the navigation tree.
12. Activate the backup media you just added in the **Devices** area. If no red bar with an error message appears in the list of available backup sets, the backup medium is set up correctly.
13. If an error message is displayed, check your entries again (see [How to Edit a Backup Medium](#) on page 1218)

### 25.2.2.2 How to Edit a Backup Medium

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. Click on **Data Backup** in the navigation bar.
2. Click **Set up Devices** in the navigation tree.
3. Activate the backup medium to be edited and click **Edit**.

The screenshot shows the 'Edit Devices' configuration window. On the left, a navigation tree is visible with the following items: Data Backup, Backup - Immediate, Scheduled Backup, Restore, Backup Sets, Set up Devices (highlighted in blue), and Import/Export XML (Beta). The main content area is titled 'Edit Devices' and contains the following fields:

|                  |               |
|------------------|---------------|
| Device           | Network drive |
| Server address   | 192.168.1.20  |
| Path             | backup        |
| Login name       | admin_user    |
| Password         | ....          |
| Max. backup sets | 5             |

4. Change the required values.
5. Click on **OK & Next**.

### 25.2.2.3 How to Delete a Backup Medium

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. Click on **Data Backup** in the navigation bar.
2. Click **Set up Devices** in the navigation tree.
3. Select the backup medium to be deleted and click **Delete**.

It is also possible to select multiple backup media for deletion.

4. Confirm the prompt with **OK**. The backup medium is deleted from the list of available backup media.

## 25.2.3 Immediate Backup

The configuration data can be immediately backed up manually.

A variety of backup media can be used for data backup; By default, the backup medium is set up as **HTTPS**. You can thus store the backup set in all storage locations that can be accessed on the client PC with which you logged into the WBM. The chosen storage location must also be accessible when restoring the backup set. If a USB device is connected to the communication system, **USB Device** is displayed as an additional backup medium. If the UC Booster Card (incl. hard disk) is connected, a further backup medium called **Local hard disk** is displayed.

The name of the backup set is assigned automatically during the backup. It includes, among other things, the date on which the backup was performed. In addition, this data is also included in a text file that must also be stored. If desired, a comment can be optionally added to identify a backup set more easily prior to a subsequent restore.

---

#### Related concepts

[Scheduled Backup](#) on page 1221

#### Related tasks

[How to Change your Own Administrator Password](#) on page 111

### 25.2.3.1 How to Save a Backup Set Immediately

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Only when using UC Suite: UC Suite has started correctly.

#### Step by Step

1. Click on **Data Backup** in the navigation bar.

2. In the navigation tree, click **Backup - Immediate**.

| Device                                 | Server address | Path                   | Login name | Max. backup sets |
|----------------------------------------|----------------|------------------------|------------|------------------|
| <input type="radio"/> Hard disk        | -              | /mnt/persistent/backup | -          | 5                |
| <input checked="" type="radio"/> HTTPS | -              | -                      | -          | -                |

3. Enter a comment for the backup set in the **Comment** field so that the backup set can be easily identified if needed later for a restore. Avoid the use of diacritical characters such as umlauts and special characters in your input.
4. If you want to create a backup set including voice messages and announcements, select the **Full Backup** option.
5. If you want to create a backup set without voice messages and announcements, select the **Only Diagnostics Data** option.
6. Activate the target drive on which the backup set is to be saved in the **Devices** area.
7. Click on **OK & Next**. The progress of the backup process is displayed in a separate window.

---

**NOTICE:** If the **OK & Next** button is grayed out, then one or more applications (e.g., UC Suite) for which the data is to be saved were not started correctly.

If you do not have access rights for the selected archive directory, you will receive an error message. Select another destination drive or change the path for the archive.

An error message appears if there is not enough disk space on the destination drive for the backup set. If this occurs, select another destination drive or delete a backup set and restart the backup.

8. The backup was successful if the message **Backup completed successfully! 100%** appears.
9. If you have selected **HTTPS** as a backup medium, you must save the backup set and the text file associated with the backup to a location of your choice. This is done automatically for the other backup media. The browser window must remain open until the save operation for the backup set and text file has been completed.

---

**NOTICE:** If you are using a USB device as a backup medium, wait till the LED of the USB device stops flashing. It is only then that the backup has been successfully stored on the USB device. You can then remove the USB device.

10. Click on **Finish**.

## 25.2.4 Scheduled Backup

You can use a schedule to automatically back up configuration data. The time, frequency and location of the automatic backup is configurable.

The scheduled data backup can be scheduled for a fixed time daily or weekly and then started automatically. This "backup job" can be created for an internal or external backup medium. It is not possible to configure multiple backup jobs.

### Related concepts

[Immediate Backup](#) on page 1219

### 25.2.4.1 How to Save a Backup Set with a Scheduled Backup

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. Click on **Data Backup** in the navigation bar.
2. In the navigation tree, click **Scheduled Backup**.

| Device    | Server address | Path                   | Login name | Max. backup sets |
|-----------|----------------|------------------------|------------|------------------|
| Hard disk | -              | /mnt/persistent/backup | -          | 5                |

3. Enter a comment for the backup set in the **Create backup set** area in the **Comment** field so that the backup set can be easily identified if needed later for a restore. Avoid the use of diacritical characters such as umlauts and special characters in your input.
4. Specify the interval for the backup:
  - Daily backup: In the **Interval** drop-down list, select the item **Daily** and then enter when the backup is to be started every day under **Backup on**.
  - Weekly backup: In the **Interval** drop-down list, select the item **Weekly** and then enter on which weekday and at what time the backup is to be started under **Backup on**.
5. Activate the target drive on which the backup set is to be saved in the **Devices** area.
6. Click on **OK & Next**. The backup is started automatically every day (daily) or every week (weekly) at the specified time.

## 25.2.5 Restore

The restoration of configuration data must be performed manually using the backup sets.

All the supported backup media can be used to restore data;

### 25.2.5.1 How to Restore a Backup Set

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Only when using UC Suite: UC Suite has started correctly.

#### Step by Step

1. Click on **Data Backup** in the navigation bar.
2. Click **Restore** in the navigation tree.

| Device                                 | Server address | Path                   | Login name | Max. backup sets |
|----------------------------------------|----------------|------------------------|------------|------------------|
| <input type="radio"/> Hard disk        | -              | /mnt/persistent/backup | -          | 5                |
| <input checked="" type="radio"/> HTTPS | -              | -                      | -          | 1                |

BackupSet\*.txt:  No file chosen

BackupSet\*.tar:  No file chosen

| Archive name                                      | Size      | Date                | Comment             |
|---------------------------------------------------|-----------|---------------------|---------------------|
| <input type="radio"/> BackupSet_201009-122817.tar | 357706272 | 2020-10-09 12:36:05 | osbiz_v3_R1.0.0_228 |

**Important Notes**

After the Restore, the system will automatically restart!

Following the Restore, VPN will be deactivated and may need to be reactivated manually if required.

Attention! If backup information from a similar but external system is used for a restore, e.g., after some defective hardware has been replaced, then the restored licensing information will be invalid! The licensing of the system will need to be renewed in such cases.

3. Activate the medium containing the backup set to be restored in the **Devices** area.
4. If you activated **HTTPS** as the backup medium, navigate to the storage location of the backup set and select the backup set. Then navigate to the storage location of the text file and select it.
5. If you activated any other backup medium than **HTTPS**, select the backup set containing the configuration data to be restored in the **List of available backup sets** area.
6. Wait until the files have been loaded onto the system and then click **OK & Next**. The recovery of the configuration data is started. The progress of the restore process is displayed.
7. After the message **Restore complete!** appears, the system will automatically reboot. The restoration is completed successfully when the system is ready for use again.

## 25.3 Updates

Updates provide the latest software available for the system components within a version.

To install updates, you will need the 3-year software support.

The version of the installed software and the expiration date of the software support are displayed on the home page of the WBM. If more recent software updates are available, this is indicated there.

---

**NOTICE:** When updating to a new minor release, it is necessary to create a new backup set.

---

The software update is performed using the WBM. On a hardware model, the software can also be optionally updated directly from a USB device without WBM access. In a communication system with the UC Booster Server, the hardware model and the UC Booster Server are updated separately.

Using the WBM, the software can be updated via the Internet web server, a local web server or directly via image files.

The following system components are updated:

- Software of the communication system
- Software of the UC clients
- Software for system telephones (updates can also be performed individually)
- Documentation

The software for the UC clients is updated together with the software of the communication system. If a more recent software version is available, users of the UC clients are notified via an Auto-Update message that an update is available and can be installed.

The software update of the IP system telephones occurs automatically with the update of the communication system, but can also be done manually. For UP0 system telephones, the update is performed manually using Manager E.

The software update can be optionally started immediately or by defining the times for the software transfer and software activation independently. The update should be performed outside the business hours of the customer, since the communication system and/or the system telephones are restarted, existing calls are dropped, and the use of the UC clients is interrupted temporarily.

After the software has been transferred to the communication system, it is activated at the selected time. The latest phone image is then automatically loaded onto the IP system telephones. After a restart of the communication system and the IP system telephones, the newly loaded software will be active.

---

**NOTICE:** Software update must not be performed simultaneously in all systems and in different software versions.

---

## **Image Files**

To update system components, compressed image files containing the software of the system components are required. These image files can be downloaded from the software server (Internet web server) and stored independently on a local web server or in the internal

network or on a USB stick, for example. There is a separate image file for the communication system without a UC Booster Card and a separate image file for a system with a UC Booster Card. Both image files also include the software for the system telephones. In addition, there is also a separate image file for each type of system telephone type in case the system telephones need to be updated separately.

The following types of image files are available:

- **tgz**: for the software of the communication system. The tgz file contains a tar file. The tar file must be unpacked from the tgz file with a decompressor such as WinZip or 7-zip, for example. The tgz file is offered for download because a check can be performed to determine whether or not the file is corrupted when downloading the software from the server.
- **tar**: for the software of the communication system. It contains the packed files for each system component.
- **app**: for the software of the system telephone.

### Local Web Server

When performing a software update via a web server, the software server (Internet web server) is accessed by default.

However, it is also possible to use a local web server for updates. To do this, the image file must be stored on the local web server, and the path to the local web server must be configured in the WBM.

### Speed Upgrade

A speed upgrade as with the HiPath 3000 is not possible.

---

**IMPORTANT:** Pulling out the SDHC card during operation will result in the loss of data!

---

### Network - Licensing

When upgrading - migrating systems in a network, where the master node is used for licensing the slave nodes, please start with the slave nodes first before the master node.

## 25.3.1 Using a Local Web Server

The software can be updated via a local web server.

The current image files must be stored on the local web server. In addition, the access data for the local web server must be entered in the WBM. This change can only be performed by an administrator with the **Expert** profile. After the access data of the local web server has been entered, this will be set as the default for all future updates of the communication system. In other words, the local web server will now be used instead of the Internet web server.

### 25.3.1.1 How to Configure Access to the Local Web Server

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

A connection to the local web server is available.

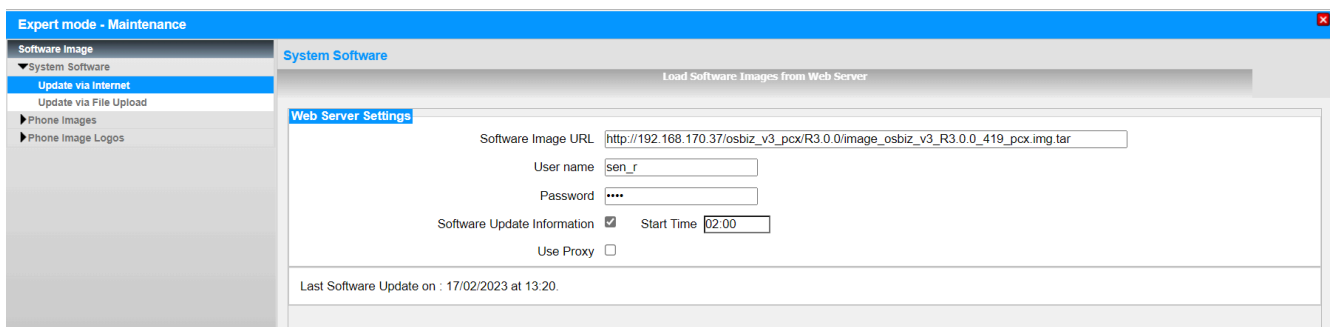

You will need the web address (URL) and the account information to access the local web server as well as the name of the image file.

The image file is stored on the local web server as a tar file, and the storage location is known. The tar file may possibly need to be unpacked from the stored tgz file.

If you use a proxy server for the update, you will also need its data (as well as the user name and password, where applicable).

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance > Software Image** in the navigation tree.
3. Click **System Software** in the menu tree.
4. Click on **Update via Internet**.

5. Set up access to the local web server:
  - a) Enter the address of the local web server, including the path and name of the image file, under **Software Image URL**.

---

**NOTICE:** The **Default** button can be used to reset the entered values back to their defaults.

---

- b) Enter the user name and password required to access the local web server in the **User Name** and **Password** fields.
  - c) Select the **Software Update Information** check box and enter the time at which the server specified above should be searched for newer software under **Start Time**.
  - d) If you are using a proxy server for the transfer, enable the **Use Proxy** check box and enter the data for the proxy server.
6. Click on **Apply**. The entered access data of the local web server is set as the default.

If a new image file is already available on the local web server, the software update is initiated, and the license agreement appears (see [How to Update the System via a Web Server](#)). The launch of the software update can, however, also be prevented if required.

## 25.3.2 Updating the Communication System

Updating the communication system includes updates to not only the software of the communication system itself, but also the software images of the system phones, which are stored on the communication system. A full update of all system components can thus be quickly and easily performed.

Before each software update, the configuration data of the communication system must be backed up ([Backup and Restore](#) ).

### Updating via a Web Server

When performing a software update via a web server, the software server (Internet web server) is accessed by default.

If a local web server is being used, the image file must be stored on the local web server.

For a communication system without a UC Booster Card, it does not matter if an image file for a system with or without a UC Booster Card is used. Only the necessary components are installed.

The system checks for the presence of new software updates after automatically setting up a connection to the web server. For systems without UC Booster, individual software update packages can be unselected to reduce the download time. Only those packages that have changed with respect to the installed software version are transferred. The starting time for the software transfer and for the software activation can be selected. If the time of the software activation is reached before the software update has been completely transferred to the system, the activation is not executed automatically. A new time of activation must then be defined manually.

### Updating via USB Storage Device

The image file is stored on a USB device. The USB storage device must be inserted in the USB server port of the communication system. This type of update can only be performed by an administrator with the **Expert** profile and is not possible for OpenScape Business S and OpenScape Business UC Booster Server.

### Updating via a File Upload

The image file is in a directory in the internal network or on the admin PC.

### Update via a USB Device without WBM Access

The communication system can be updated directly without WBM access via a USB device. This requires the USB device to be plugged into the USB server port of the system and the image file to be located at the top level of the USB device. If a reset of the communication system is performed with the USB device inserted, the software update is started automatically. This type of update is not possible with OpenScape Business S. In a system with the OpenScape Business UC Booster Server, the server must be updated additionally.

### Updating the UC Booster Server

If a UC Booster Server is being operated in addition to the communication system, then the communication software of the UC Booster Server must also be updated when updating the system software. In other words, the software of the communication system and the UC Booster Server should always be at the same level. The software update of the UC Booster Server is basically identical to the software update for the communication system; the only difference is that the administrator does not specify the IP address of the communication system when calling the WBM, but the IP address of the Linux server.

## 25.3.2.1 How to Update the System via a Web Server

### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

The availability of a new software version is indicated on the home page of WBM.

Access to the web server is available. By default, the connection to the Internet web server is set up. Instead, a local web server can also be configured. (see [Using a Local Web Server](#) ).

If the update is to be performed via a local web server, the latest image file must be stored on the local web server.

### Step by Step

1. Click in the navigation bar on **Home** and then on **Details on the contents can be obtained from here: Link**. This will open a PDF file containing important information about the new software version. Read through the information and pay attention to the information about upgrading the system. Then close the window.
2. Click on **Service Center** in the navigation bar.
3. In the navigation tree, click on **Software Update > Update via Internet**. The currently installed software version is displayed to you.
4. Click on **OK & Next**.
5. Read the license agreement (EULA) fully and then enable the radio button **I accept the license agreement**.
6. Click on **OK & Next**.

## Maintenance

| Type                   | RootFS                              | Load                | Current Version     | New Version |
|------------------------|-------------------------------------|---------------------|---------------------|-------------|
| osbiz_v3_R3.0.0_424    | <input checked="" type="checkbox"/> | osbiz_v3_R3.0.0_424 | osbiz_v3_R3.0.0_428 |             |

Estimated total download size: 1187 MB

**Software Transfer**

Start Action: ☒ Immediately

Start Action in:  Days  Hr.  Min.

Start Action on: ☐ Day  Month  Year  hh:mm

**Software Activation**

Start Action: ☒ Immediately after transfer

Start Action in:  Days  Hr.  Min.

Start Action on: ☐ Day  Month  Year  hh:mm

Local System Time: 28/03/23 13:25

7. Disable the packages that should not be updated in the **Load** column if required. This is useful with slow Internet connections, for example, or software upgrades via ISDN.
8. Select the times for the software transfer and software activation:
  - **Start Action - Immediate/Immediately after transfer:** The software will be transferred immediately and activated immediately after the transfer. The software update will be loaded into the communication system in the background. After two restarts, the software is up-to-date.
  - **Start Action in:** The software will be transferred and activated after a certain time period. Enter the time period for this in days, hours and minutes.
  - **Start Action on:** The software will be transferred and activated at a specific point in time. Enter the date and time for this point in time.

**NOTICE:** If the time of the software activation is reached before the software update has been completely transferred to the system, the activation is not executed automatically. A new time of activation must then be defined manually.

9. Click on **OK & Next**. The software update will be loaded into the system in the background and activated at the respective times you have configured. Two restarts are automatically performed one after the other for software activation.

**NOTICE:** You can close the browser window at any time.

10. You can check the current status of the update with the WBM under **Service Center > Software Update > Status**.

### 25.3.2.2 How to Update the System using a USB Storage Device

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

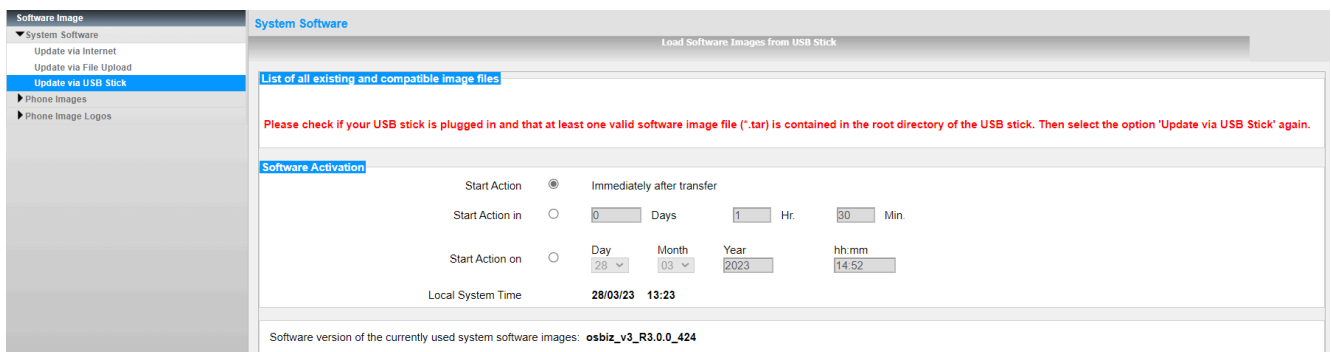

The USB storage device must be formatted with FAT32.

A current image file is stored as a tar file on the USB storage device. It is also possible to have multiple image files stored in different directories.

If the USB storage device has multiple partitions, the image file must be stored in the first partition.

### Step by Step

1. Insert the USB storage device into the USB server port on the motherboard.
2. In the navigation bar, click on **Expert Mode**.
3. Click **Maintenance > Software Image** in the navigation tree.
4. Click **System Software** in the menu tree.
5. Click on **Update via USB Stick**. All valid image files stored on the USB device are displayed with their respective version number and file name.

6. If multiple image files are stored, select the desired image file; otherwise, the image file is automatically selected.
7. Select the software activation time.
  - **Start Action - Immediately after transfer:** The software is activated immediately after it has been transferred to the communication system.
  - **Start Action in:** The software is immediately transferred to the communication system. After a specified time, the software is activated. Enter the time period for this in days, hours and minutes.
  - **Start Action on:** The software is immediately transferred to the communication system. The software is activated at a specified time. Enter the date and time for this point in time.
8. Click on **Load**. The image file is transferred to the communication system and checked for consistency. Several minutes are required for both processes. During this time, the USB device remain plugged in.
9. Unplug the USB device when instructed by the WBM and then click **Finish**. Two restarts are automatically performed one after the other at the time specified for the software activation.
10. You can check the current status of the update with the WBM under **Service Center > Software Update > Status**.

### 25.3.2.3 How to Update the System via File Upload

#### Prerequisites

The image file is stored on the internal network or directly on the Admin PC as a tar file, and the storage location is known. If a .tgz file is stored, the tar file must be extracted from the .tgz file.

#### Step by Step

1. Click on **Service Center** in the navigation bar.
2. In the navigation tree, click on **Software Update > Update via File Upload**. The currently installed software version is displayed to you.
3. Click on **OK & Next**.

The screenshot shows the Unify OpenScape Business V3 Administrator interface. The top navigation bar includes 'Home', 'Administrators', 'Setup', 'Expert mode', 'Data Backup', 'License Management', and 'Service Center'. The left sidebar shows the 'Service Center' menu with options like 'Documents', 'Software', 'Inventory', 'SW Update', 'Update via Internet', 'Update via File Upload' (highlighted), 'Status', 'E-mail Forwarding', 'Remote Access', 'Restart / Reload', and 'Diagnostics'. The main content area is titled 'Update via File Upload'. It contains a 'Remote File Name (PC File System)' field with a 'Browse...' button and the text 'No file selected.'. Below this is a checkbox labeled 'Clean up storage space before transfer' which is checked and highlighted with a red box. The 'Software Activation' section has three radio buttons: 'Start Action' (selected), 'Start Action in', and 'Start Action on'. The 'Start Action' section is expanded, showing 'Immediately after transfer' selected. Below this are input fields for 'Start Action in' (0 Days, 1 Hr, 30 Min) and 'Start Action on' (Day: 17, Month: 07, Year: 2023, hh:mm: 17:59). The 'Local System Time' is displayed as 17/07/23 16:29. At the bottom, it shows the 'Software version of the currently used system software images: osbiz\_v3\_R3.0.0\_449'.

4. Click the **Browse** button to navigate to the storage location of the image file (\*.tar).
5. The flag **Clean up storage space before transfer** is enabled by default. The following actions are triggered, to free storage memory in preparation of the software file upload.
  - All logs and traces are deleted.
  - All phone software images are deleted.
  - Any TCP dumps are deleted.
6. Select the software activation time.
  - **Start Action - Immediately after transfer:** The software is immediately transferred to the communications system in the background. After two restarts, the software is up-to-date.
  - **Start Action in:** The software is immediately transferred to the communications system in the background. After a specified time, the software is activated. Enter the time period for this in days, hours and minutes.
  - **Start Action on:** The software is immediately transferred to the communications system in the background. The software is

activated at a specified time. Enter the date and time for this point in time.

7. Click on **OK & Next**.
8. The image file is transferred to the communication system and checked for consistency. Several minutes are required for both processes.

---

**NOTICE:** If you close the browser window during the software transfer, the operation is canceled. During the consistency checks, you can continue working with the WBM or close it.

---

9. If the software is to be activated immediately, two consecutive restarts automatically occur after the consistency check has been completed successfully.
10. If the software is not to be activated immediately, click **Stop** after the successful transfer. Two restarts are automatically performed one after the other for software activation.
11. You can check the current status of the update with the WBM under **Service Center > Software Update > Status**.

#### 25.3.2.4 How to Update the System via a USB Device without WBM Access

##### Prerequisites

The USB storage device must be formatted with FAT32.

A current image file is stored as a tar file at the topmost directory level of the USB storage device. Only one image file may be stored there.

If the USB storage device has multiple partitions, the image file must be stored in the first partition.

The software version of the image file must be newer than the software version of the system. Caution: It is also possible to "update" to older versions of the software.

The communication system has been started.

##### Step by Step

1. Insert the USB storage device into the USB server port on the motherboard.
2. Press the reset button for 1 to 4 seconds. The system shuts down and initiates a restart.

During startup, the software is checked. If the USB device contains a suitable image file, the file is uploaded to the communication system. The red LED will flash at 1Hz (0.5 sec on / 0.5 sec off). Upon completion of the copy operation, the software is unpacked, and the customer data is automatically transferred. During this process, the red LED flashes in at 5Hz (100ms on / 100ms off).

3. Remove the USB device when the red LED flashes at 5Hz.

4. Finally, the system automatically performs two restarts in succession. When the green LED flashes at 1-Hz intervals (0.5 s on / 0.5 s off), the system is back in operation.

### 25.3.3 Updating System Telephones

The software of the system telephones is updated via an image file. For each type of system telephone, there is a separate image file that contains the phone software of this type. These image files are included in the software of the communication system and are automatically loaded into the communication system during updates.

The IP system telephones are thus automatically supplied with the current software. Whenever an IP system telephone is reconfigured in the WBM (from a **System Client** to a **SIP Client**, or vice versa), the appropriate software stored in the communication system is automatically loaded via the DLI into the IP system telephone. For IP system telephones that were already in operation at the system or at some other system, the factory settings must be first restored (factory reset) before the automatic software update can be performed.

Non-standard phone software can be transferred manually by the administrator to all IP system telephones of a specific type by using the WBM. The update of the software for UP0 system telephones is performed with Manager E.

If some specific phone software (image file) is flagged as the default in the WBM, the corresponding image will be automatically transferred to every IP system telephone associated with this type whenever that phone logs into the system for the first time.

When updating the software manually, it is important to ensure that the software of the system telephones is compatible with the software version of the communication system (see the Release Notes).

---

#### Related concepts

[Telephone Logos](#) on page 1201

#### 25.3.3.1 How to Load the Phone Software into the System

##### Prerequisites

You are logged into the WBM with the **Expert** profile.

The image files are stored on the local network, and the storage location is known. A separate image file is required for each system telephone type.

##### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance > Software Image** in the navigation tree.
3. Click **Phone Images** in the menu tree.

4. Click **Load**. A list of all currently existing image files in the communication system is displayed.
5. Click the **Browse** button under **Remote File Name (PC File System)** to navigate to the storage location of the image file (\*.app).
6. Click on **Load**. The image file is loaded and checked for errors.

---

**NOTICE:** If an error occurs, you will receive an error message. Verify your entries and repeat steps 5 through 6.

---

7. If the check succeeds, confirm this with **OK**. The image file is added to the list of currently existing update files in the communication system.
8. To load additional image files for other system telephone types, repeat steps 5 through 7.

### 25.3.3.2 How to Deploy the Phone Software to System Telephones

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance > Software Image** in the navigation tree.
3. Click **Phone Images** in the menu tree.
4. If you want to deploy a phone image to all system telephones of a specific type:
  - a) Click **Deploy**. A list of all currently existing image files in the communication system is displayed.
  - b) Select the check box **Deploy** for the desired phone image or images.
5. If you want to deploy a phone image to a particular system telephone:
  - a) Click on **Deploy to device**. A list of the system telephones is displayed.
  - b) Select the phone image for the desired system telephone or telephones from the **Deployable software** drop-down list.
6. Click on **Apply**.

### 25.3.3.3 How to Delete the Phone Software

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance > Software Image** in the navigation tree.

3. Click **Phone Images** in the menu tree.
4. Click **Load**. A list of all currently existing image files in the communication system is displayed.
5. Select the check box **Delete** in the row of the phone image to be deleted.
6. If you want to delete more phone images, repeat the previous step.
7. Click on **Delete**. All marked phone images will be deleted from the communication system.

### 25.3.3.4 How to Enable or Disable the Automatic Distribution of the Phone Software

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance** > **Software Image** in the navigation tree.
3. Click **Phone Images** in the menu tree.
4. Click **Deploy**. A list of all currently existing image files in the communication system is displayed.
5. If the phone software should be automatically transferred to the system phones, select the **Standard** checkbox in the row of the desired image file (default setting).
6. If the phone software should not be automatically transferred to the system phones, clear the **Standard** checkbox in the row of the desired image file.
7. Click on **Apply**.

### 25.3.3.5 How to Configure Automatic Re-flashing

Automatic re-flashing is an easy way to flash HFA software only for out of the box or factory reset OpenScape Desk Phone IP 35G Eco and OpenScape Desk Phone CP 100/110/200/205/210/400/600/600E/700/700X/710, using the system's DLI server.

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

---

**NOTICE:** Automatic re-flashing is valid only for out of the box devices (from the factory). Else, the factory settings must be restored on the device ("factory reset") before proceeding to automatic re-flashing.

---

**Step by Step**

1. Configure the device with a number and as system client:
  - a) In the navigation bar, click on **Expert Mode**.
  - b) In the navigation tree, click **Telephony Server> Station> IP Clients**.
  - c) Enter the internal number in the **Callno** field.
  - d) Enter the public number in the **DID** field.
  - e) Enter a name for the device.
  - f) Select **System Client** from the **Type** drop down menu.
  - g) Click **Apply**.
2. Set up the DHCP server to send the IP address of the DLI via the DHCP option:
  - a) In the navigation bar, click on **Expert Mode**.
  - b) In the navigation tree, click **Telephony Server> Network Interfaces> DHCP> DHCP-Server> Edit Global Parameters**.
  - c) Check the **Use Internal DLI** option at the **DNS Server** section.
3. Plug in the device and specify the terminal number once the phone is started.
4. The phone is also registered to the DLI database. To verify the device registration:
  - a) Click on **Expert Mode** in the navigation bar.
  - b) Click **Maintenance> Software Image** in the navigation tree.
  - c) Click **Phone Images** in the menu tree.
  - d) Click on **Deploy to Device**.
5. Automatic re-flashing starts and loads the HFA software stored in the communication system to the device.

---

**NOTICE:** Do not unplug the device during this process.

---

The device is now configured.

---

**NOTICE:** If the device is set to SIP (under **Telephony Server> Station> IP Clients**), it will update to the latest SIP software, only if the update is available in the corresponding software release.

When a SIP Client is changed to System Client, a manual restart of the phone is needed in order to load the HFA software.

---

---

**NOTICE:** If the re-flashing process is unsuccessful, the factory settings must be restored ("factory reset") on the device.

---

### 25.3.4 Software Status

The software status provides information about the software version and the software update.

The following statuses can be displayed:

- Current version of the software
- Newer version available for an update
- Time at which the software update is to be performed
- New software being loaded into the system
- Successful or failure of the loading process

#### 25.3.4.1 How to Check the Software Status

##### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

##### Step by Step

1. Click on **Service Center** in the navigation bar.
2. Click **Software Update > Status** in the navigation tree. You will be presented with the latest version of the software. This information is also displayed on the home page of WBM.

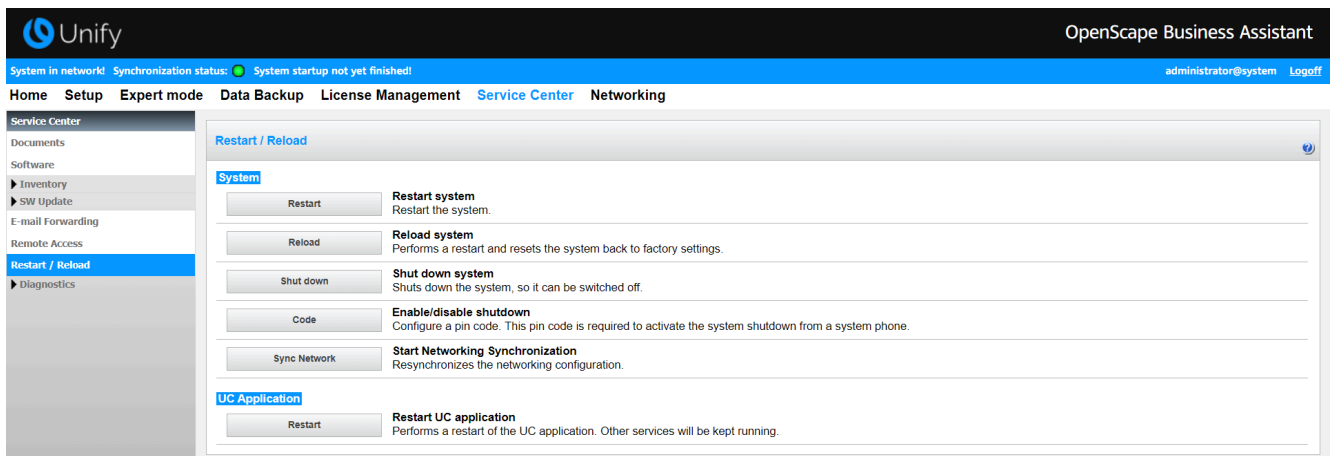

If a software update is running in the background, you will be notified about this here.

If a new software update is available on the web server, you will be likewise notified about this here. This information is also displayed on the home page of WBM.

### 25.4 Restart, Reload, Shutdown

You can use the associated features to initiate a restart or reload of the OpenScape Business communication systems or the UC Booster Card and for a controlled shutdown of OpenScape Business X. In addition, a restart (reboot) of the UC application (UC Smart or UC Suite) is triggered. To enable the controlled shutdown of OpenScape Business X via a system telephone, a PIN can be defined.

### Restarting and Reloading the UC Booster Server

If a UC Booster Server is being operated in addition to the communication system, the communication software of the UC Booster Server can also be restarted or reloaded. The restart/reload of the UC Booster Server is basically identical to the restart/reload of the communication system; the only difference is that the administrator does not specify the IP address of the communication system when calling the WBM, but the IP address of the Linux server.

---

**NOTICE:** See also [How to Delete Unify Phone Users](#) on page 1175.

---

## 25.4.1 Restarting OpenScope Business

The **Restart system** function can be used to initiate a controlled restart of OpenScope Business.

The following differences must be observed:

- OpenScope Business S and OpenScope Business X  
A controlled restart of the communication system occurs. The communication system will be operational again after the startup.  
The startup time depends on system configuration and the OpenScope Business networking scenario.
- OpenScope Business UC Booster Server (Application Server)  
If OpenScope Business X3/X5/X8 is equipped with a UC Booster Card (Application Board OCAB), a controlled restart (reboot) of the UC Application (UC Smart or UC Suite) also occurs.
- OpenScope Business UC Booster Server (Application Server)  
A controlled restart of the OpenScope Business portion and the UC Application (UC Suite) occurs. The UC Application will be operational again after the startup.

During a restart, all active applications such as myPortal for Desktop and myPortal for Outlook, for example, are disconnected. After the startup, all connections are automatically set up again.

### 25.4.1.1 How to Initiate a Restart of OpenScape Business

The **Restart system** function can be used to initiate a restart of OpenScape Business.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

---

**INFO:** During a restart, all active applications such as myPortal for Desktop and myPortal for Outlook, for example, are disconnected. After the startup, all connections are automatically set up again.

---

#### Step by Step

1. Click on **Service Center** in the navigation bar.
2. Click **Restart / Reload** in the navigation tree.
3. Click on **Restart system** followed by **OK**. OpenScape Business performs a restart (reboot).

OpenScape Business S and OpenScape Business X: The communication system will be operational again after the startup.

OpenScape Business UC Booster Server: After the startup, the UC Application (UC Suite) will be operational again.

### 25.4.2 Reloading OpenScape Business

The **Reload system** function can be used to initiate a reload of OpenScape Business.

The following differences must be observed:

- OpenScape Business S and OpenScape Business X  
The communication system is reloaded. After the subsequent startup, the communication system will be in its default state.
  - All country and customer-specific settings were deleted (system country code = Germany).
  - The communication system has the default IP address 192.168.1.2 and the internal IP range 192.168.3.xxx.
  - The licensing is retained.The startup time depends on system configuration.
- OpenScape Business UC Booster Server  
The OpenScape Business portion is reloaded. After the subsequent startup, the OpenScape Business portion will be in its default state.
  - All custom (i.e., customer-specific) settings of the OpenScape Business portion (e.g., the User Directory) were deleted.
  - The licensing is retained.The operating system will not be reset.

### 25.4.2.1 How to Initiate a Reload of OpenScape Business

The **Reload system** function can be used to initiate a reload of OpenScape Business.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

OpenScape Business S and OpenScape Business X: The configuration data of the communication system was saved in a backup set.

---

#### NOTICE:

The reload reverts the communication system to its default state. All country and customer-specific settings are deleted (system country code = Germany). The default IP address (192.168.1.2) of the communication system is reset.

---

OpenScape Business UC Booster Server: The configuration data of the OpenScape Business portion was saved in a backup set.

---

#### NOTICE:

The reload reverts the OpenScape Business portion to its default state. All custom (i.e., customer-specific) settings of the OpenScape Business portion (e.g., the User Directory) are deleted.

---

#### Step by Step

1. Click on **Service Center** in the navigation bar.
2. Click **Restart / Reload** in the navigation tree.
3. Click on **Reload system**, followed by **OK**. OpenScape Business reloads.

---

**INFO:** OpenScape Business S and OpenScape Business X: After the subsequent startup, the communication system will be in its default state. After the basic settings have been configured using the **Initial Installation** wizard, country- and customer-specific data backups can be reloaded. For more detailed information on the procedure, see [Restore](#) .

OpenScape Business UC Booster Server: After the subsequent startup, the OpenScape Business portion will be in its default state. The backed-up customer-specific data can be reloaded. For more detailed information on the procedure, see [Restore](#) .

---

## 25.4.3 Shutting Down OpenScape Business X

The **Shut down system** function can be used to shut down the OpenScape Business X communication systems gracefully, i.e., to perform a controlled shutdown.

### 25.4.3.1 How to Shut Down OpenScape Business X

The **Shut down system** function can be used to shut down OpenScape Business X communication systems gracefully, i.e., to perform a controlled shutdown.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. Click on **Service Center** in the navigation bar.
2. Click **Restart / Reload** in the navigation tree.
3. Click on **Shut down system** followed by **OK**. A controlled shutdown of the communication system is performed.

---

**INFO:** OpenScape Business X1/X3/X5: The subsequent startup of the communication system is only possible by unplugging and then reinserting the power plug.

OpenScape Business X8: the subsequent startup of the communication system is only possible by switching off all LUNA2 power supplies and then switching them back on again.

---

## 25.4.4 PIN for the controlled shutdown of OpenScape Business X

The activation of the shutdown via a system telephone is PIN-protected.

The PIN configured in the communication system must be entered for the activation via a system telephone. The configuration of this PIN is performed by an administrator with the **Advanced** profile.

### 25.4.4.1 How to Configure a PIN for the Controlled Shutdown of OpenScape Business X

The PIN is for initiating a shutdown via a system telephone.

**Prerequisites**

You are logged on to the WBM with the **Advanced** profile.

**Step by Step**

1. Click on **Service Center** in the navigation bar.
2. Click **Restart / Reload** in the navigation tree.
3. Click on **Enable/disable shutdown**.
4. Enter the desired six-digit PIN in the **PIN** field.
5. Click on **Save** followed by **OK**.

**Next steps**

The activation of a shutdown via a system telephone occurs by entering the corresponding code (default code = \*997), followed by the six-digit PIN.

- For IP phones: you can execute the controlled shutdown from the first two configured devices.
- For UP0 phones: you can execute the controlled shutdown from each of these phones. In this case, the IP clients do not have rights to execute a shutdown.

## 25.4.5 Restarting (Rebooting) the UC Booster Card (Application Board OCAB)

As an administrator, you can use the **Restart Application Board** function to initiate a controlled restart of the Application Board OCAB, including the UC application (UC Smart or UC Suite).

During a restart, all active applications such as myPortal for Desktop and myPortal for Outlook, for example, are disconnected. After the startup, all connections are automatically set up again.

In addition, the CSTA interface, the Presence Manager, Announcement Player, Media Extension Bridge and Open Directory Service are likewise restarted.

### 25.4.5.1 How to Initiate a Restart of the UC Booster Card (OCAB Application Board)

The **Restart Application Board** function can be used to initiate a controlled restart of the Application Board OCAB, including the UC application (UC Smart or UC Suite).

**Prerequisites**

You are logged on to the WBM with the **Advanced** profile.

---

**INFO:** During a restart, all active applications such as myPortal for Desktop and myPortal for Outlook,

for example, are disconnected. After the startup, all connections are automatically set up again.

---

### Step by Step

1. Click on **Service Center** in the navigation bar.
2. Click **Restart / Reload** in the navigation tree.
3. Click on **Restart Application Board** followed by **OK**. The UC Booster Card (Application Board OCAB) performs a restart.

## 25.4.6 Reloading the UC Booster Card (Application Board OCAB)

The **Reload UC Booster Card** function can be used to initiate a reload of the Application Board OCAB, including the UC application (UC Smart or UC Suite).

The Reload UC Booster Card function is used to reset the card to the factory settings and then remove it from the system. This may be necessary if the card is no longer to be used in this system due to a switch to the UC Booster Server or if it is to be installed in another OpenScape Business system.

All customer-specific data and all diagnostic data are deleted from the UC Booster Card, and the system shuts down. Then, the system must be unplugged from the power supply, and the UC Booster Card must be removed.

After the UC Booster Card has been removed and the system is rebooted, a new backup set must be created, since the configuration data has changed and the old backup set is no longer compatible. If the hard disk of the UC Booster Card was previously used as a backup medium, then another backup medium such as a network drive, a USB device or an FTP/FTPS server must be now selected (see also the [Backup and Restore](#)).

### 25.4.6.1 How to Initiate a Reload of the UC Booster Card (OCAB Application Board)

The **UC Booster Card Reload** function can be used to initiate a reload of the Application Board OCAB, including the UC application (UC Smart or UC Suite).

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. Click on **Service Center** in the navigation bar.
2. Click **Restart / Reload** in the navigation tree.

3. Click on **UC Booster Card Reload**, followed by **OK**. You are logged out of the WBM. The card is reset to the factory settings, and the system then shuts down.
4. Once the Green RUN LED of the mainboard and the controller LEDs of the UC Booster Card are completely turned off, unplug the system from the power supply and remove the UC Booster Card (see the [Backup and Restore](#)).

## 25.4.7 Restarting the UC Application

The **Restart UC Application** function can be used by an administrator to initiate a controlled restart of the UC Application (UC Smart or UC Suite).

During a restart of the UC Application, all active applications such as myPortal for Desktop and myAttendant, for example, are disconnected. After the startup, all connections are automatically set up again.

### 25.4.7.1 How to Initiate a Restart of the UC Application

The **Restart UC Application** function can be used to initiate a restart of the UC Application (UC Smart or UC Suite).

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

---

**INFO:** During a restart, all active applications such as myPortal for Desktop and myAttendant, for example, are disconnected. After the startup, all connections are automatically set up again.

---

#### Step by Step

1. Click on **Service Center** in the navigation bar.
2. Click **Restart / Reload** in the navigation tree.
3. Click on **Restart UC Application** followed by **OK**. The UC Application performs a restart.

## 25.5 Inventory Management

The term Inventory Management refers to the process for determining the current status of the OpenScape Business X and OpenScape Business S communication systems and the hardware configuration of the OpenScape Business X communication system.

### 25.5.1 System Status

The current status of the OpenScape Business X and OpenScape Business S communication systems can be determined by an administrator via the WBM. The following information can be retrieved: status of the stations, connection setup, ITSPs, VPNs and the list of configured IP addresses.

#### Station status

The station status enables the following information on the configured stations to be retrieved:

- Station number
- Name
- Device type
- IP address (for system telephones, an additional link through which the WBM of the phone can be opened is displayed.)
- MAC Address
- Current SW version
- HW version
- Status (On/Off)

#### Dial-up Network Status

The dial-up network status enables information on existing connections to PSTN partners (i.e., Public Switched Telephone Network partners such as public or home telecommunications networks, for example) of the OpenScape Business X communication system to be retrieved.

#### ITSP Status

The ITSP status enables information on the current status of preconfigured and any possibly added Internet Telephony Service Providers (ITSPs) to be retrieved. In addition, it shows which stations were set up for which ITSP.

The status of each active ITSP is indicated by the color of the associated rectangle (green = OK, orange = at least one of the stations was not properly configured).

#### VPN Status

The VPN status enables information on the configured VPN tunnels of the OpenScape Business X communication system to be retrieved:

#### Overview of IP Addresses

The IP addresses configured in the OpenScape Business X communication system are displayed.

In addition, the overview also shows with which wizards and with which menus in Expert mode the IP addresses can be configured.

Also, a status overview of the Booster Card and the Mainboard Ethernet Interfaces is displayed.

### 25.5.1.1 How to Check the Station Status

The **Status** wizard can be used to determine the current status of all configured stations.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. Click on **Service Center** in the navigation bar.
2. Click **Diagnostics > Status** in the navigation tree.
3. Click on the **Station Status** tab. The status of all configured stations is displayed.

| Service Center - Diagnostics - Status |                  |                                      |             |             |                        |            |          |
|---------------------------------------|------------------|--------------------------------------|-------------|-------------|------------------------|------------|----------|
| Station Status                        |                  |                                      | ITSP Status |             | BLF Status             |            | Status   |
| CallNo                                | Display          | Device Type                          | IP Address  | MAC Address | Current SW Version     | HW Version |          |
| 600                                   | netw_0, s600     | optiPoint 410 Advance                | -           | -           | V6. R..0               | -          | Disabled |
| 601                                   | netw_1, s601     | optiPoint 410 Advance                | -           | -           | V6. R..0               | -          | Disabled |
| **602                                 | netw_2, s602     | optiPoint 410 Advance                | -           | -           | V6. R..0               | -          | Disabled |
| 603                                   | netw_3, voip_603 | OpenStage 40 (myPortal @work)        | -           | -           | V3R4.16 myPortal @work | -          | Disabled |
| 604                                   | netw_4, voip_604 | OpenStage 40                         | -           | -           | VV.3R0.18              | -          | Disabled |
| 605                                   | voip_5, s605     | optiPoint 410 Advance                | -           | -           | V6. R..0               | -          | Disabled |
| 606                                   | netw_6, voip_606 | OpenStage 40                         | -           | -           | VV.3R0.18              | -          | Disabled |
| 607                                   | netw_7, voip_607 | OpenStage 40 (myPortal @work)        | -           | -           | V3R4.8 myPortal @work  | -          | Disabled |
| 610                                   | WebRTC, justle   | OpenStage 40 (myPortal @work)        | -           | -           | V3R1.8 myPortal @work  | -          | Disabled |
| 611                                   | Sip, justle      | SIP Extension                        | -           | -           | -                      | -          | Disabled |
| 620                                   | netw_20, s620    | OpenScape Desk Phone CP 200/200T/205 | -           | -           | -                      | -          | Disabled |

4. Click on **Finish**.

### 25.5.1.2 How to Check the Status of the Connection Setup

The **Status** wizard can be used to determine the current status of the PSTN peers of an OpenScape Business X system.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. Click on **Service Center** in the navigation bar.
2. Click **Diagnostics > Status** in the navigation tree.
3. Click on the **Dialup Network Status** tab. The list of PSTN peers is displayed.
4. Click in the row of the desired connection (PSTN peer) on **Display**. The current status of this connection (PSTN peers) is displayed.

| Service Center - Diagnostics - Status |                                        |             |                          |            |
|---------------------------------------|----------------------------------------|-------------|--------------------------|------------|
| Station Status                        | Dialog Network Status                  | ITSP Status | Overview of IP Addresses | BLF Status |
| List of PSTN Peer                     |                                        |             |                          |            |
| Status                                | Name of the dialup network (PSTN peer) |             |                          |            |
| Display                               | cls                                    |             |                          |            |
| Display                               | remote ISDN                            |             |                          |            |

5. If you want to retrieve the status information of a further connection (PSTN peer), continue as described under Step 3.
6. Click on **OK** followed by **Finish**.

### 25.5.1.3 How to Check the ITSP Status

The **Status** wizard can be used to determine the current status of the Internet Telephony Service Provider (ITSP).

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. Click on **Service Center** in the navigation bar.
2. Click **Diagnostics** > **Status** in the navigation tree.
3. Click on the **ITSP Status** tab. The current status of the preconfigured and any possibly added Internet Telephony Service Providers (ITSPs) in active status is displayed.
4. Click on **Diagnose** to get additional information about the SIP connection.
5. Click on **Finish**.

### 25.5.1.4 How to Display IP Addresses

The **Status** wizard can be used to obtain an overview of the IP addresses configured in an OpenScape Business X communication system. In addition, the overview also shows with which wizards and with which menus in Expert mode the IP addresses can be configured.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. Click on **Service Center** in the navigation bar.
2. Click **Diagnostics** > **Status** in the navigation tree.
3. Click on the **Overview IP Addresses** tab. An overview of the IP addresses configured in the communication system is displayed.

| Service Center - Diagnostics - Status |                                                                                                                                      |             |                          |  |             |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|-------------|--------------------------|--|-------------|
| Station Status                        | Dialog Network Status                                                                                                                | ITSP Status | Overview of IP Addresses |  | BLF Status  |
|                                       |                                                                                                                                      |             |                          |  |             |
| IP Address                            | Configured entry/WBM site                                                                                                            |             |                          |  | Entry       |
| 192.168.186.13                        | LAN Interface Address ('Expert mode' -> 'Network Interfaces' -> 'LAN' or 'Wizard' -> 'Basic Installation' -> 'Initial Installation') |             |                          |  |             |
| 192.168.2.1                           | Admin Interface Address ('Expert mode' -> 'Network Interfaces' -> 'Admin')                                                           |             |                          |  |             |
| 192.168.186.22                        | DNS Server ('Expert mode' -> 'Routing' -> 'IP Routing' or 'Wizard' -> 'Network Configuration')                                       |             |                          |  |             |
| 0.0.0.0                               | DNS Server ('Expert mode' -> 'Routing' -> 'IP Routing' or 'Wizard' -> 'Network Configuration')                                       |             |                          |  |             |

| Mainboard LAN 1 (WAN)                 |                                                                                                                                      |             |                          |  | ?           |
| Mainboard LAN 2                       |                                                                                                                                      |             |                          |  | ?           |
| Mainboard LAN 3 (Admin)               |                                                                                                                                      |             |                          |  | ?           |

4. Click on **Finish**.

## 25.5.2 Inventory

The Inventory enables an administrator to retrieve information on the hardware and software of OpenScope Business X and the software of OpenScope Business S.

### OpenScope Business X

The following details can be retrieved:

- Communication system

Among other things, the following information is displayed:

- Graphical representation of the communication system and the boards
- Part number of the mainboard, MAC address, IP address, host name and software version
- Details on memory amounts, including the available and used space on the SDHC card.
- Status of all applications

- Boards

The displayed information includes the following: slot, type, part number and status of all installed boards.

- UC Booster Card (Application Board OCAB), if available

Among other things, the following information is displayed:

- MAC address, IP address, host name and software version
- Details on memory amounts, including the available and used hard disk space.
- Status of all applications
- Overview of all Booster Card interfaces

The link **UC Booster Card accessible** in the home page of WBM directs the user to the **Service Center > Inventory > Booster Card** for a detailed view. The link will exist, even if there is a problem with the Booster Card and the text shows **UC Booster Card not accessible**.

The following error messages are displayed in the home page of WBM, depending on the error:

- 1) Inter-Integrated Circuit link with Booster Card not possible
- 2) Internet Protocol v6 connectivity to Booster Card not possible
- 3) Internet Protocol v4 connectivity to Booster Card not possible
- 4) Secure Socket Shell connectivity to Booster Card not possible
- 5) Network File System connectivity to Booster Card not possible
- 6) One or more Ethernet Interfaces are in Half Duplex mode, Full Duplex is highly recommended

### OpenScape Business S

The following details can be retrieved:

- Software  
Among other things, the following information is displayed: MAC address, IP address, host name and software version.
- Hard Disk Information  
Details on memory amounts, including the available and used memory.
- Applications  
All applications and their respective statuses are displayed.

### 25.5.2.1 How to Check the Inventory of OpenScape Business X

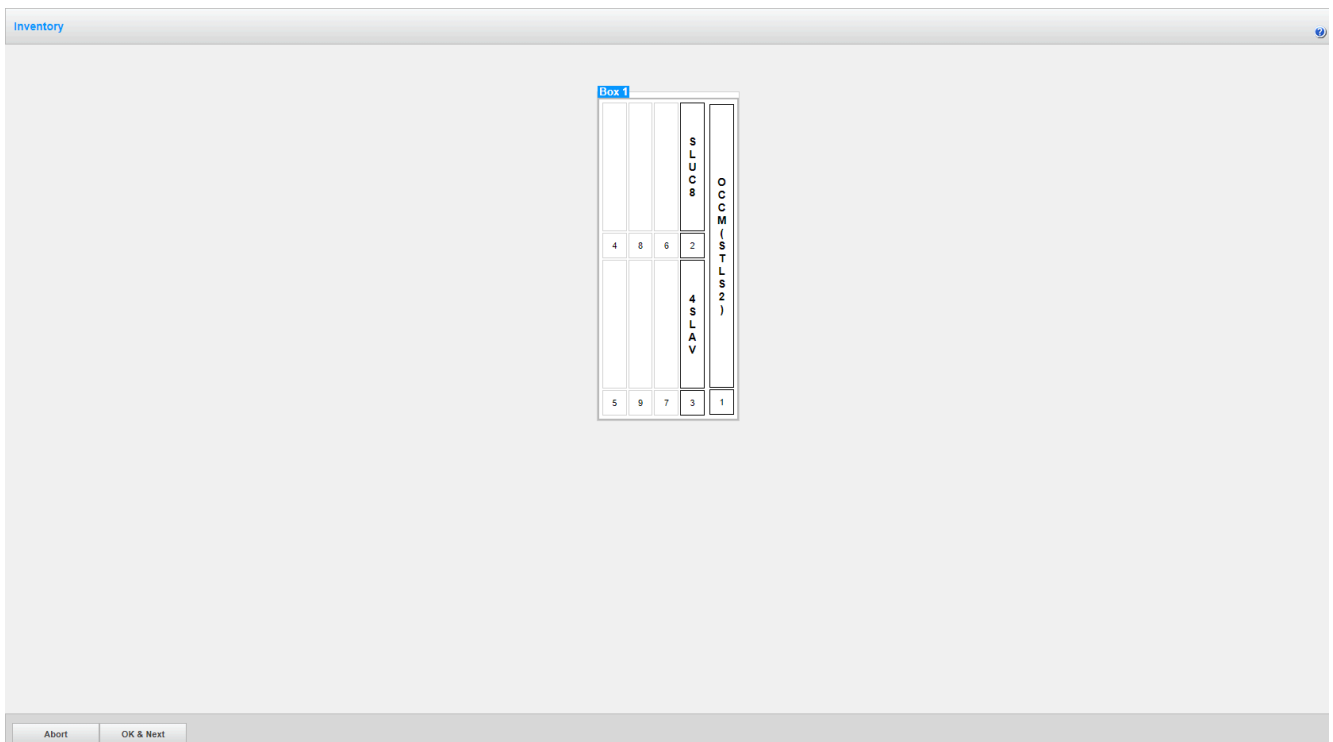

The **Inventory** wizard can be used to determine the current status of the hardware and software of the OpenScape Business X communication systems.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. Click on **Service Center** in the navigation bar.
2. In the navigation tree, click **Inventory > Overview**. You will be shown a graphical representation of the communication system and the boards.

3. Click on **OK & Next**. Information on the communication system, the available and used space on the SDHC card, the boards and the application status will be displayed.

**System**

Type: OSBiz XSW with OCPSPM  
 Mainboard Part No: S30810-Q2959-X-3  
 MAC Address: eth2-  
 MACID for license: eth0-  
 IP Address: eth2-  
 DSP IP Address: 192.168.3.2  
 Host Name: OCSME  
 Software Build Version: osbiz\_v3\_R3.0.0\_424

**SD Information**

| Total Bytes      | Available Bytes  | Used Bytes       | Use Percentage (%) |
|------------------|------------------|------------------|--------------------|
| 7 GB, 7688408 KB | 3 GB, 4027628 KB | 3 GB, 3266896 KB | 45 %               |

**Slot Modules**

| Slot No. | Card Type   | Part No.                        | Interface - Ports | Status |
|----------|-------------|---------------------------------|-------------------|--------|
| 1        | OCCM(STLS2) | S30810-Q2959-X-3                | S0                | Active |
| 2        | SLUC8       | Slot is integrated in mainboard | UP0               | Active |
| 3        | 4SLAV       | Slot is integrated in mainboard | alt               | Active |
| 11       | EVM         | Slot is integrated in mainboard | EVM               | Active |

**Sub Modules**

| Module Type | Part No. |
|-------------|----------|
|-------------|----------|

**Applications**

| Application Name     | Status   |
|----------------------|----------|
| Feature Process      | Active   |
| LDH                  | Active   |
| Admin Framework      | Active   |
| Application Database | Active   |
| License Agent        | Active   |
| Web Services         | Active   |
| Postfix              | Inactive |
| Backup/Restore       | Active   |
| OpenScope Observer   | Active   |
| Announcement-Player  | ?        |
| RSPservicesink       | Inactive |

4. Click on **OK & Next**. The subsequently displayed information depends on whether or not the communication system is equipped with a UC Booster Card (Application Board OCAB):

- a) If your communication system is not equipped with a UC Booster Card: Information on the assignment of call numbers to the boards is displayed.
- b) If your communication system is equipped with a UC Booster Card: Information on the OCAB Board, on the available and used storage space on the hard drive and on the application status and on the status of the Booster Card interfaces is displayed.

Click on **OK & Next**. Details on the allocation of call numbers to the boards will be displayed.

5. Click on **Finish**.

### 25.5.2.2 How to Check the Inventory of OpenScape Business S

You can check the current status of the OpenScape Business S software with the **Inventory** wizard.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

- 1. Click on **Service Center** in the navigation bar.
- 2. In the navigation tree, click **Inventory**. Information on the software of the communication system, the available and used hard disk storage and on the application status will be displayed.

## 25.6 Automatic Actions

This function can be used to define actions to be executed once or at regular intervals. These actions are then executed automatically by the communication system at the set time.

### 25.6.1 Garbage Collection Automatic Action

The automatic action Garbage Collection enables an automatic garbage collection to be performed on the communication system. After each garbage collection has been completed, the communication system performs a restart (reboot).

The color of the list item displayed in the menu tree indicates the status of the action (green = action activated, red = action not activated).

**Start/Stop Action** can be used to enable or start an inactive action (red list item) and to disable or stop an active action (green bullet point).

The automatic action Garbage Collection is disabled by default.

### 25.6.1.1 How to Edit the Garbage Collection Action

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance > Actions** in the navigation tree.
3. Click on **Actions > Automatic Actions > Garbage Collection** in the menu tree.
4. Click on the **Edit Action** tab.

Expert mode - Maintenance

Actions

- Manual Actions
- Automatic Actions
- Garbage Collection**
- DLS Notification

Automatic Actions

Edit Action

Start/Stop Action

Action: Garbage Collection

Action Activated: ☐

Start Time (after Midnight): 3 Hours 00 Mins.

Days on which to perform action:

- ☒ Mon
- ☒ Tue
- ☒ Wed
- ☒ Thu
- ☒ Fri
- ☒ Sat
- ☒ Sun

Apply Undo Help

5. Select the desired setting.
  - If you want the Garbage Collection action to be performed, select the **Action Activated** check box.
  - If you do not want the Garbage Collection action to be performed, clear the **Action Activated** check box.
6. If appropriate, change the **Start Time (after Midnight)**.  
 Enter the number of hours in the **Hrs** field and the number of minutes in the **Mins** field to indicate the interval after which the action should be executed.  
 Example: Let us assume that the values entered in the **Hrs** field was 3 and in the **Mins** field was 30. This means the garbage collection action will be performed at 3:30 a.m. every morning.
7. If required, change the weekdays via **Days on which to Perform Action**.  
 Enable the check boxes of the weekdays on which the action is to be performed. Clear the check boxes of the weekdays on which the action is not to be performed.
8. Click on **Apply** followed by **OK**.

### 25.6.1.2 How to Start the Garbage Collection Automatic Action (Activate)

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance** > **Actions** in the navigation tree.
3. Click on **Actions** > **Automatic Actions** in the menu tree. The names of all automatic actions are displayed in the menu tree. Disabled actions are flagged with a red bullet point. Enabled actions are flagged with a green bullet point.
4. Click **Garbage Collection** in the menu tree.
5. Click on the **Start/Stop Action** tab.
6. Click on **Start** followed by **OK**.

### 25.6.1.3 How to Stop the Garbage Collection Automatic Action (Deactivate)

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance** > **Actions** in the navigation tree.
3. Click on **Actions** > **Automatic Actions** in the menu tree. The names of all automatic actions are displayed in the menu tree. Disabled actions are flagged with a red bullet point. Enabled actions are flagged with a green bullet point.
4. Click **Garbage Collection** in the menu tree.
5. Click on the **Start/Stop Action** tab.
6. Click on **Stop** followed by **OK**.

## 25.6.2 DLS Notification Automatic Action

The automatic action DLS Notification can be used to initiate an automatic login at an external DLS server on starting up the communication system.

The color of the list item displayed in the menu tree indicates the status of the action (green = action activated, red = action not activated).

**Start/Stop Action** can be used to enable or start an inactive action (red list item) and to disable or stop an active action (green bullet point).

The automatic action DLS Notification is disabled by default.

### 25.6.2.1 How to Edit the DLS Notification Automatic Action

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance > Actions** in the navigation tree.
3. Click in the menu tree on **Actions > Automatic Actions > DLS Notification**.
4. Click on the **Edit Action** tab.

The screenshot shows the 'Expert mode - Maintenance' window. On the left, the 'Actions' menu is expanded, showing 'Manual Actions', 'Automatic Actions', 'Garbage Collection', and 'DLS Notification' (selected). The main window has a tabbed interface with 'Automatic Actions' selected. Under 'Automatic Actions', the 'Edit Action' tab is active for the 'DLS Notification' action. The configuration details are as follows:

- Action: DLS Notification
- Execution of Action: At startup
- Action Activated: ☐
- IP Address:
- Port:
- Username:
- Password:

At the bottom of the window, there are three buttons: 'Apply', 'Undo', and 'Help'.

5. Select the desired setting.
  - If you want the DLS Notification action to be performed, select the **Action Activated** check box.
  - If you do not want the DLS Notification action to be performed, clear the **Action Activated** check box.
6. If appropriate, change the IP address of the external DLS server in the **IP Address** field.
7. If appropriate, change the port of the external DLS server in the **Port** field.
8. If appropriate, change the user name for logging on to the external DLS server in the **User name** field.
9. If appropriate, change the password for logging on to the external DLS server in the **Password** field.
10. Click on **Apply** followed by **OK**.

### 25.6.2.2 How to Start the DLS Notification Automatic Action (Activate)

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance** > **Actions** in the navigation tree.
3. Click on **Actions** > **Automatic Actions** in the menu tree. The names of all automatic actions are displayed in the menu tree. Disabled actions are flagged with a red bullet point. Enabled actions are flagged with a green bullet point.
4. Click **DLS Notification** in the menu tree.
5. Click on the **Start/Stop Action** tab.
6. Click on **Start** followed by **OK**.

### 25.6.2.3 How to Stop the DLS Notification Automatic Action (Deactivate)

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance** > **Actions** in the navigation tree.
3. Click on **Actions** > **Automatic Actions** in the menu tree. The names of all automatic actions are displayed in the menu tree. Disabled actions are flagged with a red bullet point. Enabled actions are flagged with a green bullet point.
4. Click **DLS Notification** in the menu tree.
5. Click on the **Start/Stop Action** tab.
6. Click on **Stop** followed by **OK**.

## 25.6.3 Warning Mechanism for SDHC card lifetime

The automatic action Warning Mechanism for SDHC lifetime is a way to get information about the SDHC cards health state with a filesystem check during startup. A WBM wizard starts and leads the technician through the process of setting a time when the system should make a restart and execute the check.

---

**NOTICE:** In case that no filesystem errors are found by the check, **Card Health Status** will be set back to green or yellow even if errors were reported before.

---

All information is logged in the Customer Trace. The automatic action Warning Mechanism for SDHC is disabled by default

---

**NOTICE:** This option triggers a system restart while prompting an Alert box "Note: System will restart soon after you press OK."

---

WBM Home Screen recognizes two states:

- If the information from system is available a text will be presented in Home Screen informing about the general status of the card, **Card Health Status** (green, yellow, red or grey).

The general lifetime of the card is calculated based on the manufacturer specifications and the average writing cycles of the system. Different values for card lifetime are possible. This information is presented together other information at the SDHC Health check page within the WBM.

An estimated lifetime of 4 years for standard cards and 10 years for high endurance cards are stored within the system.

---

**NOTICE:** The estimated values for the lifetime are only the base for the integrated Card Health Status Warning Mechanism. These values do not imply automatically that a card is defect after this time is expired.

---

Green health status means that the card has not reached its estimated lifetime and there is no problem with the filesystem.

Yellow health status means that the card has reached its estimated lifetime.

Red health status means that there are over 50 filesystem errors detected.

Grey health status means that the card is not supported or that it is not possible to retrieve card information. The SDHC card must be replaced by a supported type.

The Warning Mechanism for Yellow health status is based on the manufacturing date and the estimated lifetime of the card. As cards can be in stock for longer time until they are used within OpenScape Business, the filesystem creation date is also considered within the calculation algorithm.

Below a calculation table is shown for Card Health Status with an estimated lifetime of 4 years.

| Factor             | Years and Weight |           |           |           |             |           |           |           |             |           |
|--------------------|------------------|-----------|-----------|-----------|-------------|-----------|-----------|-----------|-------------|-----------|
| Manufacturing Date | < 4 years        | < 5 years |           | < 6 years |             | < 7 years |           | < 8 years |             | > 8 years |
| Filesystem Created | < 4 years        | < 4 years | 4-5 years | < 4 years | 4 - 6 years | < 3 years | 3-7 years | < 2 years | 2 - 8 years | -         |
| Health Status      | Green            | Green     | Yellow    | Green     | Yellow      | Green     | Yellow    | Green     | Yellow      | Yellow    |

- If the information is not available then user will be prompted, **Card Health Status** unknown.

---

**NOTICE:** In case that the file system is corrupted the appropriate System SW image has to be downloaded from SWS and has to be copied to the SDHC card using the Card Manager Tool. After starting up the system with the new SDHC card, the configuration can be restored using the latest backup.

---

The text "**Card Health Status** " will also provide a link that will leads to the "Actions Page"

### 25.6.3.1 How to set a notification in case of errors in SDHC card

In case that the integrated filecheck function reports a number of errors which exceeds the given threshold (50 errors) or the system cannot read/write any longer from/to the SDHC Card during normal operation, the system notifies with an E-Mail or an SNMP event.

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance** > **Events** in the navigation tree.
3. Click on **Events** > **Reaction Table** in the menu tree. The names of Reaction Table are displayed in the menu tree.
4. Select **FP\_EVT\_HW\_067** in the menu tree.
5. Select one of the following available options:
  - a) Send an SNMP Trap.
  - b) Send an E-mail.
6. Click on **Apply** followed by **OK**.

---

**NOTICE:** The e-mail address needs to be configured in **Expert mode** > **Maintenance** > **Events** > **E-mail**.

---

### 25.6.3.2 How to Start the Warning Mechanism for SDHC lifetime Automatic Action

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. Save the system with the Backup function to an external medium.
2. In the navigation bar, click on **Expert Mode**.
3. Click **Maintenance** > **Actions** in the navigation tree.

4. Click on **Actions > Automatic Actions** in the menu tree. The names of all automatic actions are displayed in the menu tree.
5. Click **SDHC Health Check** in the menu tree.  
Date and time of **Local System Time** and **Last Health Check** are displayed. The content of **log file** is also displayed.
6. Select one of the following available options:
  - a) Start Health Check immediately.
  - b) Start Health Check on a specific date
7. Click on **Apply** followed by **OK**.

### 25.6.3.3 How to clone and change an SDHC card

SDHC cards have a limited lifetime in general. The lifetime depends mainly on the number of writing cycles of the SDHC card. OpenScape Business supports an integrated "SDHC Health Status" detection mechanism for the lifetime of the SDHC card and an integrated "SDHC Data Backup" function, which is described below for the replacement of the exhausted SDHC card and the creation of a new and full functional card.

---

**NOTICE:** The SDHC Data Backup function is able to copy the content of the SDHC card that is currently inserted in the system without shutting down the system. See also [How to Delete Unify Phone Users](#) on page 1175.

---

The relevant data can be backed-up to different storage locations and storage media as:

- USB stick connected to the system.
- USB SDHC card reader connected to the system.
- Network File System (NFS) drive.
- Network File System (NFS) drive via USB.

---

**NOTICE:** The USB stick or USB SDHC card reader options are not available for OpenScape Business X1. In this case, the SDHC data backup needs to be stored to a NFS drive.

---

In case where a USB card reader is used, the possibility of the SDHC card for not accessing or formatting cannot be excluded. In this case, another USB card reader or a USB stick should be used.

In case that a USB card reader with the new inserted SDHC card is used and is directly connected to the system, the integrated SDHC Data Backup function creates a full functional SDHC card. In all other cases, it creates a so-called "tar file" which contains all the system and configuration data.

---

**NOTICE:** The tar file cannot be used by the restore function of the system.

The size of SDHC Data Backup (tar file) depends on the specific data of the system and it can increase to multiple GB if media files (voicemails, call records etc.) are stored.

---

In order to clone and change a SDHC card in a live system, the following procedure is required:

- 1)** Create a SDHC Data Backup File with a suitable media (see [How to create a SDHC Data Backup File](#))
- 2)** Create a new operational SDHC card including all system data (see [How to Use the Card Manager to Write the Communication Software on the SDHC Card](#) on page 1318).
- 3)** Power off the system, change the SDHC card and power on again (See [How to Use the Card Manager to Write the Communication Software on the SDHC Card](#) on page 1318).

### 25.6.3.4 How to create a SDHC Data Backup File

#### Prerequisites

A USB stick with at least the same capacity as the SDHC card of the system or a USB card reader with a new, inserted SDHC card with at least the same size as the card of the system or a Network File System (NFS) drive which is accessible from the system.

#### Step by Step

- 1.** In the navigation bar, click on **Data Backup**.
- 2.** Click **SDHC Data Backup > Data Backup** in the navigation tree.
- 3.** Select one of the following available options depending on the available storage location and media:

##### a) NFS

A valid server address, the relevant path and valid login credentials must be configured.

Click on **Save & check**

---

**NOTICE:** A Scheduled Backup is available. Only one action can be scheduled at a time and the user will be able to change it or cancel it.

---

##### b) Card Reader

This option creates a full functional copy of the SDHC card without trace and log files.

A USB SDHC card reader with an inserted SDHC card must be plugged in the system before the copy process is started.

After the process begins, the inserted SDHC card is formatted and all relevant files are transferred to the inserted SDHC card.

---

**NOTICE:** Do not remove the USB SDHC Card reader or the inserted SDHC card before the process is finished.

---

---

**NOTICE:** The new SDHC card is full functional for immediate use in the OpenScape Business system. The new card contains all files and data except log and trace files.

---

---

**NOTICE:** A Scheduled Backup is available. Only one action can be scheduled at a time and the user will be able to change it or cancel it.

---

c) NFS via USB.

A valid server address, the relevant path and valid login credentials must be configured.

Click on **Save & check**

---

**NOTICE:** A Scheduled Backup is available. Only one action can be scheduled at a time and the user will be able to change it or cancel it.

---

d) USB.

A FAT32 formatted blank USB device has to be plugged in the system.

---

**NOTICE:** Do not remove the USB stick before the process is finished.

---

---

**NOTICE:** The copied SDHC Backup data file (tar file) can be used in the Card Manager Tool to create a full functional SDHC card for the system.

---

---

**NOTICE:** A Scheduled Backup is available. Only one action can be scheduled at a time and the user will be able to change it or cancel it.

---

4. Click on **OK & Next**. The progress of the backup process is displayed in a separate window.

---

**NOTICE:** An error message appears if the NFS share or the USB cannot be mounted or if the storage media cannot be formatted.

---

5. The message **Backup task was finished successfully** is displayed after the backup file is successfully copied.
6. Click on **Finish**.

---

**NOTICE:** Depending on the chosen storage location and media, the further procedure differs.

In case of using the SDHC Card Reader with SDHC card, the new SDHC card can immediately be used.

In all other cases, the generated SDHC Card Backup file has to be used in combination with the Card Manager tool to generate a new SDHC card.

---

### Next steps

Follow the steps to create a new operational SDHC card and change it in the live system (see [How to Use the Card Manager to Write the Communication Software on the SDHC Card](#) on page 1318)

## 25.6.3.5 How to replace an SDHC Card

### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

Only when using UC Suite: UC Suite has started correctly.

Downgrade to previous software version is not supported. If a card with V2 software is installed, then only previous minor releases of V2 can be restored.

The current Software version has to be used in order to avoid any side effect.

---

**NOTICE:** In case the SDHC card is broken and the system is down a previous backup should be used and the first 10 steps of the following procedure should be ignored. See also [How to Delete Unify Phone Users](#) on page 1175.

---

### Step by Step

1. Click on **Backup and Restore** in the navigation bar.
2. In the navigation tree, click **Backup - Immediate**.
3. Enter a comment for the backup set in the **Comment** field so that the backup set can be easily identified if needed later for a restore. Avoid the use of diacritical characters such as umlauts and special characters in your input.
4. If you want to create a backup set including voice messages and announcements, select the **Full Backup** option.
5. Activate the target drive on which the backup set is to be saved in the **Devices** area.
6. Click on **OK & Next**. The progress of the backup process is displayed in a separate window.

---

**NOTICE:** If the **OK & Next** button is grayed out, then one or more applications (e.g., UC Suite) for

which the data is to be saved were not started correctly.

If you do not have access rights for the selected archive directory, you will receive an error message. Select another destination drive or change the path for the archive.

An error message appears if there is not enough disk space on the destination drive for the backup set. If this occurs, select another destination drive or delete a backup set and restart the backup.

---

**NOTICE:** If you are using a USB device as a backup medium, wait till the LED of the USB device stops flashing. It is only then that the backup has been successfully stored on the USB device. You can then remove the USB device.

---

---

**NOTICE:** In addition to backup set, a text file associated with the backup set must also be saved. It contains information about the date and time of the backup and under which software version the backup was performed.

---

7. The backup was successful if the message **Backup completed successfully! 100%** appears.
8. If you have selected **HTTPS** as a backup medium, you must save the backup set and the text file associated with the backup to a location of your choice. This is done automatically for the other backup media. The browser window must remain open until the save operation for the backup set and text file has been completed.
9. Click on **Finish**.
10. Switch off the system.
11. Remove the existing SDHC card.
12. Install the new SDHC card.
13. Switch on the system.

When a new SDHC card is installed, the software version included to the card with the default configuration is automatically installed to the system. After Startup, system will have its default IP address.

14. Click on **Backup and Restore** in the navigation bar.
15. Click **Restore** in the navigation tree.
16. Activate the medium containing the backup set to be restored in the **Devices** area.
17. If you activated **HTTPS** as the backup medium, navigate to the storage location of the backup set and select the backup set. Then navigate to the storage location of the text file and select it.
18. If you activated any other backup medium than **HTTPS**, select the backup set containing the configuration data to be restored in the List of available backup sets area.

19. Wait until the files have been loaded onto the system and then click **OK & Next**. The recovery of the configuration data is started. The progress of the restore process is displayed.
20. After the message **Restore complete!** appears, the system will automatically reboot. The restoration is completed successfully when the system is ready for use again.

---

**NOTICE:** After the restoration the device should be deleted from the RSP server and then to be reconfigured.

---

## 25.7 Power Management

Power management automatically switches the communication system to low power mode, depending on the system load. This reduces the energy consumption of the system and thus also contributes to environmental protection. The time period in which the system switches to low power mode can be set (e.g., at night).

Power management can be enabled only if the LAN interfaces of the system are in the Ethernet Link Mode **Auto**. In the low power mode, the LAN interfaces of the system automatically switch to the 100 Mbit/s full-duplex mode. The LAN interfaces of the connected infrastructure should also be in the autosense mode.

### Operating Modes

- Active Mode

In active mode, the functions of the communication system are frequently used, and significant data transfers occur between the system and the connected infrastructure.

- Idle Mode

In idle mode, the functions of the communication system are rarely used, and no significant data transfers occur between the system and the connected infrastructure. When a function is initiated, the system switches from idle mode to active mode.

- Low Power Mode

Low-power mode has reduced energy requirements compared to the idle mode. The system operates in the 100 Mbit/s full-duplex mode.

It is also possible to operate the system permanently in the Ethernet Link Mode 100 Mbit/s full duplex or 100Mbit/s full duplex.

### 25.7.1 How to Enable or Disable the Power Management

#### Prerequisites

The LAN interface of the mainboard, via which the system is connected to the LAN infrastructure, is set to the Ethernet Link Mode **Auto**.

Only if a UC Booster Card is connected: the LAN interface of the UC Booster Card, via which the UC Booster Card is connected to the LAN infrastructure, is set to the Ethernet Link Mode **Auto**.

The LAN interfaces of the connected infrastructure (e.g., IP phones) is set to autosense mode.

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. In the navigation tree, click **Wizards > Basic Installation**.
3. Click **Edit** to start the **Power Management** wizard.
4. If you want to enable the power management:
  - a) Select the **Power Management on/off** check box.
  - b) Under **Start of LowPowerMode** and **End of LowPowerMode**, enter the time span in which the communication system should switch to the low power mode.
5. If you want to disable the power management, clear the **Power Management on/off** check box.
6. Click on **OK & Next**. Your settings are applied.
7. Click on **Finish**.

## 25.7.2 How to Change the Ethernet Link Mode the LAN Interfaces

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click on **Telephony > Network Interfaces** in the navigation tree.
3. Select the Ethernet link mode for the LAN interface of the mainboard:
  - a) Click on **Mainboard > LAN 2** in the menu tree. The communication system is integrated in the LAN infrastructure via the LAN 2 port.
  - b) If you want to enable the power management, select the list item **Auto** from the **Ethernet Link Mode** drop-down list.
  - c) If you want to set the system to low power mode permanently, select the list item **100HDX** or **100FDX** from the **Ethernet Link Mode** drop-down list.

---

#### NOTICE:

Power management cannot be enabled for the Ethernet link modes **100HDX**, **100FDX** and **1000FDX**.

---

- d) Click on **Apply**.

## Maintenance

### Monitoring and Maintenance of OpenScape Business

4. Only if a UC Booster Card is inserted: select the Ethernet Link Mode for the LAN interface of the UC Booster Card:
  - a) Click in the menu tree on **Application Board > LAN 2** or **LAN 1**, depending on which LAN interface was used to connect the UC Booster Card to the LAN infrastructure (indicated by the check mark in the **Interface Is Active** check box).
  - b) If you want to enable the power management, select the list item **Auto** from the **Ethernet Link Mode** drop-down list.
  - c) If you want to set the system to low power mode permanently, select the list item **100HDX** or **100FDX** from the **Ethernet Link Mode** drop-down list.

---

#### NOTICE:

Power management cannot be enabled for the Ethernet link modes **100HDX**, **100FDX** and **1000FDX**.

---

- d) Click on **Apply**.

## 25.8 Monitoring and Maintenance of OpenScape Business

OpenScape Business offers different functions for monitoring the current status of the system and for finding and resolving errors.

### 25.8.1 Checking the Network Connection of OpenScape Business X

The network connection between an OpenScape Business X communication system and the target address can be checked by using an ICMP (Internet Control Message Protocol) request.

Echo request packets can be sent via both the **Ping** and **Traceroute** functions. The corresponding echo reply messages are displayed together with the round-trip times.

The **Traceroute** function sends echo request packets with various incremental TTL (Time-To-Live) values.

#### 25.8.1.1 How to Ping

##### Prerequisites

You are logged into the WBM with the **Expert** profile.

##### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance > IP Diagnostics** in the navigation tree.
3. Navigate in the menu tree to **IP Routing > ICMP Request > Ping**.

4. Enter the IP address of the desired target in the **Target Address** field.
5. In the field **Number of Echo Requests to Send**, enter the desired number (default value = 3).
6. Click on **Send**.  
The acknowledgements will then be displayed together with the round trip delays.

### 25.8.1.2 How to Test the Trace Route

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance > IP Diagnostics** in the navigation tree.
3. Navigate in the menu tree to **Mainboard > ICMP Request > Trace route**.
4. Enter the IP address of the desired target in the **Target Address** field.
5. Enter the desired value (default value = 0) in the **TOS Byte** field.
6. Click on **Send**.  
The acknowledgements will then be displayed together with the round trip delays.

## 25.8.2 SNMP (Simple Network Management Protocol)

The Simple Network Management Protocol (SNMP) is a network protocol which can be used to monitor and operate networking components (such as routers, servers, switches, printers, PCs) from a central station (management console). The protocol controls communication between the monitored components and the monitoring station.

SNMP describes the structure of data packets that can be sent and the communication procedure. SNMP was designed so that all network-capable devices can be included in monitoring. SNMP-based network management tasks include

- monitoring networking components,
- performing remote control and remote configuration of networking components,
- error detection and notification.

Devices known as "agents" are used for monitoring. These are utilities that run directly on monitored components. These utilities are able to record the status of components, make settings, and trigger actions. SNMP allows the central management console to communicate with the agents over a network.

---

**NOTICE:** OpenScape Business supports SNMPv2c, but also responds to SNMPv1 snmpget requests.

---

### Management Information Databases (MIB)

The volume of data that can be administered via SNMP is defined in MIBs (Management Information Base). MIBs are data models that describe the networking components to be administered in an established manner. The MIB of the OpenScape Business X communication systems can be downloaded via the WBM (Service Center).

The communication systems have a separate SNMP agent that allows access to various system data that is stored in its MIB or Management Information Base. The MIB provides basic system information, status information, event-related data, and information on installed hardware (slots) and configured connections (ports).

SNMP supports the central monitoring and administration of networking components, including the communication systems themselves. It is possible to

- address the communication system over the TCP/IP protocol.
- access data over external management applications.
- perform remote maintenance activities.
- visualize the operating status of the communication system.
- transmit service-specific errors (Traps).

### Communities

Access to the SNMP data (MIBs) is governed by communities. A distinction is made here between read, write, and Trap communities. Each community has a specific IP address.

To enable read access to SNMP data (MIBs) on a PC, for example, the IP address of this PC must be entered in the list of read communities. To enable read and write access, the IP address must be entered in the list of write communities.

Trap Communities are used to manage the recipients of error messages (traps).

### Traps

When problems occur in a communication system, traps are generated to indicate errors and failures. The following types of traps are available:

- System traps = System errors that require immediate action for recovery.
- Performance Traps = Information on performance problems that do not require corrective action.

Traps are classified by their effects and can be retrieved by an administrator with the **Expert** profile using the WBM. A list of all traps received is displayed with the following information:

| Table column        | Meaning                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VarBind1 (Severity) | <p>Trap effect classes</p> <p>The following entries are possible:</p> <p>Critical: Error Message. This error causes problems.</p> <p>Major: error message. This error could cause problems.</p> <p>Minor: error message. The error has no problematic consequences.</p> <p>Warning: report of a possibly problematic procedure or status, but not an error message.</p> <p>Deleted</p> <p>Information: plain status messages, no error messages.</p> <p>Intermediate status</p> <p>Other traps</p> |
| VarBind2 (Name)     | Trap name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Generic Name        | General Description such as Enterprise Specific, for example                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Specific Name       | Trap type (1 = software, 2 = hardware)                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Enterprise          | –                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Time                | Time of error                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Index               | List number                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

Trap display is updated every 30 seconds. Traps are sorted in the sequence of occurrence.

Trap details can be displayed by clicking a trap name.

| SNMP Code                         | Event Log Entry       | Meaning                                                 | Required Measures | Note |
|-----------------------------------|-----------------------|---------------------------------------------------------|-------------------|------|

### 25.8.2.1 How to Display all Communities

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance** > **SNMP** in the navigation tree.
3. Click on **SNMP** > **Communities** in the menu tree. A list of all communities is displayed with the associated data (IP address, community, type).

| Expert mode - Maintenance |                     |           |                |
|---------------------------|---------------------|-----------|----------------|
| SNMP                      | Communities         |           |                |
| ▶Communities              | Display Communities |           |                |
| Traps                     |                     |           |                |
|                           |                     |           |                |
|                           | IP Address          | Community | Type           |
|                           | 127.0.0.1           | public    | Trap Community |

### 25.8.2.2 How to Add a Community

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance** > **SNMP** in the navigation tree.
3. Select the desired community.
  - If you want to add a Read Community, click **SNMP** > **Communities** > **Read Communities** in the menu tree. Click on the **Add Read Community** tab.
  - If you want to add a Write Community, click **SNMP** > **Communities** > **Write Communities** in the menu tree. Click on the **Add Write Community** tab.
  - If you want to add a Trap Community, click **SNMP** > **Communities** > **Trap Communities** in the menu tree. Click on the **Add Trap Community** tab.
4. Enter the IP address of the new community in the **IP Address** field.
5. Enter the name of the new community in the **Community** field.
6. Click on **Apply** followed by **OK**.

### 25.8.2.3 How to Edit a Community

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance** > **SNMP** in the navigation tree.
3. Navigate in the menu tree under **SNMP** > **Communities** > ... down to the desired community.
4. Click on the **Edit Community** tab.
5. Edit the community.
6. Click on **Apply** followed by **OK**.

## 25.8.2.4 How to Delete a Community

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance** > **SNMP** in the navigation tree.
3. Navigate in the menu tree under **SNMP** > **Communities** > ... down to the desired community.
4. Click on the **Delete Community** tab.
5. Click on **Delete** followed by **OK**.

## 25.8.2.5 How to Display Traps

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance** > **SNMP** in the navigation tree.
3. Click on **SNMP** > **Traps** in the menu tree.
4. Select one of the following options:
  - If you want a list of all traps to be displayed, click the **Display All Traps** tab.

Expert mode - Maintenance

- If you want a list of all critical traps to be displayed, click the **Display All Critical Traps** tab.

## 25.8.2.6 How to Display Details of a Trap

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance > SNMP** in the navigation tree.
3. Click on **SNMP > Traps** in the menu tree.
4. Click on the **Display All Traps** tab. A list of all traps is displayed with the associated data.
5. Click on the name of the desired trap. The details of that trap will be displayed.
6. Click on the **Display All Traps** tab to open the list of all traps once more.

## 25.8.3 Manual Actions

Many different logs (diagnostics data and diagnosis logs) can be loaded via manual actions.

Administrators with the **Advanced** profile can load diagnostic data (diagnosis logs) by using the **Trace** wizard.

Administrators with the **Expert** profile can load diagnostic data (diagnosis logs) in **Expert mode**.

The following logs can be loaded:

| Protocol                               | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Application case                                                                            |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------|

| Admin log (also called admin protocol) | Messages about administration processes at the communication system (login attempts, etc.)                                                                                                                                                                                                                                                                                                                                                                                                                                    | No special application                                                                      |
| License Protocols                      | Messages about the communication system components that require licenses                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Problems with licensing (the license file cannot be activated, and so on)                   |
| Customer Trace                         | Messages for the customer trace are provided in a more detailed format than in the trace log, for example (remote login, ITSP login, etc.).                                                                                                                                                                                                                                                                                                                                                                                   | Problems with the ITSP (Internet Telephony Service Provider) connection or the remote login |
| Framework Protocol                     | WBM messages                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Problems with licensing, backup, restore or with the WBM                                    |
| Diagnosis Log                          | Diagnosis logs of the communication system (FP/LDH)                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | System crash or uncontrolled shutdown of the communication system                           |

| Protocol              | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Application case                                                                        |

| CoreLog Protocol      | CoreLogs are created for resets, etc. (e.g., memory dumps at a PC).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | System crash or uncontrolled shutdown of OpenScape Business                             |

After the desired logs have been selected, a compressed file is created and stored in a specified directory.

### 25.8.3.1 How to Download Diagnostics Data / Diagnosis Logs

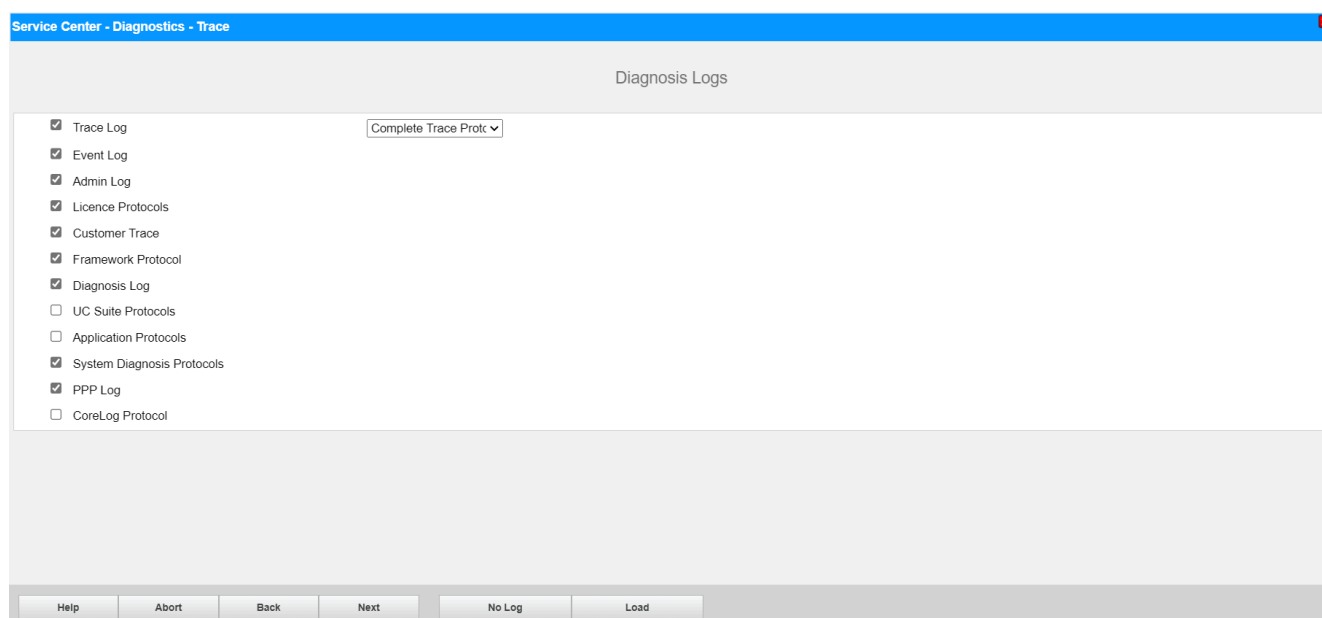

The **Trace** wizard can be used to download diagnostics data (diagnosis logs) for the communication systems.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. Click on **Service Center** in the navigation bar.
2. Click **Diagnostics** > **Trace** in the navigation tree.
3. Click on **Diagnosis Logs**.

4. Select the check boxes of the logs you want to download. Clear the check boxes of the logs you do not want to download.
5. Click on **Load** followed by **OK**. The File Download window appears.
6. Save the file in the desired directory. Then close the window that confirms the download of the file.
7. Click on **Next** followed by **Finish**.

## 25.8.4 Traces

Traces can be used to record the execution of individual program steps and their results during the execution of a program. In combination with further diagnostics data, an incorrectly executing program can be traced back to the source of the error. The individual traces to be recorded and their respective levels of detail are configured via the trace profiles and trace components.

---

**INFO:** Activating traces can have a negative impact on system performance and must hence only be performed by experienced administrators and only after consulting with the responsible Service Support.

The console trace, in particular, requires substantial system resources and thus has an adverse effect on the performance of the communication system.

---

## Networking

In order to diagnose networked communication systems, the trace data of each individual node must be collected separately. It is not possible to acquire the trace data of networked communication systems centrally.

## Trace Format Configuration

The Trace Format Configuration function can be used by an administrator with the **Expert** profile to define which header data is to be included in the trace output and how the trace data is to be formatted.

Header data for the trace output (all options are activated in the default setting):

- Global Trace Header Format Settings

If this option is enabled, the options for the following header data can be activated or deactivated.

- Subsystem ID
- Task Name
- Task ID
- Time
- Module Name
- Line Number

### Formatting the Trace Data

- Full formatting with parameter expansion (default) = large data volume, normal trace performance. Default setting
- Limited formatting (message types binary, special X-Tracer format) = medium data volume, fast trace performance.
- Limited formatting (expansion of basic data types only) = low data volume, very trace performance.
- Performance optimized trace without parameter expansion = very low data volume, extremely fast trace performance.

---

### INFO:

Note that adding more trace header data and extensive trace data formatting will decrease the overall trace performance.

---

### Trace output interfaces

This function enables an administrator with the **Expert** profile to define the interfaces for the trace output. It is possible to either enable the file trace or trace via LAN or to disable both interfaces.

| Trace output interface | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Default setting |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| File Trace             | <p><b>Switch File Trace On</b></p> <p>Trace messages are entered into a log file in the communication system.</p> <p>The following settings apply when the option is enabled:</p> <p><b>Max. Trace Quota (kByte):</b> Indicates the maximum size of the trace memory</p> <p><b>Policy to handle reach of max. quota.</b> You can choose between <b>Wrap Around (delete oldest file)</b> and <b>Stop temporarily the file trace.</b></p> <p><b>Time between creation of new trace files (sec):</b> 900</p> <p><b>Time period for which trace files are available:</b> The actual time period is specified.</p> | Enabled         |
| Trace via LAN          | <p><b>Switch Trace via LAN On</b></p> <p>Trace messages are transmitted via the LAN interface.</p> <p>The following setting applies when the option is enabled: <b>Timer value</b> = 25 sec. (delay period until data is transmitted.)</p>                                                                                                                                                                                                                                                                                                                                                                    | Not activated   |

### Trace log

If the trace output interface Switch File Trace On is enabled, the resulting log files can be transferred by an administrator with the **Expert** profile to a PC or deleted.

### Digital Loopback

Digital loopbacks are used to test the B channels of S<sub>0</sub>, S<sub>2M</sub> and T1 interfaces of any existing boards. Digital loopbacks should only be activated if requested by the service provider.

They can only be configured using E Manager.

### Event Viewer / Customer Trace Log

The **Event Viewer** wizard can be used by an administrator with the **Advanced** profile to start the event display (customer trace) In addition, the customer trace log file can be copied to a PC or deleted.

The following functions, which can be started using the wizard, are described here:

- [How to Display or Edit Event Viewer and Customer Trace Logs](#)

- [How to Download or Open the Event Viewer Log / Customer Trace Log](#)
- [How to Clear the Event Viewer Log / Customer Trace Log](#)

Administrators with the **Expert** profile can start displaying the customer trace log file in **Expert mode**. In addition, the customer trace log file can be copied to a PC or deleted.

### M5T Trace Components

This function is used to monitor the SIP stack by an administrator with the **Expert** profile. For each M5T trace component, the level of detail for the trace can be defined via trace levels (0 = lowest level of detail to 4 = maximum level of detail).

### Secure Trace

This function is used by an administrator with the **Expert** profile to record encrypted VoIP payload and signaling data streams.

If the Signaling and Payload Encryption (SPE) feature has been enabled, the VoIP payload and signaling data streams from and to the communication system and between IP phones will be encrypted.

To ensure that errors are properly analyzed, additional trace information (**Secure Trace**) can be transmitted in the LAN for a limited period of time. In this case, asymmetrically encrypted secure trace files are generated, which can only be decrypted and analyzed by Development.

The following security features have been implemented to restrict the use of the secure trace function:

- A service technician must import a so-called public key (certificate) into the relevant communication system. The certificate is part of an X.509 file and is required to generate a secure trace. The X.509 file is provided by Development. The included certificate is valid for a maximum of one month.
- A special password (passphrase) must be entered to start and stop the secure trace. This password is known only to the customer.

Thus, the certificate is the key of the service technician and the password (passphrase) is the key of the customer. Both keys are required to activate the secure trace function.

Process for generating a secure trace:

- 1) A service technician finds a problem in the customer's LAN. Together with Development, the service technician recognizes the need to generate a secure trace.
- 2) The customer is notified accordingly and must confirm that he has been notified. The customer then issues an order for the creation of a secure trace, specifying the date and time when monitoring should start and end.
- 3) A developer creates a key pair consisting of the public key and the private key. This key pair can only be used to create a single secure trace. The certificates are used in the following manner
  - The certificate with the private key is strictly confidential and can only be used by authorized developers.

The private key is required to decrypt the secure trace files.

- The certificate with the public key is passed to the service technician in the form an X.509 file in PEM or binary format.

This certificate must be imported into the relevant communication system to be able to generate a secure trace.

- 4) The service technician notifies the customer that the generation of the secure trace is to start soon. The customer, in turn, must notify all affected parties.

---

**NOTICE:** The live recording of calls and connection data is a criminal offence, unless the affected parties have been notified in advance.

---

- 5) The service technician imports the certificate with the public key into the relevant communication system.

- 6) The customer starts the secure trace by entering the password (passphrase). The secure trace files are generated.

Start and stop of the secure trace are logged by the communication system.

- 7) Upon completion of secure trace generation, the customer is notified that all secure trace activities have been stopped. The service technician removes the certificate from the communication system.

- 8) The secure trace files are made available to Development.

- 9) A developer decrypts the secure trace files using the private key and then analyzes the decrypted data.

---

**NOTICE:** Once the analysis has been completed, all relevant data must be destroyed in a secure manner. This includes the destruction of the private key so that any potential unauthorized copy of the secure trace files can no longer be decrypted.

---

### H.323 Stack Trace

This function can be used by an administrator with the **Expert** profile to set the H.323 Stack Trace Configuration. The level of detail for the trace can be defined via trace levels (0 = lowest level of detail to 4 = maximum level of detail). The following settings can be selected for the H.323 stack trace output:

| Trace output interface | Explanation                                                                             | Default setting |
|------------------------|-----------------------------------------------------------------------------------------|-----------------|
| Console Trace          | <b>Switch Console Trace On</b><br>H.323 Stack Trace messages are output on the console. | Not activated   |

| Trace output interface | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                     | Default setting |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| File Trace             | <p><b>Switch File Trace On</b></p> <p>H.323 Stack Trace messages are written to a log file.</p> <p>The following settings apply when the option is enabled:</p> <p>Max. size of the trace buffer = 50000 bytes (amount of data stored in the buffer.)</p> <p>Max. size of the trace file = 1000000 bytes (maximum size of the log file.)</p> <p>Trace Timer = 60 sec. (delay period until data is written to the log file.)</p> | Not activated   |

By activating and/or deactivating H.323 modules, you can define for which components of the H.323 stack trace the process and status information is to be recorded. The status of each H.323 module is indicated by the color of the associated bullet point (green = H.323 module active, red = H.323 module inactive).

The H.323 Stack Trace log can be transmitted to a PC or deleted.

### License Component Trace

This function is used by an administrator with the Expert profile to monitor the system-internal license agent (Customer License Agent, CLA). The level of detail for the trace can be defined via trace levels (low = lowest level of detail (default), standard = medium level of detail, all = maximum level of detail).

By default, the license component trace is enabled (trace level = low).

Changing the trace level can have a negative impact on system performance and must hence only be performed by experienced administrators and only after consulting with the responsible Service Support.

### Trace Profiles

Trace profiles define what data is to be recorded and at what level of detail. Trace components are assigned to a trace profile. This allows you to specify for which system components the process and status information should be logged by the trace profile.

Predefined trace profiles are provided for all standard scenarios. In addition, an administrator with the **Expert** profile can also create his or her own profiles. When you start a trace profile, logging is activated via this profile. When you stop the profile, logging is deactivated.

- Administrators with the **Advanced** profile can start and/or stop trace profiles by using the **Trace** wizard. The status of every trace profile is indicated by the color of the associated list item (green = trace profile active, red = trace profile not active). **Start/Stop** can be used to enable or start an inactive trace component (red bullet

point) and to disable or stop an active trace component (green bullet point).

**Load Trace** is used to transfer the generated log files to a PC or open them.

**Delete Trace** is used to delete the generated log files.

The following functions, which can be started using the wizard, are described here:

- [How to Download a System Trace Log File](#)
- [How to Delete a System Trace Log File](#)
- [How to Display all Trace Profiles](#)
- [How to Start or Stop a Trace Profile](#)
- [How to Download Diagnostics Data / Diagnosis Logs](#)
- Administrators with the **Expert** profile can collectively stop all trace profiles and selectively start and/or stop individual trace profiles in **Expert mode**.

In the menu tree display, the color of the list item indicates the status of the trace profile (green = trace profile is activated, red = trace profile is not activated). **Start/Stop Trace Profile** can be used to enable or start an inactive trace component (red bullet point) and to disable or stop an active trace component (green bullet point).

By selecting **Display Trace Profile** you can view the details of the desired trace profile: This includes the profile name, details about write protection and the status of the profile, as well as information on when, i.e., for which problems, this trace profile should be used. In addition, you can see which trace components belong to the trace profile.

| Trace Profile                       | Application case                       |
|-------------------------------------|----------------------------------------|
| Actors / Sensors / Door Opener      | No information is currently available! |
| Basic                               | No information is currently available! |
| Calls_with_Analog_Subscriber_Trunks | No information is currently available! |
| Calls_with_ISDN_Subscriber_Trunks   | No information is currently available! |
| Calls_with_System_Device_HFA        | No information is currently available! |
| Calls_with_System_Device_Upn        | No information is currently available! |
| CDR_Charging_data                   | No information is currently available! |
| CMI                                 | No information is currently available! |
| CSTA_application                    | No information is currently available! |
| Display_problems                    | No information is currently available! |
| Gateway_Stream_detailed             | No information is currently available! |
| Gateway_Stream_overview             | No information is currently available! |
| IP_Interfaces                       | No information is currently available! |
| License_problem                     | No information is currently available! |
| Network_Call_Routing_LCR            | No information is currently available! |

| Trace Profile                       | Application case                       |
|-------------------------------------|----------------------------------------|
| Peripheral_cards                    | No information is currently available! |
| RAS_or_Internal_access              | No information is currently available! |
| Resources_MOH_Conferencing          | No information is currently available! |
| SIP_Interconnection_Subscriber_ITSP | No information is currently available! |
| SIP_Registration                    | No information is currently available! |

| VPN                                 | No information is currently available! |
| Web_based_Assistant_Expert_Mode     | No information is currently available! |
| Xpressions Compact                  | No information is currently available! |

### Trace Components

Trace components can be used to record the process and status information of individual components of the communication system.

All trace components can be stopped together and started or stopped individually by an administrator with the **Expert** profile. Starting and stopping a trace component activates and deactivates the recording. The level of detail for the trace can be defined via trace levels (0 = lowest level of detail to 9 = maximum level of detail).

The color of the list item displayed in the menu tree indicates the status of the trace component (green = trace component activated, red = trace component not activated). **Start/Stop Trace Component** can be used to enable or start an inactive trace component (red bullet point) and to disable or stop an active trace component (green bullet point).

A Trace Component display shows the subsystem name, the trace component index, the set trace level, the status information and whether or not the trace component is currently active. If a trace component needs to be edited, apart from changing the trace level, the trace component can also be started or stopped.

#### 25.8.4.1 How to Download a System Trace Log File

The **Trace** wizard can be used to download system trace log files.

##### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

##### Step by Step

1. Click on **Service Center** in the navigation bar.
2. Click **Diagnostics > Trace** in the navigation tree.
3. Click on **Diagnosis Logs**.

4. Click on **No Log** to clear the check boxes of all logs.
5. Enable the **Trace Log** check box.
6. Select one of the following options:
  - If you want to download the entire system trace log, select **Complete Trace Log** in the drop-down list.
  - If you want to download the system trace log for today, select **Log from Today** in the drop-down list.
  - If you want to download the system trace log for a specific time period, select **Own Selection** in the drop-down list. Then, select the beginning and end of the desired time period in the drop-down lists **From:** and **To:**.
7. Click on **Load** followed by **OK**. The File Download window appears.
8. Save the file in the desired directory. Then close the window that confirms the download of the file.
9. Click on **Next** followed by **Finish**.

### 25.8.4.2 How to Delete a System Trace Log File

The **Trace** wizard can be used to delete system trace log files.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. Click on **Service Center** in the navigation bar.
2. Click **Diagnostics > Trace** in the navigation tree.
3. Click on **Delete Trace** followed by **OK**.
4. Click on **Next** followed by **Finish**.

### 25.8.4.3 How to Set Trace Settings to Default Values

The **Trace** wizard can be used to set system trace log files to the default state.

#### Prerequisites

You are logged on to the WBM with the **Advanced** or **Expert** profile.

#### Step by Step

1. Click on **Service Center** in the navigation bar.
2. Click **Diagnostics > Trace** in the navigation tree.
3. Click the **Default Trace Settings** button followed by **OK** in the next pop up message which notifies you that the action is completed successfully.
4. Click on **Next** followed by **Finish**.

---

**NOTICE:** Extended tracing increases the general system load and it should not be permanently active.

Trace settings should be set back to default by clicking **Default Trace Settings button** as soon as required traces have been successfully created.

**NOTICE:** If extended trace settings are active, you will be notified about this on the home page of the WBM in the **Notifications** area. A direct link to the trace settings of the Service Center is also available.

## 25.8.4.4 How to Display all Trace Profiles

The **Trace** wizard can be used to obtain information on the status of all trace profiles.

### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

### Step by Step

1. Click on **Service Center** in the navigation bar.
2. Click **Diagnostics > Trace** in the navigation tree. A list of all trace profiles appears, showing which trace profiles are started and which are not started.

| Service Center - Diagnostics - Trace                                                                                                                                            |                                     |                                                                                                                                                                                                                                                                                                   |        |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------|
| Trace Profiles                                                                                                                                                                  |                                     |                                                                                                                                                                                                                                                                                                   |        |
|                                                                                                                                                                                 | Profile Name                        | Additional Information                                                                                                                                                                                                                                                                            | Status |
| Stop                                                                                                                                                                            | Basic                               | Simple trace profile that allows a basic analysis of the system activities; enabled per default (factory settings).                                                                                                                                                                               | ●      |
| Start                                                                                                                                                                           | Calls_with_System_Device_HFA        | Shall be combined with the voice_fax_connection profile for detailed analysis of issues with HFA IP devices, e.g. registration, wrong display messages, wrong LED signals, user cannot take or answer call, call not ringing, no ringback tone.                                                   | ●      |

3. Click on **Next** followed by **Finish**.

## 25.8.4.5 How to Start or Stop a Trace Profile

The **Trace** wizard can be used to start and stop trace profiles.

### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

### Step by Step

1. Click on **Service Center** in the navigation bar.
2. Click **Diagnostics > Trace** in the navigation tree. A list of all trace profiles appears. A red bullet point indicates the trace profiles that can be started. A green bullet point indicates the trace profiles that can be stopped.
3. Select one of the following options:
  - If you want to start a trace profile, click **Start**. The color of the list item that shows the status of the associated trace profile changes from red to green.

---

**NOTICE:** Started trace profiles can have a negative impact on system performance. Consequently, after you finish your diagnostic activities, make sure that you stop all trace profiles, except for the **Default** trace profile. The **Default** trace profile must remain active.

---

- If you want to stop a trace profile, click **Stop**. The color of the list item that shows the status of the associated trace profile changes from green to red.
4. Click on **Next** followed by **Finish**.

## 25.8.4.6 How to Display or Edit the Trace Format Configuration

### Prerequisites

You are logged into the WBM with the **Expert** profile.

A request to edit the trace format configuration has been submitted by the responsible Service Support.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance > Traces** in the navigation tree.
3. Click on **Traces > Trace Format Configuration** in the menu tree. The current settings of the trace format configuration are displayed.
4. Change the desired settings if required.
5. Click on **Apply** followed by **OK**.

## 25.8.4.7 How to Display or Edit the Trace Output Interfaces

### Prerequisites

You are logged into the WBM with the **Expert** profile.

A request to edit the trace output interfaces has been submitted by the responsible Service Support.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance > Traces** in the navigation tree.
3. Click on **Traces > Trace Output Interfaces** in the menu tree. The Simple Network Management Protocol (SNMP) is a network protocol which can be used to monitor and operate networking components (such as routers, servers, switches, printers, computers) from a central station (management console).
4. Change the desired settings if required.
5. Click on **Apply** followed by **OK**.

### 25.8.4.8 How to Display or Edit Event Viewer and Customer Trace Logs

The **Event Viewer** wizard can be used to start the event display (customer trace) and to edit the Refresh settings.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. Click on **Service Center** in the navigation bar.
2. Click **Diagnostics > Event Viewer** in the navigation tree.
3. Click on the **Display** tab.
4. Select the desired setting.
  - If you want the log to automatically refresh, select the **auto refresh** check box.
  - If you do not want the log to automatically refresh, clear the **auto refresh** check box.
5. If required, click **Refresh** to manually refresh the Customer Trace log.
6. Click on **Finish**.

### 25.8.4.9 How to Download or Open the Event Viewer Log / Customer Trace Log

The **Event Viewer** wizard can be used to open the customer trace log file or to transfer it to a PC.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. Click on **Service Center** in the navigation bar.
2. Click **Diagnostics > Event Viewer** in the navigation tree.

3. Click on the **Load via HTTP** tab.
4. Click on **Load** followed by **OK**. The File Download window appears.
5. Select one of the following options:
  - If you want to download the log file, click **Save As**. Save the file in the desired directory and then close the window that confirms the download of the file.
  - If you want to open the log file, click **Open**. The contents of the compressed log file is then displayed.
6. Click on **Finish**.

### 25.8.4.10 How to Clear the Event Viewer Log / Customer Trace Log

The **Event Viewer** wizard can be used to delete the customer trace log file.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. Click on **Service Center** in the navigation bar.
2. Click **Diagnostics > Event Viewer** in the navigation tree.
3. Click on the **Clear Event Log** tab.
4. Click on **Delete Log** followed by **OK**.
5. Click on **Finish**.

### 25.8.4.11 How to Display M5T Trace Components

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance > Traces** in the navigation tree.
3. Click on **Traces > M5T Trace Components** in the menu tree.  
A list of all M5T trace components is displayed with the current settings. In addition, the names of all M5T trace components are displayed in the menu tree. The bullet point color indicates the status of each individual M5T trace component.

### 25.8.4.12 How to Start or Stop an M5T Trace Component

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

A request to start or stop a M5T trace component has been submitted by the responsible Service Support.

**Step by Step**

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance > Traces** in the navigation tree.
3. Click on **Traces > M5T Trace Components** in the menu tree.  
The names of all M5T trace components are displayed in the menu tree. A red bullet point indicates the M5T trace components that can be started. A green bullet point indicates the M5T trace components that can be stopped.
4. Click on the desired M5T trace component in the menu tree.
5. Click on the **Start/Stop Trace Component** tab.
6. Select one of the following options:
  - To start an M5T trace component, click **Start** and then **OK**.
  - To stop an M5T trace component, click **Stop** and then **OK**.

**25.8.4.13 How to Edit M5T Trace Components****Prerequisites**

You are logged into the WBM with the **Expert** profile.

A request to edit the M5T trace component has been submitted by the responsible Service Support.

**Step by Step**

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance > Traces** in the navigation tree.
3. Click on **Traces > M5T Trace Components** in the menu tree.  
A list of all M5T trace components is displayed with the current settings.
4. Change the desired settings.
5. Click on **Apply** followed by **OK**.

**25.8.4.14 How to Start or Stop the Secure Trace****Prerequisites**

You are logged into the WBM with the **Expert** profile.

**Step by Step**

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance > Traces** in the navigation tree.
3. Click on **Traces > Secure Trace** in the menu tree.
4. Click on the **Start/Stop Secure Trace** tab.
5. Select one of the following options:
  - If you want to test the secure trace, proceed as follows:  
Enter the password for the secure trace in the **Secure Trace Activation Passphrase** field.

Enter the time in minutes during which the secure trace is to be active in the **Duration of Secure Trace (Mins.)** field.

Enable the checkboxes of the protocols for which the secure trace should be created. Clear the checkboxes of the protocols for which the secure trace should not be created.

Click on **Start Secure Trace** followed by **OK**.

- To stop the secure trace, click **Stop Secure Trace** followed by **OK**.

### 25.8.4.15 How to Check the Secure Trace Status

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance > Traces** in the navigation tree.
3. Click on **Traces > Secure Trace** in the menu tree.
4. Click on the **Secure Trace State** tab. The current status of the secure trace is displayed.

### 25.8.4.16 How to Change the Secure Trace Password

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance > Traces** in the navigation tree.
3. Click on **Traces > Secure Trace** in the menu tree.
4. Click on the **Change Secure Trace Passphrase** tab.
5. Enter the current password for the secure trace in the **Current Passphrase** field.
6. Enter the new password (5 characters min., 12 characters max.) for the secure trace in the **New Passphrase** and **Confirm New Passphrase** fields.
7. Click on **Apply**.

### 25.8.4.17 How to Import the Certificate for the Secure Trace from an X.509 File

#### Prerequisites

An X.509 file in PEM or binary format is available.

You are logged into the WBM with the **Expert** profile.

**Step by Step**

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance > Traces** in the navigation tree.
3. Click on **Traces > Secure Trace** in the menu tree.
4. Click on the **Import X.509 file for Secure Trace** tab.
5. Click on **Browse** to select the desired X.509 file.
6. Click on **Open**.
7. Click on **Import Certificate from File**.

**25.8.4.18 How to Display or Edit the H.323 Stack Trace Configuration****Prerequisites**

You are logged into the WBM with the **Expert** profile.

A request to edit the H.323 stack trace configuration has been submitted by the responsible Service Support.

**Step by Step**

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance > Traces** in the navigation tree.
3. Click on **Traces > H.323 Stack Trace** in the menu tree.
4. Click on the **Edit H.323 Stack Trace Configuration** tab. The current settings for the H.323 stack trace configuration are displayed.
5. Change the desired settings if required.
6. Click on **Apply** followed by **OK**.

**25.8.4.19 How to Edit H.323 Modules****Prerequisites**

You are logged into the WBM with the **Expert** profile.

A request to edit the H.323 modules has been submitted by the responsible Service Support.

**Step by Step**

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance > Traces** in the navigation tree.
3. Click on **Traces > H.323 Stack Trace** in the menu tree.
4. Click on the **Edit All H.323 Modules** tab.
5. Select the desired setting for **Trace On**:
  - If you want to enable the trace for specific H.323 modules, select the check boxes for the desired H.323 modules. Disable the checkboxes of the H.323 modules for which the trace is to be deactivated.
  - If you want to disable the trace for all H.323 modules, click **None**.

6. Click on **Apply** followed by **OK**.

### 25.8.4.20 How to Download or Open the H.323 Stack Trace Log

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance** > **Traces** in the navigation tree.
3. Click on **Traces** > **H.323 Stack Trace** in the menu tree.
4. Click on the **Load H.323 Trace Log via HTTP** tab.
5. Click on **Load** followed by **OK**. The File Download window appears.
6. Select one of the following options:
  - If you want to save the H.323 stack trace log file, click **Save As**. Save the file in the desired directory and then close the window that confirms the download of the file.
  - To open the H.323 stack trace log file, click **Open**. The file is then displayed in the text editor.

### 25.8.4.21 How to Clear the H.323 Trace Log

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance** > **Traces** in the navigation tree.
3. Click on **Traces** > **H.323 Stack Trace** in the menu tree.
4. Click on the **Clear H.323 Trace Log** tab.
5. Click on **Delete Log** followed by **OK**.

### 25.8.4.22 How to Edit the License Component Trace

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

A request to edit the license component trace has been submitted by the responsible Service Support.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance** > **Traces** in the navigation tree.
3. Click on **Traces** > **License Component** > **CLA** in the menu tree.
4. Select one of the following options:

- If you want to stop the license component trace, select the item **Off** in the **Trace Level** drop-down list.
  - If you want a low level of detail for the trace recording, select the item **Low** in the **Trace Level** drop-down list.
  - If you want a medium level of detail for the trace recording, select the item **Standard** in the **Trace Level** drop-down list.
  - If you want a high level of detail for the trace recording, select the item **All** in the **Trace Level** drop-down list.
5. Click on **Apply**.

### 25.8.4.23 How to Display Details of a Trace Profile

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance > Traces** in the navigation tree.
3. Click on **Traces > Trace Profiles** in the menu tree. A list of all trace profiles appears. In addition, the names of all trace profiles are displayed in the menu tree. The bullet point color indicates the status of each individual trace profile.
4. Click the name of the desired trace profile in the menu tree. Details about this trace profile are displayed.

### 25.8.4.24 How to Stop all Trace Profiles

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance > Traces** in the navigation tree.
3. Click on **Traces > Trace Profiles** in the menu tree.
4. Click on the **Stop All Trace Profiles** tab.
5. Click on **Stop All** followed by **OK**.

### 25.8.4.25 How to Add a Trace Profile

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance > Traces** in the navigation tree.

3. Click on **Traces > Trace Profiles** in the menu tree.
4. Select one of the following options:
  - If you want to add a blank trace profile, click the **Add Trace Profile (Empty Profile)** tab.
  - If you want to add a trace profile containing the trace components of all trace profiles currently started, click the **Add Trace Profile (with Current Trace Settings)** tab. Select which of the displayed trace components (and with which trace level) should be included in the new trace profile.
5. Enter the name of the new trace profile in the **Profile Name** field.
6. Click on **Apply** followed by **OK**.

### 25.8.4.26 How to Display Trace Components

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance > Traces** in the navigation tree.
3. Click on **Traces > Trace Components** in the menu tree.
4. Select one of the following options:
  - If you want to display the list of all trace components, click the **Display All Trace Components** tab.
  - If you want to display the list of all started trace components, click the **Display Started Trace Components** tab.
  - If you want to display the list of all stopped trace components, click the **Display Stopped Trace Components** tab.

### 25.8.4.27 How to Display Details of a Trace Component

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance > Traces** in the navigation tree.
3. Click on **Traces > Trace Components** in the menu tree. A list of all trace components appears. In addition, the names of all trace components are displayed in the menu tree. The bullet point color indicates the status of each individual trace component.
4. Click on the name of the desired trace component in the menu tree. Details about this trace component are displayed.

## 25.8.4.28 How to Start or Stop a Trace Component

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance > Traces** in the navigation tree.
3. Click on **Traces > Trace Components** in the menu tree. The names of all trace components are displayed in the menu tree. A red bullet point indicates the trace components that can be started. A green bullet point indicates the trace components that can be stopped.
4. Click on the desired trace component in the menu tree.
5. Click on the **Start/Stop Trace Component** tab.
6. Select one of the following options:
  - To start a trace component, click **Start** and then **OK**.
  - To stop a trace component, click **Stop** and then **OK**.

## 25.8.4.29 How to Stop all Trace Components

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance > Traces** in the navigation tree.
3. Click on **Traces > Trace Components** in the menu tree.
4. Click on the **Stop All Trace Components** tab.
5. Click on **Stop All** followed by **OK**.

## 25.8.4.30 How to Set Trace Settings to Default Values

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance > Traces** in the navigation tree.
3. Click on **Traces > Trace Components** in the menu tree.
4. Click on the **Default Trace Settings** tab.
5. Click the **Default Trace Settings** button followed by **OK** in the next pop up message which notifies you that the action is completed successfully.

---

**NOTICE:** Extended tracing increases the general system load and it should not be permanently active. Trace settings should be set back to default by clicking **Default Trace Settings button** as soon as required traces have been successfully created.

---

---

**NOTICE:** If extended trace settings are active, you will be notified about this on the home page of the WBM in the **Notifications area**. **A direct link to the trace settings is also available.**

---

### 25.8.4.31 How to Edit Trace Components

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance > Traces** in the navigation tree.
3. Click on **Traces > Trace Components** in the menu tree.
4. Click on the **Edit Trace Components** tab. A list of all trace components is displayed with the current settings.
5. Change the desired settings.
6. Click on **Apply** followed by **OK**.

### 25.8.4.32 How to Forward System Log Files automatically

You can enable the option to forward automatically the system log files to an external management system/syslog server.

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click **Maintenance > Traces > Syslog Forwarding** in the navigation tree.
3. Enter the **IP address** and the **Port** of the management system in which the syslog file will be forwarded.
4. Click **Start** to save the configuration changes and initiate the process.

If the connection with the management portal/syslog server is successful then the **Connection status** has a green circle indicator.

If the connection with the management/syslog server portal is unsuccessful then the **Connection status** has a red circle indicator.

5. Click **Stop** to deactivate the process.

The **Connection status** is set to deactivated with a grey circle indicator.

6. If you change the configuration settings, click **Apply** for the changes to take effect.

### 25.8.4.33 How to Start the Kernel Crash Data Service

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

Your communication system has an V3 OCC mainboard (OCCLA, OCCMA(R), OCCMB(R)).

Make sure there is sufficient free space on the storage disk for the service to run correctly. The service requires a 200 MB of storage space. Disks affected are:

- SATA SSD 16GB (if no NVMe SSD is mounted)
- NVMe SSD

It is recommended to delete traces before starting the service, if you want to free up storage space.

#### Step by Step

1. In the navigation bar, click on **Expert mode**.
2. In the navigation tree, click on **Maintenance > Traces**.
3. Click on **Trace Components > Kernel Crash Data**.
4. Click on **Start**.

The Kernel Crash Data service starts and a system restart is automatically initiated. The service retains status after system restart.

### 25.8.4.34 How to Stop the Kernel Crash Data Service

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

Your communication system has an V3 OCC mainboard (OCCLA, OCCMA(R), OCCMB(R)).

#### Step by Step

1. In the navigation bar, click on **Expert mode**.
2. In the navigation tree, click on **Maintenance > Traces**.
3. Click on **Trace Components > Kernel Crash Data**.

4. Click on **Stop**.

The Kernel Crash Data service stops and a system restart is automatically initiated. The service retains status after system restart.

### 25.8.4.35 How to Start Media Server Trace

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert mode**.
2. In the navigation tree, click on **Maintenance > Traces**.
3. Click on **Media Server Trace**.
4. Select an option from the **Trace Level** drop-down list in order to define the level of detail for the trace.
5. Click on **Start**.

---

**NOTICE:** Active traces increase the general system load and can have a negative impact on system performance. So, Media Server trace should be disabled as soon as you finish your diagnostic activities.

---

### 25.8.4.36 How to Stop Media Server Trace

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert mode**.
2. In the navigation tree, click on **Maintenance > Traces**.
3. Click on **Media Server Trace**.
4. Click on **Stop**.

## 25.9 TCP Dump

A TCP dump is used for monitoring and evaluating data traffic in an IP network.

---

**INFO:** Activating a TCP dump can have a negative impact on system performance and must hence only be

performed by experienced administrators and only after consulting with the responsible Service Support.

---

TCP dump files are stored in the communication system. An appropriate application is required for the diagnosis of the files.

TCP dumps are often used to

- generate a LAN trace for a short period of time (e.g., for a reproducible error image).
- allow authorized service technicians to remotely access a LAN trace.

Advantages over RPCAP daemon: remote access is possible, so trace files do not have to be sent by e-mail

Disadvantages compared to RPCAP daemon: long-term traces are not meaningful; limited storage space, no capture filter can be set, more complex handling for several individual traces

## 25.9.1 How to Start a TCP Dump

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Traces > TCP Dump**.
3. Click on **Start TCP Dump**.
4. Select the desired settings.
5. Click on **Apply** followed by **OK**.

## 25.9.2 How to Stop a TCP Dump

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Traces > TCP Dump**.
3. Click on **Stop TCP Dump**.
4. Click on **OK**.

## 25.9.3 How to Delete a TCP Dump

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Traces > TCP Dump**.
3. Click on **Cleanup TCP Dump**.
4. Click on **Apply**, followed by **OK**.

## 25.10 RPCAP daemon

An RPCAP (Remote Packet Capture) daemon is used for monitoring and evaluating data traffic in an IP network.

---

**INFO:** Activating an RPCAP daemon can have a negative impact on system performance and must hence only be performed by experienced administrators and only after consulting with the responsible Service Support.

---

The RPCAP daemon enables external applications to remotely access the TCP/IP packets on the LAN interfaces of the communication system.

An RPCAP a daemon is often used for long-term traces, since the trace files are stored on a PC and not in the communication system.

Advantages over TCP dump: faster and easier to use, long-term traces possible, number and/or size of the trace files can be freely selected, trace of internal LAN possible

Disadvantages compared to TCP dump: double network traffic and therefore increased load on the LAN interfaces of the communication system, special opening of ports needed (firewall)

### 25.10.1 How to Enable the RPCAP Daemon

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

The RPCAP daemon was disabled.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Traces > rpcap Daemon**.
3. Select the desired settings.
4. Click on **Apply** followed by **OK**.

## 25.10.2 How to Disable the RPCAP Daemon

### Prerequisites

You are logged into the WBM with the **Expert** profile.

The rpcap daemon was enabled.

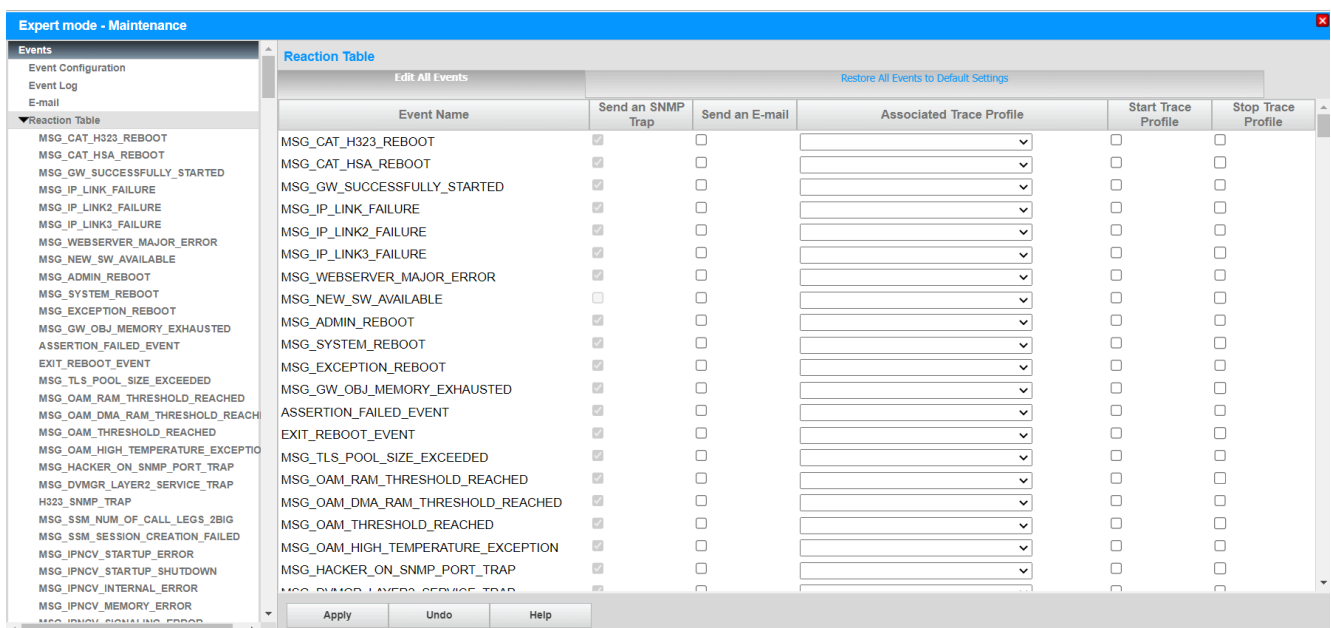

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Traces > rpcap Daemon**.
3. Click on **Apply** followed by **OK**.

## 25.11 Events

Events provide information about communication system deficiencies. All events are written to a log file that is restricted in size. A new file is created if the maximum file size is exceeded. Up to seven files can be created.

Depending on the setting in the reaction table and the problem class, events may generate an SNMP trap, trigger an e-mail and/or start or stop trace monitoring. The event log (Event Viewer) can be evaluated, configured, and saved via the WBM.

To interpret the event log file, you must download and extract the file with the WBM. The file can then be opened, edited and printed using any text editor. Once the event log file has been transferred, the file can be deleted from the communication system's memory.

Events that can trigger actions are defined by the following properties:

- Event code:

Identifies an event such as `MSG_ADMIN_LOGGED_OUT` = Logout information of an administrator.

- Event type:

The following different types exist:

- Information: plain status messages, no error messages.
- Warning: report of a possibly problematic procedure or status, but not an error message.
- Minor: error message. The error has no problematic consequences.
- Major: error message. This error could cause problems.
- Critical: Error Message. This error causes problems.
- Cleared: error message. The error was already corrected by the communication system.
- Indeterminate: error message. The cause of the error cannot be accurately determined.

- Event text

Some event texts contain variable data. These are identified in the following manner:

- %s: character string
- %u: positive or negative decimal number
- %f: floating point number
- %p: indicator (memory address)
- %x: hexadecimal number (with lower-case letters)
- %X: hexadecimal number (with upper-case letters)
- %C: single character
- %d and %I: positive decimal number

### Reaction Table

For each possible event, the Reaction Table can be used by an administrator with the **Expert** profile to independently define what action is to be taken when that event occurs.

You can set whether an SNMP trap should be sent, whether the communication system should be restarted, whether the e-mail should be sent, and whether a trace profile should be started or stopped. If the event is assigned a trace profile, the name of this profile is shown.

### E-mail Settings

These settings can be made by an administrator with the **Expert** profile to define how e-mails are sent when an event occurs.

### Diagnosis Logs

The communication system logs certain process-specific actions in diagnosis logs. These log files can be evaluated for diagnostic purposes by an administrator with the **Expert** profile.

### Alarm Signaling on Exceeding Critical Temperatures

Two critical temperature values are stored in the communication system. If the temperature of the system exceeds the first value, a warning is sent via an SNMP trap or e-mail to indicate that the system temperature is too high. In addition, this message can also be indicated on the displays of up to three system telephones (UP0 & HFA), see [How to Define Destinations for Alarm Signaling](#). If the second value is exceeded, the boards responsible for the overheating are shut down in a controlled manner (e.g., OpenScape Business Booster Card) or switched off (e.g., SLAV/SLAD). To clear the alarm and put the boards back into service, the system must be switched off and then switched on again.

The 3 destinations (system telephones) to be notified at on exceeding a temperature can be set.

## 25.11.1 How to Edit Switch Event Logging via a LAN

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click on **Maintenance > Events** in the navigation tree.
3. Click on **Events > Event Configuration** in the menu tree.
4. Select the desired setting.
  - If you want event logging to be transferred via LAN, select the check box **Switch Event Logging via LAN On**.
  - If you do not want event logging to be transferred via LAN, clear the check box **Switch Event Logging via LAN On**.
5. Click on **Apply** followed by **OK**.

## 25.11.2 How to Download the Event Log File

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click on **Maintenance > Events** in the navigation tree.
3. Click on **Events > Event Log** in the menu tree.
4. Click on the **Load via HTTP** tab.
5. Click on **Load** followed by **OK**. The File Download window appears.
6. Save the file in the desired directory. Then close the window that confirms the download of the file.

## 25.11.3 How to Delete an Event Log File

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click on **Maintenance** > **Events** in the navigation tree.
3. Click on **Events** > **Event Log** in the menu tree.
4. Click on the **Clear Event Log** tab.
5. Click on **Delete Log** followed by **OK**.

## 25.11.4 How to Edit E-Mail Settings for Events

### Prerequisites

You are logged into the WBM with the **Expert** profile.

**E-mail Forwarding** must be configured for all systems to use **Emergency Notifications recipient** option. For more information, see [How to Configure the Sending of E-mails](#) on page 188

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click on **Maintenance** > **Events** in the navigation tree.
3. Click on **Events** > **E-mail** in the menu tree.
4. Under **Subject**, enter what you want displayed as the Subject field of the e-mail.

---

**INFO:** The subject should state clearly that the e-mail concerns an event.

---

5. Enter the e-mail addresses to which the e-mail is sent in the fields **Recipient 1** through **Recipient 5**.
6. Enter the e-mail address of an on-site security officer to which an e-mail is sent when an emergency number is dialed in the **Emergency Recipient** field.

The subject of the e-mail is "New emergency call". The call number and the name of the caller, if configured, are included in the e-mail which are retrieved from the database of the system.

7. Click on **Apply** followed by **OK**.

## 25.11.5 How to Display the Event Reaction Table

### Prerequisites

You are logged into the WBM with the **Expert** profile.

**Step by Step**

1. In the navigation bar, click on **Expert Mode**.
2. Click on **Maintenance > Events** in the navigation tree.
3. Click on **Events > Reaction Table** in the menu tree. The reaction table is displayed with all possible events and their settings.

## 25.11.6 How to Edit the Reaction Settings for an Event

**Prerequisites**

You are logged into the WBM with the **Expert** profile.

**Step by Step**

1. In the navigation bar, click on **Expert Mode**.
2. Click on **Maintenance > Events** in the navigation tree.
3. Click on **Events > Reaction Table** in the menu tree. The reaction table is displayed with all possible events and their settings. In addition, the names of all possible events are displayed in the menu tree.
4. Click on the name of the desired event in the menu tree.
5. Click on the **Edit Event** tab. Details on the reaction settings for the desired event are displayed.

---

**INFO:** The reaction settings **Reset Gateway** and **Notify OpenScape** cannot be edited. It is not possible to change the **Send an SNMP Trap** setting for all events.

---

6. If possible, select the setting for **Send an SNMP Trap**:
  - If you want an SNMP trap to be sent when the event occurs, enable the check box **Send an SNMP Trap**.
  - If you do not want an SNMP trap to be sent when the event occurs, disable the **Send an SNMP Trap** check box.
7. Select the setting to **send an e-mail**:
  - If you want an e-mail to be sent when the event occurs, enable the check box **Send an E-mail**.
  - If you do not want an e-mail to be sent when the event occurs, disable the **Send an E-mail** check box.
8. Select the desired trace profile in the **Associated Trace Profile** drop-down list.
9. Select the setting to start or stop the trace profile:
  - If the selected trace profile is to be stopped when the event occurs, enable the check box **Start Trace Profile**.
  - If the selected trace profile is to be stopped when the event occurs, enable the check box **Stop Trace Profile**.
10. Click on **Apply** followed by **OK**.

## 25.11.7 How to Edit the Reaction Settings for Multiple Events

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click on **Maintenance > Events** in the navigation tree.
3. Click on **Events > Reaction Table** in the menu tree. The reaction table is displayed with all possible events and their reaction settings.

---

**INFO:** The reaction settings **Reset Gateway** and **Notify OpenScape** cannot be edited. It is not possible to change the **Send an SNMP Trap** setting for all events.

---

4. Change the reaction settings for the events you want in the reaction table:
  - If possible, select the setting for **Send an SNMP Trap**:  
If you want an SNMP trap to be sent when the event occurs, enable the check box **Send an SNMP Trap**.  
If you do not want an SNMP trap to be sent when the event occurs, disable the **Send an SNMP Trap** check box.
  - Select the setting to **send an e-mail**:  
If you want an e-mail to be sent when the event occurs, enable the check box **Send an E-mail**.  
If you do not want an e-mail to be sent when the event occurs, disable the **Send an E-mail** check box.
  - Select the desired trace profile in the **Associated Trace Profile** drop-down list.
  - Select the setting to start or stop the trace profile:  
If the selected trace profile is to be stopped when the event occurs, enable the check box **Start Trace Profile**.  
If the selected trace profile is to be started when the event occurs, enable the check box **Stop Trace Profile**.
5. Click on **Apply** followed by **OK**.

## 25.11.8 How to Download or Open Diagnosis Logs

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click on **Maintenance > Events** in the navigation tree.

3. Click on **Events > Diagnosis Logs** in the menu tree.
4. Click on the **Get Diagnosis Logs** tab. You will see a list of all available logs with the respective file name, file size in bytes, time of last activation and file attributes.
5. Click under **File Name** of the name of diagnosis log you want. The File Download window appears.
6. Save the file in the desired directory. Then close the window that confirms the download of the file.

## 25.11.9 How to Clear Diagnosis Logs

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click on **Maintenance > Events** in the navigation tree.
3. Click on **Events > Diagnosis Logs** in the menu tree. You will see a list of all available logs with the respective file name, file size in bytes, time of last activation and file attributes.
4. Click on the **Delete Diagnosis Logs** tab.
5. Click on **Delete Log** followed by **OK**.

## 25.11.10 How to Define Destinations for Alarm Signaling

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. Click on **Maintenance > Events** in the navigation tree.
3. Click on **Events > Alarm Signaling** in the menu tree.
4. In the **Stations 1-3** drop-down lists, select the three destinations (system telephones with display, UP0 & HFA) where a notification is to be displayed when the system temperature exceeds a preset critical value.
5. Click on **Apply**, followed by **OK**.

## 25.12 Configuration Data for Diagnostics

"Smaller" backup sets containing diagnostic data for Service Support can be created for diagnostic purposes. In contrast to normal backup sets, significantly smaller data amounts are produced for this purpose and can thus be easily sent with an e-mail, for example.

Diagnostics backup sets include, among other things, the configuration data of the communication system and the

UC Application (UC Smart or UC Suite). Voicemails, fax messages and announcements are not included.

The following media can be used to save backup sets for diagnostics:

- **USB Device**

The data can be backed up to a connected USB drive or a connected USB stick, for example.

---

**NOTICE:** If a USB hard disk, a partition thereof, or a USB stick is to be used for the backup, it must be formatted with FAT 32. Due to filesystem limitation, the maximum size of the backup set cannot exceed 4 GB. In such cases, alternate backup media must be selected. USB media formatted with NTFS are read-only. Note that if multiple partitions exist, only the first partition can be used for the backup.

If a bootable USB device is used for the backup, this USB device must be safely removed after the backup.

- **HTTPS**

The data can be saved via HTTPS on the hard disk of the client PC.

- **Hard Disk** (only for OpenScape UC X3/X5/X8 UC Booster Card (OCAB Application Board))

The data can be saved on the hard disk of the OCAB Application Board.

---

**INFO:** It is not possible to create a backup on the hard disk of the communication system.

---

## 25.12.1 How to Generate Configuration Data for Diagnostics

### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

### Step by Step

1. Click on **Data Backup** in the navigation bar.
2. In the navigation tree, click **Data Backup > Backup - Immediate**.

**Backup - Immediate**

Name: \_\_\_\_\_

Comment:

Complete Backup: ☐

Diagnosis data only: ☒  
(without voicemail / announcement files)

|                                        | Device | Server address | Path        | Login name | Max. backup sets |
|----------------------------------------|--------|----------------|-------------|------------|------------------|
| <input checked="" type="radio"/> HTTPS | -      | -              | -           | -          | -                |
| <input type="radio"/> Network drive    |        | 192.168.186.4  | backup_test | robot      | 3                |

OK & Next

3. Enable the **Diagnostics** check box.
4. Select the device on which the diagnostics backup set is to be saved. You have the following options:
  - If you want to save the data on a connected USB drive or a connected USB stick, enable the **USB Device** radio button.
  - If you want to back up the data using HTTPS on the hard disk of the client PC, enable the **HTTPS** radio button.
  - Only for OpenScape Business X3/X5/X8 with UC Booster Card (Application Board OCAB): If you want to save the data on the hard disk of the Application Board OCAB, select the **Hard Disk** radio button.
5. If required, enter a comment for your diagnostics backup set in the **Comment** field. Avoid the use of diacritical characters such as umlauts and special characters in your input.
6. Click on **OK & Next**. The progress of the backup process is displayed in a separate window.
7. The backup was successful if the message `Backup complete!` appears.
8. If you have selected **HTTPS** as a backup medium, you must save the diagnostics backup set and the associated text file with to a location of your choice. This is done automatically for the other backup media. The browser window must remain open until the save operation for the diagnostics backup set and text file has been completed.

---

**NOTICE:** If you selected **USB Device** as a backup medium, wait till the LED of the USB device stops flashing. It is only then that the diagnostics backup set has been completely stored on the USB device. You can then remove the USB device.

---

9. Click on **Finish**.

### **Next steps**

The diagnostics backup set can now be sent to the responsible Service Support by e-mail to assist in the troubleshooting process, for example.

## **25.13 Card Manager**

OpenScape Business is supplied with bootable mediums that contain the system software. The Card Manager is a tool intended for service support to create a new system software on an empty SDHC card, M.2 SATA SSD and UC Booster Card Hard disks (HDD). To do this, the software of the communication system must be available as a compatible image file.

The software on the SDHC card, M.2 SATA SSD or HDD is standard system software without customer data. It cannot be used for software updates or for backing up customer data. It is possible only in the case of the SDHC card to include a backup file during creation.

The Card Manager can be launched as an ISO image in a Linux boot DVD, a Linux Bootable USB stick or in a Virtual Environment.

The Card Manager software is available via the Partners Portal

### **Use Cases**

- Before delivery of the system, the software should be replaced with the latest software version.
- The storage device is defective and must be replaced by a new on which no software has yet been stored.
- The used software is corrupted and needs to be reloaded. All customer data is deleted in the process.

If a backup set exists for the recovery of the customer data, the newly installed software should match the software version with which the backup set was created so that the settings contained in the backup set can also be supported and processed by the installed software.

### **25.13.1 How to Use the Card Manager to Write the Communication Software on the M.2 SATA SSD**

You can use the Card Manager to write the communication software of OpenScape Business V3 on M.2 SATA SSD.

#### **Prerequisites**

The working memory of the PC should be at least 3 GB.

PC with a Windows 10 operating system DVD drive and at least 2 USB 2.0 or higher interfaces are available.

Card Manager Tool V3 or higher which is fully operational on a PC.

USB SATA SSD adapter is available. The adapter must have Key M and Key B support.

A qualified M.2 SATA SSD is available.

A System SW image in the correct version is available as a tar file. The SW version should match the version of the target system. It must be exactly the same version that is in use in the current storage device of the system.

Card Manager application as a DVD ISO file.

The Card Manager ISO file has to be burned to a DVD.

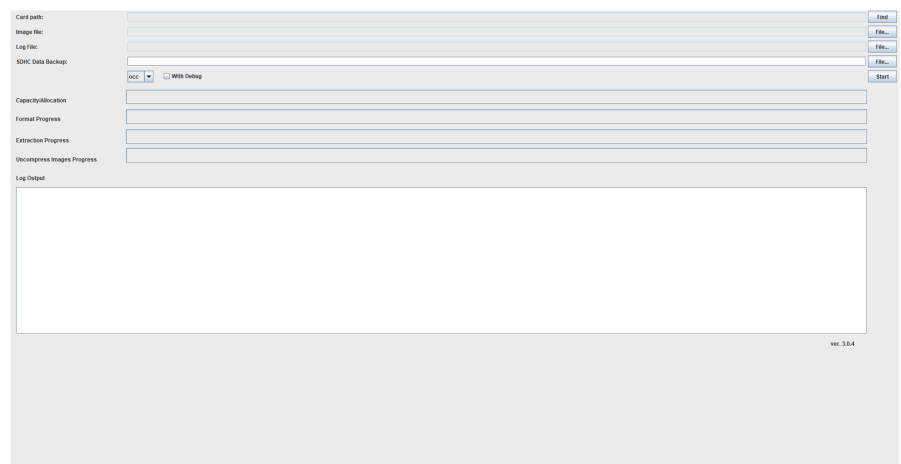

### Step by Step

1. Store the current image tar file on a USB stick and boot the Card Manager application from the DVD ISO file.
2. Connect the USB SATA SSD adapter into a USB port on the PC .
3. Insert the M.2 SATA SSD in the adapter and click **OK** on the pop-up to confirm the selection.

All data on the inserted SSD will be deleted by the Card Manager.

Do not insert any additional USB device to the PC, as it will be recognized as an OpenScape Business storage medium and all data will be deleted.

4. On the Card manager application, click **Find** next to **Card path**.

5. Insert USB stick with the image file and click on **File...** next to the **Image file** and select the image tar file stored on the USB Stick.
6. Select **OCCE** from the drop-down menu for creating the M.2 SATA SSD.
7. Optionally, you can also create a log file that records any program errors that may have occurred. To do this, click on **File...** next to **Log File** and navigate to the storage location of the log file. Enter a name for the log file and click on **Save**.
8. Click on **Start**.  
The write process is started and the progress of each step is displayed via a progress bar.
9. Click on **OK** once the installation is completed and remove the M.2 SATA SSD from the adapter.
10. Remove the adapter from the USB port.
11. Power off the communication system.

12. Insert the new M.2 SATA SSD into the switched off communication system.
13. Turn on the communication system. The system starts with the new M.2 SATA SSD, the same software version and configuration and is ready for operation when the green LED flashes at 1Hz (0.5 sec on / 0.5 sec off).

---

**NOTICE:** If the M.2 SATA SSD is inserted in an OpenScape Business communication system, the system is started in the factory default state including, among other things, the default IP address 192.168.1.2.

---

Restore a backup of the system. The backup should have the same minor version with the installed system.

### 25.13.2 How to Use the Card Manager to Write the Communication Software on the SDHC Card

You can use the Card Manager to write the communication software of OpenScape Business V3 on an SDHC Card.

#### Prerequisites

PC with a Windows 10 operating system DVD drive and at least 2 USB 2.0 or higher are available.

Card Manager Tool V3 or higher which is fully operational on a PC.

USB SDHC card reader is available.

A qualified SDHC card is available.

Optional a SDHC Data Backup file (tar file) stored on a USB stick together with the image system.

The write protection of the SDHC card is disabled.

A System SW image in the correct version is available as a tar file. This can be either the small (OCC) or the big (OCAB) image file. The SW version should match the version of the target system. It must be exactly the same version that is in use in the current SDHC card of the system.

Card Manager application as a DVD ISO file.

The Card Manager ISO file has to be burned to a DVD.

#### Step by Step

1. Store the current image tar file on a USB stick and boot the Card Manager application from the DVD ISO file.
2. Connect the USB SDHC card reader into a USB port of the PC.
3. Unplug the card reader, insert the SDHC card, plug in the card reader again and click **OK** on the pop-up window. The path of the SDHC card appears under **Card path**.

All data on the inserted SSD will be deleted by the Card Manager. Do not insert any additional USB device to the PC, as it will be recognized as an OpenScape Business storage medium and all data will be deleted.

4. On the Card manager application, click **Find** next to **Card path**.

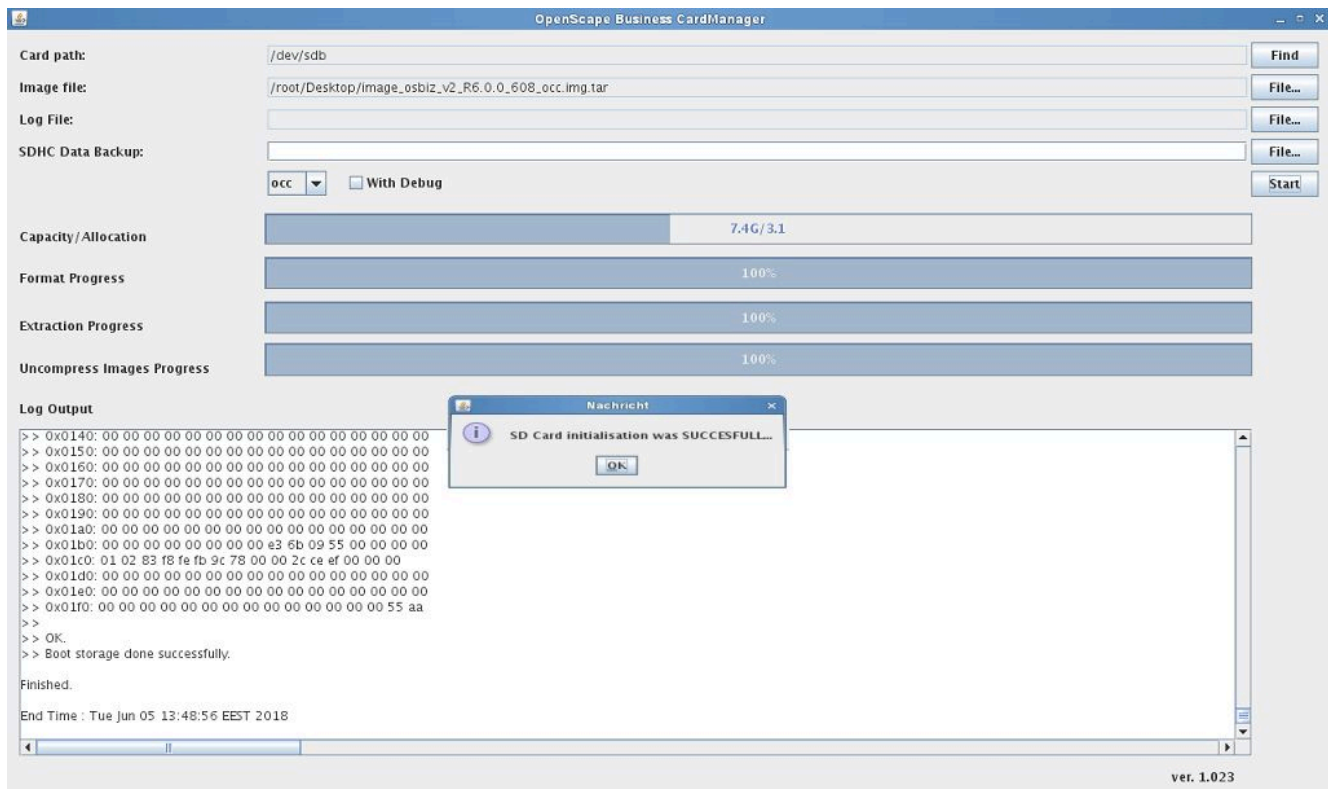

5. Insert USB stick with the image file and click on **File...** next to the **Image file** and select the image tar file stored on the USB Stick.
6. Select **OCC** from the drop-down menu for creating the SDHC card.
7. Optionally, you can also create a log file that records any program errors that may have occurred. To do this, click under **Log File** on **File...** and navigate to the storage location of the log file. Enter a name for the log file and confirm it with **Save**.
8. Optionally, click under **SDHC Data Backup** on **File...** and select the .tar file with a customer specific SDHC Card Data Backup file. The path to the .tar file appears under **SDHC Data Backup**.
9. Click on **Start**.

The write process is started and the progress of each step is displayed via a progress bar.

---

**NOTICE:** If the text field (**SDHC Data Backup**) is filled, Card Manager will firstly compare the version of the SDHC Card Backup file with the version of the system SW image file. In case of a mismatch an error message is displayed and the process is aborted. In case of a match, the Card Manager writes the selected image and then extracts the specified .tar file in the SDHC. If no SDHC Data Backup is available, the text field should remain empty.

---

10. Click on **OK** once the installation is completed and remove the SDHC card from the card reader.
11. Remove the card reader from the USB port.
12. Power off the communication system.
13. Insert the new SDHC card into the SD slot of the switched off communication system.
14. Turn on the communication system. The system starts with the new SDHC card and with the same software version and configuration and is ready for operation when the green LED flashes at 1Hz (0.5 sec on / 0.5 sec off).

---

**NOTICE:** If the SDHC card is inserted in an OpenScape Business communication system, the system is started in the factory default state including, among other things, the default IP address 192.168.1.2.

---

### 25.13.3 How to Use the Card Manager to Write the Communication Software on the OCAB hard disk

You can use the Card Manager to write the communication software of OpenScape Business V3 with OCAB on OCAB hard disk.

### Prerequisites

PC with a Windows 10 operating system DVD drive and at least 2 USB 2.0 or higher interfaces are available.

Card Manager Tool V3 or higher which is fully operational on a PC.

An adapter for the OCAB hard disk is available. The adapter must have Key M and Key B support.

A qualified OCAB hard disk is available.

A System SW image (OCAB) in the correct version is available as a tar file. The SW version should match the version of the target system. It must be exactly the same version that is in use in the current storage device of the system.

Card Manager application as an ISO file.

The Card Manager ISO file has to be burned to a DVD.

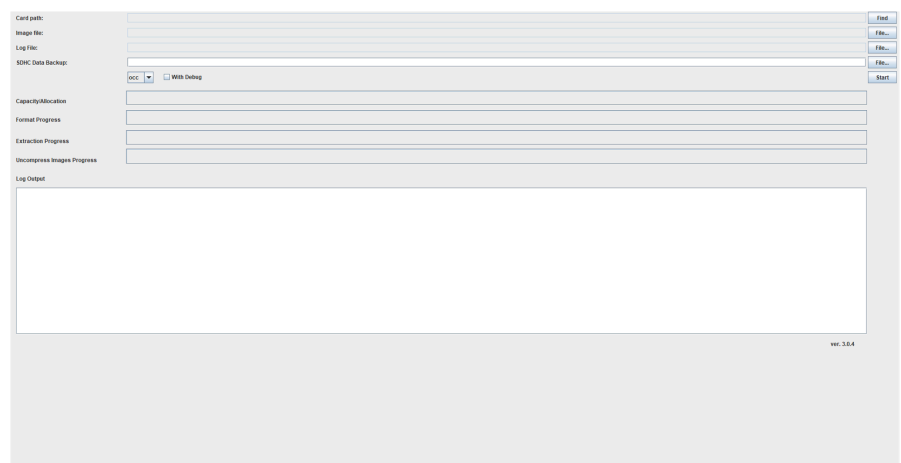

### Step by Step

1. Store the current image tar file on a USB stick and boot the Card Manager application from the DVD ISO file.
2. Connect the adapter into a USB port on the PC .
3. Insert the OCAB hard disk in the adapter and click **OK** on the pop-up to confirm the selection.

All data on the inserted hard disk will be deleted by the Card Manager.

Do not insert any additional USB device to the PC, as it will be recognized as an OpenScape Business storage medium and all data will be deleted.

4. On the Card manager application, click **Find** next to **Card path**.

5. Insert USB stick with the image file and click on **File...** next to the **Image file** and select the image tar file stored on the USB Stick.
6. Select **OCAB** from the drop-down menu for creating the OCAB hard disk.
7. Optionally, you can also create a log file that records any program errors that may have occurred. To do this, click on **File...** next to

## Maintenance

### Monitoring and Maintaining the UC Suite

**Log File** and navigate to the storage location of the log file. Enter a name for the log file and click on **Save**.

**8.** Click on **Start**.

The write process is started and the progress of each step is displayed via a progress bar.

**9.** Click on **OK** once the installation is completed and remove the OCAB hard disk from the adapter.

**10.** Remove the adapter from the USB port.

**11.** Power off the communication system.

**12.** Mount the new OCAB hard disk into the UC Booster Card and then insert it in the switched off communication system.

**13.** Turn on the communication system. The system starts with the new OCAB hard disk, the same software version and configuration and is ready for operation when the green LED flashes at 1Hz (0.5 sec on / 0.5 sec off).

---

#### NOTICE:

All customer media data are lost. You can do a restore of a system backup set to get these data back.

---

## 25.14 Monitoring and Maintaining the UC Suite

The WBM **Expert** profile offers administrators numerous functions for monitoring and maintaining the UC Suite.

### 25.14.1 Logging

The execution of the UC Suite is monitored internally by the system. **System Logging** can be used to set whether logs should be created. In addition, a log of the activities of the UC Suite (e.g., the start of a UC Suite client) is maintained in **Client Logs**.

The screenshot shows the 'Server' configuration window with the 'Logging' tab selected. The 'System Logging' section has a checkbox for 'Log Trace Messages (Verbose)' which is currently unchecked. The 'Client Logs' section has a text field for 'Client Log Path' and two checkboxes: 'Enable log upload' (unchecked) and 'Enable client logging' (checked). At the bottom of the window are 'Save' and 'Reset' buttons.

## System Logging

The following system logs can be enabled or disabled:

| System log                   | Default setting |
|------------------------------|-----------------|
| Log Trace Messages (Verbose) | Not activated   |

The results of the enabled system log are written daily to a log file with the designation `vs-yyyy-mm-dd.log` (e.g., `vs-2013-01-222.log`) and stored in the communication system under `/var/system/trace_log/vsl/log`.

---

**INFO:** The analysis of these log files can only be performed by Development.

---

## Client Logs

**Client Logs** are the log files of the UC Suite. For each UC Suite client (myPortal for Desktop, myAttendant, etc.) and station (user), a separate directory is created, and the relevant log files are stored in it. The logs record the activities of a subscriber such as starting the client, outgoing and incoming calls, etc.

---

**INFO:** The storage of client logs is supported only for the UC Suite clients used with Microsoft Windows operating systems.

---

The path in which the **CC-Logs** directory with the subdirectories for the individual UC Suite clients is to be stored can be defined. You can also select whether the directory is to be stored on every client PC or on a central PC or server on the network.

By default, the **CC-Logs** directory is stored in the following path:  
`<Drive>:\Documents and Settings/<PC User Name>/CC-Logs`

The retention period for **Client Logs** is 5 days. No changes are possible.

The logging of the UC Suite activities in **Client Logs** is enabled by default. Administrators with the **Advanced** profile can disable logging on a station-specific basis by using the **User Directory** wizard. An administrator with the **Expert** profile can disable logging on a station-specific basis in **Expert Mode**.

Depending on the scenario, the client logs are also stored by default on the hard disk of the UC Booster Card (OCAB), the UC Booster Server or the OpenScape Business S communication system. An administrator with the **Expert** profile can disable the saving of client logs on the system hard disk in **Expert Mode**.

An administrator with the **Advanced** profile can use the **Trace** wizard to download the client logs (log files) of the UC Suite clients (myPortal for Desktop, myAttendant, etc.) used by the internal subscribers.

An administrator with the **Expert** profile can use the **Expert mode** wizard to download the client logs (log files) of the UC Suite clients

(myPortal for Desktop, myAttendant, etc.) used by the internal subscribers.

### 25.14.1.1 How to Enable or Disable Recording of System Logs

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Applications > OpenScape Business UC Suite**.
3. Click on **Server**, followed by **Logging**.
4. Select one of the following options, under the **System Logging** area:
  - If trace messages are to be recorded daily in a log file, select the **Log Trace Messages (Verbose)** check box.
  - If you do not want trace messages to be recorded in a log file, clear the **Log Trace Messages (Verbose)** check box).
5. Click on **Save**.

### 25.14.1.2 How to Enable or Disable the Recording of Client Logs on a System-wide Basis

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Applications > OpenScape Business UC Suite**.
3. Click on **Server**, followed by **Logging**.
4. Select one of the following options, under the **System Logging** area:
  - If client logs are to be recorded, select the **Enable client logging** check box.
  - If you do not want client logs are to be recorded, clear the **Enable client logging** check box.

---

**INFO:** The recording of client logs is supported only for the UC Suite clients used with Microsoft Windows operating systems.

---

5. Click on **Save**.

### 25.14.1.3 How to Enable or Disable the Recording of Client Logs on a Station-specific Basis

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. In the navigation bar, click on **Setup**.
2. Click in the navigation tree on **Wizards > UC Suite**.
3. Click on **Edit** to start the **User Directory** wizard.
4. Mark the desired station in the user directory and click **Edit**.
5. Click on **My Preferences > Miscellaneous** in the menu tree.
6. Select one of the following options:
  - If client logs are to be recorded for the desired subscriber, select the **Log Debug Messages (Verbose)** check box.
  - If you do not want client logs are to be recorded for the desired subscriber, clear the **Log Debug Messages (Verbose)** check box.

---

**INFO:** The recording of client logs is supported only for the UC Suite clients used with Microsoft Windows operating systems.

---

7. Click on **Save**.
8. If you want to enable or disable the recording of client logs for further subscribers, repeat steps 4 through 7.

### 25.14.1.4 How to Configure the Storage Path for Client Log Files

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Applications > OpenScape Business UC Suite**.
3. Click on **Server**, followed by **Logging**.
4. In the field **Client Log Path:**, under the **Client Logs** area, enter the storage path in which the CC-Logs directory with the individual subdirectories of the UC Suite clients and their client log files are to be stored. Select one of the following options:
  - If the CC-Logs directory is to be stored on every client PC, enter the following, for example: <Drive>:\<Path>.
  - If the CC Logs directory is to be stored on a central PC or server on the network, enter the following, for example: \\<IP address>\<Drive>\<Path>.

---

**INFO:** The storage of client logs is supported only for the UC Suite clients used with Microsoft Windows operating systems.

---

5. Click on **Save**.

### 25.14.1.5 How to Enable or Disable Central Storage of Client Logs on the Hard Disk of the Communication System

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Applications > OpenScape Business UC Suite**.
3. Click on **Server**, followed by **Logging**.
4. Select one of the following options, under the **Client Logs** area:
  - If you want client logs to be saved on the hard disk of the UC Booster Card (OCAB), the UC Booster Server or the OpenScape Business S communication system, select the **Enable log upload** check box.
  - If you do not want client logs to be saved on the hard disk of the UC Booster Card (OCAB), the UC Booster Server or the OpenScape Business S communication system, clear the **Enable log upload** check box.

---

**INFO:** The recording of client logs is supported only for the UC Suite clients used with Microsoft Windows operating systems.

---

5. Click on **Save**.

### 25.14.1.6 How to Download the Client Logs of all Internal Stations

The **Trace** wizard can be used to download client logs (log files) of the UC Suite clients (myPortal for Desktop, myAttendant, etc.) used by internal subscribers. Client logs are supported only for the UC Suite clients used with Microsoft Windows operating systems.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. Click on **Service Center** in the navigation bar.
2. Click **Diagnostics > Trace** in the navigation tree.
3. Click on **Diagnosis Logs**.

4. Click on **No Log** to clear the check boxes of all logs.
5. Select the check box **Application Protocols**.
6. Select one of the following options:
  - If you want to download the entire existing log, select **Complete Trace Log** in the drop-down list.
  - If you want to download the log for today, select **Log from Today** in the drop-down list.
  - If you want to download the log for a specific time period, select **Own Selection** in the drop-down list. Then, select the beginning and end of the desired time period in the drop-down lists **From:** and **To:**.
7. Click on **Load** followed by **OK**. The File Download window appears.
8. Save the file in the desired directory. Then close the window that confirms the download of the file.
9. Click on **Next** followed by **Finish**.

## 25.14.2 Notification

**E-mail notifications** can be sent to the entered **Recipients** to provide advance warnings about critical disk usage levels for the hard disk, for example, or about errors.

The sending of e-mails can be linked to the following **conditions**:

| Conditions               | Default setting |
|--------------------------|-----------------|
| Send Critical Messages   | Enabled         |
| Send Crash Notifications | Activated       |

The Send Critical Messages and Send Crash Notifications settings should be enabled and thus sent. These messages warn the entered recipients about a potential problem that needs to be reported to the responsible Service Support.

In addition, you can define how many of the last lines of a log file should be included with the sent e-mail. The following system errors can be reported (in English only):

| System error                                                    |
|-----------------------------------------------------------------|
| NULL monitor                                                    |
| Could not notify Call Handler                                   |
| Terminate call failed                                           |
| Unable to load VM Structure from file                           |
| Alsa stuck                                                      |
| Alsa cancel failed                                              |
| MEN CallID 0                                                    |
| NULL alsa handle                                                |
| Database connection failed                                      |
| Rules engine logic failure                                      |
| Config schema format failure                                    |
| 90% Disk usage mark                                             |
| Main: Could not connect to the database !                       |
| Main: Could not load the configuration from the database!       |
| Main: Could not open configuration file !                       |
| Main: Could not read the settings from the configuration file ! |
| A segmentation fault was detected.                              |
| Database logic error                                            |
| Database schema error                                           |
| Connection Server failed to start                               |
| MultisiteSync failed to start                                   |
| Multisite failed to start                                       |
| TransferManager failed to start                                 |
| IPC failed to start                                             |
| ConferenceManager failed to start                               |
| CallManager failed to start                                     |
| MediaProcessing failed to start                                 |
| Queues failed to start                                          |
| Import failed to start                                          |
| Data client failed to start                                     |
| DirectoryClient failed to start                                 |
| DirectoryServer failed to start                                 |
| FV failed to start                                              |
| IM failed to start                                              |
| Switch failed to start                                          |

### 25.14.2.1 How to Configure E-mail Notifications of System Errors

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Applications > OpenScape Business UC Suite**.
3. Click on **Server** followed by **Notifications**.
4. Select the desired setting for the e-mail notification, under the **Email Notifications** area:
  - If you want e-mail notifications, activate the **Enable e-mail notifications of system errors** check box.
  - If you do not want e-mail notifications, clear the **Enable e-mail notifications of system errors** check box.
5. Enter the e-mail addresses of the individuals to whom e-mail notifications are to be sent in the **Recipients** field. Complete the input of each e-mail address by pressing Enter so that each e-mail address is in a separate line.
6. Select the desired setting for critical messages
  - If you do want e-mail notifications for critical messages, activate the **Send Critical Messages** check box.
  - If you do not want e-mail notifications for critical messages, clear the **Send Critical Messages** check box.
7. Select the desired setting for crash notifications
  - If you do want e-mail notifications for system crashes, activate the **Send Crash Notifications** check box.
  - If you do not want e-mail notifications for system crashes, clear the **Send Crash Notifications**.
8. Enter the number of log file lines to be sent with an e-mail in the **Send Lines of Log File** field.

9. Click on **Save**.

## 25.14.3 Maintenance

Retention periods can be defined via the Maintenance for messages, for call information in the Call Journal, for calls recorded with myAgent, for faxes and e-mails received and sent for the Contact Center and for log files.

You can also set at what time the following data for which the set retention periods have expired is deleted on a daily basis:

- Messages
- Call information in the call journal (call history)
- Calls recorded with myAgent (contact center)
- Faxes and e-mails received and sent for the Contact Center
- Log files

The default setting is 2:00 a.m.

In addition, it is also possible to start the system maintenance immediately and to thus initiate the immediate deletion of the above data for which the respectively set retention periods have expired. This may be necessary, for example, if the hard disk capacity of the communication system has reached a critical level.

The screenshot shows a web-based configuration interface for a server. At the top, there's a 'Server' header with several tabs: 'General Settings', 'Live Record', 'Logging', 'Notifications', 'Maintenance' (which is highlighted in blue), 'VoiceMail', and 'Contact Card Mapping'. Below the tabs, the 'Maintenance' section is expanded. It contains four main categories of settings, each with a list of items and their retention periods in days. The first category is 'Maintenance' with a single setting 'Begin system maintenance at' set to '02:00' and a 'Clear Up Now' button. The second category is 'Message' with four settings: 'Keep inbox messages for' (60 days), 'Keep played / read messages for' (30 days), 'Keep saved messages for' (365 days), and 'Keep deleted messages for' (30 days). The third category is 'Fax' with four settings: 'Keep inbox faxes for' (4 days), 'Keep read faxes for' (5 days), 'Keep deleted faxes for' (5 days), and 'Keep sent faxes for' (5 days). The fourth category is 'Calls Information Maintenance' with two settings: 'Keep call history for' (365 days) and 'Close conversation after' (5 days). At the bottom of the form, there are 'Save' and 'Reset' buttons.

For more information on **Message Maintenance**, see [Voicemail Box](#) .

For more information on **Maintaining Fax Messages**, see [Fax Box](#) .

For more information on **Calls Information Maintenance**: Call History, see [Journal](#) .

With **Calls Information Maintenance: Contact Center**, the calls recorded with myAgent and the received and sent faxes and e-mails for the Contact Center that have exceeded the set retention period are deleted. The default setting for the retention period for contact center data is 60 days.

**INFO:** The retention periods for the maintenance of the call information are independent of one another.

Contact Center reports are based on the call history. If a shorter retention period was set for the call history than for the contact center data, some reports may no longer be available.

---

During **Log File Maintenance**, the log files for which the set retention periods have expired are deleted. The default setting for the retention period for log files is 10 days.

### 25.14.3.1 How to Configure the Time for Maintenance

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Applications > OpenScape Business UC Suite**.
3. Click on **Server** followed by **Maintenance**.
4. Enter the time at which the daily maintenance is to be performed in the **Begin system maintenance at** field, under the **Maintenance** area. Routine system maintenance tasks such as deleting messages, call information in the call journal, and log files for which the set retention periods have expired will then be initiated at the time specified here.
5. Click on **Save**.

### 25.14.3.2 How to Configure Retention Periods for Log Files

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Applications > OpenScape Business UC Suite**.
3. Click on **Server** followed by **Maintenance**.
4. Enter the retention period in days in the **Keep log information for** field, under the **Log File Maintenance** area. Log files are deleted when the retention period specified here expires.
5. Click on **Save**.

### 25.14.3.3 How to Perform Immediate System Maintenance

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Applications > OpenScape Business UC Suite**.
3. Click on **Server** followed by **Maintenance**.
4. Click on **Clear Up Now**, under the **Maintenance** area.

---

**INFO:** The following items for which the set retention periods have been exceeded are deleted: messages, call information in the call journal, calls recorded with myAgent, received and sent faxes and e-mails for the contact center and the log files.

---

5. Click on **OK** to confirm the deletion.

## 25.14.3.4 How to Configure the Retention Period for Contact Center Data

### Prerequisites

You are logged into the WBM with the **Expert** profile.

### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Applications > OpenScape Business UC Suite**.
3. Click on **Server** followed by **Maintenance**.
4. Enter the retention period in days in the **Contact Center** field, under the **Calls Information Maintenance** area. The calls recorded with myAgent and the received and sent faxes and e-mails for the contact center will be deleted if they have exceeded the retention period set here.
5. Click on **Save**.

## 25.15 Monitoring the UC Smart

Administrators can query the current status of the UC Smart using the WBM in **Expert** mode.

### 25.15.1 How to Query the Current Status of UC Smart

#### Prerequisites

You are logged into the WBM with the **Expert** profile.

#### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Applications > UC Smart**.

### 3. Click on **Status**.

The current status of the application server and the number of active connections for each UC client is displayed.

## 25.16 Remote Services

Different Remote Services provide remote access to the communication system and the connected components to authorized service technicians. This reduces the cost of maintenance activities, while still providing users with on-site support in solving their problems.

Due to the highest level of security, the RSP.servicelink should be given precedence over Remote Service. For more information see [RSP.servicelink](#).

### 25.16.1 RSP.servicelink

Remote access with RSP.servicelink connectivity (**Remote Service Platform**) offers authorized service technicians of a Remote Service Partner the option to remotely administer the communication system as well as the UC Booster applications comfortably and securely from a distance. To configure RSP.servicelink, only an Internet connection, a web browser, the partner ID and the partner password of the remote service partner are required. RSP.servicelink ensures a broadband connection with high security.

RSP.servicelink is based on OpenVPN technology. It uses the SSL/TLS protocol and encryption and provides the highest level of security with an additional client certificate. The term RSP.servicelink is abbreviated to RSP in the documentation.

---

**NOTICE:** RSP is using the range 100.64.0.1 - 100.127.255.254 for the tun0 interface, when RSP is active, which means that if an external IP within this range needs to be accessed, a static route should be added in the Open Scope Business system to route the traffic through the desired interface.

---

RSP offers the following major advantages in combination with OpenScopeBusiness:

- High security through outbound Internet connection

The entire remote connection setup is always initiated by the communication system. This means that the firewall of the customer network must only allow one HTTP connection to a single address in the Remote Service Center (port 443). Under normal circumstances, no change is required in the security policies of customers or their firewalls, since this port is usually already open for outbound internet call in the firewall of the customer. High security for the customer network is thus guaranteed.

With RSP, the administrator of the communication system retains control over the remote connection by simply enabling and disabling access. In the case of RSP.servicelink, a client certificate is automatically installed as well.

- High bandwidth

Due to the broadband Internet connection, diagnostics data can be transmitted much faster, thus increasing the quality of service.

- Simple and cost-effective setup

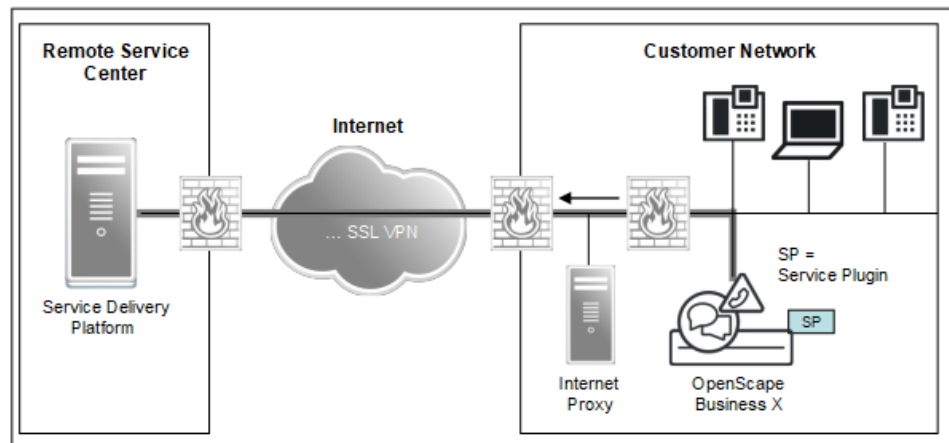

The software of the communication system already includes a so-called RSP.servicelink. When activating the service plugin, the partner ID of the Remote Service Partner and also the partner password must be entered.

Every remote service partner who uses the RSP.servicelink has a separate partner ID.

The RSP.servicelink plugin should be deactivated and then reactivated when a software update is going to be performed.

- Future-proof

RSP is the basis for future (value-added) services such as automated backups, reporting and monitoring, for example.

**Figure 17: RSP - Overview for OpenScape Business X**

RSP supports all the usual Web Services Standards, including the Hypertext Transfer Protocol Secure (HTTPS), Simple Object Access Protocol (SOAP) and Extensible Markup Language (XML).

Communication between the client side and the Remote Service Center is always secured with an AES-256-CBC encryption for RSP.servicelink.

## Service Plugins

The RSP.servicelink plugin can be enabled or disabled individually.

The RSP.servicelink plugin must be reset after the mainboard has been replaced, for example. Resetting the service plugin deletes the entire RSP configuration and disables the plugin.

---

**NOTICE:** In case the system is not in DTAG mode and the RSP.servicelink plugin is active, it is not possible to change the proxy settings configuration. The **Registration / Configuration button is disabled.**

In DTAG mode, if RSP.servicelink plugin is active, pressing Registration / Configuration button shows directly Proxy Settings page with Abort/Finish buttons. This is also possible from the remote server.

---

## Device Management (Managed Device)

In communication systems without a UC Booster, remote access to further devices (e.g., Xpressions Compact) in the customer LAN can be enabled by configuration on the SIRA side. IP phones can be configured on the SIRA side by using the "Managed Devices" function.

---

**INFO:** Remote access to other OpenScape Business communication systems in the customer LAN is not possible. Each OpenScape Business must be configured for remote access.

---

## Activating/Deactivating

The following options are available for activating or deactivating the service plugins:

- Using the **Activation / Deactivation** wizard

There is a separate activation/deactivation wizard for the RSP service plugins.

- By entering a code at the system telephone (default: activation via \*996, deactivation via #996)

For security reasons, a 4-digit PIN must be entered in addition to the code for the activation and deactivation via a system telephone. The configuration of this PIN is performed in the WBM of the communication system with the **Advanced** profile.

## Backup and Restore

RSP credentials are stored in the backup set of the system.

If a new OpenScape Business system is set up via cloning or via data restore (migration), and the original system had RSP access configured, it has to be ensured that the cloned or restored system has a different RSP configuration active.

You have to deactivate or uninstall the RSP before cloning or backing up the original system.

If a certificate for connecting to RSP is used in more than one systems, then the certificate will be revoked and none of the OpenScape systems will be able to connect to RSP service.

### Prerequisites

- Internet access for the communication system or the HTTP proxy in the customer LAN.
- Any existing firewall in the customer LAN must be opened for Registrar:
  - https://188.64.18.51
  - https://188.64.17.51
- Any existing firewall in the customer LAN must be opened for VPN:
  - https://188.64.18.50
  - https://188.64.17.50
- A default router must be specified in the Internet configuration.

---

**NOTICE:** In case the system is in DTAG mode during system startup and has internet access without the RSP.serviceplugin being installed and configured, then a script will automatically install, configure and activate RSP.serviceplugin using the PartnerID and password for DTAG (device name will be the MAC address of the system). The script will also be called periodically every 10 minutes (e.g for the case where is no internet access after initial system installation). The script will not activate automatically RSP.serviceplugin in case the user has manually deactivated it.

---

### 25.16.1.1 How to Install, Configure and Register the RSP.servicelink Plugin

The **Registration / Configuration** wizard can be used to install, configure and register the RSP.servicelink Plugin for remote access to the communication system using RSP.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. Click on **Service Center** in the navigation bar.
2. Click on **Remote Access** in the navigation tree.
3. Click on **Registration / Configuration**.
4. If the RSP.servicelink plugin is not yet installed, click on **Install** and then on **OK & Next**.
5. If the RSP.servicelink plugin is already installed, click **OK & Next**.
6. If no proxy server is used in the customer network, click **OK & Next**, since the **Proxy Parameters** do not need to be configured. Skip the next two steps.

7. If a proxy server is used in the customer network, you must select the **Proxy Parameters** setting depending on the customer network:
  - If a proxy with the HTTP protocol exists in the customer network, select the **Enable HTTP Proxy** check box. Enter the host name on the **HTTP Proxy Host** field and the port number of the proxy server in the **HTTP Proxy Port** field. If required, enter the user name and password required for the authentication at the proxy server in the **User Name** and **Password** fields.
  - If a proxy with the SOCKS protocol exists on the customer network, select the **Enable SOCKS Proxy** check box. Enter the host name on the **SOCKS Proxy Host** field and the port number of the proxy server in the **SOCKS Proxy Port** field. If required, enter the user name and password required for the authentication at the proxy server in the **User Name** and **Password** fields.

---

**INFO:** The type and configuration of the proxy server determines whether or not authentication is required.

---

8. Click **OK & Next**.
9. Change the preset partner ID in the **Partner ID** field only if required.
10. Enter your password in the **Password** field.
11. Enter the device name. You can find the device with the device name in the SIRA Equipment Explorer (EqE). The MAC address of the OpenScape Business is the default entry.
12. Click **Finish**.

The **Connection Status** row in the **RSP.servicelink** column indicates whether the registration was successful. In the event of an unsuccessful registration, the following error messages may be displayed:

- MAC already registered:  
Solution: Delete the device (= OpenScape Business communication system) on the SIRA Equipment Explorer and register it again with the **Registration / Configuration** wizard.

---

**NOTICE:** You can find the device on the SIRA Equipment Explorer through the device name or the MAC address. The device name or the MAC address of the OpenScape Business communication system can be found in the **Service Center** under **Remote Access**.

---

- Configuration Error:  
Solution: Re-enter the Partner ID and Password in the **Registration / Configuration** wizard and exit the wizard correctly.
- Wrong Credentials:

Solution: Re-enter the Partner ID and Password in the **Registration / Configuration** wizard and exit the wizard correctly.

### 25.16.1.2 How to Enable the RSP.servicelink Plugin

The **Activation / Deactivation** wizard can be used to disable the RSP.servicelink Plugin for remote access to the communication system using RSP.

#### Prerequisites

A functioning DNS configuration is available.

A default router for Internet access or, alternatively, a proxy server in the customer network is available.

The RSP.servicelink Plugin is deactivated.

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. Click on **Service Center** in the navigation bar.
2. Click on **Remote Access** in the navigation tree.
3. Click in the **RSP.servicelink** column on **Enable / Disable**.
4. Click **Activate**.

### 25.16.1.3 How to Disable the RSP.servicelink Plugin

The **Activation / Deactivation** wizard can be used to disable the RSP.servicelink Plugin for remote access to the communication system.

#### Prerequisites

The RSP.servicelink plugin is enabled.

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. Click on **Service Center** in the navigation bar.
2. Click on **Remote Access** in the navigation tree.
3. Click on **Enable/ Disable** in the **RSP.servicelink** column.
4. Click on **Deactivate**.

### 25.16.1.4 How to Reset the RSP Service Plugin

The **Activation / Deactivation** wizard can be used to reset the RSP Service Plugin. This deletes the entire RSP configuration and disables the plugin.

**Prerequisites**

You are logged on to the WBM with the **Advanced** profile.

**Step by Step**

1. Click on **Service Center** in the navigation bar.
2. Click on **Remote Access** in the navigation tree.
3. Click in the **RSP.servicelink** column on **Enable / Disable**.
4. Click **Reset to Default** followed by **OK**.
5. Click in the **RSP.servicelink** column on **Enable / Disable**.
6. Click on **Deactivate**.
7. Delete the device on the SIRA server (= OpenScape Business communication system).

---

**NOTICE:** You can find the device on the SIRA server via the MAC address. The MAC address of the OpenScape Business communication system can be found in the **Service Center** under **Inventory**.

---

### 25.16.1.5 How to Configure a PIN for Activating and Deactivating the RSP.servicelink Plugin

The PIN for activating and deactivating the RSP.servicelink plugin via a system telephone.

**Prerequisites**

You are logged on to the WBM with the **Advanced** profile.

**Step by Step**

1. Click on **Service Center** in the navigation bar.
2. Click on **Remote Access** in the navigation tree.
3. Enter the desired four-digit PIN in the **PIN** field.
4. Click **Save** followed by **OK**.

**Next steps**

The activation of the primary service plugin via a system phone occurs by entering the corresponding code (default code = \*996), followed by the four-digit PIN.

The deactivation of the service plugins via a system phone occurs by entering the corresponding code (default code = #996), followed by the four-digit PIN.

## 25.16.2 Remote Access

Remote access can be used by authorized service technicians to access the OpenScape Business X communication systems remotely

via an Internet connection. This ensures that support is available when solving administration tasks or performing troubleshooting.

You must enable remote access to activate remote access to the communication system. The following access method is possible:

### Remote Access via Internet Connection

---

**INFO:** Remote access via an Internet connection presents a higher security risk.

---

To dial in via the Internet, the service technician needs a special port (**Port Number**) to access the communication system. Port number 10099 is specified by default. When using an external router, port forwarding must be set up in the external router for this port number.

The port number must not be blocked by a possible firewall on the PC of the service technician. Port number selection should therefore be coordinated with the service technician.

The UC Booster Applications (e.g., UC Suite, Open Directory Service, Gate View) cannot be administered via this remote access.

You must disable remote access to block remote access to the communication system.

---

**NOTICE:** To prevent unauthorized access to the communication system, remote access must be turned off when completing the remote administration.

---

## 25.16.2.1 How to Enable Remote Access via ISDN

The **Remote Access** wizard can be used to provide authorized service technicians with access to the communication system via an ISDN connection.

### Prerequisites

OpenScape Business X has an ISDN trunk connection.

You are logged on to the WBM with the **Advanced** profile.

### Step by Step

1. Click on **Service Center** in the navigation bar.
2. Click on **Remote Access** in the navigation tree.
3. Click on **Remote Access** to start the **Remote Access** wizard.
4. Activate the radio button **Remote access: on** to enable remote access.
5. Activate the radio button **Remote Access via: ISDN** to enable remote access via ISDN.
6. Enter the internal call number you want to use for remote access in the **Call No** field.

7. Enter the DID number you want to use for remote access in the **MSN/DID Number** field.
8. Click on **OK & Next** followed by **Finish**.

### 25.16.2.2 How to Configure PCs with Microsoft Windows Vista for Remote Access via ISDN

#### Prerequisites

The PC is equipped with an ISDN card and has an ISDN trunk connection.

An OpenScape Business X3/X5/X8 communication system with a point-to-point connection is to be accessed. The local area code and PABX number of the communication system are known.

Remote access via ISDN has been enabled. The dial-in number for remote access to the communication system is available.

The User Name and Password for accessing the communication system are known.

---

**INFO:** The following description applies to a PC with the Microsoft Windows Vista operating system. The procedure for PCs with the Microsoft Windows XP operating system is analogous to the one described below.

---

#### Step by Step

1. Click **Start** in Windows Vista and select **Connect To**. The **Connect to a network** window appears.
2. Click on **Set up a connection or network**.
3. Click on the connection option **Connect to a workplace** and then on **Next**.
4. Click on **Dial directly**.
5. In the **Telephone number** field, enter the CO code (e.g., 0), followed by the local area code (e.g., 089), the PABX number (e.g., 12345678) and the dial-in number (e.g., 666).  
The complete entry for the example above would thus be:  
008912345678666
6. Enter a designation for this connection in the **Destination name** field.
7. Enable the check box **Don't connect now; just set it up so I can connect later**.
8. Click on **Next**.
9. Enter the user name for accessing the communication system in the **User name** field
10. and the password for accessing the communication system in the **Password** field.

---

**NOTICE:** The default user name and the default password for system access via the Manager E service tool are used as the default credentials for accessing the communication system.

---

11. Click on **Create**.
12. Click on **Connect now**.

This enables remote access to the communication system.

---

**INFO:** To deactivate the connection, click on **Start > Connect To**. Click on the designation of the connection defined in step 6 (**Destination name**) and then on **Disconnect**.

To activate the connection, click on the designation defined in step 6 (**Destination name**) and then on **Connect**.

---

### 25.16.2.3 How to Configure PCs with Microsoft Windows 7 for Remote Access via ISDN

#### Prerequisites

The PC is equipped with an ISDN card and has an ISDN trunk connection.

An OpenScape Business X3/X5/X8 communication system with a point-to-point connection is to be accessed. The local area code and PABX number of the communication system are known.

Remote access via ISDN has been enabled. The dial-in number for remote access to the communication system is available.

The User Name and Password for accessing the communication system are known.

---

**INFO:** The following description applies to a PC with the Microsoft Windows 7 operating system

---

#### Step by Step

1. Click in the **Start** menu of Windows 7 on **Control Panel**.
2. Click on **Network and Internet**.
3. Click on **Network and Sharing Center**.
4. Click on **Set up a connection or network**.
5. Click on the connection option **Connect to a workplace** and then on **Next**.
6. Click on **Dial directly**.

7. In the **Telephone number** field, enter the CO code (e.g., 0), followed by the local area code (e.g., 089), the PABX number (e.g., 12345678) and the dial-in number (e.g., 666).  
The complete entry for the example above would thus be:  
008912345678666
8. Enter a designation for this connection in the **Destination name** field.
9. Enable the check box **Don't connect now; just set it up so I can connect later**.
10. Click on **Next**.
11. Enter the user name for accessing the communication system in the **User name** field
12. and the password for accessing the communication system in the **Password** field.

---

**NOTICE:** The default user name and the default password for system access via the Manager E service tool are used as the default credentials for accessing the communication system.

---

13. Click on **Create**.
14. Click on **Connect now**. The message `Connection established` then appears.
15. Click on **Close**.

This enables remote access to the communication system.

---

**INFO:** To deactivate the connection, click on the **Networking** icon in the toolbar. Click on the designation of the connection defined in step 8 (**Destination name**) and then on **Disconnect**.

To activate the connection, click on the designation defined in step 8 (**Destination name**) and then on **Connect**.

---

#### 25.16.2.4 How to Enable Remote Access via Internet Access with a Fixed IP Address

The **Remote Access** wizard can be used to provide authorized service technicians with access to the communication system via an Internet connection.

##### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

You have a port number which can be used for Internet access to the communication system by the service technician. This port number must not be blocked by a possible firewall on the PC of the service technician.

### Step by Step

1. Click on **Service Center** in the navigation bar.
2. Click on **Remote Access** in the navigation tree.
3. Click on **Remote Access** to start the **Remote Access** wizard.
4. Activate the radio button **Remote access: on** to enable remote access.
5. Enable the radio button **Remote Access via: Internet** to enable remote access via the Internet.
6. Enter the port number you want to use for remote access in the **Port Number** field.  
Port number 10099 is specified by default.
7. Click on **OK & Next**. The message *Remote Access has been activated ...* is displayed. This message includes the URL, via which the communication server can be accessed remotely using a web browser.
8. Click on **Finish**.

### 25.16.2.5 How to Enable Remote Access via Internet Access without a Fixed IP Address

The **Remote Access** wizard can be used to provide authorized service technicians with access to the communication system via an Internet connection.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

You have a port number which can be used for Internet access to the communication system by the service technician. This port number must not be blocked by a possible firewall on the PC of the service technician.

A DynDNS account is available.

### Step by Step

1. Click on **Service Center** in the navigation bar.
2. Click on **Remote Access** in the navigation tree.
3. Click on **Remote Access** to start the **Remote Access** wizard.
4. Activate the radio button **Remote access: on** to enable remote access.
5. Enable the radio button **Remote Access via: Internet** to enable remote access via the Internet.
6. Enter the port number you want to use for remote access in the **Port Number** field.  
Port number 10099 is specified by default.
7. Click on **OK & Next** to accept the entries. The **Configure DynDNS-Account** window appears.
8. Enter the user name for your DynDNS account with the DynDNS provider in the **Login Name** field if this is not already displayed.

9. Enter the password of your DynDNS account with the DynDNS provider in the **Password** and **Retype Password** fields if this is not already displayed.
10. In the **Hostname** field, enter the host name assigned to you by the DynDNS provider, but without the domain name (e.g., `myhost`) if this is not already displayed.
11. Select your DynDNS provider in the **Domain name** drop-down list (e.g., `dyndns.org`) if this is not already displayed. Your complete domain name would then be `myhost.dyndns.org`, for example.
12. Click on **Connection test**. The **Test DynDNS Access** window appears.
13. Click on **OK**. The DynDNS access data is now transmitted to the provider. This takes about 10 seconds.
14. If the test was successful, the message `Remote Access has been activated ...` is displayed. This message includes the URL, via which the communication server can be accessed remotely using a web browser. Click on **Finish**.
15. If the test was successful, click **OK**. Notes on the possible causes of errors, if any, will appear in the subsequent **DynDNS Access** window. Click on **OK**. The **Configure DynDNS-Account** window appears. You can now check and correct the access data you had entered (steps 8 through 11) if required). Continue as described under step 12.

### 25.16.2.6 How to Disable Remote Access

The **Remote Access** wizard can also be used to disable remote access.

#### Prerequisites

You are logged on to the WBM with the **Advanced** profile.

#### Step by Step

1. Click on **Service Center** in the navigation bar.
2. Click on **Remote Access** in the navigation tree.
3. Click on **Remote Access** to start the **Remote Access** wizard. Shows whether remote access via the Internet and/or ISDN is enabled.
4. Activate the radio button **Remote access: off** to disable remote access.
5. Select the remote access option you want to disable:
  - If you want to disable remote access via the Internet, enable the **Remote Access via: Internet** radio button.
  - If you want to disable remote access via ISDN, enable the **Remote Access via: ISDN** radio button.
6. Click on **OK & Next**.
7. Click on **Back** if you also want to deactivate the second remote-access option. Repeat steps 4 through 6.

8. Click on **Finish**.

### 25.16.3 Online User

The Online User enables the remote control, verification and monitoring of OpenStage telephones via a Windows PC. The behavior of an OpenStage telephone is recreated via the Online User on the PC.

In order to communicate with an OpenStage phone, the phone software must have a so-called dongle key.

The following entries must be made via the Online User in order to access an OpenStage telephone:

- OpenStage phone type
- IP address of the OpenStage telephone
- Administrator password of the OpenStage telephone

Details on using the Online User can be obtained from the following documentation: *OpenStage HUSIM Phone Tester User Guide*. Access to this document is available via the intranet portal for technical product documentation at [http://apps.g-dms.com:8081/techdoc/search\\_en.htm](http://apps.g-dms.com:8081/techdoc/search_en.htm).

The Manager E service tool provides online users for the remote control, testing and monitoring of OpenStage phones.

---

**NOTICE:** The gateway IP address reported by Online User is the same as system IP address. Gateway IP address is not the default-route IP address.

---

#### 25.16.3.1 How to Start the Online User

##### Prerequisites

You are logged into the WBM with the **Expert** profile.

##### Step by Step

1. In the navigation bar, click on **Expert Mode**.
2. In the navigation tree, click on **Maintenance > Online User**. The login window of the Online User is displayed.
3. Select the model of the desired OpenStage telephone from the **Model** drop-down list.
4. Enter the IP address of the desired OpenStage telephone in the **Phone IP** field.
5. Enter the administrator password of the desired OpenStage telephone in the **Password** field. The default administrator password is 123456.
6. Select the desired transport protocol in the **Protocol** drop-down list.

7. Select one of the following options for the Internet Protocol Version IPv:
  - If you want to use Internet Protocol Version 4, select the option **IPv4**.
  - If you want to use Internet Protocol Version 6, select the option **IPv6**.
8. Select the number of key modules in the **Number of Key Modules** drop-down list.
9. Click on **OK** to initiate access to the desired OpenStage telephone.

---

**INFO:** Details on the operation of the Online User can be found in the *OpenStage HUSIM Phone Tester User Guide*, which can be retrieved from [http://apps.g-dms.com:8081/techdoc/search\\_en.htm](http://apps.g-dms.com:8081/techdoc/search_en.htm).

---

## 26 Migration

Open Scape Business V1, V2 systems and HiPath 3000 systems can be migrated/upgraded to OpenScape Business V3.

The following migration / upgrade scenarios are supported by OpenScape Business V3 software.

---

**NOTICE:** It is vital to delete active Unify Phone users prior to e.g. system migrations, to avoid critical discrepancies between the OpenScape Business database and the cloud database. More information can be found in the Unify Experts Wiki [Unify Phone Whitepaper](#).

---

---

**NOTICE:** See also [How to Delete Unify Phone Users](#) on page 1175.

---

### **OpenScape Business X System including UC Booster Card or Booster Server**

- Software Upgrade from OpenScape Business X V2 to V3 with "V2 Mainboard"
- Hardware/Software Migration from OpenScape Business X V2 to V3 with "V3 Mainboard"
- Hardware/Software Migration from OpenScape Business X V1 to V3 with "V3 Mainboard"
- Hardware/Software Migration from OpenScape Business X V3 with "V2 Mainboard" to V3 with "V3 Mainboard"

### **OpenScape Business S System**

- Software Upgrade from OpenScape Business S V2 to V3

### **OpenScape Business Network**

- Migration / Upgrade of an OpenScape Business network from V2 to V3

### **HiPath 3000 including OpenScape Office HX**

- Hardware Migration HiPath 3000 including OpenScape Office HX

### **HiPath 500**

- Hardware Migration HiPath 500 to OpenScape Business X1 V3

Depending on the source system, existing licenses can be transferred completely or partially. The same applies to the further use of peripheral modules and connected terminal devices.

Existing software support for OpenScape Business Systems will stay unchanged after the migration.

You can reduce the migration / upgrade efforts for the continued use of existing licenses, compared to an "offline" license transfer,

by connecting the OpenScape Business System to the Unify Central License Server and using the **CLS Connect** feature .

Within this section, the following terms are used:

|                     |                                                                               |
|---------------------|-------------------------------------------------------------------------------|
| <b>Migration</b>    | in case of Hardware and Software change                                       |
| <b>Upgrade</b>      | in case of a pure Software change                                             |
| <b>V2 mainboard</b> | term used for the mainboard family introduced with OpenScape Business.        |
| <b>V3 mainboard</b> | term used for the mainboard family that has been introduced with Software V3. |

---

**NOTICE:** A prerequisite for all migration scenarios in order to upgrade from a V2 mainboard to a V3 mainboard system, is that the administrator has to upload the backup set via HTTPS device. Other devices such as Hard Disk, FTP or Network drive are not supported and will fail the migration process.

---

---

**NOTICE:** There are two valid migration paths depending on the software version of the OSBiz system. Either use a backup set from a V2 hardware system on the latest V2R7 bind, or use the same V3 software bind on both the V2 mainboard and V3 mainboard systems to ensure consistency in the database.

---

---

**NOTICE:** If an OpenScape Office V3 MX/LX system will be replaced with an OpenScape Business system, the last one must be ordered as a new system.

---

## 26.1 Software Upgrade for OpenScape Business X Systems

A Software upgrade of OpenScape Business X systems essentially involves replacing some of the SW components.

Before upgrading the software of an OpenScape Business X system, you must determine the current system configuration and the hardware/software and license components to be replaced, if applicable.

**Table 31: OpenScape Business X Software Upgrade - Hardware/Software Checklist**

| Components                 | Replaced by                    |
|----------------------------|--------------------------------|
| <b>Hardware Components</b> |                                |
| Xpressions Compact card    | Smart VM or UC Suite Voicemail |

| Components                          | Replaced by                                              |
|-------------------------------------|----------------------------------------------------------|
| <b>Software Components</b>          |                                                          |
| V2 Systems software on SDHC card    | V3 System software (image from Software Download Server) |
| VPN on WAN in the system terminated | VPN in external router terminated                        |
| XMPP                                | No follow-on solution                                    |
| myPortal Smart                      | myPortal @work                                           |
| <b>License Components</b>           |                                                          |
| Licenses in license file            | Transfer of the licenses into a new license file         |

### 26.1.1 Software Upgrade of OpenScape Business X V2 to OpenScape Business X V3

When you SW upgrade an OpenScape Business X model from software version V2 to V3, only the system software is replaced - the V2 mainboard and any existing UC booster card or booster server are retained. Existing licenses and the customer configuration are maintained. The existing software support will continue unchanged after the migration.

Before the software upgrade from version V2 to V3, if not already existing, you must set up a permanent access to the Unify License Server (via Internet) in the system and activate the function **CLS Connect**. This simplifies the license transfer and shortens the migration time considerably.

#### Prerequisites

For the SW upgrade and the transfer of the existing customer configuration, the system must be operated with the last released SW version V2R7 before the upgrade. If necessary, upgrade the system to the latest SW version. To do this, the system must have a valid Software Support status.

For the system SW upgrade from V2 to V3, depending on whether CLS Connect is used or not, the following item is required:

- OpenScape Business V3 SW Upgrade License (only when **CLS Connect** is not used)

#### Functional boundary conditions and restrictions

You can completely transfer existing licenses from the existing V2 mainboard to the V3 mainboard in the course of the migration. License transfer without activating the CLS Connect function requires the "SW Upgrade" license and a much more complex handling and time expenditure than using the CLS Connect function.

The customer configuration and customer data are automatically transferred from SW version V2 to V3 during the SW upgrade process.

The main technical steps of the SW upgrade are described in the following chapters. To retain the existing licenses a distinction regarding the handling is made between:

- SW Upgrade for permanent licensing with and without CLS Connect
- SW Upgrade with PayGo licensing

#### 26.1.1.1 SW Upgrade of permanently licensed systems with CLS Connect

Perform the following upgrade steps in sequence.

##### Step by Step

1. Prepare the OpenScape Business System
  - a) Upgrade the existing system to software version V2R7.
  - b) Set up access to the Unify Central License Server (CLS) in the system and test the connection.
  - c) Activate **CLS Connect** in the system.
2. Perform software upgrade
  - a) Perform software upgrade to V3 via the OpenScape Business Assistant.
  - b) System configuration is automatically transferred to V3.
  - c) Existing licenses are taken over after V3.
3. Automatic generation of the license file by the central license server.

After restarting the system, the system transfers the information that the existing licenses are operated with software version 3 to the CLS.

#### 26.1.1.2 SW Upgrade of permanently licensed systems without CLS Connect

Perform the following upgrade steps in sequence.

##### Step by Step

1. Prepare the OpenScape Business System.
  - a) Upgrade the existing system to SW version V2R7.
2. Create "Upgrade License File" for the V2 system at the Central License Server (CLS)
  - a) Activate the "SW Upgrade License" for the existing system.
  - b) Generate a new license file for the MAC address of the V2 mainboard
  - c) Download the license file from CLS
3. Import and activate the license file in the OpenScape Business V2 system.
4. Perform SW upgrade.
  - a) Perform SW Upgrade to V3 via the OpenScape Business Assistant.

## Migration

### Software Upgrade of UC Booster Server to OpenScape Business X V3

- b) System configuration is automatically transferred to V3.
- c) Licenses existing in the system are transferred to V3
- 5. Reboot the system after SW upgrade.

#### 26.1.1.3 SW Upgrade of PayGo licensed systems

Perform the following upgrade steps in sequence.

##### Step by Step

1. Prepare OpenScape Business System
  - a) Upgrade the existing system to SW version V2R7.
2. Regenerate the license file on the central license server (CLS)
  - a) Regenerate a new license file for the MAC address of the V2 mainboard.
  - b) Download the license file from CLS.
3. Import and activate the new license file in the OpenScape Business V2 system.
4. SW Upgrade OpenScape Business SW
  - a) Performing a SW upgrade to V3 via the OpenScape Business Assistant.
  - b) System configuration is automatically transferred to V3.
  - c) The system is ready for operation after restart.

## 26.2 Software Upgrade of UC Booster Server to OpenScape Business X V3

The SW upgrade from a UC Booster Server V2 to version V3 can be done in one step.

A SW upgrade from a UC Booster Server V1 to version V3 must be done in two steps. First upgrade from V1 to V2R7, then from V2R7 to V3.

### 26.2.1 How to Upgrade UC Business Booster Server V2 to V3

The SW Upgrade of the UC Booster Server from V2 to V3 is only necessary for OpenScape Business X systems with a V2 Mainboard. OpenScape Business X systems with V3 mainboards do not require a UC Booster Server any longer. In this case SW version V2.7 is required on the UC Booster Server to migrate customer configuration and licenses to the V3 mainboard.

##### Prerequisites

- Linux operating system must be checked and upgraded if necessary (see *technical Release note for OpenScape Business V3 system SW*)

- UC Booster Server is operated with the last released SW version V2R7 before the upgrade. If necessary, upgrade the system to the latest SW version.
- First update the OpenScape Business X system to which the UC Booster Server is connected to SW Version V3 including licensing according to description in [Software Upgrade of OpenScape Business X V2 to OpenScape Business X V3](#) on page 1350
- UC Booster Server SW Image V3

Before a UC Booster Server SW upgrade, determine the current system configuration and the HW / SW and license components that may need to be replaced.

**Table 32: OpenScape Business S Migration - HW/SW Checklist**

| Components                                                                  | Replaced by                                                                                           |
|-----------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------|
| <b>Hardware Components</b>                                                  |                                                                                                       |
| Server PC                                                                   | Reuse is possible. HW Requirements must be checked for OpenScape Business S extensions. <sup>10</sup> |
| <b>Software Components</b>                                                  |                                                                                                       |
| SLES 12 Operating System                                                    | Reuse is possible. Eventually an upgrade to latest service pack is required <sup>11</sup>             |
| XMPP                                                                        | No follow-on solution                                                                                 |
| myPortal Smart                                                              | myPortal @work                                                                                        |
| <b>License Components</b>                                                   |                                                                                                       |
| Licenses in license file (is part of the OpenScape Business X license file) | Transfer of the licenses into a new license file                                                      |

<sup>10</sup> The existing server PC HW can be used when the configuration of the UC Booster Server System remains unchanged after the SW upgrade. If expansions are planned after the SW upgrade, the hardware requirements may need to be adapted according to the specifications in *OpenScape Business S Installation Guide, chapter Prerequisites*.

<sup>11</sup> The SLES operating system installed on the server PC can be adopted in case of a UC Booster Server SW upgrade. However, it should be upgraded to the last released service pack before the SW upgrade.

If Novell has discontinued SW support for the SLES version used, the customer must be informed and, if necessary, a SLES upgrade must be marketed.

The SLES upgrade may have to be performed in several steps to take over existing OpenScape Business S installations including the customer configuration and customer data. An existing SLES Update Key remains valid with a SLES Upgrade. However, it may have to be de-registered with Novell before the SLES upgrade and then re-registered for the new system.

## Migration

### Hardware/Software Migration of OpenScape Business X Systems to V3

| Components                                       | Replaced by                                                                                       |
|--------------------------------------------------|---------------------------------------------------------------------------------------------------|
| CSTA application ( via UC Booster card / server) | CSTA license for connecting external solutions (not required for UC Suite, TAPI 170 and TAPI 120) |

The following describes the OpenScape Business SW Upgrade while keeping the SLES operating system.

#### Step by Step

1. Upgrade OpenScape Business X system to V3.  
See [Software Upgrade of OpenScape Business X V2 to OpenScape Business X V3](#) on page 1350 for details.
2. Upgrade the UC Booster Server SW to V3  
Use the upgrade function within the OpenScape Business Assistant of the UC Booster Server to upgrade the V2R7 SW to the version V3 (see [Updating the Communication System](#) on page 1226).
3. Perform a data backup after SW upgrade  
Back up your V3 data (see [Immediate Backup](#) on page 1219)

## 26.3 Hardware/Software Migration of OpenScape Business X Systems to V3

When migrating OpenScape Business X systems, both HW, SW and license components are exchanged.

Before migrating a Business X system, determine the current system configuration and the HW / SW as well as license components to be replaced.

---

**NOTICE:** The OCCLA board with V3 system can go up to 60 (+16) MEB channels. Migration to the new board is restoring the existing OCC configuration. If you want to take advantage of the additional MEB Channels, then you should reconfigure your system by using the appropriate wizards/WBM pages.

---

Modules that are present in slot 10 of OpenScape Business X5 wall systems cannot be operated in conjunction with V3 mainboards. These modules must be replaced by successor modules / solutions.

**Table 33: OpenScape Business X Migration - HW/SW Checklist**

| Component                  | Replaced by                                                  |
|----------------------------|--------------------------------------------------------------|
| <b>Hardware Components</b> |                                                              |
| Existing "V2 mainboard"    | V3 mainboard (basic or advanced, depending on configuration) |

| Component                                                                                                        | Replaced by                                                                                                                      |
|------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| UC Booster card / server (with UC Suite)                                                                         | Additional M.2 SSD                                                                                                               |
| CMA module                                                                                                       | CMAe module                                                                                                                      |
| EXMR module for external announcement devices                                                                    | V3 Mainboard (Audio In jack on the front panel)                                                                                  |
| S0 interfaces on the V2 Mainboard                                                                                | S0 terminal of S0 peripheral card                                                                                                |
| Xpressions Compact card                                                                                          | Smart VM or UC Suite Voicemail                                                                                                   |
| X5W cards for slot 10 <ul style="list-style-type: none"><li>• SLCN16</li><li>• SLA16N</li><li>• SLA24N</li></ul> | Replaced by: <ul style="list-style-type: none"><li>• Cordless direct connect</li><li>• SLAV16</li><li>• SLAV16 + SLAV8</li></ul> |
| Optipoint 500 phones                                                                                             | OpenScape Deskphone CP phones                                                                                                    |
| Optipoint 400 phones                                                                                             |                                                                                                                                  |
| <b>Software Components</b>                                                                                       |                                                                                                                                  |
| V2 System SW on SDHC card                                                                                        | V3 System SW (Image from Software Download Server)                                                                               |
| VPN on WAN in the system terminated                                                                              | VPN in external router terminated                                                                                                |
| XMPP                                                                                                             | No follow-on solution                                                                                                            |
| myPortal Smart                                                                                                   | myPortal @work                                                                                                                   |
| <b>License Components</b>                                                                                        |                                                                                                                                  |
| Licenses in license file                                                                                         | Transfer of the licenses into a new license file                                                                                 |
| External CSTA applications (up to now license-free, because connected to UC Booster card / Server HW)            | Separate CSTA license for connecting external solutions (not required for UC Suite, TAPI 170 and TAPI 120)                       |

### 26.3.1 Migration from OpenScape Business X V2 to OpenScape Business X V3

When migrating an OpenScape Business X model from V2 to V3, the mainboard and the system software are replaced. Existing licenses and the customer configuration can be transferred. The existing software support is continued unchanged after the migration.

Before the migration, if not already existing, configure a permanent access to the Unify License Server (via Internet) in the system and activate the "CLS Connect" feature. This simplifies the license transfer and shortens the migration time considerably. The customer must be informed about the required access from the OpenScape Business System to the CLS.

### Prerequisites

The system is operated with the last released SW version V2R7 before the upgrade. When necessary, upgrade the system to the latest SW version. To do this, the system must have a valid Software Support status.

For the migration from V2 to V3, depending on whether CLS Connect, UC Suite or external CSTA applications are used, the following items are required:

- V3 Mainboard
- V3 SW on M.2 SATA SSD data storage
- M.2 SSD 256 GB mass data storage (optional with UC Suite application)
- OpenScape Business V3 HW Migration License (if CLS Connect is not used)
- OpenScape Business CSTA License (optional)

### Functional boundary conditions and restrictions

Existing licenses can be completely transferred from the existing V2 mainboard to the V3 mainboard during the migration. The license transfer without activating the CLS Connect function requires the "HW Migration" license and a much more complex handling and time expenditure than using the CLS Connect function.

The customer configuration and customer data are migrated from SW version V2 to V3 via a backup / restore process.

The main technical steps of the migration are described in the following topics. In order to retain the existing licenses a distinction regarding the handling is made between:

- SW Upgrade for permanent licensing with and without CLS Connect
- SW Upgrade with PayGo licensing

---

**NOTICE:** During the migration from V2 Mainboard to V3 Mainboard, the additional EVM ports are not additionally included in the SmartVM hunt group. This requires manual configuration, in the course of which one the COS restriction should be also made.

---

### 26.3.1.1 How to Migrate to V3 Permanently Licensed Systems with CLS Connect

Perform the following migration steps in sequence.

#### Step by Step

1. Prepare the OpenScape Business System
  - a) Upgrade the existing system to SW version V2R7
  - b) Set up access to the Central License Server (CLS) in the system and test the connection
  - c) Activate CLS Connect in the system

2. Generate license file at the central license server (CLS)
  - a) Transfer the existing licenses from the MAC address of the V2 mainboard to the MAC address of the V3 mainboard using the **Regenerate** function
  - b) Generate a new license file for the MAC address of the V3 mainboard
3. Backup the V2 system configuration and customer data.
4. Exchange mainboards
  - a) Shut down the system and switch off all supply voltages
  - b) Use V3 data carrier and if necessary optional mass data storage on the V3 mainboard
  - c) Remove the OCCB Voice Channel Booster card from the V2 mainboard and plug it into the V3 mainboard.
  - d) Replace V2 Mainboard by V3 Mainboard in the system
  - e) Switch on supply voltages again  
The system boots automatically.
5. Set basic system parameters within WBM after startup
  - a) Set system date and time
  - b) Set application package  
UC Smart for system without UC or with UC Smart  
UC Suite for systems with UC Suite
6. Restore the system configuration
  - a) Restoring the backup using the restore function
  - b) Importing the newly created license file

### 26.3.1.2 How to Migrate to V3 Permanently Licensed Systems without CLS Connect

Perform the following migration steps in sequence.

#### Step by Step

1. Prepare the OpenScape Business System
  - a) Upgrade the existing system to SW version V2R7
2. Create "migration license file" for the V2 system at the central license server (CLS)
  - a) Activate the "HW Migration License" for the existing system
  - b) Generate a new license file for the MAC address of the V2 mainboard.  
For this, enter the MAC address of the V3 mainboard.
  - c) Download the license file from CLS
3. Import the license file into the OpenScape Business V2 system
4. Take a note of the **Confirmation Code** displayed in the OpenScape Business Assistant
5. Generate a new license file for the V3 mainboard at the central license server (CLS)

- a) Create a new license file for the MAC address of the V3 mainboard at the CLS by regenerating the MAC address of the V2 mainboard and the previously noted confirmation code
- b) Search for the OpenScape Business System with the MAC address of the V3 mainboard in the CLS.
- c) Unlock the OpenScape Business System by entering and activating the Confirmation Code
- d) Regenerate the license file
- e) Download the newly generated license file from CLS
- 6.** Backup the V2 system configuration and customer data.
- 7.** Exchange mainboards
  - a) Shut down the system and switch off all supply voltages
    - a)** Use V3 data carrier and if necessary optional mass data storage on the V3 mainboard
    - b)** Remove the OCCB Voice Channel Booster card from the V2 mainboard and plug it into the V3 mainboard.
    - c)** Replace V2 Mainboard by V3 Mainboard in the system
  - b) Switch on supply voltages again  
The system boots automatically.
- 8.** Set basic system parameters within WBM after start-up
  - a) Set system date and time
  - b) Set application package  
UC Smart for system without UC or with UC Smart  
UC Suite for systems with UC Suite
- 9.** Restore the system configuration
  - a) Restore the backup using the restore function
- 10.** Import manually the new license file into the V3 system after system start-up

### 26.3.1.3 How to Migrate to V3 PayGo Licensed Systems

Perform the following migration steps in sequence.

#### Step by Step

- 1.** Prepare the OpenScape Business System
  - a) Upgrade the existing system to SW version V2R7
- 2.** Backup the V2 system configuration and customer data.
- 3.** Regenerate the license file on the central license server (CLS)
  - a) Regenerate a new license file for the MAC address of the V3 mainboard  
Transfer the existing licenses from the MAC address of the V2 mainboard to the MAC address of the V3 mainboard.
  - b) Download the new license file from the CLS
- 4.** Exchange mainboards
  - a) Shut down the system and switch off all supply voltages
  - b) Use V3 data carrier and if necessary optional mass data storage on the V3 mainboard

- c) Remove the OCCB Voice Channel Booster card from the V2 mainboard and plug it into the V3 mainboard.
- d) Replace V2 Mainboard by V3 Mainboard in the system
- e) Switch on supply voltages again  
The system boots automatically.
- 5. Set basic system parameters within WBM after startup
  - a) Set system date and time
  - b) Set application package  
UC Smart for system without UC or with UC Smart  
UC Suite for systems with UC Suite
- 6. Restore the system configuration
  - a) Restore the backup using the restore function
- 7. Import manually the new license file into the V3 system and activate the license file

## 26.4 Migration of an OpenScape Business X V3 System from V2 Mainboard to V3 Mainboard

In this scenario, the existing V2 mainboard of the OpenScape Business System and any UC Booster HW that can be present are replaced with a V3 mainboard. The system was previously upgraded to SW version V3, for example, in the course of the SW support.

Existing licenses and the customer configuration can be transferred. The existing software support service will continue unchanged after the migration.

A possibly existing UC Booster Card or a UC Booster Server is no longer necessary in connection with the V3 mainboard. An additional mass data storage is used on the V3 mainboard for this purpose.

In [Table 33: OpenScape Business X Migration - HW/SW Checklist](#) on page 1354 you can find information which components are substituted by using the V3 mainboard or are discontinued without substitution. A CSTA license is required for an existing connection of external CSTA applications. This does not apply to the connection of OpenScape TAPI 170 or TAPI 120.

### Prerequisites

The system is operated with the last released SW version V2R7 before the upgrade. If necessary, upgrade the system to the latest SW version. To do this, the system must have a valid Software Support status.

For the migration, the following items are required, depending on whether CLS Connect, UC Suite or external CSTA applications are used:

- V3 Mainboard
- V3 SW on M.2 SATA SSD data storage
- M2 SSD 256 GB mass data storage (optional with UC Suite application)
- OpenScape Business V3 HW Migration License (optional)

- OpenScape Business CSTA License (optional)

### Functional boundary conditions and restrictions

Existing licenses can be completely transferred from the existing V2 mainboard to the V3 mainboard in the course of the migration. The license transfer without activating the CLS Connect function requires the "HW Migration" license and a much more complex handling and time consuming than using the CLS Connect function.

The customer configuration and customer data are transferred via a backup / restore process.

The main technical steps of the migration are described in the following topics. In order to retain the existing licenses a distinction regarding the handling is made between:

- SW Upgrade for permanent licensing with and without CLS Connect
- SW Upgrade with PayGo licensing

---

**NOTICE:** During the migration from V2 Mainboard to V3 Mainboard, the additional EVM ports are not additionally included in the SmartVM hunt group. This requires manual configuration, in the course of which one the COS restriction should be also made.

---

Converting a KDS in the same software version to a different system type is not supported by Manager E. If you want to only use the KDS data you can try the following steps:

- Perform a full V2 mainboard to V3 mainboard system migration.
- Download the V3 mainboard system KDS with Manager E and store it locally.
- Reload the V3 mainboard system.
- Upload the previously stored V3 mainboard system KDS in your V3 mainboard system.

The V3 mainboard system will use the KDS database configuration and you can continue with the manual UC configuration.

---

**NOTICE:** Migrating the V2 mainboard system KDS to the V3 mainboard system is not supported, as the V2 mainboard database is not compatible with the V3 mainboard database.

---

## 26.4.1 How to Migrate to V3 Mainboard Permanently Licensed Systems with CLS Connect

Perform the following migration steps in sequence.

### Step by Step

1. Prepare the OpenScape Business System
  - a) Set up access to the Central License Server (CLS) in the system and test the connection

- b) Activate CLS Connect in the system
- 2. Generate license file at the central license server (CLS)
  - a) Transfer the existing licenses from the MAC address of the V2 mainboard to the MAC address of the V3 mainboard using the **Regenerate** function
  - b) Generate a new license file for the MAC address of the V3 mainboard
- 3. Backup the V3 system configuration and customer data.
- 4. Create a backup of the Booster Server configuration if necessary.
- 5. Exchange mainboards
  - a) Shut down the system and switch off all power supplies
  - b) Use V3 data carrier and if necessary optional mass data storage on the V3 mainboard
  - c) Remove the OCCB Voice Channel Booster card from the V2 mainboard and plug it into the V3 mainboard.
  - d) Replace V2 Mainboard by V3 Mainboard in the system
  - e) Switch on supply voltages again

The system boots automatically.
- 6. Set basic system parameters within WBM after startup
  - a) Set system date and time
  - b) Set application package
    - UC Smart for system without UC or with UC Smart
    - UC Suite for systems with UC Suite
- 7. Restore the system configuration
  - a) Import the newly created license file
  - b) Restore the system backup and, if necessary, the Boster Server backup using the restore function

## 26.4.2 How to Migrate to V3 Mainboard Permanently Licensed Systems without CLS Connect

Perform the following migration steps in sequence.

### Step by Step

- 1. Create "migration license file" for the existing V2 mainboard at the central license server (CLS)
  - a) Activate the "HW Migration License" for the existing system
  - b) Generate a new license file for the MAC address of the V2 mainboard
    - For this, the MAC address of the V3 mainboard must be entered.
  - c) Download the license file from CLS
- 2. Import the license file into the OpenScape Business System with V2 mainboard.
- 3. Take a note of the **Confirmation Code** displayed in the OpenScape Business Assistant
- 4. Generate a new license file for the V3 mainboard at the central license server (CLS)

- a) Create a new license file for the MAC address of the V3 mainboard at the CLS by regenerating the MAC address of the V2 mainboard and the previously noted confirmation code.
  - a) Search for the OpenScape Business System with the MAC address of the V3 mainboard in the CLS.
  - b) Unlock the OpenScape Business System by entering and activating the Confirmation Code
  - c) Regenerate the license file
- b) Download the newly generated license file from CLS.
5. Backup the system configuration and customer data.
6. Exchange mainboards
  - a) Shut down the system and switch off all supply voltages
  - b) Use V3 data carrier and if necessary optional mass data storage on the V3 mainboard
  - c) Remove the OCCB Voice Channel Booster card from the V2 mainboard and plug it into the V3 mainboard.
  - d) Replace V2 Mainboard by V3 Mainboard in the system
  - e) Switch on supply voltages againThe system boots automatically.
7. Set basic system parameters within WBM after startup
  - a) Set system date and time
  - b) Set application package
    - UC Smart for system without UC or with UC Smart
    - UC Suite for systems with UC Suite
8. Restore the system configuration after system startup
  - a) Restore the backup using the restore function
9. Import manually the new license file into the V3 system after system startup.

### 26.4.3 How to Migrate to V3 Mainboard PayGo Licensed Systems

Perform the following migration steps in sequence.

#### Step by Step

1. Backup the system configuration and customer data.
2. Regenerate the license file on the central license server (CLS)
  - a) Regenerate a new license file for the MAC address of the V3 mainboard  
Transfer the existing licenses from the MAC address of the V2 mainboard to the MAC address of the V3 mainboard.
  - b) Download the new license file from the CLS
3. Exchange mainboards
  - a) Shut down the system and switch off all supply voltages
  - b) Use V3 data carrier and if necessary optional mass data storage on the V3 mainboard

- c) Remove the OCCB Voice Channel Booster card from the V2 mainboard and plug it into the V3 mainboard.
- d) Replace V2 Mainboard by V3 Mainboard in the system
- e) Switch on supply voltages again  
The system boots automatically.
- 4.** Set basic system parameters within WBM after startup
  - a) Set system date and time
  - b) Set application package  
UC Smart for system without UC or with UC Smart  
UC Suite for systems with UC Suite
- 5.** Restore the system configuration after system startup
  - a) Restore the backup using the restore function
- 6.** Import manually the new license file into the V3 system and activate the license file

## 26.5 Software Upgrade of OpenScape Business S

Before an OpenScape Business S system software upgrade, determine the current system configuration and the HW / SW and license components that may need replacement.

**Table 34: OpenScape Business S Migration - HW/SW Checklist**

| Components                 | Replaced by                                                                                           |
|----------------------------|-------------------------------------------------------------------------------------------------------|
| <b>Hardware Components</b> |                                                                                                       |
| Server PC                  | Reuse is possible. HW Requirements must be checked for OpenScape Business S extensions. <sup>12</sup> |
| Optipoint 400 phones       | OpenScape Deskphone CP phones                                                                         |
| <b>Software Components</b> |                                                                                                       |
| SLES12 Operating System    | Reuse is possible. Eventually an upgrade to latest service pack is required <sup>13</sup>             |

<sup>12</sup> The existing server PC HW can be used if the configuration of the UC Booster Server System remains unchanged after the SW upgrade. If expansions are planned after the SW upgrade, the hardware requirements may need to be adapted according to the specifications in *OpenScape Business S Installation Guide, chapter Prerequisites*.

<sup>13</sup> The SLES operating system installed on the server PC can be adopted in case of an OpenScape Business S / UC Booster Server SW upgrade. However, it should be upgraded to the last released service pack before the SW upgrade.

If Novell has discontinued SW support for the SLES version used, the customer must be informed and, if necessary, a SLES upgrade must be marketed.

The SLES upgrade may have to be performed in several steps to take over existing OpenScape Business S installations including the customer configuration and customer data.

| Components                                       | Replaced by                                        |
|--------------------------------------------------|----------------------------------------------------|
| V2 System SW on SDHC card                        | V3 System SW (Image from Software Download Server) |
| XMPP                                             | No follow-on solution                              |
| myPortal Smart                                   | myPortal @work                                     |
| <b>License Components</b>                        |                                                    |
| Licenses in license file                         | Transfer of the licenses into a new license file   |
| CSTA application ( via UC Booster card / server) | CSTA application ( via UC Booster card / server)   |

### 26.5.1 Software Upgrade from OpenScape Business S V2 to OpenScape Business S V3

When upgrading an OpenScape Business S model from SW version V2 to V3, only the system SW is exchanged.

Existing licenses and the customer configuration are taken over. The existing software support will continue unchanged after the migration.

In this case, no separate order items are required for the System SW upgrade from V2 to V3.

That the SW version V3 no longer supports certain functions and hardware components. In [Table 34: OpenScape Business S Migration - HW/SW Checklist](#) on page 1363 you will find information about which components are substituted in version V3 and which components are omitted without substitution. This depends on the expansion of the customer system.

#### Prerequisites

The system operates with the last released SW version V2R7 before the upgrade. If necessary, upgrade the system to the latest SW version. To do this, the system must have a valid Software Support status.

Before the SW upgrade from version V2 to V3, setup a permanent access to the Unify license server (via the Internet) in the system and activate the **CLS Connect** function.

#### Functional Boundary Conditions and Restrictions

Existing licenses can only be taken over in the course of the SW upgrade if the CLS Connect function is activated.

---

An existing SLES Update Key remains valid with a SLES Upgrade. However, it may have to be de-registered with Novell before the SLES upgrade and then re-registered for the new system.

The following describes the OpenScape Business SW Upgrade while keeping the SLES operating system.

The customer configuration and customer data are automatically transferred from SW version V2 to V3 during the SW upgrade process.

The main technical steps of the migration are described in the following chapters. To retain the existing licenses a distinction regarding the handling is made between:

- SW Upgrade for permanent licensing with and without CLS Connect
- SW Upgrade with PayGo licensing

### **Technical handling of the upgrade**

The main technical steps of the upgrade are described below. A distinction is made between:

- Upgrade for permanent licensing with CLS Connect
- Upgrade with PayGo licensing

## **26.5.1.1 How to Upgrade to V3 Permanently Licensed Systems with CLS Connect**

Perform the following migration steps.

### **Step by Step**

- 1. Prepare the OpenScape Business V2 System**
  - a) Upgrade the existing system to SW version V2R7
  - b) Set up access to the Central License Server (CLS) in the system and test the connection
  - c) Activate CLS Connect in the V2 system
- 2. Prepare SLES operating system**

Upgrade the operating system to the service pack last released from the SLES version used in connection with OpenScape Business S.
- 3. Upgrade OpenScape Business Software**
  - a) Execute the software upgrade to V3 via OpenScape Business Assistant.
  - b) The system configuration is automatically transferred to V3.
  - c) Existing licenses are transferred to V3.
- 4. License file is generated automatically by the central license server (CLS)**
  - a) After restarting the system, the system transfers the information that the existing licenses are operated with software version 3.
  - b) The license server automatically generates a new license file with the V3 info and transfers it back to the system.

## **26.5.1.2 How to Upgrade to V3 PayGo Licensed Systems**

Perform the following migration steps.

### Step by Step

1. Prepare the OpenScape Business System
  - a) Upgrade the existing system to SW version V2R7
2. Prepare SLES operating system

Upgrade the operating system to the service pack last released from the SLES version used in connection with OpenScape Business S.
3. Regenerate the license file on the central license server (CLS)
  - a) Regenerate a new license file for the V2 system
  - b) Download the new license file from the CLS
4. Import and activate the new license file in the OpenScape Business V2 system.
5. Upgrade OpenScape Business Software
  - a) Execute the software upgrade to V3 via OpenScape Business Assistant.
  - b) The system configuration is automatically transferred to V3.
  - c) The system is ready for operation after reboot.

## 26.5.2 Software Upgrade from OpenScape Business S V2 to OpenScape Business S V3

Perform the following migration steps to upgrade an OpenScape Business S V1 system to an OpenScape Business S V2 system.

### Prerequisites

Before performing the migration, check whether the hardware and software properties of the Linux server are appropriate for OpenScape Business S V2. An upgrade to the Linux server (for example, more available RAM) may be sufficient. The SLES 64 bit Linux operating system, that has been released for OpenScape Business V2 is a prerequisite. For the upgrade step to OpenScape Business SW version V3, the SLES 64 version that has been release for V3 is required.

If a new Linux server is required, the OpenScape Business V1 S communication software must be installed after installing Linux. A V1 data backup can then be transferred and you can continue with migration step 1.

### Functional Boundary Conditions and Restrictions

When the system is upgraded from OpenScape Business V1 to OpenScape Business V2, then no ITSP activation/deactivation can be done in Internet Telephony wizard until a reset to LCR is done. Already configured ITSPs in OpenScape Business V1 will continue to work also in OpenScape Business V3 even without resetting the LCR. You can edit the already activated ITSP but not deactivate it. In order to make any activation/deactivation change in the wizard, reset the LCR. This is to reflect the necessary changes for the increase of ITSPs from 4 to 8. To reset LCR, go to **Expert Mode > LCR > LCR Flags** and click the **Reset LCR Data** flag.

### Upgrade procedure

Perform the following upgrade steps.

#### 1) Update the OpenScape Business V1 software

Using the WBM, update the OpenScape Business V1 software to the version V1 R3.3 or higher (see [Updating the Communication System](#) on page 1226).

#### 2) Load the OpenScape Business V2 license file

Load the OpenScape Business V2 license file into the OpenScape Business V1 system and activate the licenses (see [Activating Licenses \(Standalone\)](#) on page 292).

The license for the free SLES upgrades can still be used.

#### 3) Load the current OS Biz V2 software

Using the WBM, load the current OpenScape Business V2 software into the communication system. The V1 data is automatically converted to V3 data in the process (see [Updating the Communication System](#) on page 1226).

#### 4) Perform a data backup

Back up your V2 data (see [Immediate Backup](#) on page 1219).

## 26.6 OpenScape Business V2 Network Migration/Upgrade to V3

When migrating or upgrading an OpenScape Business network to V3, all nodes in the network must be upgraded to SW version V3. For the networking functions it is irrelevant whether the SW version V3 is operated on a OpenScape Business X system in the network with a V2 mainboard or with a V3 mainboard.

Upgrade each OpenScape Business node of the network separately. The components required for an upgrade are to be determined per node depending on the individual systems according to the descriptions in chapters [Software Upgrade for OpenScape Business X Systems](#) on page 1349, [Software Upgrade of UC Booster Server to OpenScape Business X V3](#) on page 1352, [Hardware/Software Migration of OpenScape Business X Systems to V3](#) on page 1354 or [Migration of an OpenScape Business X V3 System from V2 Mainboard to V3 Mainboard](#) on page 1359.

The licenses for the nodes in the V2 network can be transferred to the V3 systems via the Central License Server. There are different procedures for systems with or without **CLS Connect** function. The "Pay as you go" licensing procedure is not supported in the OpenScape Business network.

The effort required for transferring licenses with **CLS Connect** is significantly lower in a network than without the CLS Connect function.

---

**IMPORTANT:** Upgrade of the nodes in a network in the sequence as described for each scenario. It is essential, that all slave nodes are in operation with the software

version V3 before the master node can be migrated or upgraded to software version V3.

During the network upgrade an heterogeneous network with V2 and V3 software will occur for a transitional period. During this time, the full functionality of the network's performance range cannot be guaranteed. In some scenarios the upgraded / migrated systems will operate in emergency mode only until the license file is updated by the master node.

---

OpenScape Business networks can be realized in various combinations regarding the use of OpenScape Business X and S systems and the licensing of the systems in the network. The most important steps for the migration or upgrade of an OpenScape Business network and their sequence are shown by means of typical combinations.

The description always assumes that a network license file exists in the Central License Server for the network, by means of which the master node supplies all slave nodes with license information.

- **Network consisting of OpenScape Business X Systems only**
  - Scenario 1: HW migration only in the master node, SW upgrade in all slave nodes
  - Scenario 2: SW upgrade for all OpenScape Business X nodes in the network
- **Network consisting of OpenScape Business S and OpenScape Business X systems**
  - Scenario 3: OpenScape Business S is master node and OpenScape Business X systems are slave nodes
    - Scenario 3a: SW upgrade in all OpenScape Business nodes of the network
    - Scenario 3b: SW upgrade in the OpenScape Business S master node, migration of the slave nodes

### 26.6.1 Scenario 1: Hardware Migration of Master node, Software Upgrade of Slave nodes

When migrating the network, a distinction must be made between the **CLS Connect** function and the license transfer procedure.

#### 26.6.1.1 Migration/Upgrade with CLS Connect in the Master Node

##### Prerequisites

- All nodes in the network are operated with the last released SW version V2R7.x.
- At the Central License Server (CLS) there is a central network license file for the master node of the network.
- The **CLS Connect** function is activated in the Master Node. CLS Connect does not have to be switched on in the Slave Nodes.

**Step by Step**

1. Upgrade all slave nodes to software version V3 (for details see [Software Upgrade for OpenScape Business X Systems](#) on page 1349 or [Software Upgrade of UC Booster Server to OpenScape Business X V3](#) on page 1352)
  - a) Import V3 software via OpenScape Business Assistant (WBM) and upgrade the system.
  - b) Configuration and license information is kept.  
The system is not operational after startup, due to invalid license file.
2. Generate a new network license file on the license server.
  - a) Regenerate the network license file for the Master node to the MAC address of the V3 mainboard
  - b) Download new network license file from CLS
3. Migrate Master node to V3 mainboard (for details see [Hardware/Software Migration of OpenScape Business X Systems to V3](#) on page 1354)
  - a) Backup system configuration via WBM
  - b) Exchange the mainboard
  - c) Set date/time and application package via WBM
  - d) Import and activate the new network license file via WBM.
  - e) Restore the system configuration via WBM  
The license file is not overwritten in this case.
4. The master node automatically transfers the new license information to the slave nodes.

---

**NOTICE:** This transmission of licenses to slave nodes may take up to 15 minutes.

---

**26.6.1.2 Migration/Upgrade without CLS Connect in the Master Node****Prerequisites**

- All nodes in the network are operated with the last released SW version V2R7.x.
- At the Central License Server (CLS) there is a central network license file for the master node of the network.
- Hardware Migration license for Master node is available
- Software Upgrade licenses are available for each Slave node

**Step by Step**

1. Generate new network license file on the license server
  - a) Break down the network file at the CLS into individual license files
  - b) Generate a license file for the master node  
Activate the hardware migration license for the master node
  - c) Generate license file for slave nodes  
Activate the software upgrade license for each individual slave node

- d) Merge the individual nodes license files to a new network license file
- e) Download the new network license file from CLS
- 2. Upgrade slave nodes to V3 (for details see [Software Upgrade for OpenScape Business X Systems](#) on page 1349 or [Software Upgrade of UC Booster Server to OpenScape Business X V3](#) on page 1352)
  - a) Import V3 software via OpenScape Business Assistant (WBM) and upgrade the system.
  - b) The configuration and license information are automatically transferred.

The system is not operational after startup, due to invalid license file.
- 3. Migrate Master node to V3 (for details see [Hardware/Software Migration of OpenScape Business X Systems to V3](#) on page 1354)
  - a) Backup system configuration via WBM
  - b) Switch the mainboard
  - c) Set date/time and application package via WBM
  - d) Import and activate the new network license file via WBM.
  - e) Restore the system configuratin via WBM (license file is not overwritten in this case)
- 4. The master node automatically transfers the new license information to the slave nodes.

---

**NOTICE:** This transmission of licenses to slave nodes may take up to 15 minutes.

---

## 26.6.2 Scenario 2: Software Upgrade of all Systems in the Network to V3

When upgrading the network software, the use of **CLS Connect** function or not defines the procedure to be followed for transferring the license.

### 26.6.2.1 Software Upgrade with CLS Connect in the Master Node

#### Prerequisites

- All nodes in the network are operated with the last released SW version V2R7.x.
- At the Central License Server (CLS) there is a central network license file for the master node of the network.
- The **CLS Connect** function is activated in the Master Node. CLS Connect does not have to be switched on in the Slave Nodes.

#### Step by Step

1. Migrate all slave nodes to software version V3 (for details see [Software Upgrade for OpenScape Business X Systems](#) on page

1349 or [Software Upgrade of UC Booster Server to OpenScape Business X V3](#) on page 1352)

a) Import V3 software via OpenScape Business Assistant (WBM) and upgrade the system.

b) Configuration and license information is kept.

The system is not operational after startup, due to invalid license file.

2. Upgrade Master node to V3 (for details see [Software Upgrade for OpenScape Business X Systems](#) on page 1349 or [Software Upgrade of UC Booster Server to OpenScape Business X V3](#) on page 1352)
  - a) Import V3 software via OpenScape Business Assistant (WBM) and upgrade the system.
  - b) The configuration and license information is retained.
  - c) Restart the system.
3. Following steps are automatic (no manual intervention is required)
  - a) Master node reports to CLS after startup with software version 3.
  - b) CLS generates a new network license file.
  - c) CLS transfers the new network license file to the master node.
  - d) Master node automatically transmits the new license information to the slave nodes.

---

**NOTICE:** This transmission of licenses to slave nodes may take up to 15 minutes.

---

## 26.6.2.2 Software Upgrade without CLS Connect in the Master Node

### Prerequisites

- All nodes in the network are operated with the last released SW version V2R7.x.
- At the Central License Server (CLS) there is a central network license file for the master node of the network.
- Software Upgrade licenses are available for each node

### Step by Step

1. Generate new network license files on the license server
  - a) Break down the network file at the CLS into individual license files
  - b) Generate a license file for the master node
 

Activate the software upgrade license for the master node
  - c) Generate license file for slave nodes
 

Activate the software upgrade license for each individual slave node
  - d) Merge the individual nodes license files to a new network license file
  - e) Download the new network license file from CLS

2. Migrate all slave nodes to the V3 (for details see [Software Upgrade for OpenScape Business X Systems](#) on page 1349 or [Software Upgrade of UC Booster Server to OpenScape Business X V3](#) on page 1352)
  - a) Import V3 software via OpenScape Business Assistant (WBM) and upgrade the system.
  - b) The configuration and license information is retained.
  - c) The system is not ready for operation after startup, due to invalid license file.  
The system is not operational after startup, due to invalid license file.
3. Upgrade Master node to V3 (for details see [Software Upgrade for OpenScape Business X Systems](#) on page 1349 or [Software Upgrade of UC Booster Server to OpenScape Business X V3](#) on page 1352)
  - a) Import V3 software via OpenScape Business Assistant (WBM) and upgrade the system.
  - b) The configuration and license information is retained.
  - c) Import the network license file into the master node and activate the license file
4. The master node automatically transfers the new license information to the slave nodes.

---

**NOTICE:** This transmission of licenses to slave nodes may take up to 15 minutes.

---

### 26.6.3 Scenario 3a: Software Upgrade of all Nodes

In this scenario, the master node is an OpenScape Business S system, and the slave nodes are OpenScape Business X systems.

This scenario is identical to [Scenario 2: Software Upgrade of all Systems in the Network to V3](#) on page 1370

### 26.6.4 Scenario 3b: Software Upgrade in the Master Node, Hardware Migration of the Slave Nodes

In this scenario the slave nodes are migrated to the V3 mainboard and SW version 3 by a HW/SW exchange. In the OpenScape Business S master system the SW is upgraded from V2 to V3. For the HW/SW upgrade of the network, the use of the CLS Connect function defines the license transfer procedure.

#### 26.6.4.1 Migration / Upgrade with CLS Connect in the Master Node

##### Prerequisites

- All nodes in the network are operated with the last released SW version V2R7.x.

- At the Central License Server (CLS) there is a central network license file for the master node of the network.
- The **CLS Connect** function is activated in the Master Node. CLS Connect does not have to be switched on in the Slave Nodes.
- V3 Mainboards including V3 software are available

### Step by Step

1. Migrate all slave nodes to the V3 mainboard (for details see [Hardware/Software Migration of OpenScape Business X Systems to V3](#) on page 1354)
  - a) Backup the system configuration via WBM
  - b) Replace mainboards
  - c) Set date/time and application package via WBM
  - d) Restore the system configuration via WBM

The system is not operational after startup, due to invalid license file.
2. Upgrade Master node to V3 (for details see [Software Upgrade for OpenScape Business X Systems](#) on page 1349 or [Software Upgrade of UC Booster Server to OpenScape Business X V3](#) on page 1352)
  - a) Import V3 software via OpenScape Business Assistant (WBM) and upgrade the system.
  - b) The configuration and license information is retained.
  - c) Restart the system.
3. Following steps are automatic (no manual intervention is required)
  - a) Master node reports to CLS after startup with software version 3.
  - b) CLS generates a new network license file.
  - c) CLS transfers the new network license file to the master node.
  - d) Master node automatically transmits the new license information to the slave nodes.

---

**NOTICE:** This transmission of licenses to slave nodes may take up to 15 minutes.

---

## 26.6.4.2 Migration / Upgrade without CLS Connect in the Master Node

### Prerequisites

- All nodes in the network are operated with the last released SW version V2R7.x.
- At the Central License Server (CLS) there is a central network license file for the master node of the network.
- The software Upgrade license for the Master node is available
- Hardware Migration licenses are available for each slave node
- V3 Mainboards including V3 software are available

### Step by Step

1. Generate a new network license file on the license server

## Migration

### Migrating from HiPath 3000 to OpenScape Business V3

- a) Break down the network file at the CLS into individual license files
  - b) Generate a license file for the master node  
Activate the software upgrade license for the master node
  - c) Generate license file for slave nodes  
Activate the hardware migration license for each slave node
  - d) Merge the individual nodes license files to a new network license file
  - e) Download the new network license file from CLS
2. Migrate all slave nodes to the V3 mainboard (for details see [Hardware/Software Migration of OpenScape Business X Systems to V3](#) on page 1354)
- a) Backup the system configuration via WBM
  - b) Replace mainboards
  - c) Set date/time and application package via WBM
  - d) Restore the system configuration via WBM
- The system is not operational after startup, due to invalid license file.
3. Upgrade Master node to V3 (for details see [Software Upgrade for OpenScape Business X Systems](#) on page 1349 or [Software Upgrade of UC Booster Server to OpenScape Business X V3](#) on page 1352)
- a) Import V3 software via OpenScape Business Assistant (WBM) and upgrade the system.
  - b) The configuration and license information is retained.
  - c) Import the network license file into the master node and activate the license file
4. The master node automatically transfers the new license information to the slave nodes.

---

**NOTICE:** This transmission of licenses to slave nodes may take up to 15 minutes.

---

## 26.7 Migrating from HiPath 3000 to OpenScape Business V3

This section describes the technical migration of HiPath 3000 / HiPath 500 V9 standalone systems and HiPath 3000 internetworks to OpenScape Business V3 with V3 mainboards.

When migrating from HiPath 3000 systems to OpenScape Business X V3 with V3 mainboards, depending on the hardware configuration, part of the hardware equipment of the system and the connected terminals / clients can be transferred.

Before migrating a HiPath 3000, the current system configuration and the HW / SW as well as license components to be replaced, if any, must be determined by subsequent checks.

### General Checks

- **Function compatibility check**

Please inform yourself about which features are longer supported or have changed as compared to HiPath 3000 V9. Chapter [HiPath 3000 Changed/Dropped Features and Interfaces](#) on page 1399 lists the HiPath 3000 features that are no longer supported in OpenScape Business or have been replaced by newer features.

- **Software version check**

The system must be operated under SW version V9 before migration. Systems with SW version smaller than V9 must be upgraded to SW version V9 and put into operation before migration.

- **Protective earthing check**

For all OpenScape Business X communications systems, protective grounding via an additional grounding conductor is mandatory!

### **Hardware compatibility check**

For technical reasons, some modules and devices cannot be used in the OpenScape Business X systems. When migrating from HiPath 3000 V9 to OpenScape Business V3 these modules and terminals must be removed. If required, use the respective successor types instead. The list of no longer supported modules and their successors can be found in *OpenScape Business X3/X5/X8 Service Documentation* on section *Not Supported HW Components*.

- **Power Supply**

OpenScape Business 33xx / 35xx can be operated with UPSC-D / DR or OCPSM power supply. Any remaining PSU power supplies must be replaced with OCPSM. Suitable PSU upgrade kits are available.

- **Peripheral components**

Please check whether the existing hardware can still be used. No longer supported modules or end devices must be removed and replaced by successors if necessary.

- **Backplane check**

In HiPath 3550 systems, slot 10 of the backplane is no longer addressed by the V3 mainboard. Existing peripheral modules that use this slot cannot be operated in OpenScape Business.

- **Phone device check**

OpenScape Business V3 systems with V3 mainboards support analog, ISDN, SIP and OpenStage or OpenScape Deskphone IP / CP devices. Existing Optiset E, Optipoint 4xx and Optipoint 5xx devices must be replaced.

- **Housing check**

In migrated HiPath 33xx/35xx systems, the housing caps may have to be replaced and fan units installed if necessary.

Corresponding delivery items are available.

### **Other checks**

- **Call number plan for networked systems**

With pure voice networking, open and closed numbering is possible. When using UC Suite, closed numbering is required in the network (network-wide UC functionality).

### 26.7.1 Migration of HiPath 33xx, 35xx, 3800 to OpenScape Business X3/X5/X8 V3

When migrating a HiPath 33xx, 35xx or 3800 system to OpenScape Business X V3, the mainboard, the determined peripheral groups and end devices as well as the system SW are replaced. Existing licenses can be migrated with an Upgrade License. The system configuration can be transferred. After migration, the OpenScape Business V3 system has a software support of 3 years.

For the migration from HiPath 3000 V9 to OpenScape Business V3 the following items are required in principle:

- V3 Mainboard
- V3 SW on SSD data storage
- M2 SSD 256 GB mass data storage (optional with UC Suite application)
- OpenScape Business Upgrade HiPath 3000 V9 (license migration), or
- OpenScape Business Upgrade HiPath 3000 V8 (license migration), or
- OpenScape Business Upgrade HiPath 3000 V7 (license migration)
- OpenScape Business CSTA License (optional)

If necessary, further hardware components and licenses must be ordered in addition. This depends on the configuration of the customer system.

In *OpenScape Business X3/X5/X8 Service Documentation* on section *Not Supported HW Components* you will find information on which components are substituted in version V3 or are discontinued without substitution. Please note that a CSTA license is required for an existing connection of external CSTA applications. This does not apply to the connection of OpenScape Business TAPI 170 or TAPI 120.

#### Prerequisites

All HW / SW components have been checked for reusability.

All new HW / SW components are available

An upgrade license for upgrading from HiPath 3000 V7, V8 or V9 to OpenScape Business V3 has been ordered and the LAC of the upgrade license is available to retrieve the new license from the license server.

The system has been updated to latest SW version V9 for the technical SW migration and the transfer of the existing customer configuration.

The latest version of the Manager E is used

### Determining the OpenScape Business licenses during the migration

The licenses existing in HiPath 3000 systems can be transferred to the OpenScape Business V3 system by activating the "OpenScape Business Upgrade HiPath 3000 (V7, V8 or V9)" license in the central license server. During the license transfer a new license file for the OpenScape Business V3 system is created with the following licenses.

**Table 35: HiPath 3000 License Migration**

| HP 3000 License           | OpenScape Business License                | Remarks                                                   |
|---------------------------|-------------------------------------------|-----------------------------------------------------------|
|                           | Basic license                             | Newly created incl. 3 years SW support                    |
|                           | OpenDirectory Base license                | Newly created                                             |
|                           | Web Collaboration Connector license       | Newly created                                             |
|                           | TDM user license                          | Number calculated from system configuration <sup>14</sup> |
| IP-Subscriber (ComScendo) | IP User License                           | 1:1 transfer from HP 3000 license file                    |
|                           | TDM User Licenser                         | calculated from system configuration <sup>14</sup>        |
| S2M Channels              | IP/S2M/TI Trunk licenses                  | 1:1 transfer from HP 3000 license file                    |
| Mobility Entry            | Mobility User licenses                    | 1:1 transfer from HP 3000 license file                    |
| Xpressions Compact        | Xpressions Compact licenses <sup>15</sup> | 1:1 transfer from HP 3000 license file <sup>15</sup>      |

### Determination of the TDM user licenses within the license file

During the technical conversion of the HiPath 3000 system configuration, the number of active TDM subscribers is determined by the Manager E tool and written to an "inventory (XML) file".

The number of TDM user licenses is determined as follows:

- 1x TDM user license per active UP0 port - phone (master/slave) ready, phone number available
- 1x TDM User License per registered DECT phone - phone number available

<sup>14</sup> Determined in the course of the technical conversion description see below.

<sup>15</sup> The Xpressions Compact licenses are included in the license file but cannot be used in SW version V3.

- 1x TDM user license per active a/b port (phone number) for plugged modules
- 1x TDM user license per active S0 port (MSN phone number) for active modules

The TDM user license migration itself is performed offline at the CLS via the XML inventory file.

The central license server checks whether a license file exists for the MAC address of the HiPath 3000 mainboard.

If a license file is available, the license migration is performed on the basis of this license file and the information in the "inventory file".

If no license file is available, the OpenScape Business upgrade is performed on the basis of the information in the "Inventory (XML) file

Depending on the available Upgrade License (V7, V8 or V9) the following percentage of the determined TDM users are taken over to OpenScape Business.

- Upgrade from HiPath 3000 V4 or older to OpenScape Business V3:  
No TDM users are calculated for cheaper / free of charge OpenScape Business upgrade licenses
- Upgrade from HiPath 3000 V5, V6 or V7 to OpenScape Business V3:  
70% of TDM users are calculated for cheaper / free of charge OpenScape Business upgrade licenses
- Upgrade from HiPath 3000 V8 to OpenScape Business V3:  
80% of TDM users are calculated for cheaper / free of charge OpenScape Business upgrade licenses
- Upgrade from HiPath 3000 V9 OpenScape Business V3:  
100% of TDM users are calculated for cheaper / free of charge OpenScape Business upgrade licenses.

### Functional boundary conditions and restrictions

- The license migration can be done to V3 only. A license migration to V2 is not supported by Manager E.
- The license migration of a HiPath 3000 system (mainboard) can only be performed once, and the mainboard is blocked for further actions at the CLS after the migration.
- To migrate S2M lines and ComScendo subscribers, a HiPath 3000 license file must be available on the central license server.
- The TDM user licenses generated during the migration cannot be transferred to other systems or to a CLS account.
- User licenses and UC user-oriented licenses are permanently assigned to the subscribers in OpenScape Business. Please note that for myAgent and myAttendant users the sufficient number of licenses is available. In OpenScape Business, changes of the presence status for other users by myAgent users are bound to the myAttendant license. These must be ordered separately.
- The Deskshare User (IP Mobility) feature requires a license in OpenScape Business as opposed to HiPath 3000. Additional IP user licenses must be available and assigned to the "Deskshare Users" within the OpenScape Business Assistant licensing dialog.

- No license migration is performed for the following products and features:
  - HG1500 B-channels: The board is dropped, since the functionality is integrated on the new mainboard.
  - optiClient Attendant V8: does not run on OpenScape Business.  
Follow-up product: OpenScape Business Attendant
  - optiClient BLF V1/V2: does not run on OpenScape Business.  
Follow-up product: OpenScape Business BLF
  - HiPath TAPI 120/170 V2: does not run on OpenScape Business.  
Follow-up product: OpenScape Business TAPI 120/170
  - Entry VoiceMail: The module is dropped, since it is integrated on the new mainboard  
Follow up product: Smart Voicemail
  - myPortal entry web services communications clients on the plug PC.
  - Base stations: licenses for base stations are no longer required.
  - ITSP trunk access: licenses must be purchased to use ITSP channels for Internet telephony in OpenScape Business.
  - As in the past, no licenses are required for S0, Analog and CAS trunks.
  - For networking and the connection of external systems via tie lines, one network license per node must be purchased in OpenScape Business.

### Technical handling

Perform the following migration steps in sequence:

#### **1) Download the HiPath 3000 Customer Data Base (CDB) from the system**

Download the current HiPath 3000 CDB from the HiPath 3000 system using the latest version of Manager E.

#### **2) Record the HG1500 settings (optional)**

If one or more HG1500 boards are plugged in, you must note the HG1500 settings that were changed with respect to the default settings using the HG1500 WBM:

- IP Routing
- PSTN Routing
- IP Firewall
- MAC Firewall
- Application Firewall
- IP Accounting
- IP Mapping
- SNMP

#### **3) Convert the HiPath 3000 CDB**

Convert the current HiPath 3000 CDB to the OpenScape Business V3 CDB using the latest version of Manager E.

#### **4) Swap out the hardware**

Replace the old HiPath 3000 mainboard with the new OpenScape Business V3 mainboard. Remove all HG1500 boards and all boards and sub-boards that are no longer supported. All OpenScape Business communication systems must be grounded with an additional ground wire.

### 5) Perform the initial installation

Configure the communication system via the WBM with the **Initial installation** wizard. Note that the HG1500 settings you recorded earlier should also be taken into account here.

### 6) Load the converted CDB

Load the converted CDB into the OpenScape Business V2 system using the latest version of Manager E. The OpenScape Business system will then restart automatically.

### 7) Generate new license file at the CLS

Generate a new license file at the CLS with the LAC of the upgrade license, the configuration file (XML file) and the locking ID of OpenScape Business.

### 8) Activate and assign licenses

License the OpenScape Business communication system within 30 days with the help of the license file.

### 9) Reset LCR entries

If required, you can reset the configured LCR entries in the HiPath 3000 system (for example, dial plans, routing tables, dial rules) to the default entries of OpenScape Business. This setting can be found in the WBM in the **Basic Installation** wizard.

## 26.7.1.1 How to Load the CDB from HiPath 3000

### Prerequisites

A HiPath 3000 communication system (HiPath 3300, HiPath 3350, HiPath 3500, HiPath 3550 and HiPath 3800) is available.

All phones are connected and active.

The latest version of Manager E is installed on the admin PC.

The admin PC is connected to the HiPath 3000 communication system.

### Step by Step

1. Log into Manager E at the admin PC.
2. Click on **File > Transmit** in the menu bar.
3. Click on the **Communications** tab.
4. Select the appropriate option in the **Access** area, depending on the type of connection from the admin PC to the communication system.
5. Enable the radio button **Read/write CDB** and click on **System > PC**.
6. Click on **OK**. The CDB is transferred from HiPath 3000 to Manager E.

7. After the successful transfer, click **OK** and then on **Close**.
8. Click in the menu bar on **File** > **Save customer database as** and save the CDB on the admin PC in a folder of your choice.

#### Next steps

[How Read out the HG1500 Settings](#) on page 1381

### 26.7.1.2 How Read out the HG1500 Settings

#### Prerequisites

One or more HG1500 boards are inserted.

You are logged on to Manager E.

#### Step by Step

1. In Manager E, click in the System view on the HG1500 entry. The WBM of the HG1500 opens.
2. Make a note of the settings that have been changed from their default settings. The HG1500 settings are not transferred during the conversion of the CDB and must be entered again in the WBM at the initial startup of OpenScape Business.

#### Next steps

[How to Convert the HiPath 3000 CDB](#) on page 1381

### 26.7.1.3 How to Convert the HiPath 3000 CDB

#### Prerequisites

HiPath 3000 communication system (HiPath 3300, HiPath 3350, HiPath 3500, HiPath 3550 and HiPath 3800) is available.

The admin PC is connected to the HiPath 3000 communication system.

#### Step by Step

1. Click on **File** > **Convert customer database** in the menu bar.
2. Select the CDB previously stored on the admin PC and click **OK**.
3. Enter your **Name** and your **Contract number** as your customer data and click **Next**.
4. Select **OpenScape Business V2** as the **Version** and click **Next**.
5. Click **OK** to confirm the unsupported boards advisory messages.
6. Click **Yes** to confirm the window which informs you about the number of TDM users to perform the migration and proceed with the migration.  
The number of TDM user which will be migrated is calculated automatically.
7. Click **Next** to confirm the window which informs you about which boards are plugged.

8. Click in the menu bar on **File > Save customer database as** and save the CDB under a different name on the admin PC in a folder of your choice.
9. Close Manager E.

### Next steps

[How to Replace the HiPath 3300/3500 Hardware](#) on page 1382 or

[How to Replace the HiPath 3350/3550 Hardware](#) on page 1383 or

[How to Replace the Hardware for HiPath 3800](#) on page 1385

## 26.7.1.4 How to Replace the HiPath 3300/3500 Hardware

### Prerequisites

A HiPath 3000 communication system (HiPath 3300 or HiPath 3500, rack-mount) is up and running.

OpenScape Business V3 Mainboard (OCCMRA or OCCMRB).

### WARNING:

Risk of electric shock through contact with live wires

Make sure that a separate protective ground wire with the required minimum cross section is available for the communication system (see Service Documentation, Hardware Installation).

### Step by Step

1. Switch off the HiPath 3000 system and disconnect the system's power plug.
2. Unplug all connectors (such as analog stations, ISDN lines, etc.) from the mainboard.
3. Loosen the two locking screws in the front panel of the mainboard.
4. Pry the mainboard loose from the backplane with two board wrenches (C39165-A7027-C26).
5. Using both hands, carefully slide out the HiPath 3000 mainboard horizontally from the board shelf and place it on a flat, grounded conductive surface.
6. Remove any existing HG1500 boards from the housing. The freed HG1500 slots can be used for additional boards.
7. If necessary, remove any boards that are no longer supported from the housing. The freed slots can be used for additional boards.
8. Remove all subboards inserted into the HiPath 3000 mainboard and plug them (if still needed and supported) into the OpenScape Business V3 mainboard.
9. Plug the M.2 SATA SSD with system SW and optional M.2 NVMe SSD on the V3 mainboard.

10. Plug optional modules such as OCCBH or OCCBL
11. Using both hands, carefully slide the OCCMRA or OCCMRB mainboard horizontally into the same slot in which the HiPath 3000 mainboard was previously located.
12. Connect optional modules such as STRBR to V3 mainboard.
13. Reconnect all connectors on the mainboard (such as analog stations, ISDN lines, etc.).

---

**NOTICE:** If more than 2 analog a/b ports were used in HiPath 3300 or 3500, 1 or 2 Y-adaptor cables will be required in OpenScape Business. Up to 4 a/b ports can be connected through the 2 physical RJ11 sockets. Due to space constraints, the new mainboard has only 2 RJ11 sockets through which the 4 a/b stations must be connected.

---

14. Make sure that your communication system is properly connected to the ground wire.
15. Reconnect the system's power plug and power up the system.

#### Next steps

[How to Perform the Initial Installation](#) on page 1385

### 26.7.1.5 How to Replace the HiPath 3350/3550 Hardware

#### Prerequisites

A HiPath 3000 communication system (HiPath 3350 or HiPath 3550, wall-mount) is up and running.

OpenScape Business Mainboard (OCCMA or OCCMB).

In case of a migration from HiPath 3350 / 3550 to OpenScape Business X3W/X5W the protection ground terminal has to be installed as shown in figure below. Afterwards the protection ground wire has to be connected as described within OpenScape Business V2, OpenScape Business X3/X5/X8, Installation Guide.

---

**WARNING:**

Risk of electric shock through contact with live wires

Make sure that a separate protective ground wire with the required minimum cross section is available for the communication system (see Service Documentation, Hardware Installation).

---

**Step by Step**

1. Switch off the HiPath 3000 system and disconnect the system's power plug.
2. Unlatch the housing and remove it.
3. Remove the cover.
4. Unplug all edge connectors (such as analog stations, ISDN lines, etc.) from the mainboard.
5. Remove the board latch.
6. Using both hands, carefully remove the HiPath mainboard from the board shelf and place it on a flat, grounded conductive surface.
7. Remove any existing HG1500 boards from the housing. The freed HG1500 slots can be used for additional boards.
8. If necessary, remove any boards that are no longer supported from the housing. The freed slots can be used for additional boards.
9. Remove all subboards inserted into the HiPath 3000 mainboard and plug them (if still needed and supported) into the OpenScape Business mainboard.
10. Plug the M.2 SATA SSD with system SW and optional M.2 NVMe SSD on the V3 mainboard.
11. Plug optional modules such as OCCBH or OCCBL.
12. Carefully insert the OpenScape Business OCCMA or OCCMB mainboard into the same slot in which the HiPath 3000 mainboard was previously located.
13. Connect optional modules such as STRBR to V3 mainboard.
14. Reconnect all edge connectors on the mainboard (such as analog stations, ISDN lines, etc.). Note that the connectors for ISDN lines must first be passed through the hole of the new board latch.
15. Secure the new board latch.
16. Make sure that your communication system is properly connected to the ground wire.
17. Put the housing back on and latch it.
18. Reconnect the system's power plug and power up the system.

**Next steps**

[How to Perform the Initial Installation](#) on page 1385

### 26.7.1.6 How to Replace the Hardware for HiPath 3800

#### Prerequisites

A HiPath 3800 communication system is up and running.

OpenScape Business Mainboard OCCLA.

---

#### WARNING:

Risk of electric shock through contact with live wires

Make sure that a separate protective ground wire with the required minimum cross section is available for the communication system (see Service Documentation, Hardware Installation).

---

#### Step by Step

1. Switch off the HiPath 3000 system and disconnect the system's power plug.
2. Unplug all connectors from the mainboard.
3. Using both hands, carefully slide out the HiPath 3000 mainboard from the board shelf and place it on a flat, grounded conductive surface.
4. Pull out any existing HG1500 boards from the board shelf. The freed HG1500 slots can be used for additional boards.
5. If present, remove any boards that are no longer supported from the board shelf. The freed slots can be used for additional boards.
6. Remove all subboards inserted into the HiPath 3000 mainboard and plug them (if still needed and supported) into the OpenScape Business mainboard.
7. Plug the M.2 SATA SSD with system SW and optional M.2 NVMe SSD on the V3 mainboard.
8. Plug optional modules such as OCCBH or OCCBL.
9. Carefully insert the OpenScape Business OCCLA mainboard into the same slot in which the HiPath 3000 mainboard was previously located.
10. Plug all connectors back into the mainboard.
11. Make sure that your communication system is properly connected to the ground wire.
12. Reconnect the system's power plug and power up the system.

#### Next steps

[How to Perform the Initial Installation](#) on page 1385

### 26.7.1.7 How to Perform the Initial Installation

The initial installation of the communication system is described in [Integration into the Customer LAN](#) ).

The initial installation includes the configuration of the system's IP address, the DHCP settings and the country and time settings.

If an HG 1500 was installed together with the HiPath 3000, the IP address of the HG 1500 should be entered as the IP address of the OpenScape Business system during the initial installation.

After the initial installation has been completed successfully, the communication system performs a restart.

### Next steps

[How to Load the Converted CDB into the New System](#) on page 1386

## 26.7.1.8 How to Load the Converted CDB into the New System

### Prerequisites

The hardware has been replaced.

The admin PC is connected to the OpenScape Business communication system (via the LAN interface).

The admin PC is configured to receive the IP address and the subnet mask from the OpenScape Business DHCP server.

### Step by Step

1. Log into Manager E at the admin PC.
2. Click on **File > Open customer database** in the menu bar.
3. Navigate to the location of the converted OpenScape Business CDB and click **OK**.
4. Confirm the message with **OK**.
5. Click on **File > Transmit** in the menu bar.
6. Click on the **Communications** tab.
7. Enable the **IP - HiPath** option in the **Access** area and enter the IP address of the OpenScape Business communication system in the IP address field. Default: 192.168.1.2.
8. Enable the **Security** radio button.
9. Click on **Change Password**.
10. Enter the old and the new password and confirm with **OK**.
11. Enable the radio button **Read/write CDB**.
12. Enable the **Call Charges** and **Hardware** check boxes and click on **PC > system**.
13. Click **OK**. Manager E transfers the CDB to the system.
14. After successful transfer of the CDB, click **OK** and then on **Close**.
15. Exit Manager E. The system automatically performs a restart.

### Next steps

[How to Generate a New License File](#) on page 1387

### 26.7.1.9 How to Generate a New License File

#### Prerequisites

The LAC of the upgrade license is available.

The registration data of the customer is available.

#### Step by Step

1. Log into the WBM with the **Advanced** profile.
2. Click on **License Management** in the navigation bar.
3. Make a note of the locking ID of OpenScape Business, which appears above the table.
4. In the navigation tree, click on **Registration**.
5. Enter your data and click **OK & Next**.
6. Click **Export data**. A configuration file (XML file) is generated with the registration data and inventory information, including the number of connected TDM stations.
7. Save the configuration file in a directory of your choice.
8. Log into the CLS with the user name and password.
9. Click on **License > Generate License Key** in the menu tree.
10. Enter the LAC of the upgrade license under **LAC** and click **Generate Key**.
11. Select the feature **OpenScape Business V2 Update HiPath 3000** and click again on **Generate Key**.

## License Key Generation Details

---

### Technical Details

With 'Verify' you can check your input data and view licenses that are already generated for this Locking ID (e.g.: MAC Address) in the detail section below.

**CAUTION:** For virtual systems the Advanced Locking ID has to be used. For hardware based systems the MAC address is of relevance.

To calculate the Advanced Locking ID click here:

\*Locking ID:  Alias Name:

Locking ID of Network CLA:

Configuration File Content:

SIEL-ID: SID:1324300658865

OpenScape Business V1

| Quantity to Use                | Available Quantity | Existing Quantity New System | Max Quantity | Feature                                      | Duration | Version | Type        | Action          |
|--------------------------------|--------------------|------------------------------|--------------|----------------------------------------------|----------|---------|-------------|-----------------|
| <input type="text" value="1"/> | 1                  |                              | 1            | OpenScape Business V1 Upgrade HiPath 3000 V9 |          | V1      | New License | To be activated |

12. Enter the Locking the ID of OpenScape Business in the **Locking ID** field.
13. Open the configuration file with a text editor (e.g., Notepad) and copy the entire contents of the configuration file into the **Configuration File Content** field.
14. Click **Next** and follow the instructions to generate a new license file.

---

**NOTICE:** The license migration procedure can only be performed once at the CLS. Consequently, please make sure that all the details are accurate!

---

15. Save the new license file in a directory of your choice.

**Next steps**

[How to Activate a License File Offline](#) on page 1389

**26.7.1.10 How to Activate a License File Offline**

Offline license activation is described in the chapter [How to Activate Licenses Offline \(Standalone\)](#).

**Next steps**

[How to Assign Licenses](#) on page 1389

**26.7.1.11 How to Assign Licenses**

The license assignment is described in [Assigning Licenses \(Standalone\)](#) on page 295.

**26.7.1.12 How to Reset the LCR Entries**

The basic installation of the communication system is described in [Basic Configuration](#) on page 143 ).

The basic installation includes the configuration of the system call number and the stations as well as access to the Internet and Internet telephony.

In the **Basic Installation** wizard, in the **Central Functions for Stations** window, you will find an additional radio button to **Delete the configured LCR data and initialize the LCR with default data**. This radio button appears only if a converted CDB was previously loaded into the system. If this radio button is selected, the configured LCR entries in the HiPath 3000 system will be deleted and replaced by the default entries of the OpenScape Business system.

---

**Related concepts**

[Station Data](#) on page 147

**26.7.2 Migration of a HiPath 3000 System with OpenScape Office V3 HX to OpenScape Business V3 with V3 Mainboard**

When migrating HiPath 3000 systems with a connected OpenScape Office HX Server, the external server is not required. Its function is taken over by the corresponding V3 mainboard of the OpenScape Business X System.

The HiPath 3000 system is migrated as described in [Migration of HiPath 33xx, 35xx, 3800 to OpenScape Business X3/X5/X8 V3](#) on page 1376.

OpenScape Office HX licenses are part of the HiPath 3000 license file. Therefore, they are also transferred to OpenScape Business licenses in the course of the HiPath 3000 license migration.

### Requirements

To migrate OpenScape Business HX licenses, a HiPath 3000 license file must be available on the central license server.

For the HiPath 3000 licenses the license migration is performed as shown in [Table 35: HiPath 3000 License Migration](#) on page 1377. The following applies to the OpenScape Office HX license migration:

**Table 36: OpenScape Office HX License Migration**

| OpenScape Office HX License           | OpenScape Business License                     | Remarks                                                                                            |
|---------------------------------------|------------------------------------------------|----------------------------------------------------------------------------------------------------|
| Per Basic license                     | 1x AutoAttendant license                       |                                                                                                    |
| Per OpenScape Office Standard User:   | 1x UC User<br>1x Voicemail User<br>1x Fax User | Applies to Standard User Licenses in the HX Basic Licenses 5/10 as well as to Single User Licenses |
| OpenScape Office HX Voicemail License | 500 x Voicemail User                           |                                                                                                    |
| myPortal for Outlook                  | Groupware User                                 | Number as in the license file                                                                      |
| myAttendant                           | myAttendant                                    | Number as in the license file                                                                      |
| myAgent                               | myAgent User                                   | Number as in the license file                                                                      |
| Contact Center Fax                    | Contact Center Fax User                        | Number as in the license file                                                                      |
| Contact Center E-Mail                 | Contact Center E-Mail User                     | Number as in the license file                                                                      |
| myReports                             | myReports                                      | Number as in the license file                                                                      |
| Application Launcher                  | Application Launcher                           | Number as in the license file                                                                      |
| OpenDirectory Connector               | OpenDirectory Connector                        | Number as in the license file                                                                      |

### Functional boundary conditions and restrictions

The license migration can only be done to V3. A license migration to V2 is not supported by Manager E.

The license migration can only be performed once.

User licenses and UC user-oriented licenses are permanently assigned to the users in OpenScape Business. Please note that for myAgent and myAttendant users the sufficient number of licenses is available.

In OpenScape Business, changes of the presence status for other users by myAgent users are bound to the myAttendant license. These must be ordered separately.

It is not possible to transfer announcements, pictures, voicemails, fax, journal, contact center data, subscriber configuration, profiles, external directory, schedules from OpenScape Office HX to OpenScape Business V3 with V3 mainboard.

### 26.7.3 Migration of a HiPath 3000 System with OpenScape Office V3 HX to OpenScape Business V3 with UC Booster Server

The Migration has to be done in two steps. In a first step the systems are migrated to V2. In a subsequent step the systems are migrated to V3.

This migration scenario should only be performed in case that customer data within the OpenScape Office HX server needs to be kept. The migration is time consuming and a new UC Booster Server needs to be set up. The migration ends in an OpenScape Business X V3 System with V2 mainboard and connected UC Booster Server V3.

A migration according to [Migration of a HiPath 3000 System with OpenScape Office V3 HX to OpenScape Business V3 with V3 Mainboard](#) on page 1389 should be considered alternatively if customer data in the HX server need not to be kept.

#### Step 1 Migration of a HiPath 3000 System with OpenScape Office V3 HX to OpenScape Business V2

Within this step HiPath 3000 is migrated to OpenScape Business V2 and the UC functionality of the OpenScape Office V3 HX is mapped to an OpenScape Business UC Booster Server V2.

The UC Booster Server needs to be installed from scratch on a new HW and SW base. The licenses and customer data can be transferred from OpenScape Office V3 HX to the UC Booster Server if the UC Booster Server is set up first with OpenScape Business SW Version 1R2.2 only in this case the following UC configuration and user data are transferred:

- Announcements
- Images
- Voicemail
- Faxes
- Journal
- Contact Center Data
- User settings
- User Profiles
- External directory
- Schedules

The following UC configuration data and user data are **not** transferred and must be reconfigured in the UC Booster Server:

- Web services (e.g., XMPP, Web Collaboration, Mobility)
- Open Directory Service

After transferring licenses and customer data the UC Booster Server SW needs to be upgraded to SW version V1R3.3 and afterwards upgraded again to latest SW version V2R7.

For migration / upgrade perform the following steps in sequence:

### 1) Record agent IDs (only when using the Contact Center)

Record the mappings of agent IDs to the stations of the UC Suite, since these assignments will not be migrated. The assignments must be reconfigured with the **UCD** wizard in the WBM of the OpenScape Business communication system.

### 2) Update OpenScape Office V3 HX

First update the OpenScape Office V3 HX to the V3 R3FR6 software if this has not already been performed.

### 3) Create an OpenScape Office V3 HX backup set

Create a backup set on an external device via the WBM of OpenScape Office V3 HX.

More detailed information can be found in the online help of the OpenScape Office Assistant.

### 4) Upgrade the HiPath 3000

Perform the upgrade from HiPath 3000 to OpenScape Business V1 as described in the migration procedure for a standalone system (see [Migration of HiPath 33xx, 35xx, 3800 to OpenScape Business X3/X5/X8 V3](#) on page 1376). The licenses of the OpenScape Office V3 HX are transferred to OpenScape Business during the license migration at the license server. The license file contains the license data for both OpenScape Business X3/X5/X8 and the UC Suite.

### 5) Setup UC Booster Server and integrate it in the customer LAN

The Linux operating system SLES 64 bit must be installed on the new server PC (Linux server), followed by the communication software (Version V1 R2.2). For details, please refer to the *OpenScape Business Linux Server Installation Guide*.

### 6) Activate the UC Booster

Activate the UC Booster functionality in the WBM of the OpenScape Business communication system (**Basic Installation > Initial Installation > Package with UC Suite on OpenScape Business UC Booster Server**) and enter the IP address of the new server PC (using the same IP address as the old server PC if possible). Make sure that the UC Suite is active on the UC Booster Server.

For more detailed information, see the section "Initial Installation of OpenScape Business X3/X5/X8" under [How to Define the UC Solution](#) on page 142.

### 7) Configure the UC Booster

The IP address of the communication system must be specified in the WBM of the UC Booster Server.

For more detailed information, see the section "Initial Installation of the OpenScape Business UC Booster" under [Announcing the IP Address of the Communication System](#) on page 267.

### 8) Convert the OpenScape Office V3 HX backup set

The OpenScape Office V3 HX backup set saved on the external media must be converted via a Linux script to an OpenScape Business V1 backup set. To do this, you must be familiar with Linux. The converted backup set must then be loaded into the UC Booster Server via the WBM. The UC configuration data and user data mentioned above will then be available.

More information on how to do this can be found in this section under [How to Convert an OpenScape Office V3 HX Backup Set](#) on page 1393.

### 9) Update UC Booster Server software to V2

First update the UC Booster Server to the Version V1 R3.3 and then to the latest OpenScape Business V2 software.

## 26.7.3.1 How to Convert an OpenScape Office V3 HX Backup Set

### Prerequisites

The OpenScape Business UC Booster server is operational.

The OpenScape Office V3 HX backup set is available on the external medium.

### Step by Step

1. Copy the OpenScape Office V3 HX backup set from the external medium to the server PC (Linux server) into the following directory:

```
/mnt/persistent/apollo/
```

2. Open a terminal on the server PC or connect to it with an SSH shell. You will need root privileges for this.
3. Navigate to the backup directory with the following command:

```
cd /mnt/persistent/backup/
```

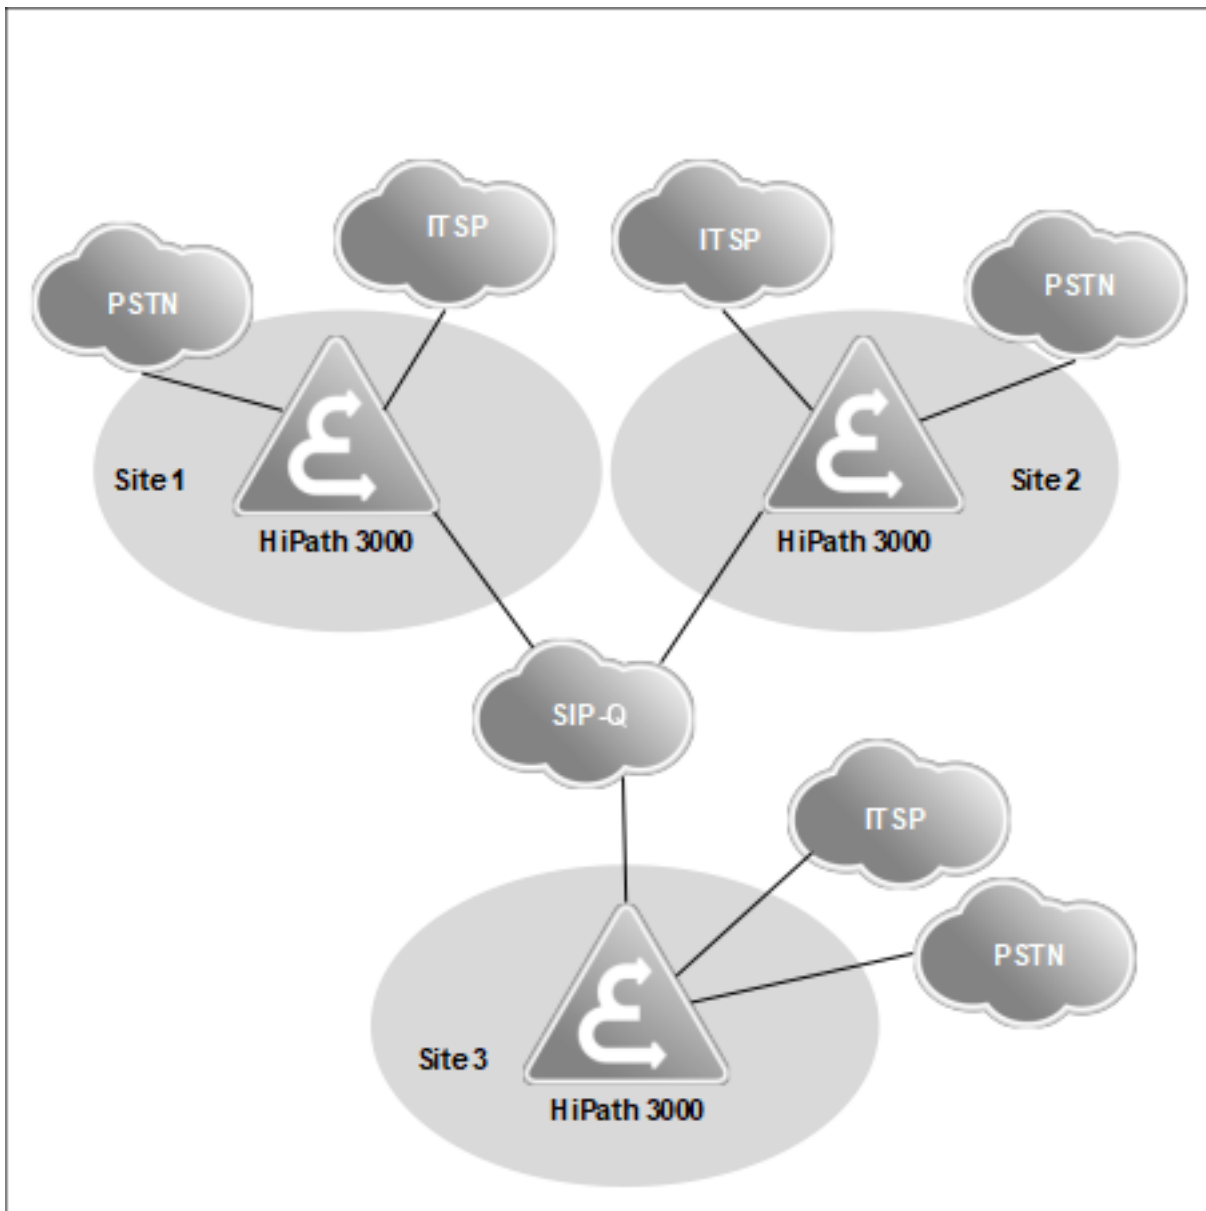

4. Invoke the conversion script as follows:

```
/opt/symappl/services/backup/script/migrate.sh /mnt/
persistent/apollo/<name of the backup set>
/opt/symappl/services/backup/script/migrate.sh /mnt/
persistent/apollo/BackupSet_130913-0400007.tar
```

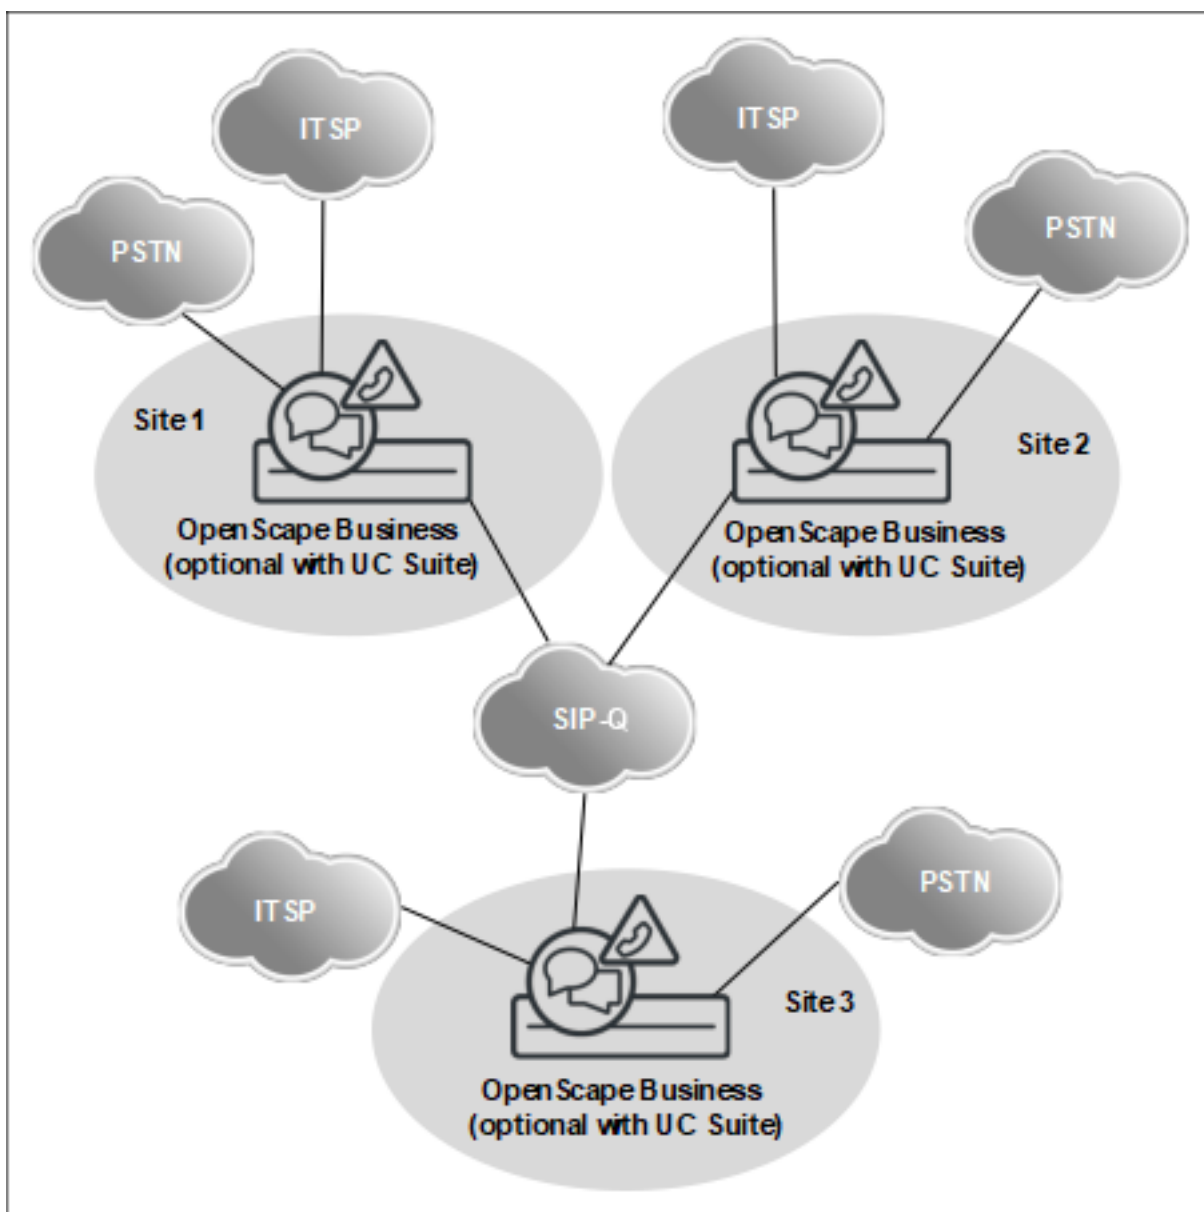

5. After the conversion script is run, the converted backup set can be used for the restore.

## 26.7.4 Migration of a HiPath 3000 network to OpenScape Business network

In order to upgrade a HiPath 3000 network to an OpenScape Business network, the following migration steps must be completed as described below.

**Figure 18: HiPath 3000 V9 Internetwork**

**Figure 19: OpenScape Business Internetwork**

### Migration Steps

Perform the following steps in sequence:

#### 1) Upgrade the HiPath 3000

All HiPath 3000 systems of the internetwork must be upgraded separately according to the migration description for a standalone system (see 1.7.1).

#### 2) Edit the configuration

The following configuration parameters must subsequently be adapted using the WBM expert mode:

- LCR entries
- Voicemail system (hunt group, code to dial the voicemail)
- Announcements

### **3) Execute the licensing procedure.**

Once all systems have been upgraded, the individual license files are combined into a network-wide license at the CLS.

## **26.7.5 Migration of a HiPath 3000 Internetwork with HiPath 5000 RSM**

An HiPath 3000/5000 network with a common network license file can be broken down into standalone systems with individual license files via the Central License Server (CLS). Each standalone system is now migrated to OpenScape Business and licensed separately.

If required, the OpenScape Business systems can be merged to a network group with a single network license file at the CLS after migration.

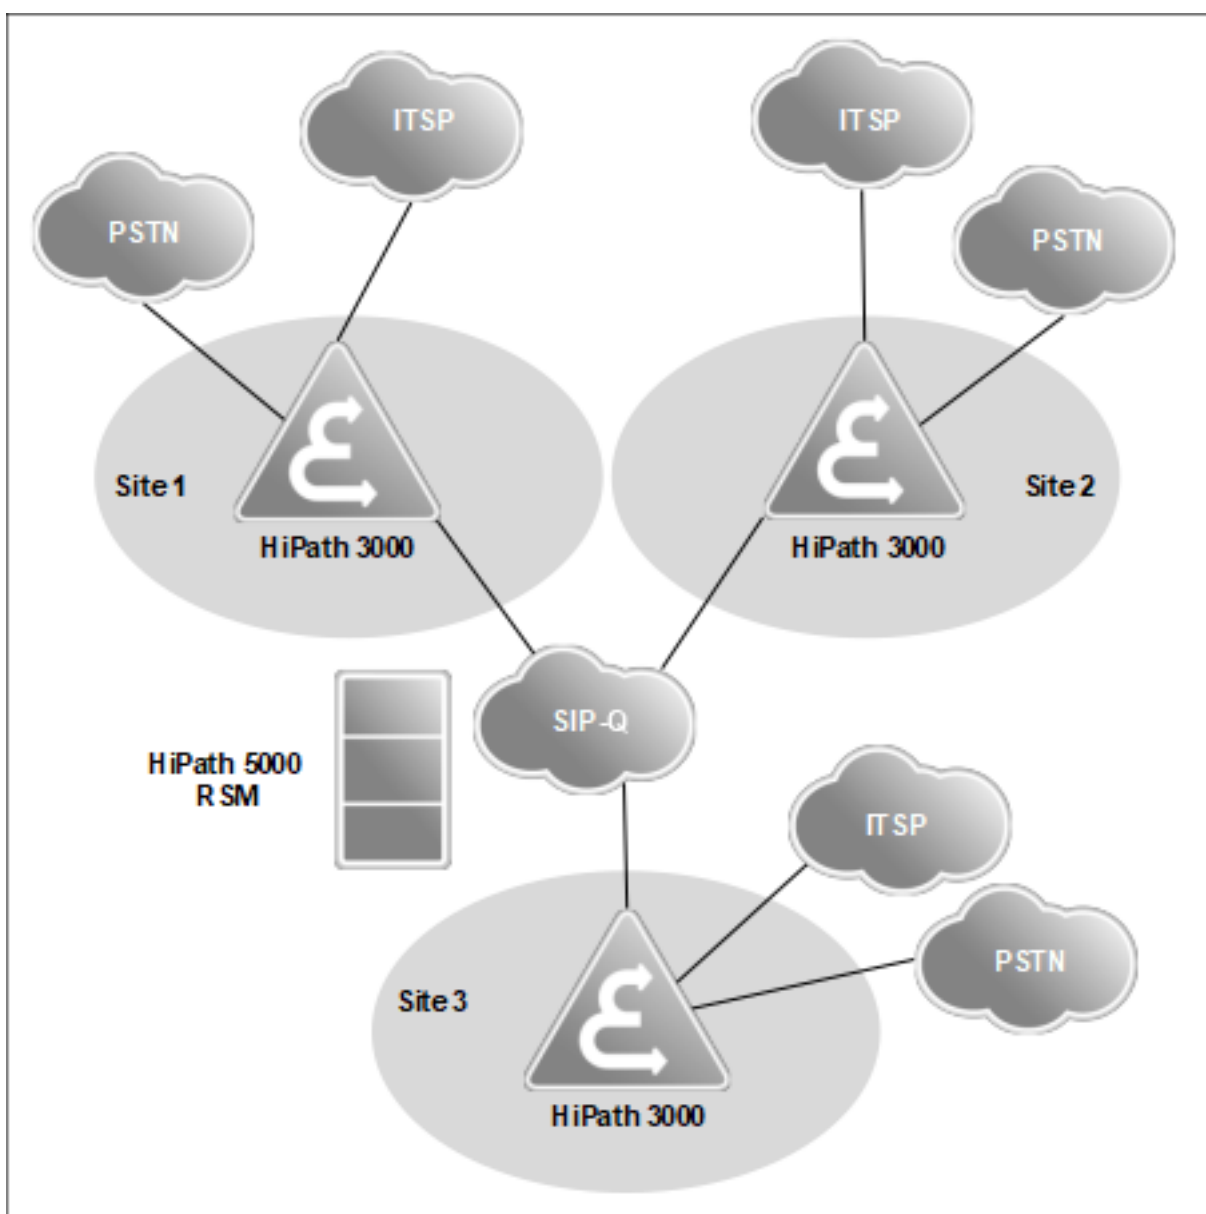

The functionality of HiPath 5000 RSM has been integrated in OpenScape Business, hence HiPath 5000 RSM itself is no longer needed in the OpenScape Business internetwork.

For networking the OpenScape Business systems OpenScape Business Networking licenses must be available additionally per node.

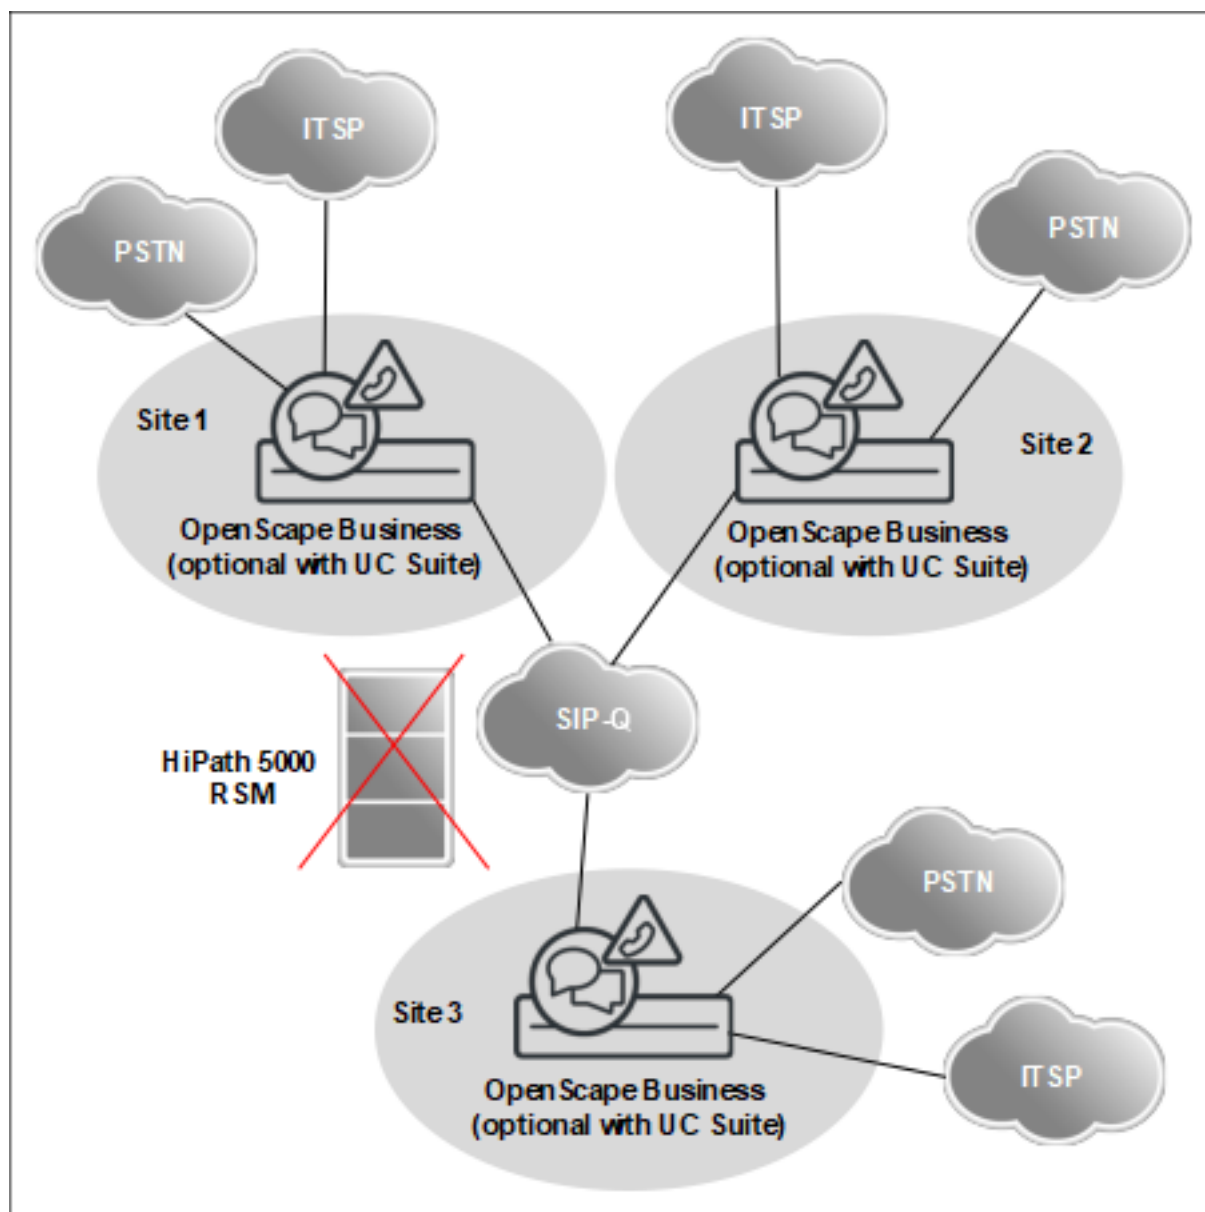

For Internet telephony and T1 trunks additional trunk licenses are required.

The following migration steps must be completed as described bellow.

**Figure 20: HiPath 3000 V9 Internetwork**

**Figure 21: OpenScape Business Internetwork**

### Migration Steps

Perform the following steps in sequence:

#### 1) Split the network license file into individual license files

A HiPath 3000 internetwork with HiPath 5000 RSM uses network-wide licensing. Split the network license file into individual license files at the CLS and assign those files to the locking IDs (MAC addresses) of the HiPath 3000 V9 systems before starting the actual migration to OpenScape Business.

- First, assign the licenses of the HiPath 5000 RSM internetwork to the individual locking IDs of the HiPath 3000 nodes.  
Recommendation: Create an Excel list in which the individual licenses are mapped to the locking IDs of the HiPath 3000 systems.

- Contact the licensing hotline and request that the licenses be split in accordance with the Excel list.
- Download the individual licenses of the HiPath 3000 systems from the CLS and check them. There is no need to activate the licenses, i.e., to transfer them to the HiPath 3000 systems.

## 2) Remove HiPath 5000 RSM

Make sure that HiPath 5000 RSM is switched off before upgrading the HiPath 3000 systems.

## 3) Upgrade the HiPath 3000

All HiPath 3000 systems of the internetwork must be upgraded separately according to the migration description for a standalone system. See 1.7.1

## 4) Edit the configuration

The following configuration parameters must subsequently be adapted within OpenScape Business systems using the WBM expert mode:

- LCR entries
- Voicemail system (hunt group, code to dial the voicemail)
- Announcements

## 5) Execute the licensing procedure.

Once all systems have been upgraded, the individual license files of OpenScape Business are combined into a network-wide license at the CLS.

---

**NOTICE:** In case of a network-wide extension on UC functionality, it is necessary to change from open to closed numbering in order to adapt the internal numbers. Thus, the open numbering must be disabled, while the node number must be deleted and subsequently added as a prefix (for example, extended internal number 87100 instead of 100 and 88100 instead of 100).

Differences:

- The selection of participants in their own node is made with the extended internal number.
  - The internal number and the DID number may differ if necessary, but the DID numbers must not be changed.
- 

## 26.7.6 HiPath 3000 Changed/Dropped Features and Interfaces

Some HiPath 3000 features and interfaces have been adapted for OpenScape Business and enhanced in functionality.

### Replacing the MMC Card

For technical reasons, the SDHC / M.2 SATA SSD card cannot be replaced while the system is switched on (a procedure which is known as speed update for HiPath 3000). Furthermore, the SDHC / M.2 SATA

SSD card of a licensed system A cannot be used for another system B because the license is bound to the locking ID of mainboard A. If the SDHC / M.2 SATA SSD card is to be used in System B, it must be first initialized with new software by using the Card Manager.

### **HG1500 DSP channels / B channels**

The HG1500 module is no longer required. The DSP functionality is integrated in OpenScape Business on the V3 motherboard and via optional Voice Channel Booster cards.

Please determine the number of DSP channels required. DSP channels are required to implement network transitions from TDM telephony to VoIP. OpenScape Business has 8 DSP channels integrated on the V3 mainboard. To extend DSP channels, the DSP module OCCB1/OCCBL (up to 40 channels) or the DSP module OCCB3/OCCBH (up to 120 channels) can be used.

### **entry Web Services**

The entry Web Services are no longer supported. The successor to myPortal entry is called myPortal @work and provides extended functionality. myPortal for Mobile has been replaced by myPortal to go (Web Edition). The Plug PC is no longer required in order to use myPortal to go

### **Entry Voicemail**

The Entry Voicemail module is dropped in OpenScape Business - the function is integrated as Smart Voicemail in the OpenScape Business mainboard. Smart Voicemail users must be licensed.

### **External Voicemail**

If the HiPath 3000 uses an external voicemail solution such as Xpressions, the ten EVM ports must be changed from **PhoneMail** to **Standard** in Manager E after CDB conversion.

### **Enhanced SIP Functionality**

The following SIP features have been additionally implemented as compared to HiPath 3000 V9:

- Call completed elsewhere
- Message Waiting Indication for Voicemail
- Calling Name Presentation (CNIP)
- Distinctive Ringing (internal/external calls)
- 3rd Party Call Control
- Call Forwarding busy/no reply/unconditional (handset controlled)

### **SIP Trunking**

To connect external SIP servers (e.g., OpenScape Alarm Server, HiPath 4000, OpenScape Voice or UC Suite), additional native SIP/SIP-Q routes are available in OpenScape Business (as opposed to only one SIP-Q route in HiPath 3000). Thus, in addition to the classical routes for the CO, networking and ITSP, independent native SIP/SIP-Q trunk interfaces (called the SIP Interconnection) are provided for certified SIP applications.

See [Networking OpenScape Business](#)

## **LCR**

Routing tables 1 to 15 are intended for default entries or for configuration using wizards. During a migration, the existing entries in the HiPath 3000 are not transferred to these routing tables. Manual post-processing of the routing tables is therefore required.

## **Simplified Dialing**

Either the "LCR" function or the "Prime Line (Simplified dialing)" function can be activated but not both at the same time. For this reason, "LCR" is activated automatically during migration while "Prime Line (Simplified dialing)" is deactivated. To deactivate "LCR" and to activate "Prime Line (Simplified dialing)", the Basic Installation wizard must be completed before the relevant flags can be set in Manager E (not for OpenScape Business X1 because it does not allow administration via the Manager E).

---

**NOTICE:** Simplified dialing is not supported in CSTA applications.

---

## **VoIP over PPP via ISDN**

Routed voice calls over lines with low bandwidth are no longer supported.

## **G.723 support**

G.723 codecs are no longer supported.

## **Babyphone**

The Babyphone (room monitoring) feature is no longer supported. Since "CSTA monitoring" is always active (a system phone can be monitored by an application such as myAgent or myPortal, for example), "room monitoring" can no longer be activated for this system phone. During CDB conversion with Manager E, the code for activating the room monitor is deleted.

## **Number of Base Stations and DECT Telephones at OpenScape Business X3**

The number of base stations at OpenScape Business X3 was increased from 3 to 7 as compared to HiPath 33xx. The number of DECT telephones at OpenScape Business X3 was increased from 16 to 32 as compared to HiPath 33xx.

## **HiPath 3000 BS4**

Base station licenses are no longer required in OpenScape Business.

## **SSDP based on the Plug PC**

SSDP is integrated in OpenScape Business. The Plug PC is no longer required.

### Accounting interface

The interfaces of the accounting data have changed compared to HiPath 3000.

### V24 applications

V24 applications are no longer supported.

### CSTA applications

Within OpenScape Business V3 either a V3 mainboard or a UC Booster Card / Server in combination with a V2 mainboard is required for connecting CSTA applications. In an internetwork, a V3 mainboard / UC Booster Card / Server must exist only in the master node. The applications must support the CSTAv3 protocol. Compared with HiPath 3000, changes have been implemented to the CSTA protocol. Consequently, CSTA applications at HiPath 3000 V9 may not run compatibly at OpenScape Business systems. The CSTAv2 protocol is no longer supported.

In SW Version 3 a CSTA license is required for used of the CSTA interface with following except for:

- UC Booster Card CSTA connections in general
- OpenScape Business TAPI 120 or TAPI 170 CSTA connections in general

Compared to the HiPath 3000 CSTA interface, the OpenScape Business CSTA interface has been modified as follows:

- The connection to the CSTA interface is identical for standalone and networked OpenScape Business slave node. CSTA at master node in a network provides enhanced functionality. It occurs exclusively via the LAN. RS-232 (V.24) and S0 interfaces are no longer supported.
- Additional hardware and software components such as the CSTA Service Provider (CSP), HG 1500 board or HiPath 5000 RSM System are no longer required with OpenScape Business. Instead UC Booster HW or V3 mainboards are required.
- The CSTA interface is licensed with exception of UC Booster Card and TAPI 120/170 connections.
- A maximum of 4 CSTA links can be used for connecting external applications. In the default factory state, 3 of the 4 CSTA interfaces are preconfigured for the use of internal applications of OpenScape Business. These can optionally also be used for connecting external applications.
- The protection of the CSTA interfaces against abuse has been improved. The access mechanism has been revised.
- MULAP monitoring via CSTA is only possible if a monitor point is set on the MULAP number. Individual MUALP members cannot be monitored. If a CSTA application would nonetheless like to monitor individual MULAP members, no CSTA events will be transmitted to the application by OpenScape Business. This also applies to MULAP members who are part of a hunt group.
- The provided CSTA functions have been expanded. Details can be found in the OpenScape Business CSTA Interface Manual.
- The CSTA Phase II protocol version is no longer supported.

- CSTA applications to be used with OpenScape Business should be tested and released in conjunction with OpenScape Business.

**HiPath TAPI 120/170 V2 Applications**

For HiPath TAPI 120/170 V2, the existing licenses cannot be transferred. New licenses must be purchased. HiPath TAPI 120/170 V2 must be uninstalled, and OpenScape Business TAPI 120/170 V1 must be installed and configured instead.

TAPI licenses can be configured in OpenScape Business on a user basis, thus eliminating the need for TAPI licensing within the TAPI device. Licensing is required as of the first TAPI user (so even TAPI120 is thus no longer license-free for the first 6 users). The CMD (CSTA Message Dispatcher) is integrated in OpenScape Business. A separate Windows server for the CMD is therefore no longer required. Connectivity to external TAPI applications is possible for OpenScape Business and OpenScape Business S. OpenScape Business requires a V3 Mainboard or a UC Booster Card / Server. In an internetwork, either an OpenScape Business S must exist, or a V3 mainboard / UC Booster Card / Server must exist at least on the master node.

Compared to HiPath TAPI 120/170 V2, the OpenScape Business TAPI 120/170 V2 V1 has been modified as follows:

- Access to the system is only possible via Ethernet LAN. RS-232 und S0 interfaces are no longer supported.
- New shared TAPI license on a "per user" basis for TAPI 120 TSP und TAPI 170 TSP.
- The licenses are bound to the locking ID of OpenScape Business.
- Existing HiPath TAPI 120 TSP or HiPath TAPI 170 TSP user licenses are not supported by the new licensing mechanism.
- No backward compatibility with HiPath 3000 V8 or V9
- The following applies for TAPI 170 TSP:
  - By default, access to the system occurs via Port 8800.
  - The configuration of the CSTA credentials in the setup dialog is mandatory.
  - Multi-node support in the network via the CSP of the central master node.
- The following applies for TAPI 120 TSP:
  - By default, access to the system occurs via Port 8900.
  - Single-node support, even when connected to the master node of a network.

**Other External Applications**

Subsequent applications connected externally to HiPath 3000 can no longer be operated on OpenScape Business.

| HiPath 3000 Application                                 | Successor Application for OpenScape Business          | Remarks                                         |

## HiPath 5000 RSM Changed/Dropped Features

HiPath 5000 RSM is no longer supported. The functionality of HiPath 5000 RSM has been integrated into OpenScape Business. This means that a separate server is no longer required.

**Table 37: Differences between HiPath 5000 RSM and OpenScape Business V3**

| Feature                                                                | HiPath 5000 RSM                                                                                                                                       | OpenScape Business                                                                                                                                                                |
|------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Network-wide licensing, assignment of licenses to the individual nodes | All system licenses of the network are combined at the CLS into a network-wide license.                                                               | All system licenses of the network are combined at the CLS into a network-wide license.                                                                                           |
| Network-wide administration                                            | DB Feature Server: all nodes of the network are combined into a network CDB using Manager E. The numbering scheme is synchronized across the network. | All nodes of the network are recorded through the OpenScape Business Assistant (WBM) with a network wizard. The numbering scheme is synchronized network-wide (closed numbering). |

| Feature                                               | HiPath 5000 RSM                                                                                                       | OpenScape Business                                                                                                                                                                                                                                                                                                             |
|-------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Connection to external nodes or external applications | SIP-Q connection of up to 4 external nodes                                                                            | Up to 10 SIP interconnection routes with up to 2 SIP-Q or up to 10 Native SIP or up to 8 ITSP                                                                                                                                                                                                                                  |
| Resilience / Survivability                            | User survivability for HFA phones with closed numbering                                                               | User survivability for HFA phones with closed numbering (change from OpenScape Business S <-> OpenScape Business X3/X5/X8)                                                                                                                                                                                                     |
| Backup / Restore                                      | Netwide                                                                                                               | Local                                                                                                                                                                                                                                                                                                                          |
| Inventory function                                    | Netwide                                                                                                               | Local                                                                                                                                                                                                                                                                                                                          |
| Presence Manager                                      | Network-wide function with the provision of 5000 RSM                                                                  | Network-wide function with the provision of a multi-node CSP based on the OpenScape Business UC Booster Card, the OpenScape Business UC Booster Server or OpenScape Business S. Prerequisite: closed numbering.                                                                                                                |
| TAPI 170 on a standalone system                       | TAPI 170 on a standalone system runs on a Windows PC with its own licensing (separate license file for the TAPI 170). | TAPI 170 on a standalone system runs on a Windows PC. The license request and supply of the TAPI 170 database occurs from the SQL DB of OpenScape Business. The connection of the TAPI 170 occurs via the CSP of the system (OpenScape Business UC Booster Card, OpenScape Business UC Server Booster or OpenScape Business S) |

| Feature                     | HiPath 5000 RSM                                                                                                                                                          | OpenScape Business                                                                                                                                                   |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TAPI 170 in an Internetwork | TAPI 170 runs on 5000 RSM with its own licensing (separate license file for the TAPI 170). The TAPI 170 database is obtained from the DB Feature Server of the 5000 RSM. | As with the standalone system, but the connection of the TAPI 170 occurs at the multinode CSP of a master node (i.e., network-wide). Prerequisite: closed numbering. |

### Mixed Networks

Mixed internetworks consisting of OpenScape Business and OpenScape Office are not supported.

## 26.8 Migration within OpenScape V3 Business

The various migration options within OpenScape Business X V3 systems with V2 mainboards are described here.

---

**NOTICE:** These scenarios are obsolete (not valid) for OpenScape Business X V3 systems with V3 mainboards!

---

### Increasing the Number of UC Smart Users

You can choose from the following options:

- Migration of **OpenScape Business X** (UC Smart) to **OpenScape Business X** with **UC Booster Card** (UC Smart)  
Useful for 50 to 150 UC Smart users. All the configuration and user data is transferred. No data transfer occurs with downgrades. Additional UC user licenses are required for the new UC Smart users. OpenScape Business X1 is not expandable with the UC Booster Card.
- Migration of **OpenScape Business X** (UC Smart) to **OpenScape Business X** with **UC Booster Server** (UC Smart)  
Useful for 50 to 500 UC Smart users. All the configuration and user data is transferred. No data transfer occurs with downgrades. Additional UC user licenses are required for the new UC Smart users.
- Migration of **OpenScape Business X** with **UC Booster Card** (UC Smart) to **OpenScape Business X** with **UC Booster Server** (UC Smart)  
Useful for 150 to 500 UC Smart users. All the configuration and user data is transferred. No data transfer occurs with downgrades. Additional UC user licenses are required for the new UC Smart users.

### Upgrade from UC Smart to UC Suite

You can choose from the following options:

- Migration of **OpenScape Business X** (UC Smart) to **OpenScape Business X** with **UC Booster Card** (UC Suite)

The configuration and user data is not transferred. An upgrade license to UC Suite clients is required for the existing UC Smart clients. The conversion of the UC solution to UC Suite occurs in the WBM with the **Initial Installation** wizard.

- Migration of **OpenScape Business X** (UC Smart) to **OpenScape Business X** with **UC Booster Server** (UC Suite)

The configuration and user data is not transferred. An upgrade license to UC Suite clients is required for the existing UC Smart clients. The conversion of the UC solution to UC Suite occurs in the WBM with the **Initial Installation** wizard.

- Migration of **OpenScape Business X** with **UC Booster Card** (UC Smart) to **OpenScape Business X** with **UC Booster Server** (UC Suite)

The configuration and user data is not transferred. An upgrade license to UC Suite clients is required for the existing UC Smart clients. The conversion of the UC solution to UC Suite occurs in the WBM with the **Initial Installation** wizard.

- Migration within **OpenScape Business S** from UC Smart to UC Suite

The configuration and user data is not transferred. An upgrade license to UC Suite clients is required for the existing UC Smart clients. The conversion of the UC solution to UC Suite occurs in the WBM with the **Initial Installation** wizard.

- Migration within **OpenScape Business UC Booster Server** from UC Smart to UC Suite

The configuration and user data is not transferred. An upgrade license to UC Suite clients is required for the existing UC Smart clients. The conversion of the UC solution to UC Suite occurs in the WBM with the **Initial Installation** wizard.

### **Increasing the Number of UC Suite Users**

You can choose from the following options:

- Migration of **OpenScape Business X** with **UC Booster Card** (UC Suite) to **OpenScape Business X** with **UC Booster Server** (UC Suite)

Useful for 150 to 500 UC Suite users. All the configuration and user data is transferred. No data transfer occurs with downgrades. Additional UC User or Groupware User licenses are required for the new UC Suite users.

## **26.9 Migration of HW boards**

The following hardware migration actions are possible in case of an OpenScape Business X8 system:

- Replacements of SLMO24N with SLMU
- Replacements of SLMO8N with SLMU
- Replacements of SLCN with SLMUC (SLMU + CMAe)

### 26.9.1 Replacement of SLM024N with SLMU

A simple card exchange is supported. The SLM024N can be removed from the system and the new SLMU can be plugged. All configured ports are kept unchanged. There is no need to switch off the system.

### 26.9.2 Replacement of SLM8N with SLMU

As the SLMU card has more ports than the SLM08, the SLM08 card must be removed per administration. In order to remove the card from the system, the Online User with the following dialog should be used:

Systemadministration 29- 4 - 1

and change the card type to SLMUC.

---

**NOTICE:**

If the users are configured for UC Suite, they are created with the default settings. All previous data (for example, Voicemail, Fax, User settings) are lost.

---

---

**NOTICE:**

If the SLM08 is exchanged with the SLMU card without removing the card with the described procedure, the additional 16 ports from the SLMU card might be lost as they could not be configured. This will happen if there is already another card in operation using the port range of these 16 ports. If there is a single SLM08 in the system, replaced by an SLMU card, all ports will be available.

---

### 26.9.3 Replacement of SLCN with SLMUC (SLMU plus CMAe)

As the SLMU card has more ports than the SLCN, the SLCN must be removed per administration before the SLMUC go into service in that slot. The process to remove the card is the following:

- 1) De-Register all CMI handsets from their Base Station**
- 2) Remove the card from the system**
- 3) Remove the SLCN card per Online User with the dialog:**

Systemadministration 29- 4 - 1

and change the card type to SLMUC.

- 4) Install the SLMUC card**
- 5) Configure the used Handset**
- 6) Register the CMI handsets**

All affected DECT Phones (maximum of 128) have to be connected for the new registration.

---

**NOTICE:**

When replacing an SLCN card by an SLMUC, it is also needed a blind cover for the SLMUC instead of the plastic cover which is used for the SLCN.

---

---

**NOTICE:**

If the users are configured for UC Suite, they are created with the default settings. All previous data (for example, Voicemail, Fax, User settings) are lost.

---

## 26.10 Migration from OpenScape Business X1 V2 to OpenScape Business X1W V3

When migrating an OpenScape Business X1 model, the complete system needs to be replaced.

Existing licences can be taken over. The customer configuration cannot be taken over and must be restored manually after the migration. The existing software support will be continued unchanged after the migration or a new software support date for the V3 mainboard will be adopted if this is valid beyond 31/12/2026.

Before the migration, permanent access to the Unify license server (via the Internet) should be set up in the system, if not already available, and the "CLS Connect" function should be activated. This simplifies the license transfer and shortens the migration time considerably. The customer must be informed about the required access from the OpenScape Business System to the CLS.

### Required order items

For the migration of the X1 model to X1W with V3 mainboard, the following order items are required depending on whether CLS Connect, UC Suite or external CSTA applications are used:

- X1W System
- V3 SW on M.2 SATA SSD data storage
- M2 SSD 256 GB mass data storage (optional with UC Suite application)
- OpenScape Business Upgrade for OS Biz X1 license (is always needed)
- OpenScape Business CSTA license (optional)

### Functional boundary conditions

Existing licenses can be transferred completely from the existing X1 System to the X1W System with V3 mainboard in the course of the migration. License transfer without activating the CLS Connect function requires the "Migration" license and a much more complex handling and a higher time expenditure than using the CLS Connect function.

X1 systems with active CLS Connect cannot be upgraded to X1W systems with V3 mainboard via the "Regeneration" function. The

license "OpenScape Business Upgrade for OS Biz X1" must always be activated, but no confirmation code must be entered during the upgrade process.

Upgrading OpenScape Business X1 PAYGO system to OpenScape Business X1W PAYGO systems is not supported.

In the event that OpenScape Personal Edition clients are operated on the system and corresponding licenses are available, these must always be regenerated manually at the central license server for the new locking ID (MAC address) of the V3 mainboard, regardless of whether CLS Connect is used or not.

The customer configuration cannot be taken over and must be restored manually after the migration.

### **Technical handling of the migration**

The main technical steps of the migration are described below. A distinction is made between:

- Migration with permanent licensing
  - Migration with activated CLS Connect function and connection to the central license server
  - Migration without CLS Connect function and without connection to the central license server

Further details about the technical handling of the migration are contained in the OpenScape Business Administrations manual.

## **26.10.1 How to Migrate to X1W V3 Permanently Licensed Systems with CLS Connect**

### **Step by Step**

- 1.** Generate license files at the Central License Server (CLS).
  - a) Activate the "OpenScape Business Upgrade for OS Biz X1" license on the X1 system with V2 mainboard. During the activation process provide the V3 mainboard MAC address.
  - b) Generate a new license file for the MAC address of the X1W system with V3 mainboard. This license file includes the extended SW support.
  - c) Transfer of possibly existing Personal Edition licenses from the MAC address of the V2 mainboard to the MAC address of the V3 mainboard using the "Regenerate" function and generation of a new license file for the Personal Edition licenses.
- 2.** Prepare the OpenScape Business System.
  - a) Upgrade the existing system to SW version V2R7.
  - b) Set up access to the Central License Server (CLS) in the system and test the connection.
  - c) Activate CLS Connect in the system. If not already done, SW support will be extended again for 3 months.
- 3.** X1 System exchange

- a) X1 System shut down and switch off all supply voltages.
- b) Use V3 data carrier and if necessary optional mass data storage on the X1W System.
- c) Remove the CAME and or the OCCB Voice Channel Booster card from the V2 mainboard and plug it into the X1W V3 mainboard.
- d) Replace the X1 System by the X1W system.
- e) Connect the grounding cable to the X1W system.
- f) Connect the telephone, trunk line, LAN and, if applicable, USB cables to the X1 W system.
- g) Switch on supply voltages again, system boots automatically.
- 4. Set Basic System Parameters within WBM after startup.**
  - a) Set system date and time.
  - b) Set application package.
    - UC Smart for systems without UC or with UC Smart
    - UC Suite for systems with UC Suite
  - c) Restore the system configuration.
    - Manual configuration of the X1W.
    - Importing the newly created license files.

## 26.10.2 How to Migrate to X1W V3 Permanently Licensed Systems without CLS Connect

### Step by Step

- 1. Prepare OpenScape Business System.**
  - a) Upgrade the existing system to SW version V2R7.
- 2. Create a migration license file for the X1 with V2 mainboard at the central license server (CLS).**
  - a) Activation of the "X1 Migration License" for the existing system.
  - b) Generate the new license file for the MAC address of the V2 mainboard. For this, the MAC address of the X1W system must be entered at the CLS.
  - c) Downloading the license file from CLS. This license file includes the extended SW support.
- 3. Import the license file into the OpenScape Business X1 System with V2 mainboard.**
- 4. Note the "Confirmation Code" displayed in OpenScape Business Assistant.**
- 5. Generate a new license file for the X1W system with V3 mainboard at the central license server (CLS).**
  - a) Create a new license file for the MAC address of the X1W System with V3 mainboard at the CLS by regenerating the MAC address of the X1 with V2 mainboard and the previously noted confirmation code.
    - Search for the OpenScape Business System with the MAC address of the X1W System with V3 mainboard in the CLS.

- Unlocking the OpenScape Business System by entering and activating the Confirmation Code.
  - Regenerate the license file.
  - b) Download the newly generated license file from CLS.
- 6. Mainboard exchange**
- a) Shut down the system and switch off all supply voltages.
  - b) Use V3 data carrier and if necessary optional mass data storage on the X1W System with the V3 mainboard.
  - c) Remove the CAME and or the OCCB Voice Channel Booster card from the V2 mainboard and plug it into the X1W with V3 mainboard.
  - d) Replace the X1 System with V2 mainboard with the X1W System with V3 mainboard.
  - e) Connect the grounding cable to the X1W system.
  - f) Connect the telephone, trunk line, LAN and, if applicable, USB cables to the X1 W system.
  - g) Switch on the power supply again and the system boots automatically.
- 7. Set Basic System Parameters within WBM after startup.**
- a) Set system date and time.
  - b) Set application package.
    - UC Smart for systems without UC or with UC Smart
    - UC Suite for systems with UC Suite
  - c) Restore the system configuration.
    - Manual configuration of the X1W
  - d) Manual import of the new license file into the V3 system after system startup.

## 27 Configuration Limits and Capacities

The configuration limits and capacities are based on system-specific maximum values of a single system. The maximum values of a system in a network can be different.

### 27.1 Maximum values for stations

- Data for systems with V2 OCC mainboards can be found in [Table 38: Expansion Level Stations/Users with OCCx mainboards](#) on page 1413
- Data for systems with V3 OCC mainboards can be found in [Table 39: Expansion Level Stations/Users with OCCSB/R, OCCMA/B or OCCLA mainboards](#) on page 1414
- Data for OpenScape Business S Server systems can be found in [Table 40: Expansion Level Stations/Users with OpenScape Business S](#) on page 1415

**Table 38: Expansion Level Stations/Users with OCCx mainboards**

| Stations                                                         | X1               | X3W/R | X5W/R | X8  |
|------------------------------------------------------------------|------------------|-------|-------|-----|
| <b>Stations maximum</b>                                          |                  |       |       |     |
| Max. number of stations <sup>17</sup>                            | 30               | 500   | 500   | 500 |
| <b>IP stations</b>                                               |                  |       |       |     |
| IP-Stations System (HFA)                                         | 20 <sup>18</sup> | 500   | 500   | 500 |
| IP-Stations (SIP)                                                | 20 <sup>18</sup> | 500   | 500   | 500 |
| <b>TDM stations</b>                                              |                  |       |       |     |
| Max. number of TDM Stations <sup>19</sup><br><sup>23</sup>       | 30               | 384   | 384   | 384 |
| Analog stations (TDM)                                            | 4                | 20    | 68    | 384 |
| U <sub>P0</sub> Master stations (TDM) <sup>23</sup>              | 8                | 24    | 56    | 384 |
| U <sub>P0</sub> Slave stations (TDM) (incl. a/b and S0 adapters) | 8                | 24    | 56    | 116 |
| S0 ISDN stations (TDM)                                           | 2                | 36    | 52    | 128 |
| DECT-CMI stations (TDM)                                          | 16               | 64    | 64    | 250 |
| <b>Mobility User</b>                                             |                  |       |       |     |
| Max. number of mobility users <sup>20</sup>                      | 30               | 150   | 150   | 150 |
| Mobility Entry users                                             | 20               | 150   | 150   | 150 |
| myPortal to go users <sup>21</sup>                               | 30               | 150   | 150   | 150 |

## Configuration Limits and Capacities

| Stations                             | X1 | X3W/R | X5W/R | X8  |
|--------------------------------------|----|-------|-------|-----|
| Circuit users <sup>22</sup>          | 30 | 150   | 150   | 150 |
| Skype for Business users             | 30 | 150   | 150   | 150 |
| <b>Other users</b>                   |    |       |       |     |
| RAS users                            | 2  | 500   | 500   | 500 |
| Virtual stations freely configurable | 30 | 250   | 250   | 250 |

**NOTICE:** For each system configuration, it must be checked whether the rated power output of the native power supply is sufficient or whether an external auxiliary power supply is required (see *OpenScape Business Service Documentation - Power Requirements of a Communication System*).

**Table 39: Expansion Level Stations/Users with OCCSB/R, OCCMA/B or OCCLA mainboards**

| Stations                              | X1W |            | X3W/R |            | X5W/R |            | X8  |            |
|---------------------------------------|-----|------------|-------|------------|-------|------------|-----|------------|
|                                       |     | + NVMe SSD |       | + NVMe SSD |       | + NVMe SSD |     | + NVMe SSD |
| <b>Stations maximum</b>               |     |            |       |            |       |            |     |            |
| Max. number of stations <sup>17</sup> | 30  | 30         | 500   | 500        | 500   | 500        | 500 | 500        |
| <b>IP stations</b>                    |     |            |       |            |       |            |     |            |
| IP-Stations System (HFA)              | 500 | 500        | 500   | 500        | 500   | 500        | 500 | 500        |
| IP-Stations (SIP)                     | 500 | 500        | 500   | 500        | 500   | 500        | 500 | 500        |
| <b>TDM stations</b>                   |     |            |       |            |       |            |     |            |

<sup>16</sup> Values are staggered according to UC Booster configuration: Booster Server / Booster Card / without UC Booster

<sup>17</sup> Sum of: IP (HFA), IP (SIP), Analog, UP0 Master/Slave, DECT (CMI), ISDN S0, Mobility and Deskshare subscribers

<sup>18</sup> Sum of IP user and desk share user (limitation via configuration)

<sup>19</sup> Sum of: Analog, UP0, DECT (CMI) and ISDN S0 subscribers

<sup>20</sup> Sum of: Mobility Entry, myPortal to go- Circuit- Skype for Business participants

<sup>21</sup> The number of simultaneous VoIP connections of the subscriber depends on:

**1)** the DSP channels available in the system for gateway calls (IP/TDM transition).

**2)** the internal RTP proxy channels available in the system for VoIP calls via the Internet.

<sup>22</sup> The number of simultaneous connections depending on the DSP channels available in the system for gateway calls (IP/TDM transition).

<sup>23</sup> Depending on the types of phones and the total power requirements of the communication system

| Stations                                                                                             | X1W                       |                           | X3W/R                     |                           | X5W/R                     |                           | X8                      |                         |
|------------------------------------------------------------------------------------------------------|---------------------------|---------------------------|---------------------------|---------------------------|---------------------------|---------------------------|-------------------------|-------------------------|
|                                                                                                      |                           | + NVMe SSD                |                           | + NVMe SSD                |                           | + NVMe SSD                |                         | + NVMe SSD              |
| Max. number of TDM Stations <sup>19 23</sup>                                                         | 384                       | 384                       | 384                       | 384                       | 384                       | 384                       | 384                     | 384                     |

<sup>25</sup> Sum of; SIP trunk, ITSP, SIPQ, TDM line channels and MEB Trunk channels w/o (MEB announcement channels).

<sup>26</sup> In networking with OpenScape Business S as ITSP gateway, more than 60 channels are also possible

<sup>27</sup> The MEB channels are dynamically assigned by the system for system-internal announcements. They are always included in the maximum number of line channels.

<sup>28</sup> For systems with UC Suite, the MEB channels are dynamically generated for: Voicemail, AutoAttendant, Fax, Call Me connections, announcements and conference calls. They only count towards the maximum number of line channels in UC Suite systems.

<sup>29</sup> Values are staggered according to UC Booster configuration: Booster Server / Booster Card / without UC Booster

| DTMF receiver                                                           | 16   | 16   | 16   | 16   | 16   | 16 | 16           | Per call via ITSP |

### 27.3.1 Details on the use of DSP channels

Within OpenScape Business, "DSP channels" are used for the conversion (transcoding) of data streams. In principle this is required if there is an IP to TDM or TDM to IP transition for the voice data or if an encryption of the voice data is required. In detail:

- Voice connection between IP telephone and ISDN or analog (trunk) line.

<sup>32</sup> Values are staggered according to UC Booster configuration: Booster Server / Booster Card / without UC Booster

<sup>33</sup> The value depends on UC Suite: System with UC Suite / System without UC Suite

<sup>34</sup> Values apply to OpenScape Business as ISDN gateway. G.711 to T38 or vice versa without UC Suite Fax

<sup>35</sup> UC Suite can generally handle up to 8 simultaneous fax connections. OpenScape Business X3/X5/X8 as ISDN gateway can process 3 to 12 simultaneous faxes depending on the DSP module. Both parameters in combination determine the number of simultaneous T.38 or G.711 fax connections.

<sup>36</sup> Values are staggered according to Voice Channel Booster configuration: with OCCBH or OCCB3 / with OCCBL or OCCB1 / mainboard only

- Voice connection via IP SIP/ITSP line and internal UP0/E, a/b or ISDN telephones.
- Voice connection from IP line or IP subscriber to an internal conference. Here, a gateway channel is required for each line/IP client involved in a conference.
- Connections from UP0/E, a/b or ISDN phones or ISDN/ analog lines to UC Suite announcements, voicemail, fax or conferences.
- Encrypted voice connections between terminals and encrypted voice connections over ITSP lines.
- Connections to internal Music on Hold require one DSP channel per configured MoH codec.

For the following connections no DSP channel is needed for:

- Connection between internal IP users without encryption (direct payload)
- Connection between ITSP and IP subscriber without encryption. (direct payload)

The DSP channels are realized by a signal processor, which is integrated on the respective OCCL or OCCLA motherboard in the models X1, X3, X5 and X8.

Depending on the type of transcoding, one signal processor can handle more or less DSP channels simultaneously. The following coding (codecs) is supported.

- **For voice connections**

- Conversion from IP (G.711) to TDM with G.711 or vice versa.
- Conversion from IP (G.711) to TDM with G.711 or vice versa with encryption (SPE).
- Conversion from IP (G.729) to TDM with G.711 or vice versa.
- Conversion from IP (G.729) to TDM with G.711 or vice versa with encryption (SPE).

- **For fax connections**

- Conversion from T.38 to G.711 when using OpenScape Business as ISDN gateway.
- Conversion from G.711 Fax to T.38 Fax or vice versa when using the UC-Suite Fax feature.

If the capacity of the signal processor integrated on the mainboard is not sufficient to realize the required number of DSP channels, they can be extended by using the optionally available "Voice Channel Booster" cards OCCBL or OCCBH.

The maximum number of available DSP channels depending on the encoding is shown in Table 11. Please note that each row represents the maximum number of similar DSP channels, but these are dynamically allocated by the system during operation. The number of DSP channels currently occupied during operation can be determined via the OpenScape Business Assistant (WBM). You find further notes about determining the required number of DSP channels in the administration manual.

## Configuration Limits and Capacities

Maximum values for features

### 27.3.2 Details on the use of RTP proxy channels

OpenScape Business uses an internal "RTP proxy" for all VoIP connections via the Internet. The proxy offers a pool of RTP channels that are assigned to the VoIP connections via Internet as follows.

- 1 RTP proxy channel per ITSP call
- 1 RTP proxy channel per circuit call
- 1 RTP proxy channel per Unify Phone call
- 1 RTP proxy channel per system Device @Home in one call
- 1 RTP proxy channel per SIP Device @Home in one call
- 1 RTP proxy channel per myPortal to go VoIP @Home in one call
- 1 RTP proxy channel per myPortal @work VoIP @Home in one call

Within the different OpenScape Business models a different number of RTP proxy channels is available. See [Table 44: Expansion Level other functions / resources](#) on page 1418.

#### Examples

- An external outgoing voice call from an internal IP system subscriber via an ITSP line requires an RTP proxy channel.
- An external voice call from the myPortal to go VoIP Client via internal (campus) WiFi to a subscriber in the public network via an ITSP line requires an RTP proxy channel. This is used for the connection via ITSP to the called subscriber in the public network.
- An external voice call from the myPortal to go VoIP Client via public WiFi to a subscriber in the public network over an ITSP line requires two RTP proxy channels. One RTP proxy channel is required for connecting the VoIP Client to OpenScape Business and another RTP proxy channel for the connection via ITSP to the called subscriber in the public network.
- An external voice call arriving via ITSP to a myPortal @work VoIP Client in the home office requires two RTP proxy channels. One RTP proxy channel is required for the connection from the ITSP to the OpenScape Business system and another one for the connection from OpenScape Business via Internet to the myPortal @work VoIP Client in the home office.

### 27.4 Maximum values for features

The maximum values described here are mainly based on the software capacities of OpenScape Business.

#### 27.4.1 Connection to Service Provider

| X1/X1W                                                |    | X3W/R |    | X5W/R |    | X8W/R |    | Server (S) |
|-------------------------------------------------------|----|-------|----|-------|----|-------|----|------------|
| V2                                                    | V3 | V2    | V3 | V2    | V3 | V2    | V3 |            |
| ITSP (Internet Telephony Service Provider) connection |    |       |    |       |    |       |    |            |

|                             | X1/X1W |     | X3W/R |     | X5W/R |     | X8W/R |     | Server (S) |
|-----------------------------|--------|-----|-------|-----|-------|-----|-------|-----|------------|
|                             | V2     | V3  | V2    | V3  | V2    | V3  | V2    | V3  |            |
| SIP trunk channels          | 30     | 120 | 60    | 120 | 60    | 120 | 60    | 120 | 180        |
| Simultaneous activated ITSP | 8      | 8   | 8     | 8   | 8     | 8   | 8     | 8   | 8          |
| <b>Routes</b>               |        |     |       |     |       |     |       |     |            |
| Routes                      | 16     | 16  | 16    | 16  | 16    | 16  | 16    | 16  | 16         |
| Overflow routes per route   | 1      | 1   | 1     | 1   | 1     | 1   | 1     | 1   | 1          |

## 27.4.2 Stations

|                                          | X1W                 | X3W/R               | X5W/R               | X8                  | Server (S)          |
|------------------------------------------|---------------------|---------------------|---------------------|---------------------|---------------------|
| <b>Station number / DID number</b>       |                     |                     |                     |                     |                     |
| Digits per station number/<br>DID number | 16<br>(default = 3) | 16<br>(default = 3) | 16<br>(default = 3) | 16<br>(default = 3) | 16<br>(default = 3) |

## 27.4.3 UC Smart Expansion Levels

- Expansion levels with V2 OCC mainboards can be found in [Table 45: Expansion Level UC Smart with OCCx mainboards](#) on page 1423
- Expansion levels with V3 OCC mainboards can be found in [Table 46: Expansion Level UC Smart with OCCSB/R, OCCMA/B or OCCLA mainboards](#) on page 1425
- Expansion levels with OpenScope Business S Server systems can be found in [Table 47: Expansion Level UC Smart with OpenScope Business S](#) on page 1426

**Table 45: Expansion Level UC Smart with OCCx mainboards**

|                                                         | X1 | X3W/R                       | X5W/R                       | X8                          |
|---------------------------------------------------------|----|-----------------------------|-----------------------------|-----------------------------|
| <b>UC Smart User maximum</b>                            |    |                             |                             |                             |
| Max number of UC Smart user (Accounts)                  | 30 | 250/ 150/ 50 <sup>37</sup>  | 250/ 150/ 50 <sup>37</sup>  | 250/ 150/ 50 <sup>37</sup>  |
| <b>UC Smart Clients</b>                                 |    |                             |                             |                             |
| Number of simultaneous active UC clients. <sup>38</sup> | 30 | 500/ 300/ 150 <sup>37</sup> | 500/ 300/ 150 <sup>37</sup> | 500/ 300/ 150 <sup>37</sup> |
| myPortal @work                                          | 30 | 250/ 150/ 50 <sup>37</sup>  | 250/ 150/ 50 <sup>37</sup>  | 250/ 150/ 50 <sup>37</sup>  |

## Configuration Limits and Capacities

|                                                                                     | X1  | X3W/R                      | X5W/R                      | X8                         |

<sup>43</sup> Values are staggered according to UC Booster configuration: Booster Server / Booster Card / without UC Booster

<sup>44</sup> Sum of: myPortal Desktop, myPortal for Outlook, myAttendant, myAgent, myReports, myPortal @work, myPortal to go, myPortal for Teams, CP 400/600/600E/700/700X/710 UC mode (Background: Several clients with the same UC Suite account can log on to the system)

<sup>45</sup> The lower value applies to systems with UC Suite Contact Center

<sup>46</sup> The number of simultaneous VoIP connections of the subscriber depends on

**1)** the DSP channels available in the system for gateway calls (IP/TDM transition).

**2)** the internal RTP proxy channels available in the system for VoIP calls via the Internet.

<sup>47</sup> The UC Booster Card supports a maximum of 500 voicemail boxes, regardless of the UC Suite client limit (150 users).

<sup>48</sup> The value depends on the available hard disk HD / SSD storage capacity. A subscriber-related limitation is not implemented.

**1)** Voicemail / Recordings: One minute recording times uses about 1MB storage space

**2)** Fax: A standard fax (2 DIN A4 pages) corresponds to approx. 48 KB of storage space)

**Example:** The storage volume of the partition for recording voice announcements, voicemails, voice calls and faxes is 20 GB for a 160 GB hard drive. This corresponds to a total recording time of about 20000 minutes.

<sup>49</sup> In case of longer recordings the recording is split and send in multiple files.

## Configuration Limits and Capacities

|-----------------------------------------------|-------|-------|-------|-------|------------|
| <b>Call Detail Recording Central</b>          |       |       |       |       |            |
| Entries in the call data buffer per system    | 20000 | 20000 | 20000 | 20000 | 20000      |
| <b>Account Code (ACCT):</b>                   |       |       |       |       |            |
| Account code entries per communication system | 1000  | 1000  | 1000  | 1000  | 1000       |
| Verifiable digits per Acc. code               | 11    | 11    | 11    | 11    | 11         |
| Permitted characters                          | 0-9   | 0-9   | 0-9   | 0-9   | 0-9        |

# 28 Expert mode

**Expert mode** provides menus and functions to configure and maintain the system.

## 28.1 Display Conventions for Parameter Descriptions

The parameter descriptions follow the structure of the Expert mode in the WBM.

|           |                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Menu Item | <p>Each menu item in the Expert mode is associated with a (context-sensitive) help topic that you can call up directly from within the WBM. The title of the Help topics displays the path of the WBM window.</p> <p>Example:</p> <p><b>Basic Settings &gt; System &gt; System Flags</b></p>                                                                                                                                                  |
| Tab       | <p>Each tab has a separate parameter table in the help topic associated with it. The same parameters of different tabs are described in the same parameter table. About each parameter table is a list of the tab(s) for which the parameters are valid.</p> <p>Example:</p> <ul style="list-style-type: none"><li>• <b>Add Static IP Address</b></li><li>• <b>Edit Static IP Address</b></li><li>• <b>Delete Static IP Address</b></li></ul> |
| Area      | <p>If the WBM windows are organized into areas, you will find this structure reflected in the parameter table as well. The parameter table will then contain a subheading for each area, followed by the parameters of this area.</p>                                                                                                                                                                                                         |

|                                      |                                                                                                                                                                                                                                                                                                      |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Parameters                           | Parameters are described in a two-column parameter table. The left column contains the parameter names. The right column describes the parameters. Self-explanatory parameters are mentioned, but not described. Value ranges and default values can be found at the end of the description, if any. |
| Parameter (optional)                 | Parameters that do not need to be filled are flagged with the keyword "optional".                                                                                                                                                                                                                    |
| Entry in drop-down list              | Drop-down list items which are not self-explanatory are also listed as named parameters in the left column of the parameter table. The entry is separated by a colon from the name of the drop-down list.<br><br>Example:<br><b>Encryption Algorithms: AES</b>                                       |
| Check boxes, Radio buttons and Flags | The descriptions for check boxes, radio buttons and flags always refer to the enabled state.                                                                                                                                                                                                         |

## 28.2 Maintenance

The functions for maintaining the communication system, e.g., for uploading Music on Hold or updating software images are grouped together under **Maintenance**.

### 28.2.1 Configuration

Under **Configuration** you will find a group of functions to load Music on Hold (MoH) or display the hardware configuration, for example.

#### 28.2.1.1 Configuration > Music on Hold (MoH) > Load to Gateway

Parameter Description of Tabs::

- **Load Music on Hold Files via HTTP**

| Parameters                               | Description |
|------------------------------------------|-------------|
| <b>Load Music on Hold Files via HTTP</b> |             |

| Parameters            | Description                                                                                                                                        |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>MoH Day File</b>   | Selection of the MoH file for day service from the local file system.<br>File format: see note in WBM.                                             |
| <b>MoH Night File</b> | Selection of the MoH file for night service from the local file system.<br>File format: see note in WBM.                                           |
| <b>Load</b>           | Loads the selected MoH files into the system (requires a restart).<br>Activation under Setup, Central Telephony > Music on Hold/<br>Announcements. |

Parameter Description of Tabs::

- **Load Audio Files via HTTP**

| Parameters                          | Description                                                                                                                          |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <b>Load Audio Files via HTTP</b>    |                                                                                                                                      |
| <b>Announcement File</b>            | Select the WAV file with the announcement from the local file system.<br>File format: see note in WBM.                               |
| <b>Already Uploaded Audio Files</b> |                                                                                                                                      |
| <b>Wave File</b>                    | Displays the announcement files loaded in the communication system                                                                   |
| <b>Delete</b>                       | Deletes the announcement file                                                                                                        |
| <b>Load</b>                         | Loads the selected announcement file into the system.<br>Activation under Setup, Central Telephony> Music on Hold/<br>Announcements. |

### 28.2.1.2 Configuration > Announcements > Load to Gateway

Parameter Description of Tabs:

- **Load Audio Files via HTTP**

| Parameters                          | Description                                                                                            |
|-------------------------------------|--------------------------------------------------------------------------------------------------------|
| <b>Load Audio Files via HTTP</b>    |                                                                                                        |
| <b>Announcement File</b>            | Select the WAV file with the announcement from the local file system.<br>File format: see note in WBM. |
| <b>Already Uploaded Audio Files</b> |                                                                                                        |
| <b>Wave File</b>                    | Displays the announcement files loaded in the communication system                                     |
| <b>Delete</b>                       | Deletes the announcement file                                                                          |

| Parameters  | Description                                                                                                                      |
|-------------|----------------------------------------------------------------------------------------------------------------------------------|
| <b>Load</b> | Loads the selected announcement file into the system.<br>Activation under Setup, Central Telephony> Music on Hold/Announcements. |

### 28.2.1.3 Configuration > Port Configuration

Parameter Description of the Tab:

- **Export Configuration**

| Parameters                  | Description                                                                                                                                                                                                                                                       |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| <b>Mailboxes for backup</b> | List of voicemail boxes to be restored.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Buttons</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Browse</b>               | Enables navigation to the storage path of the backup file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Load</b>                 | The voicemail boxes contained in the backup file are displayed.<br>On clicking the button again, the greetings and messages of the selected voicemail boxes are restored.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

### 28.2.1.7 Configuration > Branding

Parameter Description of the Tab:

- **Branding**

| Parameters      | Description               |
|-----------------|---------------------------|
| <b>Branding</b> | Selects the product name. |

### 28.2.1.8 Configuration > IP Gateway Address

Parameter Description of the Tab:

- **Change IP gateway address**

| Parameters                       | Description                                                            |
|----------------------------------|------------------------------------------------------------------------|
| <b>Change IP gateway address</b> |                                                                        |
| <b>Gateway IP address</b>        | Entry of the IP address of the communication system, e.g., 192.168.1.2 |

## 28.2.2 Software Image

The functions for refreshing the gateway software and the phone images are grouped together under **Software Image**.

### 28.2.2.1 Software Image > System Software > Update via Internet

Parameter Description of Tabs::

- **Load Software Images from Web Server**

| Parameters                         | Description                                                                                                   |
|------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <b>Web Server Settings</b>         |                                                                                                               |
| <b>Software Image URL</b>          | Display and edit the link to the software server, including the path to the image file.                       |
| <b>User name</b>                   | User name for logging into the software server.                                                               |
| <b>Password</b>                    | Password for logging into the software server.                                                                |
| <b>Software Update Information</b> | Activation of the check to determine whether a new software version has been provided on the software server. |
| <b>Start Time</b>                  | Time of the check.<br>Value range: 00.00 to 24.00, default value: 02.00                                       |
| <b>Use Proxy</b>                   | Proxy activation, if a proxy is used.                                                                         |
| <b>HTTP Proxy</b>                  |                                                                                                               |
| <b>HTTP Proxy</b>                  | Input of the link to the proxy server.                                                                        |
| <b>HTTP Proxy Port</b>             | Input of the port of the proxy server.<br>Default value: 80                                                   |
| <b>User name</b>                   | User name for logging into the proxy server.                                                                  |
| <b>Password</b>                    | Password for logging into the proxy server.                                                                   |

| Parameters                                                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Use Dedicated Static Route</b>                                   | Customers with a WAN connection for SIP trunks without internet data volume, can use the <b>Use Dedicated Static Route</b> functionality to perform an OSBiz software update via alternative LAN interface. The dynamic IP address of the update server is determined automatically and is then available as a routing entry for this process. To use this option: <ul style="list-style-type: none"> <li>• Activate the flag <b>Use Dedicated Static Route</b></li> </ul> |
| <b>Dedicated Static Route for Software Update via LAN Interface</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Gateway IP Address of the Route</b>                              | Configure the IP address of the default gateway of the LAN interface - through which a connection to the Internet is possible - as the Gateway IP address of the route.                                                                                                                                                                                                                                                                                                    |
| <b>Last Software Update on</b>                                      | Displays when the last software update was performed.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Buttons</b>                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Default</b>                                                      | Resets edited values back to the default values.                                                                                                                                                                                                                                                                                                                                                                                                                           |

## 28.2.2.2 Software Image > System Software > Update via File Upload

Parameter Description of Tabs:

- **Load Software Images via File Upload**

| Parameters                                                           | Description                                                                                                                                                                                        |
|----------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Remote File Name (PC File System)</b>                             | Navigate to the storage location of the image file.                                                                                                                                                |
| <b>Clean up storage space before transfer</b>                        | When the update is run with this flag active, logs, traces, phone software images, and TCP dumps, are deleted to free storage memory.                                                              |
| <b>Software Activation</b>                                           |                                                                                                                                                                                                    |
| <b>Start action immediately after transfer</b>                       | The software is immediately transferred to the communication system in the background. After two restarts, the software is up-to-date.                                                             |
| <b>Start Action in</b>                                               | The software is immediately transferred to the communication system in the background. After the specified period, the software is activated. Input of the time period in days, hours and minutes. |
| <b>Start Action on</b>                                               | The software is immediately transferred to the communication system in the background. The software is activated at the specified time. Input of the time as the date and time.                    |
| <b>Local System Time</b>                                             | Displays the date and time of the system.                                                                                                                                                          |
| <b>Software version of the currently used system software images</b> | Displays the software version of the current image file.                                                                                                                                           |

### 28.2.2.3 Software Image > System Software > Update via USB Stick

Parameter Description of Tabs::

- **Load Software Images from USB Stick**

| Parameters                                                           | Description                                                                                                                                                                                        |
|----------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>List of all existing compatible image files</b>                   |                                                                                                                                                                                                    |
| <b>Version</b>                                                       | Displays the version number of the image files found on the USB device.                                                                                                                            |
| <b>Load</b>                                                          | Selection of the image file found on the USB device to be used for the software update.                                                                                                            |
| <b>File name</b>                                                     | Displays the file names of the image files found on the USB device.                                                                                                                                |
| <b>Size of Image (MB)</b>                                            | Displays the file size of the image files found on the USB device.                                                                                                                                 |
| <b>Software Activation</b>                                           |                                                                                                                                                                                                    |
| <b>Start action immediately after transfer</b>                       | The software is transferred immediately to the communication system in the background and activated. System operations are temporarily interrupted for the activation.                             |
| <b>Start Action in</b>                                               | The software is immediately transferred to the communication system in the background. After the specified period, the software is activated. Input of the time period in days, hours and minutes. |
| <b>Start Action on</b>                                               | The software is immediately transferred to the communication system in the background. The software is activated at the specified time. Input of the time with the date and time.                  |
| <b>Local System Time</b>                                             | Displays the date and time of the system.                                                                                                                                                          |
| <b>Software version of the currently used system software images</b> | Displays the current software version.                                                                                                                                                             |

### 28.2.2.4 Software Image > Phone Images > Load

Parameter Description of Tabs:

- **Load Phone Software**

| Parameters                               | Description                                                        |
|------------------------------------------|--------------------------------------------------------------------|
| <b>Remote File Name (PC File System)</b> | Selection of the phone software (image file)                       |
| <b>Currently installed images</b>        |                                                                    |
| <b>Delete</b>                            | The phone images are marked for deletion.                          |
| <b>File name</b>                         | Displays the file name of the image file.                          |
| <b>Device type</b>                       | Displays the system telephone type associated with the image file. |

| Parameters     | Description                                                          |
|----------------|----------------------------------------------------------------------|
| <b>Version</b> | Displays the version of the image file.                              |
| <b>Buttons</b> |                                                                      |
| <b>Load</b>    | The specified phone image is loaded into the communication system.   |
| <b>Delete</b>  | The selected phone images are deleted from the communication system. |

### 28.2.2.5 Software Image > Phone Images > Deploy

Parameter Description of Tabs:

- **Deployment of phone software**

| Parameters                        | Description                                                                                                                                                                                |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Currently installed images</b> |                                                                                                                                                                                            |
| <b>Deploy</b>                     | If this check box is selected, the phone software is transmitted to all connected system telephones of the telephone type.                                                                 |
| <b>File name</b>                  | Displays the file name of the image file.                                                                                                                                                  |
| <b>Device type</b>                | Displays the system telephone type associated with the image file.                                                                                                                         |
| <b>Version</b>                    | Displays the version of the image file.                                                                                                                                                    |
| <b>Type</b>                       | Type of the system telephone.                                                                                                                                                              |
| <b>Standard</b>                   | Any phone software flagged as the default will be automatically transferred to any system telephone associated with this type whenever that phone logs into the system for the first time. |

### 28.2.2.6 Software Image > Phone Images > Deploy to device

Parameter Description of Tabs:

- **Deployment of phone software per device**

If the user is a Deskshare User the check box will be greyed-out, so you cannot deploy a device to that user.

| Parameters                        | Description                                                                         |
|-----------------------------------|-------------------------------------------------------------------------------------|
| <b>Currently installed images</b> |                                                                                     |
| <b>Call no</b>                    | Phone number of the system telephone.                                               |
| <b>Device type</b>                | Type of the system telephone.                                                       |
| <b>IP Address</b>                 | IP address of the system telephone; direct link to the WBM of the system telephone. |
| <b>MAC Address</b>                | MAC address of the system telephone.                                                |

| Parameters                 | Description                                                             |
|----------------------------|-------------------------------------------------------------------------|
| <b>Current SW version</b>  | Current software version of the system telephone.                       |
| <b>Deployable software</b> | Selection of the phone image to be transmitted to the system telephone. |

### 28.2.2.7 Software Image > Phone Image Logos > Load

An image (e.g., a company logo) can be loaded onto the display of the system telephones (OpenStage 40/60/80 or Telekom variants); displayed in the idle state (on-hook). For details on the specification of the logo file, see [Telephone Logos](#) .

Parameter Description of Tabs:

- **Loading the Phone logo**

| Parameters                               | Description                                                              |
|------------------------------------------|--------------------------------------------------------------------------|
| <b>Remote File Name (PC File System)</b> | Selection of the file with the phone logo.                               |
| <b>Currently Installed Logo Images</b>   |                                                                          |
| <b>Delete</b>                            | The phone logo files are marked for deletion.                            |
| <b>File name</b>                         | Displays the file name of the telephone logo file.                       |
| <b>Buttons</b>                           |                                                                          |
| <b>Load</b>                              | The specified phone logo file is loaded into the communication system.   |
| <b>Delete</b>                            | The selected phone logo files are deleted from the communication system. |

### 28.2.2.8 Software Image > Phone Image Logos > Deploy

An image (e.g., a company logo) can be loaded onto the display of the system telephones (OpenStage 40/60/80 or Telekom variants); displayed in the idle state (on-hook). For details on the specification of the logo file, see [Telephone Logos](#) .

Parameter Description of Tabs:

- **Deployment of phone logos**

| Parameters                             | Description                                                                                               |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------|
| <b>Currently Installed Logo Images</b> |                                                                                                           |
| <b>Deploy</b>                          | If the check box is selected, this phone logo file will be transmitted to the selected system telephones. |
| <b>File name</b>                       | Displays the file name of the telephone logo file.                                                        |

| Parameters                                            | Description                                                                                                                          |
|-------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <b>Deploy to Workpoints with Selected Device Type</b> | Selection to determine whether the phone logo is to be sent to all system telephones or only to a specific type of system telephone. |

## 28.2.3 Cordless

Functions for all configured base stations are grouped together under **Cordless**.

### 28.2.3.1 Cordless > Base Stations

Parameter Description of Tabs:

- **Base station status**

| Parameters               | Description                                                                                                                                                                                                                                |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Base station data</b> |                                                                                                                                                                                                                                            |
| <b>BS Frequency</b>      | The frequencies of the selected base station is displayed here. Up to 10 different frequency channels can be selected simultaneously (see table below).                                                                                    |
| <b>Base station</b>      | Number of the base station.                                                                                                                                                                                                                |
| <b>SW Version</b>        | Software version of the base station.                                                                                                                                                                                                      |
| <b>HW version</b>        | Hardware version of the base station.                                                                                                                                                                                                      |
| <b>Status</b>            | State of the associated port: port active<br>Port not connected<br>Port blocked<br>Port connected, inactive<br>Port connected, inactive<br>1st expansion port for ... (no. of main port)<br>2nd. expansion port for ... (no. of main port) |
| <b>Overload</b>          | Number of the overload situations on the UP0/E interface.                                                                                                                                                                                  |
| <b>Restart</b>           | Number of times the base station was restarted.                                                                                                                                                                                            |
| <b>L1/L2 Error</b>       | Number of L1/L2 errors that occurred in the base station.                                                                                                                                                                                  |
| <b>Abnormal Release</b>  | Number of interrupted calls in the base station.                                                                                                                                                                                           |
| <b>Calls by BS</b>       | Number of calls made via the base station (both incoming and outgoing).                                                                                                                                                                    |

| Parameters                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Hopping Mode</b>       | Cordless Version 2 systems always operate in fast hopping mode, i.e., all frequency - time slot pairs can be used. This provides for 120 duplex channels. In the case of base stations with slow hopping, only every second frequency - time slot pair can be used. This means that only 60 duplex channels are available. All cordless version 1 systems operate in slow hopping mode.                                                                                                                                                                                                                                                      |
| <b>BHO Count OK</b>       | Number of successfully completed intracell handovers (bearer handovers BHO), i.e., successful transfer of the carrier frequency and/or the time slot within a radio cell. Not supported by Hicom cordless EM V2.1 and V2.2. Although the meter is not supported, the Bearer Handover feature is available.                                                                                                                                                                                                                                                                                                                                   |
| <b>BHO Count not OK</b>   | Number of intracell handovers that failed (bearer handovers BHO). Not supported by Hicom cordless EM V2.1 and V2.2. Although the meter is not supported, the Bearer Handover feature is available.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Intra SLC Handover</b> | Number of handover procedures within the SLC card. This is counted in the new base station.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Inter SLC handover</b> | Number of handover procedures between SLC cards. This is counted in the new base station.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>SLC-wide</b>           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Lost Calls</b>         | Number of calls that could not be processed due to a lack of resources.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>SLMUC Overload</b>     | Number of overload situations on the SLC board. The number of free pool elements on the SLC board falls below a minimum value. All incoming connections will be rejected by the SLC IWU until the overload situation returns to normal.                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>LR Roam</b>            | LR Roam counts each connection for a mobile telephone with a default PMID and located at a different SLC. Number of locate request messages that reported roaming (i.e., the current location of the mobile telephone has changed). Each time the mobile phone is switched on, a locate request is executed. If the mobile phone is switched off and switched on again in another radio cell, this meter does not execute a count.                                                                                                                                                                                                           |
| <b>LR Async</b>           | LR Async counts each connection for a mobile telephone with a default PMID where the current location SLC is unchanged. This refers to the number of locate request messages which reported layer asynchronicity (i.e., the current location of the mobile phone is unchanged). The count is always performed for the home SLC, and only if a connection is actually set up or supports the CHO with the default PMID. In addition, the criteria for a location update must be met for each connection, i.e., a LOCATE request has been received or the security procedures, authentication (and coding) have been implemented for the link. |
| <b>HDLC Error</b>         | Number of uncritical HDLC error messages that were not reported to the communication system (overflow, underrun, CRC error).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>CMI Version</b>        | The current cordless version is displayed here.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## 28.2.4 Port/Board Status

The status of all boards can be displayed. In addition, the boards and their ports can be released and locked.

### 28.2.4.1 Port/Board Status > Board Status

Parameter Description of Tabs:

- **Board Status**

| Parameters         | Description                                                                                                                                |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Slot</b>        | Physical slot number.                                                                                                                      |
| <b>Board</b>       | Board designation.                                                                                                                         |
| <b>Not plugged</b> | Checked if the board is not inserted.                                                                                                      |
| <b>Faulty</b>      | Checked if the board is not defective (not charged).<br>It is also possible that a defective or unconfigured board is not displayed.       |
| <b>Is Locked</b>   | Checked if at least one port of this board is locked.                                                                                      |
| <b>Free</b>        | Checked if all ports of this board are free.                                                                                               |
| <b>Res.</b>        | Checked if at least one station or line of this board has picked up a call, is being called or is currently being used for an active call. |
| <b>Clock ref.</b>  | Checked if the board provides the reference clock.                                                                                         |
| <b>Buttons</b>     |                                                                                                                                            |
| <b>Start</b>       | Starts the update of the display. The status is updated every 3 seconds.                                                                   |

| Parameters  | Description                      |
|-------------|----------------------------------|
| <b>Stop</b> | Stops the update of the display. |

### 28.2.4.2 Port / Board Status > Out of Service

Parameter Description of Tabs:

- **Port out of Service**
- **Board out of Service**

| Parameters               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Access</b>            | Slot and port at which the station or line is connected.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Call no.</b>          | Call number assigned to the port.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Name</b>              | Name assigned to the station or line.                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Status</b>            | Depending on whether or not an allowed station or allowed line is connected to the port, the ports may be <b>active</b> or <b>inactive</b> . Ports may also be in the <b>In Service</b> (default) or <b>Not in Service through Tool</b> status, i.e., if they were locked via <b>Lock card</b> .<br><br>The <b>In Service</b> status is not identical with <b>active</b> . The port status could be <b>active</b> , <b>In Service</b> , for example, or even <b>inactive</b> , <b>In Service</b> . |
| <b>Buttons</b>           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Lock Selection</b>    | The selected ports are locked.<br><br>On locking U <sub>P0/E</sub> ports, the associated physical port is always taken out of service. Consequently, on selecting a master port, the corresponding slave port is also taken out of service.                                                                                                                                                                                                                                                        |
| <b>Release selection</b> | The selected ports are released.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Lock card</b>         | The selected boards and their ports are locked.<br><br>On locking individual mobile phones of a Cordless board, the entire board and thus all mobile phones are always locked. The locking of individual mobile phones is achieved by changing the PIN of the mobile phones.                                                                                                                                                                                                                       |
| <b>Release card</b>      | The selected boards and their ports are released.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

### 28.2.5 Traces

Trace functions are grouped together under **Traces**. The administrator can start and stop traces and change the trace settings.

#### 28.2.5.1 Traces > Trace Format Configuration

The Trace Format Configuration can be used to define which header data is to be included in the trace output and how the trace data is to be formatted.

Parameter Description of Tabs:

- **Edit Trace Configuration**

| Parameters                                                               | Description                                                                                                                                                                                                                                                                  |
|--------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Data Included in the Trace Header Output</b>                          |                                                                                                                                                                                                                                                                              |
| <b>Global Trace Header Format Settings</b>                               | When this flag is activated, the options for the following header data can be activated or deactivated.<br>Default value: Enabled                                                                                                                                            |
| <b>Subsystem ID</b>                                                      | When this flag is activated, the subsystem ID is included in the trace output.<br>Default value: Enabled                                                                                                                                                                     |
| <b>Task Name</b>                                                         | When this flag is activated, the task name is included in the trace output.<br>Default value: Enabled                                                                                                                                                                        |
| <b>Task ID</b>                                                           | When this flag is activated, the task ID is included in the trace output.<br>Default value: Enabled                                                                                                                                                                          |
| <b>Time</b>                                                              | When this flag is activated, the specified time is included in the trace output.<br>Default value: Enabled                                                                                                                                                                   |
| <b>Module Name</b>                                                       | When this flag is activated, the module name is included in the trace output.<br>Default value: Enabled                                                                                                                                                                      |
| <b>Line Number</b>                                                       | When this flag is activated, the line number is included in the trace output.<br>Default value: Enabled                                                                                                                                                                      |
| <b>Formatting of the Trace Data</b>                                      |                                                                                                                                                                                                                                                                              |
| <b>Full formatting with Parameter Expansion</b>                          | Standard output mode: All data types are expanded.<br>Trace output: Normal (suitable for normal operation)<br>Default value: Enabled                                                                                                                                         |
| <b>Limited Formatting (Message types binary, special XTracer format)</b> | In this restricted output mode, the data types are shown in binary format, i.e., as present at the time of the trace. The binary format is intended for analysis with the X-Tracer tool.<br>Trace output: Fast (suitable for medium to high load)<br>Default value: Disabled |

| Parameters                                                     | Description                                                                                                                                                                                          |
|----------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Limited Formatting (only basic data types)</b>              | In this output mode, only elementary data types (e.g., integer, short, long, string) will be expanded.<br>Trace output: Very fast (suitable for high load)<br>Default value: Disabled                |
| <b>Performance optimized Trace without Parameter Expansion</b> | In this output mode, data type expansion is disabled. Thus, there is also no overhead for trace formatting.<br>Trace output: Extremely fast (suitable for very high load)<br>Default value: Disabled |

### 28.2.5.2 Traces > Trace Output Interfaces

Parameter Description of Tabs:

- **Edit Trace Output Interfaces**

| Parameters                                                                          | Description                                                                                                                  |
|-------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <b>File Trace</b>                                                                   |                                                                                                                              |
| <b>Switch File Trace On</b>                                                         | When this flag is activated, trace messages in the communication system are written to a log file.<br>Default value: Enabled |
| <b>Maximum Trace Quota (Kbytes)</b>                                                 | Displays the maximum size of the trace memory in kilobytes                                                                   |
| <b>Policy to handle reach of max. quota</b>                                         | Option to select what should occur on reaching the maximum trace quota.                                                      |
| <b>Policy to handle reach of max. quota: Wrap Around (remove oldest trace file)</b> | Whenever the maximum trace quota is reached, the oldest respective trace log file is overwritten.<br>Default value: Enabled  |
| <b>Policy to handle reach of max. quota: Stop temporarily the File Trace</b>        | On reaching the maximum trace quota, the trace file output is stopped.<br>Default value: Disabled                            |
| <b>Time between creation of new trace files (sec)</b>                               | Displays the time in seconds after which a new trace log file is created.                                                    |
| <b>Time range, for which trace files are available</b>                              | Displays the time range for which trace log files are available.                                                             |
| <b>Trace via LAN (XTracer)</b>                                                      |                                                                                                                              |
| <b>Switch Trace via LAN On (XTracer)</b>                                            | Trace messages are transmitted via the LAN interface.<br>Default value: Disabled                                             |
| <b>Timer Value (sec)</b>                                                            | Displays the time in seconds after which trace data is transmitted.                                                          |

### 28.2.5.3 Traces > Trace Log

Parameter Description of Tabs:

- **Load via HTTP**
- **Clear Trace Log**

---

**INFO:** The deletion of trace log data cannot be undone.

---

| Parameters                | Description                                                                |
|---------------------------|----------------------------------------------------------------------------|
| <b>Trace Log</b>          |                                                                            |
| <b>Complete Trace Log</b> | All existing trace log files are downloaded                                |
| <b>Log from Today</b>     | The trace log files of the current day (as of 00:00 hours) are downloaded. |
| <b>Own Selection</b>      | Trace log files of the selected time period are downloaded.                |

### 28.2.5.4 Traces > Digital Loopback

They can only be configured using E Manager.

Digital loopbacks are used to test the B channels of S<sub>0</sub>, S<sub>2M</sub> and T1 interfaces of any existing boards. Digital loopbacks should only be activated if requested by the service provider.

Parameter Description of Tabs:

- **Edit Digital Loopback**

### 28.2.5.5 Traces > Customer Trace Log

This function can be used to start the event display (customer trace). Message types include System, SIP, STUN and LDAP.

Parameter Description of Tabs:

- **Display**
- **Load via HTTP**
- **Clear Trace Log**

| Parameters                                  | Description                                                                                                                   |
|---------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <b>auto refresh</b>                         | When this flag is activated, the display for the customer trace log is refreshed automatically.<br><br>Default value: Enabled |
| <b>Seconds until next automatic refresh</b> | Time in seconds after which the customer trace log is refreshed automatically.                                                |

### 28.2.5.6 Traces > M5T Trace Components

This function is used to monitor the SIP stack.

Changes to the settings should only be made if requested by the responsible Service Support.

Parameter Description of Tabs:

- **Edit M5T Trace Components**
- **Start/Stop Trace Component**

| Parameters          | Description                                                                                                                                                          |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Package Name</b> | Name of the M5T trace component                                                                                                                                      |
| <b>Trace level</b>  | Level of detail for the recording of the M5T trace component (trace level 0 = lowest level of detail to trace level 9 = maximum level of detail)<br>Default value: 0 |
| <b>Trace On</b>     | When this flag is activated, the M5T trace component data is recorded.<br>Default value: Disabled                                                                    |
| <b>Crotch</b>       | Increment of the activation                                                                                                                                          |

### 28.2.5.7 Traces > Secure Trace

This function is used to record encrypted VoIP payload and signaling data streams.

The recording of encrypted connection data is subject to the mandatory approval of the customer and may only be performed in coordination with the responsible Service Support. For more detailed information on the procedure, see [Traces](#) (Secure Trace).

---

**NOTICE:** The live recording of calls and connection data is a criminal offence, unless the affected parties have been notified in advance.

---

Parameter Description of Tabs:

- **Change Secure Trace Passphrase**
- **Import X.509 file for Secure Trace**

| Parameters                                       | Description                                                              |
|--------------------------------------------------|--------------------------------------------------------------------------|
| <b>Change Secure Trace Activation Passphrase</b> |                                                                          |
| <b>Current Passphrase</b>                        | Current password (passphrase) for starting and stopping the secure trace |

| Parameters                              | Description                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>New Passphrase</b>                   | New password (passphrase) for starting and stopping the secure trace<br>Value range: 5 to 12 characters                                                                                                                                                                                                                                                                        |
| <b>Confirm New Passphrase</b>           | Identical new password (passphrase) for starting and stopping the secure trace<br>Value range: 5 to 12 characters                                                                                                                                                                                                                                                              |
| <b>Certificate file (PEM or binary)</b> | Selection of the X.509 file that contains the certificate to be imported into the communication system.<br>After selecting the X.509 file, the fingerprint of the certificate to be imported can be displayed before importing the certificate into the communication system.<br><b>INFO:</b> The certificate should be imported only after the fingerprint has been verified. |

### 28.2.5.8 Traces > Secure Trace > Secure Trace Certificate

This function is used to display the imported secure trace certificate.

Parameter Description of Tabs:

- **Show Secure Trace Certificate**

### 28.2.5.9 Traces > Secure Trace > Secure Trace Settings

This function is used to query the status of a secure trace and to start or stop the secure trace.

Parameter Description of Tabs:

- **Secure Trace State**
- **Start/Stop Secure Trace**

| Parameters                                | Description                                                      |
|-------------------------------------------|------------------------------------------------------------------|
| <b>Current Secure Trace State</b>         |                                                                  |
| <b>Secure Trace is active</b>             | Status of the Secure Trace                                       |
| <b>Automatic Deactivation Time</b>        | Time at which the secure trace is automatically disabled.        |
| <b>Secure Trace for these protocols</b>   | Displays the protocols for which the secure trace is created.    |
| <b>Start Parameters</b>                   |                                                                  |
| <b>Secure Trace Activation Passphrase</b> | Password (passphrase) for starting and stopping the secure trace |

| Parameters                              | Description                                                                                                                    |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <b>Duration of Secure Trace (Mins.)</b> | Time period, in minutes, during which the secure trace is to be active.<br><b>INFO:</b> Entering a value is mandatory.         |
| <b>Secure Trace for these protocols</b> |                                                                                                                                |
| <b>TC (TLS)</b>                         | When this flag is activated, the secure trace takes into account the TC (TLS) protocol.<br>Default value: Disabled             |
| <b>H.323 Core/HSA (TLS)</b>             | When this flag is activated, the secure trace takes into account the H.323 Core/HSA (TLS) protocol.<br>Default value: Disabled |
| <b>MMX (PEP)</b>                        | When this flag is activated, the secure trace takes into account the MMX (PEP) protocol.<br>Default value: Disabled            |
| <b>SIP Core/SSA (TLS)</b>               | When this flag is activated, the secure trace takes into account the SIP Core/SSA (TLS) protocol.<br>Default value: Disabled   |
| <b>MSC (SRTP)</b>                       | When this flag is activated, the secure trace takes into account the MSC (SRTP) protocol.<br>Default value: Disabled           |

### 28.2.5.10 Traces > H.323 Stack Trace

This function is used to track problems with components that use the H.323 protocol.

Changes to the settings should only be made if requested by the responsible Service Support.

Parameter Description of Tabs:

- **Edit H.323 Stack Trace Configuration**
- **Edit All H.323 Modules**
- **Load H.323 Trace Log via HTTP**
- **Clear H.323 Trace Log**

| Parameters           | Description                                                                                                                           |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <b>General</b>       |                                                                                                                                       |
| <b>Trace level</b>   | Level of detail for the trace (trace level 0 = lowest level of detail to trace level 4 = maximum level of detail)<br>Default value: 2 |
| <b>Console Trace</b> |                                                                                                                                       |

| Parameters                              | Description                                                                                                   |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <b>Switch Console Trace On</b>          | When this flag is activated, H.323 Stack Trace messages are output to the console.<br>Default value: Disabled |
| <b>File Trace</b>                       |                                                                                                               |
| <b>Switch File Trace On</b>             | When this flag is activated, H.323 Stack Trace messages are written to a log file.<br>Default value: Disabled |
| <b>Maximum Trace Buffer Size (byte)</b> | Maximum size of the trace buffer in bytes (amount of data stored in the buffer.)                              |
| <b>Maximum Trace File Size (byte)</b>   | Maximum size of the trace log file in bytes                                                                   |
| <b>Trace Timer (sec)</b>                | Time, in seconds, after which trace data is written to the log file.                                          |
| <b>Module Name</b>                      | Name of the H.323 Stack Trace Module                                                                          |
| <b>Trace On</b>                         | When this flag is activated, the H.323 stack trace module is enabled.                                         |

### 28.2.5.11 Traces > Call Supervision

This function can be used to start and stop the monitoring of trunk and station interfaces (also called subscriber line interfaces).

Parameter Description of Tabs:

- **Start/Stop Protocol**
- **Display**
- **Load via HTTP**

| Parameters                  | Description                                                                            |
|-----------------------------|----------------------------------------------------------------------------------------|
| <b>Selected Port</b>        | Trunk or station interface for which the call supervision is to be started or stopped. |
| <b>No.</b>                  | Sequential number.                                                                     |
| <b>Time</b>                 | Time of the event.                                                                     |
| <b>Call number / Access</b> | Call number and physical interface.                                                    |

| Parameters   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>State</b> | <p>State of the interface.</p> <p>The following interface states are possible:</p> <ul style="list-style-type: none"> <li>• Idle (interface is dormant)</li> <li>• Call Initiated (interface is ready)</li> <li>• Overlap Sending (external sending of digits)</li> <li>• Outgoing Call Proc (end of dialing)</li> <li>• Call Request (waiting for alert)</li> <li>• Call Present (interface is ringing)</li> <li>• Active (interface is in talk state)</li> <li>• Hold (interface is in the hold state)</li> <li>• Disconnect Indication (request to disconnect an active call)</li> <li>• Direct (interface is in speaker call mode)</li> <li>• Intrusion (intrusion is activated.)</li> <li>• Callback A (callback subscriber A)</li> <li>• Callback B (callback subscriber B)</li> <li>• Busy (interface is busy)</li> <li>• Error (error state)</li> <li>• Disconnect PI (waiting for PI (progress indicator) release)</li> <li>• Sensor (signal was sent by sensor.)</li> <li>• Conference Master</li> <li>• Paging</li> <li>• Help Dial (Associated Dialing is used.)</li> <li>• Remote (interface occupied through remote service or DISA)</li> <li>• ACD (call distribution)</li> <li>• Unknown State</li> </ul> |
| <b>Event</b> | <p>Event</p> <p>The following events are possible:</p> <ul style="list-style-type: none"> <li>• Setup (trunk interface: incoming or outgoing seizure)</li> <li>• Setup Ackn (trunk interface: seizure acknowledgment)</li> <li>• Info (trunk interface: Info (Number Digits))</li> <li>• Call Proc (trunk interface: unevaluated end-of dialing)</li> <li>• Progress (trunk interface: additional info for call setup)</li> <li>• Alert (trunk interface: evaluated end-of dialing)</li> <li>• Connect (trunk interface: connection of B channel)</li> <li>• Connect Ackn (trunk interface: acknowledgement of connecting B-channel)</li> <li>• Disconnect (trunk interface: request for disconnect)</li> <li>• Release (trunk interface: acknowledgement of disconnect)</li> <li>• Release Compl (trunk interface: connection released)</li> <li>• Monitor On (trunk/station interface: call supervision started)</li> <li>• Monitor Off (trunk/station interface: call supervision stopped)</li> <li>• Off Hook (station interface: handset lifted)</li> <li>• On Hook (station interface: handset cradled)</li> <li>• Digit (station interface: digits are dialed)</li> </ul>                                          |

| Parameters                                  | Description                                                                                                    |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------|
| <b>auto refresh</b>                         | If the flag is enabled, the call supervision display is automatically refreshed.<br><br>Default value: Enabled |
| <b>Seconds until next automatic refresh</b> | Time in seconds after which the call supervision is to be refreshed.                                           |

### 28.2.5.12 Traces > License Component

This function is used to monitor the system-internal license agent (Customer License Agent, CLA).

Changes to the settings should only be made if requested by the responsible Service Support.

Parameter Description of Tabs:

- **Change the CLA trace component**

| Parameters                   | Description                                                                                             |
|------------------------------|---------------------------------------------------------------------------------------------------------|
| <b>Package Name</b>          | Name of the license trace component.                                                                    |
| <b>Trace level</b>           | Defines the level of detail for the trace of the license trace component<br><br>Default value: Standard |
| <b>Trace level: Low</b>      | Low level of detail for the trace recording.                                                            |
| <b>Trace level: Standard</b> | Medium level of detail for the trace recording.                                                         |
| <b>Trace level: All</b>      | High level of detail for the trace recording.                                                           |
| <b>Trace level: Off</b>      | License trace component stopped.                                                                        |

### 28.2.5.13 Traces > Trace Profiles

Trace profiles contain predefined trace components for monitoring complete functional units of the communication system.

Parameter Description of Tabs:

- **Display all Trace Profiles**
- **Add Trace Profile (Empty Profile)**
- **Add Trace Profile (with Current Trace Settings)**
- **Stop all Trace Profiles**
- **Start/Stop Trace Profile**

| Parameters             | Description                                         |
|------------------------|-----------------------------------------------------|
| <b>Profile Name</b>    | Name of the trace profile                           |
| <b>Profile started</b> | Indicates whether a trace profile has been started. |

| Parameters                             | Description                                                                                                                                  |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>This trace profile is read-only</b> | Indicates whether a trace profile is read-only (all existing default trace profiles are read-only).                                          |
| <b>Trace Component</b>                 | Name of the trace component                                                                                                                  |
| <b>Included</b>                        | When this flag is activated, the trace component is included in the new trace profile to be added.<br><br>Default value: Enabled             |
| <b>Level</b>                           | Level of detail for the recording of the trace component (trace level 0 = lowest level of detail to trace level 9 = maximum level of detail) |

#### 28.2.5.14 Traces > Trace Components

Trace components can be used to record the process and status information of individual components of the communication system.

Parameter Description of Tabs:

- **Display All Trace Components**
- **Display Started Trace Components**
- **Display Stopped Trace Components**
- **Edit Trace Components**
- **Stop all Trace Components**
- **Start/Stop Trace Component**
- **Default Trace Settings**

| Parameters                   | Description                                                                                                       |
|------------------------------|-------------------------------------------------------------------------------------------------------------------|
| <b>Subsystem Name</b>        | Name of the trace component                                                                                       |
| <b>Trace Component Index</b> | Sequential number                                                                                                 |
| <b>Trace level</b>           | Level of detail for the trace (trace level 0 = lowest level of detail to trace level 9 = maximum level of detail) |
| <b>Trace On</b>              | When this flag is activated, the trace component data is recorded.                                                |

#### 28.2.5.15 Traces > TCP Dump

A TCP dump is used for monitoring and evaluating data traffic in an IP network. An appropriate application is required for the diagnosis of the TCP dump files.

Parameter Description of Tabs:

- **TCP Dump State**

| Parameters             | Description         |
|------------------------|---------------------|
| <b>Start TCP Dump</b>  | Starts the TCP dump |
| <b>Start Parameter</b> |                     |

| Parameters                      | Description                                                                                                                                                                                                                                             |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Interface Name</b>           | Interface for which the data traffic is evaluated.<br><br>The available interfaces are displayed under <b>Interface Details</b> . If you select <b>any</b> , the data traffic will be evaluated for all available interfaces.<br><br>Default value: any |
| <b>Packet Size</b>              | Size of data packets to be recorded (in bytes).<br><b>0</b> means that each packet will be recorded in its entirety.<br>Value range: 0 to 2000000000, default value: 0                                                                                  |
| <b>Criteria for Terminating</b> |                                                                                                                                                                                                                                                         |
| <b>Number of Packets</b>        | Number of data packets after which the TCP dump will be stopped.                                                                                                                                                                                        |
| <b>Time until Stop (sec)</b>    | Time in seconds after which the TCP dump will be stopped.                                                                                                                                                                                               |
| <b>Stop TCP Dump</b>            | Stops the TCP dump                                                                                                                                                                                                                                      |
| <b>Cleanup TCP Dump</b>         | Deletes the TCP dump files stored in the communication system                                                                                                                                                                                           |
| <b>auto refresh</b>             | When this flag is activated, the status display is refreshed automatically.<br><br>Default value: Enabled                                                                                                                                               |

### 28.2.5.16 Traces > rpcap Daemon

An RPCAP (Remote Packet Capture) daemon is used for monitoring and evaluating data traffic in an IP network. The RPCAP daemon enables external applications to remotely access the TCP/IP packets on the LAN interfaces of the communication system. An RPCAP daemon is often used for long-term traces, since the trace files are stored on a PC and not in the communication system.

---

**NOTICE:** The safety notes listed in the tab must be observed.

---

Parameter Description of Tabs:

- **rpcap**

| Parameters                                    | Description                                                               |
|-----------------------------------------------|---------------------------------------------------------------------------|
| <b>Address to Bind to</b>                     |                                                                           |
| <b>IP Address (either numeric or literal)</b> | IP address of the HOST used for the recordings.<br>Default value: 0.0.0.0 |
| <b>Port (please choose a free one)</b>        | Port of HOST used for the recordings.                                     |

| Parameters                                    | Description                                                                                                                     |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <b>Trace Internal LAN</b>                     | When this flag is activated, the data traffic between two boards is recorded via the eth9 interface.<br>Default value: Disabled |
| <b>Client identification to allow access</b>  |                                                                                                                                 |
| <b>IP Address (either numeric or literal)</b> | IP address of the remote client on which the trace is output.<br>Default value: 0.0.0.0                                         |

### 28.2.5.17 Traces > Kernel Crash Data

The Kernel Crash Data service is used to automatically collect kernel crash data. It is available only on OSBiz X systems with V3 mainboards: OCCLA, OCCMA(R), OCCMB(R).

The service requires a 200 MB of storage space. Disks affected are:

- SATA SSD 16GB (if no NVMe SSD is mounted)
- NVMe SSD

It is recommended to delete traces before starting the service, if you want to free up storage space. If there is no sufficient space, service will not collect data.

Parameter Description of Tabs:

- **Kernel Crash Data**

| Parameters                       | Description                                                                                |
|----------------------------------|--------------------------------------------------------------------------------------------|
| <b>Kernel Crash Data service</b> | Status of the service:<br>Green: The service is enabled.<br>Grey: The service is disabled. |
| <b>Start</b>                     | Starts the Kernel Crash Data service.                                                      |
| <b>Stop</b>                      | Stops the Kernel Crash Data service.                                                       |

Upon starting or stopping the Kernel Crash Data Service, a system restart is automatically initiated. The service retains status after system restart.

With the service enabled, after a system restart with reason WATCHDOG or KERNEL\_OOPS, kernel crash data are available in the oso diagnostic storage space. In order to collect kernel crash data, the **CoreLog Protocol** checkbox must be selected under **Service Center > Diagnostics > Trace > Diagnosis logs**.

After collecting the kernel crash data, the service must be disabled manually.

### 28.2.5.18 Traces > Media Server Trace

Media Server Trace can be used to record the process and status information of Media Server component of the communication system.

Parameter Description of Tabs:

- **Edit Media Server Trace Component**

| Parameters          | Description                                                                                                              |
|---------------------|--------------------------------------------------------------------------------------------------------------------------|
| <b>Package Name</b> | Name of the trace component<br>Default value: Media Server                                                               |
| <b>Trace Level</b>  | Level of detail for the trace (None, Unspecified, Default, Fatal, Error, Warning, Info, Unexpected, Debug, Fine, Finest) |
| <b>Trace Status</b> | Status of the trace:<br>Green: The trace is enabled.<br>Grey: The trace is disabled.                                     |
| <b>Start</b>        | Starts the Media Server trace.                                                                                           |
| <b>Stop</b>         | Stops the Media Server trace.                                                                                            |

## 28.2.6 Events

The functions for displaying and controlling events are grouped together under **Events**. These include event configuration, for instance, and e-mail settings.

### 28.2.6.1 Events > Event Configuration

Parameter Description of Tabs:

- **Edit Event Configuration**

| Parameters                                       | Description                                                                                                       |
|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| <b>Event File Settings</b>                       |                                                                                                                   |
| <b>Maximum Event Buffer Size (byte)</b>          | Displays the maximum event buffer size in bytes                                                                   |
| <b>Maximum Event File Size (byte)</b>            | Displays the maximum size of the event log file in bytes                                                          |
| <b>Event Timer (sec)</b>                         | Displays the time in seconds after which a new event log file is created.                                         |
| <b>Event via LAN (XTracer)</b>                   |                                                                                                                   |
| <b>Switch Event Logging via LAN On (XTracer)</b> | When this flag is activated, event log messages are transmitted via the LAN interface.<br>Default value: Disabled |

| Parameters               | Description                                                                                   |
|--------------------------|-----------------------------------------------------------------------------------------------|
| <b>Timer Value (sec)</b> | Displays the time in seconds after which event log data is transmitted via the LAN interface. |

### 28.2.6.2 Events > Event Log

This function is used to download or delete the event log file.

Parameter Description of Tabs:

- **Load via HTTP**
- **Clear Event Log**

### 28.2.6.3 Events > E-mail

Parameter Description of Tabs:

- **Edit E-mail Settings**

| Parameters                               | Description                                                                                                  |
|------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| <b>E-mail Settings</b>                   |                                                                                                              |
| <b>Subject</b>                           | Text that appears in the Subject field of the e-mails.                                                       |
| <b>E-mail Address (Recipients)</b>       |                                                                                                              |
| <b>Recipient 1</b>                       | E-mail address to which an e-mail is sent when an event occurs.                                              |
| <b>Recipient 2</b>                       | E-mail address to which an e-mail is sent when an event occurs.                                              |
| <b>Recipient 3</b>                       | E-mail address to which an e-mail is sent when an event occurs.                                              |
| <b>Recipient 4</b>                       | E-mail address to which an e-mail is sent when an event occurs.                                              |
| <b>Recipient 5</b>                       | E-mail address to which an e-mail is sent when an event occurs.                                              |
| <b>Emergency Notifications Recipient</b> |                                                                                                              |
| <b>Emergency Recipient</b>               | E-mail address of an on-site security officer to which an e-mail is sent when an emergency number is dialed. |

### 28.2.6.4 Events > Reaction Table

For each possible event, the Reaction Table can be used to independently define what action is to be taken when that event occurs.

Parameter Description of Tabs:

- **Edit All Events**
- **Restore All Events to Default Settings**
- **Edit Event**
- **Start/Stop Associated Trace Profile**

| Parameters                      | Description                                                                                                                               |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Event Name</b>               | Name of the event                                                                                                                         |
| <b>Send an SNMP Trap</b>        | When this flag is activated, an SNMP trap is sent when the event occurs.                                                                  |
| <b>Send Email</b>               | When this flag is activated, an e-mail is sent to the e-mail recipient specified under <b>Edit E-mail Settings</b> when the event occurs. |
| <b>Associated Trace Profile</b> | Trace profile which is started or stopped when the event occurs.                                                                          |
| <b>Start Trace Profile</b>      | When this flag is activated, the selected trace profile is started when the event occurs.                                                 |
| <b>Stop Trace Profile</b>       | When this flag is activated, the selected trace profile is stopped when the event occurs.                                                 |
| <b>Reboot the Gateway</b>       | Indicates whether the communication system is restarted when the event occurs.                                                            |
| <b>Reboot the Gateway: Yes</b>  | The communication system is restarted when the event occurs.                                                                              |
| <b>Reboot the Gateway: No</b>   | The communication system is not restarted when the event occurs.                                                                          |
| <b>Notify OpenScape</b>         | Indicates whether a message is sent to the communication system when the event occurs.                                                    |
| <b>Notify OpenScape: Yes</b>    | A message is sent to the communication system when the event occurs.                                                                      |
| <b>Notify OpenScape: No</b>     | No message is sent to the communication system when the event occurs.                                                                     |

### 28.2.6.5 Events > Diagnosis Logs

Displays the diagnosis logs (log files) that were created automatically during critical system conditions.

Parameter Description of Tabs:

- **Get Diagnosis Logs**
- **Clearing Diagnosis Logs**

| Parameters            | Description                                                             |
|-----------------------|-------------------------------------------------------------------------|
| <b>File name</b>      | Name of the diagnosis log (log file) stored in the communication system |
| <b>Size (in Byte)</b> | Size of the diagnosis logs in bytes                                     |
| <b>Modified</b>       | Modification date of the diagnosis log                                  |

| Parameters         | Description                                                                                                                      |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <b>Permissions</b> | Attributes of the diagnosis log: <ul style="list-style-type: none"> <li>• r = read access</li> <li>• w = write access</li> </ul> |

### 28.2.6.6 Events > Alarm Signaling

The stations (system telephones with display, UP0 & HFA) to be notified when the system temperature exceeds 55 degrees Celsius. If the temperature exceeds 60 degrees Celsius, the boards responsible for the overheating (e.g., OCAB, SLAD60/16) are shut down in a controlled manner or switched off.

Parameter Description of Tabs:

- **Edit alarm signaling**

| Parameters                              | Description                              |
|-----------------------------------------|------------------------------------------|
| <b>Temperature alarm signaling port</b> |                                          |
| <b>Station 1</b>                        | Target 1 (subscriber with system phone). |
| <b>Station 2</b>                        | Target 2 (subscriber with system phone). |
| <b>Station 3</b>                        | Target 3 (subscriber with system phone). |

### 28.2.7 Restart / Reload

Can be used to initiate a restart or reload of OpenScape Business and for a controlled shutdown of OpenScape Business X. In addition, a restart (reboot) of the UC application (UC Smart or UC Suite) or the UC Booster Card (Application Board OCAB) is triggered. To enable the controlled shutdown of OpenScape Business X via a system telephone, a PIN can be defined. In the case of a network, the networked communication systems can be synchronized.

#### 28.2.7.1 Restart / Reload > Restart / Reload

| <b>Sync Network</b>              | <p>Synchronization of networked communication systems:</p> <p>After any phone numbers, DID numbers or names have been changed, the data in all networked communication systems are updated through synchronization.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Parameters                    | Description                                                                                                                                                                                                                                                                         |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Restart UC Application</b> | Controlled restart of the UC application (UC Smart or UC Suite):<br>During a restart of the UC Application, all active applications such as myPortal for Desktop and myAttendant, for example, are disconnected. After the startup, all connections are automatically set up again. |

## 28.2.8 SNMP

The functions for configuring communities and traps are grouped together under **SNMP**. Communities are used to regulate SNMP data access authorizations. Traps are generated if system problems occur to inform administrators of errors and failures.

### 28.2.8.1 SNMP > Communities

Parameter Description of Tabs:

- **Display Communities**

| Parameters                  | Description                                                                                                                                                 |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>IP address</b>           | IP address of the SNMP communication partner.<br>At address 127.0.0.1, any communication with external IP addresses is blocked.                             |
| <b>Community</b>            | Identification/Access password for the SNMP user.<br><b>INFO:</b> To increase security, it is recommended that the default value <b>public</b> not be used. |
| <b>Type</b>                 | Selection of the type.                                                                                                                                      |
| <b>Type: Read Community</b> | Communication partner with SNMP read access.                                                                                                                |
| <b>Type: Read Community</b> | Communication partner with SNMP read and write access.                                                                                                      |
| <b>Type: Trap-Community</b> | Communication partner to which error messages (traps) are sent.                                                                                             |

### 28.2.8.2 SNMP > Communities > Read Communities

Parameter Description of Tabs:

- **Display Read Communities**
- **Add Read Community**

| Parameters        | Description                                                                                                                     |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <b>IP address</b> | IP address of the SNMP communication partner.<br>At address 127.0.0.1, any communication with external IP addresses is blocked. |

| Parameters       | Description                                                                                                                                                 |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Community</b> | Identification/Access password for the SNMP user.<br><b>INFO:</b> To increase security, it is recommended that the default value <b>public</b> not be used. |

### 28.2.8.3 SNMP > Communities > Write Communities

Parameter Description of Tabs:

- **Display Write Communities**
- **Add Write Community**

| Parameters        | Description                                                                                                                                                 |

| <b>Time</b>                | Time of error                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Index</b>               | Sequential number                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## 28.2.9 Admin Log (also called Admin Protocol)

The administrator can use **Admin Log** to change the configuration (e.g., the language) of the administration log.

### 28.2.9.1 Admin Protocol > Configuration

Parameter Description of the Tab:

- **Edit Configuration**

| Parameters                | Description                                                                                                                                                                                                                      |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Admin Log Language</b> | Setting of the preferred language for the Admin Log. The Admin Log provides an overview of the changes made at the communication system.<br><br>Possible languages: German, English, French, Spanish, Italian, Portuguese, Dutch |

### 28.2.9.2 Admin Protocol > Admin Log Data

Parameter Description of the Tab:

- **Load via HTTP**

| Parameters           | Description                                                                                                                                                                                            |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Load via HTTP</b> | Saves the Admin log of the communication system. The Admin log enables you to track when and by whom changes were made to the communication system. All logins at the communication system are logged. |

## 28.2.10 Actions

The functions that support the administrator with repetitive administration tasks such as deleting log data are grouped together under **Actions**.

### 28.2.10.1 Actions > Manual Actions > Diagnosis Logs

Parameter Description of Tabs:

- **Load data via HTTP**

| Parameters               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Trace Log</b>         | <p>When this flag is activated, the system trace log files are downloaded. The following choices are available:</p> <ul style="list-style-type: none"> <li>• Complete Trace Log: The full set of existing system trace log files is downloaded.</li> <li>• Log from Today: The system trace log files of the current day (as of 00:00 hours) are downloaded.</li> <li>• Own Selection: From: XXX To: YYY: The system trace log files of the selected time period are downloaded.</li> </ul> <p>Default value: Enabled, Complete Trace Log</p> |
| <b>Event Log</b>         | <p>When this flag is activated, log files with information about actions and events of the communication system (reset, power on/off, etc.) are downloaded.</p> <p>Default value: Enabled</p>                                                                                                                                                                                                                                                                                                                                                 |
| <b>Admin Log</b>         | <p>When this flag is activated, log files with information about administration procedures (login attempts, etc.) are downloaded.</p> <p>Default value: Enabled</p>                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Licence Protocols</b> | <p>When this flag is activated, log files with messages about the communication system components that require licenses are downloaded.</p> <p>Default value: Enabled</p>                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Customer Trace</b>    | <p>When this flag is activated, log files with messages for the customer (remote login, ITSP login, etc.) are downloaded. The messages for the customer trace are provided in a more detailed format than in the trace log, for example.</p> <p>Default value: Enabled</p>                                                                                                                                                                                                                                                                    |

| Parameters                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Framework Protocol</b>    | <p>When this flag is activated, log files with WBM messages are downloaded.</p> <p>Default value: Enabled</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Diagnosis Log</b>         | <p>When this flag is activated, the diagnosis logs of the communication system are downloaded.</p> <p>Default value: Enabled</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>UC Suite Protocols</b>    | <p>When this flag is activated, log files with UC Suite messages (UC Suite, SCP and MEB logs) are downloaded. The following choices are available:</p> <ul style="list-style-type: none"> <li>• Complete Trace Log: All existing UC Suite, CSP and MEB log files are downloaded.</li> <li>• Log from Today: The UC Suite, CSP and MEB log files of the current day (as of 00:00 hours) are downloaded.</li> <li>• Own Selection: From: XXX To: YYY: The UC Suite, CSP and MEB log files of the selected time period are downloaded.</li> </ul> <p>All log files are archived together in a compressed file. The following file naming conventions apply to the OpenScape Business logs: UC Suite log files = vs_yyyy_mm_dd.log, CSP log files = cspttrace_yyyy_mm_dd.log, MEB log files = mebtrace_yyyy_mm_dd.log</p> <p>Default value: Disabled</p> |
| <b>Application Protocols</b> | <p>When this flag is activated, log files with messages of the application side of the communication system (for example, CSP protocols) are downloaded.</p> <ul style="list-style-type: none"> <li>• Complete Trace Log: All existing log files are downloaded</li> <li>• Log from Today: The log files of the current day (as of 00:00 hours) are downloaded.</li> <li>• Own Selection: From: XXX To: YYY: The log files of the selected time period are downloaded.</li> </ul> <p>All log files are archived together in a compressed file.</p> <p>Default value: Disabled</p>                                                                                                                                                                                                                                                                    |
| <b>System Diagnosis Logs</b> | <p>When this flag is activated, the diagnosis logs of the communication system are downloaded.</p> <p>Default value: Enabled</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>PPP Logs</b>              | <p>When this flag is activated, log files with messages for the Point-to-Point Protocol are downloaded.</p> <p>Default value: Enabled</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>CoreLog Protocol</b>      | <p>When this flag is activated, log files with information about the most recent state of the operating system are downloaded. CoreLogs are created during system restart, for example.</p> <p>Default value: Disabled</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## 28.2.10.2 Actions > Manual Actions > DLI Maintenance

Parameter Description of Tabs:

- **DLI Devices Maintenance**

| Parameters                | Description                                                                                                                                                                                                                                            |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Delete Device</b>      | Select the system telephone that is to be deleted. With this action, the system telephone is deleted from DLI database.<br><br><b>NOTICE:</b> Before any DLI Maintenance Action (delete), you must ensure first that the device is not in use anymore. |
| <b>Call no</b>            | Phone number of the system telephone.                                                                                                                                                                                                                  |
| <b>Device type</b>        | Type of the system telephone.                                                                                                                                                                                                                          |
| <b>IP Address</b>         | IP address of the system telephone; direct link to the WBM of the system telephone.                                                                                                                                                                    |
| <b>MAC Address</b>        | MAC address of the system telephone.                                                                                                                                                                                                                   |
| <b>Current SW version</b> | Current software version of the system telephone.                                                                                                                                                                                                      |

## 28.2.10.3 Actions > Automatic Actions > Garbage Collection

Parameter Description of Tabs:

- **Edit Action**
- **Start/Stop Action**

| Parameters                             | Description                                                                                                                                                                                                                                                                                 |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Action Activated</b>                | When this flag is activated, automatic garbage collection will be performed on the communication system at regular intervals. After each garbage collection has been completed, the communication system performs a restart (reboot).<br>Default value: Disabled                            |
| <b>Start Time (after Midnight)</b>     | Garbage collection is performed after midnight.<br>Example: Let us assume that the value entered in the <b>Hrs</b> field was 3 and in the <b>Mins</b> field was 30. This means the garbage collection action will be started at 3:30 a.m. every morning.<br>Default value: 3 hours, 00 min. |
| <b>Days on which to perform action</b> | Garbage collection is performed on the selected weekdays.<br>Default value: Enabled                                                                                                                                                                                                         |

## 28.2.10.4 Actions > Automatic Actions > DLS Notification

Parameter Description of Tabs:

- **Edit Action**
- **Start/Stop Action**

| Parameters              | Description                                                                                                                                                 |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Action Activated</b> | When this flag is activated, the automatic login at an external DLS server is initiated on starting up the communication system.<br>Default value: Disabled |
| <b>IP address</b>       | IP address of the external DLS server<br>Default value: 0.0.0.0                                                                                             |
| <b>Port</b>             | Port of external DLS server<br>Default value: 10444                                                                                                         |
| <b>User name</b>        | User name for logging into the external DLS server                                                                                                          |
| <b>Password</b>         | Password for logging into the external DLS server                                                                                                           |

### 28.2.10.5 Actions > Automatic Actions > SDHC Health Check

Parameter Description of Tabs

- SDHC Health Check

| Parameters                                                                                   | Description                                                                 |
|----------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------|
| SDHC Health Check                                                                            |                                                                             |
| <b>Start Health Check</b>                                                                    | Enables the immediate Health Check of the card                              |
| <b>Start Health Check on</b>                                                                 | Enables a scheduled day, month, year and time for Health Check of the card. |
| <b>Log File</b><br>The result of the last file checks is displayed.                          |                                                                             |
| <b>Status / Recommended action</b><br>Recommend actions for every Health Status of the card. |                                                                             |

### 28.2.11 Platform Diagnostics

Platform Diagnostics Option (only for Development).

### 28.2.12 Application Diagnostics

Application Diagnostics Option (only for Development).

### 28.2.12.1 Application Diagnostics > Developer Settings > Trace Console Output

Application Diagnostics Option (only for Development).

### 28.2.12.2 Application Diagnostics > Developer Settings > Take Over Write Token

Application Diagnostics Option (only for Development).

### 28.2.12.3 Application Diagnostics > Mainboard

Changes to the settings should only be made if requested by the responsible Service Support.

### 28.2.12.4 Application Diagnostics> Developer Settings> SIP Provider Profiles

Parameter description of tags:

- Add SIP provider profiles
- Edit SIP provider profiles

This page is intended for use by well trained technicians during the certification of a new ITSP. Please read the documents available in the unify wiki: [http://wiki.unify.com/index.php/Collaboration\\_with\\_VoIP\\_Providers#How\\_to\\_get\\_a\\_new\\_VoIP\\_provider\\_released](http://wiki.unify.com/index.php/Collaboration_with_VoIP_Providers#How_to_get_a_new_VoIP_provider_released) for more information.

## 28.2.13 IP Diagnostics

IP Diagnostics Option (Only for Development).

### 28.2.13.1 IP Diagnostics > Mainboard > Address Resolution Protocol

This function is used to display the data of the Address Resolution Protocol ARP. The mapping table shows the assignment of network addresses to MAC addresses.

Parameter Description of Tabs:

- **Display Address Resolution Protocol**

| Parameters        | Description                                                                                               |
|-------------------|-----------------------------------------------------------------------------------------------------------|
| <b>IP address</b> | Displays the network addresses that are currently connected to the mainboard of the communication system. |

| Parameters         | Description                                                                        |
|--------------------|------------------------------------------------------------------------------------|
| <b>MAC Address</b> | Displays the physical address of the connected network addresses                   |
| <b>Type</b>        | Displays the address assignment type. Fixed (static) or dynamic assignment.        |
| <b>Interface</b>   | Internal designation of the existing LAN interfaces (e.g., eth0, eth1, eth2, eth3) |

### 28.2.13.2 IP Diagnostics > Mainboard > ICMP Request > Ping

This function can be used to check the network connection between the communication system and a freely selectable target address with a ping command (echo request).

Parameter Description of Tabs:

- **Execute Ping**

| Parameters                             | Description                                                                                                                                      |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ICMP Parameter</b>                  |                                                                                                                                                  |
| <b>Target Address</b>                  | IP address of the target whose network connection to the communication system is checked using echo request packets.<br>Default value: 127.0.0.1 |
| <b>Number of Echo Requests to Send</b> | Number of echo request packets to be sent for checking the network connection<br>Default value: 3                                                |

### 28.2.13.3 IP Diagnostics > Mainboard > ICMP Request > Traceroute

This function uses ICMP echo requests to determine via which routers data packets are transmitted to the requested target address.

Parameter Description of Tabs:

- **Trace route**

| Parameters            | Description                                                                                                                                                   |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ICMP Parameter</b> |                                                                                                                                                               |
| <b>Target Address</b> | IP address of the target whose traceroute to the communication system is checked using ICMP echo requests.<br>Default value: 127.0.0.1                        |
| <b>TOS Byte</b>       | Indicates whether TOS (Type of Service) bytes are sent. TOS bytes provide information on the quality of a service.<br>Value range: 0 to 255, default value: 0 |

## 28.2.14 Online User

Web tool for remote control of OpenStage phones.

### 28.2.14.1 Online Users

The Online User opens the Java Husim Phone Tester (jHPT). This is a web-based tool to remotely control OpenStage telephones via the Internet. Using a web interface, an existing system telephone is controlled by transmitting real keystrokes and displays of the communication system. Separate documentation is available for the jHPT, which can be downloaded via the Help function of the tool (so no further description of the jHPT pages is provided here).

## 28.3 Telephony

The functions for configuring the telephony settings (such as subscriber configuration or Call Management (CM), for example) are grouped under **Telephony**.

### 28.3.1 Basic Settings

Functions for configuring system flags, directory settings and speed dials, DynDNS, Quality of Service, date and time, and call charges are grouped together under **Basic Settings**.

#### 28.3.1.1 Basic Settings > System > System Flags

Parameter Description of Tabs::

- **Edit System Flags**

| Parameters                                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Through-connection for external FWD on</b>              | When this flag is activated, calls forwarded to an external destination are put through immediately. The forwarding occurs regardless of whether an internal or external (MSI/ISDN) call is involved. If the call forwarding occurs via an ISDN trunk, and the external forwarding destination is located in another network (such as a GSM network, for example), the call setup from the ISDN Central Office is reported with the progress indicator Leaving ISDN. As of this point in time, the caller incurs connection charges.<br><br>Default value: Disabled |
| <b>Call forwarding to main station interface permitted</b> | When this flag is activated, calls over analog trunks (MSI) follow the external call forwarding.<br><br>Default value: Enabled                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Parameters                                               | Description                                                                                                                                                                                                                                                                                                             |
|----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Hunting to external call forwarding destination</b>   | <p>When this flag is activated, the following applies: if the external call forwarding destination cannot be reached, the call is forwarded to the next destination entered in the call destination list.</p> <p>Default value: Disabled</p>                                                                            |
| <b>Conference tone</b>                                   | <p>When this flag is activated, the participants of a conference are reminded that they are currently in a conference call by a special tone at intervals of 20 seconds.</p> <p>Default value: Disabled</p>                                                                                                             |
| <b>Warning signal for call pickup groups</b>             | <p>When this flag is activated, a call for a member of a call pickup group is signaled to the other group members with an optical signal (via the display). If the call is not answered within four call cycles (4 x 5 seconds), the other group members also receive a warning tone.</p> <p>Default value: Enabled</p> |
| <b>Increase volume for optiPoint/OpenStage terminals</b> | <p>When this flag is activated, optiPoint and OpenStage phones are switched to an alternative attenuation plan, which increases the volume.</p> <p>Default value: Disabled</p>                                                                                                                                          |
| <b>Relocate allowed</b>                                  | <p>When this flag is activated, system telephones can be physically relocated without changing the logical configuration (call number, name, key programming, etc).</p> <p>Default value: Disabled</p>                                                                                                                  |
| <b>More than 1 external conference member</b>            | <p>When this flag is activated, multiple external subscribers can attend a conference.</p> <p>Default value: Enabled</p>                                                                                                                                                                                                |
| <b>Trunk reservation, automatic</b>                      | <p>When this flag is activated, a subscriber can reserve a trunk in advance if there are no free trunks available (busy signal). The subscriber receives a recall as soon as this trunk becomes free and can then set up the external connection.</p> <p>Default value: Disabled</p>                                    |
| <b>No. redial with a/c code</b>                          | <p>When this flag is activated, on redialing, any account code that was entered is also repeated in addition to the station number.</p> <p>Default value: Disabled</p>                                                                                                                                                  |

| Parameters                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Simplified dialing</b>              | <p>When this flag is activated, dialing a single digit at a system telephone immediately triggers line seizure, and the required call number is dialed. It is not necessary to dial the access code. To dial an internal station, one of the following procedures must be used:</p> <ul style="list-style-type: none"> <li>• Press the Internal key (Mute will change to Internal, if simplified dialing is active) and dial the station number</li> <li>• or press the corresponding DSS key.</li> </ul> <p>This function is only available if only one route (see Routes) has been configured.</p> <p>If Entry, ISDN or a/b telephones are still connected in the communication system, LCR with automatic dialing is not possible.</p> |
| <b>Use only default number for MSN</b> | <p>When this flag is activated, on an S0 bus, MSNs (Multiple Subscriber Numbers) can only be created for already existing internal station numbers (to prevent any possible toll fraud).</p> <p>Default value: Disabled</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Path optimization</b>               | <p>When this flag is activated, path optimization is performed in networked communication systems. The flag must be enabled for all communication systems belonging to a network. Example for two networked systems (system 1 and system 2): For a call from subscriber A (system 1) to subscriber B (system 2) and subsequent call forwarding to subscriber C (system 1), two trunks are reserved. With path optimization, the connection from A to C is automatically switched over a single trunk.</p> <p>Default value: Enabled</p>                                                                                                                                                                                                   |
| <b>DTMF automatic</b>                  | <p>When this flag is activated, it causes DTMF mode to be activated each time an outgoing call is set up. This enables answering machines to be checked remotely, for example.</p> <p>Default value: Enabled</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Broadcast with connection</b>       | <p>When this flag is activated, the Speaker call (Paging) function lets you set up an internal connection without the called subscriber lifting the handset. On lifting the handset, the call becomes a normal two-party call.</p> <p>Default value: Enabled</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Tone from CO</b>                    | <p>When this flag is activated, a connection is switched through to the Central Office or to a networked communication system even if no tone is sent from the peer.</p> <p>Default value: Disabled</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Ringback protection</b>             | <p>When this flag is activated, collect calls are automatically released.</p> <p>Default value: Disabled</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Parameters                                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Euro-impedance</b>                               | <p>When this flag is activated, the following impedance values apply in Europe:</p> <p>a/b interfaces for the analog station connection: Input impedance = 270 Ohms + 750 Ohms    150 nF, Second ringer impedance = 270 Ohms + 750 Ohms    150 nF, Relative Level A/D = 0 dBr, Relative Level D/A = -7 - 7 dBr</p> <p>a/b interfaces for the analog trunk connection: Input impedance = 270 Ohms + 750 Ohms    150 nF, Second ringer impedance = 270 Ohms + 750 Ohms    150 nF, Relative Level A/D = -6 - 6 dBr, Relative Level D/A = -1 - 1 dBr</p> <p>Default value: Disabled</p>                                     |
| <b>Different phonemail messages Day/Night</b>       | <p>When this flag is activated (in a communication system with Voicemail), different Voicemail announcements can be activated for a station by transmitting different station numbers for that station to the Voicemail. As a prerequisite, different call forwarding destinations for day and night modes must be configured for that station.</p> <p>Default value: Disabled</p>                                                                                                                                                                                                                                      |
| <b>Display international / national code number</b> | <p>When this flag is activated, you can define the display format for system speed dialing (SSD) numbers for incoming calls for which no name is stored in the SSD memory. The complete phone number (PABX number + Direct Inward Dialing (DID) number, including the local area code and country code, if available) is shown on the display of the phone. Example: The SSD number 06671234 was set up without a name. Local area code = 02302, PABX number = 667, DID number = 1234. In the case of an incoming call from 6671234, the number 023026671234 appears on the display.</p> <p>Default value: Disabled</p> |
| <b>Line change for direct call</b>                  | <p>This flag is used to define the behavior of a Direct Station Select (DSS) key during an active call on a MULAP trunk. Relevant for Team Configuration / Team Group, Executive/Secretary / Top Group, Basic MULAP, Executive MULAP. On pressing a Direct Station Select (DSS) key, a line change is performed. The call is placed on hold and can only be resumed at this phone.</p> <p>Default value: Disabled (not for U.S. and Canada), Enabled (for U.S. and Canada only)</p>                                                                                                                                     |
| <b>Automatic redial</b>                             | <p>Automatic redialing is performed when a called subscriber is busy. The time parameter Timer for automatic redial defines after how much time the redialing is activated.</p> <p>Default value: Disabled</p>                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Voice mail Node call number</b>                  | <p>When this flag is activated for networked communication systems, it defines whether or not the node number must be supplied for the identification of one central or multiple decentralized voicemail server(s). The node number must be supplied for the identification of the voicemail server or servers.</p> <p>Default value: Disabled</p>                                                                                                                                                                                                                                                                      |

| Parameters                                                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Call Pickup after automatic recall</b>                                    | <p>When this flag is activated, recalls and callbacks are also signaled at other members of a call pickup group and can be accepted by them.</p> <p>Default value: Disabled</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Configurable CLIP</b>                                                     | <p>When this flag is activated, instead of the actual station number, the number entered under Clip/Lin is transmitted to the called external connection and presented on the display. If the Clip/Lin entry is empty, the station number is transmitted.</p> <p>Default value: Enabled</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Caller list at destination in case of Forward Line</b>                    | <p>When this flag is activated, in case of a Forward Line Key (MULAP), incoming calls are entered in the caller list of the destination station.</p> <p>Default value: Disabled</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Call forwarding after deflect call / single step transfer</b>             | <p>When this flag is activated, the following applies: if a subscriber has enabled call forwarding to an internal destination (call deflection), the call is signaled at that destination. After the call forwarding time has expired, the call is signaled at the first destination entered in the call destination list and subsequently at the second destination, if any, and so on. Example: For station A, a deflect call to station B was executed. The first destination entered in the call destination list of station B is station C, and the second destination is station D. In this case, the call will be signaled at station C first and then at station D, after the call forwarding time has expired. The activation of this flag only makes sense if the flag Follow call management in case of deflect call / single step transfer is also activated.</p> <p>In order this flag to have any effect the redirecting functions will take place in call, Deflect and single step call transfer, and applies mainly to calls handled via UC (Auto Attendant/ UCD groups) where those redirection functions are applicable.</p> <p>Default value: Enabled</p> |
| <b>Follow call management in case of deflect call / single step transfer</b> | <p>When this flag is activated, the following applies: if a subscriber has enabled call forwarding to an internal destination (call deflection), the call is first signaled at that destination and subsequently at any further destination entered in the call destination list (after the call forwarding time has expired). Example: For station A, a deflect call to station B was executed. The first destination entered in the call destination list of station B is station C. After the call forwarding time has expired, the call is signaled at station C.</p> <p>In order this flag to have any effect the redirecting functions will take place in call, Deflect and single step call transfer, and applies mainly to calls handled via UC (Auto Attendant/ UCD groups) where those redirection functions are applicable.</p> <p>Default value: Enabled</p>                                                                                                                                                                                                                                                                                                     |
| <b>Warning tone during voice recording</b>                                   | <p>If the flag is enabled, the following applies for OpenScape Business X: If voice recording (Live Call Record) is activated during a call, a corresponding advisory tone is output if the flag is set.</p> <p>Default value: Enabled</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Parameters                                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>E.164 numbering scheme</b>                                      | <p>This flag is used to activate or deactivate CDB networking of cross-location or worldwide customer systems. Stations can be reached via a public number (the E.164 call number) in national or international format (for example, internal calling party number in ISDN format), without dialing a node number first. Each station is represented by its E.164 call number, which can be displayed in an optimized format. If the flag is activated, the internal call number is transferred in E.164 format.</p> <p>If this flag is set, SIP stations are registered with the long version of the E.164 call number (location number + internal call number, for example, 4923026673665).</p> <p>Default value: Disabled</p> |
| <b>Extended Key Functionality</b>                                  | <p>If the flag is enabled, once a key is defined as the "Shift key", only phone numbers without LED support can be saved at the second key level which is now available. Any key functions on the first key level can be programmed. LED signaling is associated with the first key level only.</p> <p>Default value: Disabled</p>                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Calling number in pickup groups / ringing groups / CFN /RNA</b> | <p>When this flag is activated, the station number and name of a caller are displayed at all members of a call pickup group, all members included in a ringing group and at CFN (call forwarding) and CFNA (call forwarding on no answer) destinations. The station number and name are presented on the display.</p> <p>Default value: Enabled</p>                                                                                                                                                                                                                                                                                                                                                                              |
| <b>SPE support</b>                                                 | <p>When this flag is activated, the Signaling and Payload Encryption (SPE) feature is supported. The VoIP payload and signaling data streams to and from the communication system and between OpenStage system telephones are encrypted.</p> <p>Default value: Disabled</p> <hr/> <p><b>NOTICE:</b> If you want to use the Cloud Service, Unify Video, then the <b>SPE Support</b> must be disabled in order to register the trunk, unless there is a SPE Certificate imported in the System.</p> <hr/>                                                                                                                                                                                                                          |

| Parameters                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>SPE advisory tone</b>                                  | <p>When this flag is activated, the following applies: when the system flag SPE Support is enabled, and an OpenStage 15, 20, 20 E or 20 G phone is used, subscribers are notified about an unencrypted connection by a beep tone in addition to the display. Enabling the station parameter Payload Security is a prerequisite for the usage of SPE by a subscriber. No beep tone is heard when using an OpenStage 40, 40 G, 60, 60 G, 80 or 80 G telephone. The status of the connection (encrypted/unencrypted) is permanently shown in the display.</p> <p>Default value: Disabled</p> <hr/> <p><b>NOTICE:</b> If you want to use the Cloud Service, Unify Video, then the <b>SPE advisory tone</b> must be disabled in order to register the trunk, unless there is a SPE Certificate imported in the System.</p> <hr/> |
| <b>SIP Prov. to SIP Prov. transit</b>                     | <p>When this flag is activated, transit line connections are allowed for ITSP connections. A connection is a transit connection when a single call occupies two lines in the same communication system. Example: An external is forwarded to an internal station via an ITSP. The internal station then transfers the call again to an external destination via an ITSP. This results in a transit line connection within the communication system. Two trunks are occupied for the duration of the call. The resulting transit line connections are allowed.</p> <p>Default value: Disabled</p>                                                                                                                                                                                                                            |
| <b>Transparent dialing of * and # on trunk interfaces</b> | <p>When this flag is activated, Centrex features can be enabled or disabled via IP trunks (ITSP) and ISDN trunks. Several providers offer Centrex (Central Office Exchange) features that can be enabled or disabled by using codes. The input of a code must occur in the dialing state (e.g., after entering the trunk code). The input always begins with * (asterisk) or # (pound). This must be followed by the actual code (digits 0 through 9) and terminated with # (pound). It is not possible to enable or disable Centrex features in the talk state. Centrex features can be enabled or disabled via IP trunks (ITSP) and ISDN trunks.</p> <p>Default value: Disabled</p>                                                                                                                                       |
| <b>Add seizure code for MEX</b>                           | <p>Applies only to external calls that are initiated via the ITSP "Mobile Extension (MEX)" feature. If the flag is enabled, the system automatically adds the CO code to the phone number for external outgoing calls if the phone number consists of more than 7 digits, since the system then interprets it as an external phone number. If the phone number consists of less than 7 digits, the CO code is not added, since the system interprets the number as an internal call number. If the flag is disabled, then the service provider must add the CO code to the phone number for all external outgoing calls.</p> <p>Default value: Disabled</p>                                                                                                                                                                 |

| Parameters                                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>CMI MWI ringer</b>                                                    | <p>If this flag is enabled, the Message Waiting Indication (MWI) beep is activated for DECT phones (CMI: Cordless Multicell integration). In other words, when a new message is received in the voicemail box, an alert tone is sent.</p> <p>Default value: Disabled</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Automatic Openstage TDM Phones Software Update</b>                    | <p>If this flag is enabled, when the software version of a TDM phone is older than the software version of the system then the software of the phone is automatically updated.</p> <p>Default value: Enabled</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Restrict indirect trunk group connections according to CON Matrix</b> | <p>If a company has branches in several cities, then each branch can have a line to the national telecom provider. These branches can also be connected to one another via private tie trunks.</p> <p>For reasons of national regulations (e.g., in India) it can be illegal to make the following connection: A station uses the private tie trunk from their communications system to a private communications system in another city and then a national telecom provider trunk to reach a local external destination. Instead a national telecom provider trunk should be used directly for calls between cities. This requirement is implemented as follows:</p> <ul style="list-style-type: none"> <li>• Connections between private tie trunks can be restricted by configuring the CON matrix.</li> <li>• For private tie trunks which involve the features Call-forwarding, Transfer and Conference features, the flag "Restrict indirect trunk group connections according to CON Matrix" was introduced. Activating/deactivating this flag has the following effects: <ul style="list-style-type: none"> <li>– Activated: Calls between cities using private tie trunks are restricted.</li> <li>– Deactivated: Calls between cities using private tie trunks are permitted.</li> </ul> </li> </ul> <p>Default value: Disabled</p> |
| <b>Open numbering</b>                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>active</b>                                                            | <p>When open numbering is used, a station is identified by the node number, followed by the call number or the DID number. This makes it possible to assign the same call number to stations in different nodes. In a networked system, this flag is always set identically for all systems.</p> <p>Default value: Disabled</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Node call number</b>                                                  | <p>If open numbering is set, the call number of the node must be entered here. A station can be reached from other nodes only by dialing this node call number, followed by the station number. If the total number of digits of the node call number and the station number exceeds 7, a corresponding warning is issued.</p> <p>Default value: Disabled</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Transit permission</b>                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Parameters                              | Description                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Feature Transit</b>                  | When this flag is activated, transit connections associated with specific features such as external call forwarding, call transfers and DISA applications, for example, are allowed. This applies regardless of whether tie trunk or trunk-to-trunk connections are involved.<br>Default value: Enabled                                                   |
| <b>Tie traffic transit</b>              | When this flag is activated, transit connections in direct inward dialing for tie trunk connections (networked communication systems) are allowed.<br>Default value: Enabled                                                                                                                                                                              |
| <b>External traffic transit</b>         | When this flag is activated, transit connections in direct inward dialing for trunk-to-trunk connections are allowed.<br>Default value: Disabled                                                                                                                                                                                                          |
| <b>Special switch</b>                   |                                                                                                                                                                                                                                                                                                                                                           |
| <b>CALL PROC no send</b>                | This flag must be enabled if the service provider should not receive any Call Proceeding Messages (ISDN message) from the communication system.<br>Default value: Disabled                                                                                                                                                                                |
| <b>Automatic, cyclical line seizure</b> | If this flag is enabled, outgoing calls will cyclically seize new ISDN trunks when the connection setup fails (e.g., no ACK acknowledgment). Line numbers or route numbers are incremented.<br>Default value: Enabled                                                                                                                                     |
| <b>Restriction for UC calls</b>         |                                                                                                                                                                                                                                                                                                                                                           |
| <b>Restriction for UC calls</b>         | When this flag is activated, for all UC calls initiated by the system (e.g., via the Call-Me service), a check is performed before dialing to determine whether the requesting UC user has the requisite class of service for that call. If the UC user does not have the required class of service, the call is not executed.<br>Default value: Disabled |

### 28.3.1.2 Basic Settings > System > Time Parameters

All adjustable time parameters are listed in the table (**Description** column). The timer value for each time parameter can be set via the **Base** and **Factor** columns. The actual time = Base x Factor. If the value 255 is entered in the **Factor** column, this timer is inactive.

Parameter Description of Tabs::

- **Edit Time Parameters**

| Parameters                                                        | Description                                                                                                                                                                                                                           |
|-------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>P.O.T. suffix dialing time code / Receiver activation time</b> | Controls the duration of the connection of the code receiver with DTMF terminal units and therefore the ready-to-dial condition. After expiry of this timer the code receiver will be released.<br>Value range: 5 - 15 s              |
| <b>Time for activation of P.O.T features</b>                      | Will be activated if the signal key is pressed. The signal key helps to distinguish whether a subscriber wants to resume a consultation hold or whether he wants to activate a feature such as conferencing.<br>Value range: 2 - 4 s  |
| <b>Reseizure blocking time</b>                                    | Is started after trunk release and bars an immediate outgoing seizure during this time.<br>Value range: 0 - 5 s                                                                                                                       |
| <b>Callback delay time</b>                                        | Is started, if a subscriber changes into idle. Once this time has expired, a check is made to see whether automatic callback is to be implemented. This gives the user an opportunity to make further calls.<br>Value range: 0 - 60 s |
| <b>Length of call back</b>                                        | In case an automatic callback is not answered within this time, the call is finished and the callback is postponed.<br>Value range: 15 - 60 s                                                                                         |
| <b>Intercept time for automatic recall</b>                        | If an automatic recall of a blind transfer is not answered within this time, it is intercepted to the attendant console, if this intercept criterion has been configured.<br>Value range: 20 - 600 s                                  |
| <b>Dial time during transfer before answer</b>                    | If a blind transfer (to a busy station) is not answered within this time, the recall is forwarded to the extension that transferred the call.<br>Value range: 30 - 600 s                                                              |
| <b>End-of-selection for incomplete dialing (Austria)</b>          | Supervisory timer for direct inward dialing. In case no selection occurs during this time, the direct inward dialing is recognized as incomplete or as no dialing. (Austria only)<br>Value range: 10 - 30 s                           |
| <b>End-of-selection time (no dialing)</b>                         | In case selection is not started within a certain time, an end-of-selection is automatically generated.<br>Value range: 5 - 15 s                                                                                                      |
| <b>Time between 1st and 2nd announcement for FAX-DID</b>          | Fax/DID, analog direct inward dialing, time after voice announcement.<br>Default value: 15 s                                                                                                                                          |

| Parameters                                                          | Description                                                                                                                                                                                                                                                                                                   |
|---------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Time for parking + change to hold</b>                            | Reactivation of a parked call must occur within a timeout. In case the parked call is not answered (resumed) within this time, the station, which has parked the call, will be recalled. With the automatic recall, the hold status reverts to an active status.<br>Value range: 60 - 255 s                   |
| <b>End-of-selection for incomplete dialing</b>                      | In case dialing is not continued within a certain time, an end-of-selection is automatically generated.<br>Value range: 10 - 20 s                                                                                                                                                                             |
| <b>P.O.T. Minimum flash time</b>                                    | Defines a minimum time for the recognition of a flash within which the loop must be broken.<br>Default value: 0 s                                                                                                                                                                                             |
| <b>P.O.T Maximum flash time</b>                                     | Defines a maximum time for the recognition of a flash within which the loop may be broken.<br>Default value: 0 s                                                                                                                                                                                              |
| <b>Time for activation of automatic recall at attendant console</b> | In case an automatic recall at the attendant console is not answered during this time, the call will be released.<br>Value range: 30 - 180 s                                                                                                                                                                  |
| <b>MSI NSA Lead time</b>                                            | Lead time for the rotary dial normally open contact (NSA); is used to prevent dialing noise in the handset for pulse dialing equipment (before the pulse).<br>Default value: 0 s                                                                                                                              |
| <b>MSI NSA Follow time</b>                                          | Follow time for the rotary dial normally open contact (NSA); is used to prevent dialing noise in the handset for pulse dialing equipment (after the pulse).<br>Default value: 0 s                                                                                                                             |
| <b>Fault extraction time for ring</b>                               | Time to hide line faults for pulse dialing.<br>Default value: 0 s                                                                                                                                                                                                                                             |
| <b>End-of-dialing for 1A dialing</b>                                | Indicates the time after which the last digit will be dialed out for the 1A procedure. The outdialing of a digit occurs after input of the next digit. The last digit is dialed after expiry of the timer or if it is marked with the end of dialing indication (#) by the station.<br>Value range: 4 - 4.5 s |
| <b>Additional charge time</b>                                       | When a trunk is released, incoming call charge information (call charge pulses) on analog trunks can be analyzed by the communication system during this time. The trunk is blocked for outgoing connections during this time.<br>Default value: 0 s                                                          |
| <b>Interdigit time for pulse dialing</b>                            | Allowed delay between each digit for pulse dialing<br>Default value: 10 s                                                                                                                                                                                                                                     |

| Parameters                                         | Description                                                                                                                                                                                                                                               |
|----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Dial tone monitoring time</b>                   | This is the waiting time for dialing tone. In case this timer expires, the system assumes a failure of the trunk. The trunk will be marked as "failed".<br>Default value: 10 s                                                                            |
| <b>Pause duration for pulse dialing</b>            | Pulse dialing occurs through pulse-pause sequences and the detection of pauses on pulse-dialing lines.<br>Default value: 0 s                                                                                                                              |
| <b>Pulse time for pulse dialing</b>                | Pulse dialing occurs through pulse-pause sequences. Detection of pulses on pulse dialing lines.<br>Default value: 0 s                                                                                                                                     |
| <b>Flash time for PBXs</b>                         | Break time for station loop to trigger control functions (e.g., consultation) in the system.<br>Default value: 0 s                                                                                                                                        |
| <b>Flash time for trunks</b>                       | Break time for station loop to trigger control functions (e.g., consultation) on the MSI line.<br>Default value: 0 s                                                                                                                                      |
| <b>Minimum pulse time for pulse dialing-P.O.T.</b> | Pulse dialing occurs through pulse-pause sequences. Detection of pulses from the pulse dialing phone.<br>Default value: 0 s                                                                                                                               |
| <b>Maximum pulse time for pulse dialing-P.O.T.</b> | Pulse dialing occurs through pulse-pause sequences. Detection of pulses from the pulse dialing phone.<br>Default value: 80 ms                                                                                                                             |
| <b>Transmission time for DTMF signals</b>          | Country-specific duration of DTMF dial characters.<br>Default value: 80 ms                                                                                                                                                                                |
| <b>Pause between DTMF signals</b>                  | Country-specific pause between DTMF dial characters.<br>Default value: 80 ms                                                                                                                                                                              |
| <b>MOH delay timer</b>                             | In case a connection is held, music on hold is applied, if configured. However, MOH is only activated after this time has expired, in order to make sure that activation of features such as conferencing is not hindered by MOH.<br>Value range: 1 - 5 s |
| <b>Pause before dial (only for Development)</b>    | If dial tone detection is not possible or desired for analog trunks, dialing can be automatically initiated after this time period.<br>Default value: 3 s                                                                                                 |
| <b>Minimum charge pause</b>                        | Time between call charge pulses.<br>Default value: 0 min.                                                                                                                                                                                                 |
| <b>Minimum charge impulse</b>                      | Duration of call charge pulses.<br>Default value: 0 min.                                                                                                                                                                                                  |

| <b>Time until warning tone in main station interface transit connection</b>  | Transit connections are monitored depending on the type of protocols. This is to avoid, that a connection remains endlessly. If at least one trunk in this transit connection has release recognition, the time is not monitored (see the exceptions in the table below). There is no release recognition for analog trunks. However, there is a hardware option for silent reversal. This makes release recognition possible for analog trunks.<br><br>The Table for transit monitoring (the following is valid for the trunk types specific to the US:) shows the trunk types where a monitoring timer is implemented. The length of the monitoring can be configured. However, when using an analog trunk with silent reversal, note that there are call numbers where it's possible that there is no answer and therefore where no release can be recognized. As a rule, these call numbers are for announcement services. This must be explicitly pointed out to the operator of the communication system.<br>Value range: 120 s - 42 min |
| <b>Time from warning tone until release...</b>                               | In the case of monitoring the time for transit connections, a warning tone occurs after the monitoring timer expires. So that the call can be ended, the connection is only cleared down after this timer has expired, and not immediately.<br>Value range: 10 - 650                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Parameters                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Display name / call number</b> | <p>It is possible to configure which of the following data is displayed for calls on the screens of all connected telephones: Calling ID only, Name (if present), or both Name and calling ID at the same time. If a telephone does not support one of these settings, instead of displaying the name and the calling ID at the same time, only the calling ID may be shown, for example. OpenStage telephones support the simultaneous display of the name and calling ID.</p> <p>Default value: Name and calling ID</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Display name / algorithm</b>   | <p>Full name support is done with three fields, one for the first name, one for the last name and a third for the display name. Display name field can store up to 16 characters, name and last name fields can store up to 32 characters.</p> <p>One of the following options of the display name algorithm can be used:</p> <ul style="list-style-type: none"> <li>• &lt;last name&gt;, &lt;first name&gt;</li> <li>• &lt;last name&gt;, &lt;first name initial.\&gt;</li> <li>• &lt;first name&gt;, &lt;last name&gt;</li> <li>• &lt;first name initial&gt;, &lt;last name&gt;</li> <li>• &lt;last name&gt;</li> </ul> <p>Default value: &lt;last name&gt;, &lt;first name&gt;</p> <hr/> <p><b>IMPORTANT:</b> For MULAP users, the option <b>&lt;first name&gt;, &lt;last name&gt;</b> is not recognized in UC Suite. If this option is used, then first and last name of UC Suite users appear together in the first name field in UC user directory, and the last name field remains empty. For this case, use the default value of the option, where comma is used as a separator.</p> <hr/> |
| <b>Transfer before answer</b>     | <p>If a call is transferred before it has been answered, either the number of the party transferring the call or the number of the party placing the call can be displayed at the receiving station. A call which was switched by "Transfer before answer" cannot be rejected by the called party. If Transferred by is selected, the display will show the transferring party before the connection is established and after the call is released. If Transferred to is selected, the display will show the transferring party as long as the transferring party is connected to the receiving station. After the transferring party releases the call and there is a connection, the display will change from the transferring party to the transferred party.</p> <p>Default value: Transferred to</p>                                                                                                                                                                                                                                                                                          |

| Parameters                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Automatic recall</b>        | <p>If a call is transferred and then recalled, either the number of the party transferring the call or the number of the party recalling the call can be displayed at the receiving station. An internal B station displays the call transfer. C receives a ring tone until either B answers or A recalls. This item can be used to configure what is to be shown on the display of transfer destination B: either station A (caller) or C (transferred destination). If an automatic recall is started from station A, both stations receive the display no reply.</p> <p>Default value: Transferred destination</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Date/Time format</b>        | <p>The date can be displayed in various formats.</p> <p>Default value: Europe - 24 hour format</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Caller list, mode</b>       | <p>If Internal and external calls or Only external calls is activated, all calls that were not accepted are saved in a list whose contents can then later be retrieved using a system procedure. If All external calls whether answered or not is activated, then calls that have been accepted are also saved in the caller list. No call numbers are removed from the caller list, either for incoming or outgoing calls. If all of the memory locations in the caller list have already been used, the oldest entry is overwritten when an additional call number is saved. Calls that have not been accepted are displayed in the manner already described in the Missed Calls List feature. Calls that have been accepted are displayed in the same manner as for the "Save call number" functionality of the caller list. If an external incoming call is routed via the AutoAttendant to an internal station and the station is currently busy or has call forwarding activated, no entry is made to the missed calls list.</p> <p>Default value: External calls only</p> |
| <b>Call number suppression</b> | <p>When this flag is activated, the calling number is not displayed in ISDN, i.e., the called party does not see the calling number (this feature also needs to be activated at the telephone company). There are call scenarios in which a caller may have been set to "presentation restricted" by the Central Office. If this flag is enabled, the caller's number is displayed to the called party. If this flag is disabled, the text "Number unknown" appears. The flag always depends on the CO settings of each provider.</p> <p>Default value: disabled</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Parameters                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Internal Phonebook</b>                       | <p>Users can access a system-wide online directory (phone book) that includes names and call numbers for all internal extensions. System-specific display terminals allow users to scroll through the directory, to display all available internal stations with their names and call numbers, and then dial any of the stored numbers. Terminal devices with alphanumeric keypads can use this to search for a specific number. Select the appropriate option from the list: no: No access to the directory is possible; internal: Access to the internal directory (stations, groups and speed-dial destinations) is possible; LDAP: Access to the directory information of the LDAP server. LDAP access must be configured via LDAP for this purpose; all: Users can choose between accessing the internal directory or the LDAP directory.</p> <p>Default value: Internal</p> |
| <b>Internal Phonebook via Unified Directory</b> | <p>When this flag is activated, the user can search contacts in all directories. The search/lookup requests are handled as requests to the Unified directory. When the flag is not activated, the search/lookup requests are handled locally from the system.</p> <p>Default value: Enabled</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Switches</b>                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Call timer display</b>                       | <p>No call charge information is displayed for outgoing external calls. For UP0/E devices with a display, the current call duration is displayed. For analog lines, time recording is started by a timer (five seconds after the end-of-dialing) and for digital trunks with CONNECT. The communication system does not support call duration display for S0 devices.</p> <p>Default value: disabled</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Display for info message</b>                 | <p>Info messages are shown on the display of system telephones.</p> <p>Default value: enabled</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Outreach call number transparent</b>         | <p>If a call is forwarded to an external station, the number of the calling station is displayed at the called station. In a networked system, the option must be set in the node at which a trunk connection is activated. This feature is contingent on the explicit release of the chargeable function Clip No Screening in the CO. This flag works as a toggle with the flag Suppress station number under Routes.</p> <p>Default value: disabled</p>                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Parameters                                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>SST with transfer option (transfer caller's number)</b> | <p>With the flag activated, when the user selects the "Start Transfer?" menu option (while on an active call) the transfer will be executed as Single Step Transfer (no consultation call). If the user selects to make first a consultation call (e.g. "Enquiry?" option) and then transfer the new call to the held party, then the transfer will be executed as normal blind transfer (or transfer after answer). In case of Single Step Transfer the calling number is displayed at the external destination when the mobile device rings, i.e. the called party sees the calling number and not the number of the transferring party when the call is transferred by a system device. The flag "Outreach call number transparent" must be also activated.</p> <p>Default value: disabled</p> <hr/> <p><b>NOTICE:</b> If the transferred party is an external device, then the function CLIP no screening must be supported by the Network Provider and activated. Otherwise, the default DID of the system will be used from CO, or the call will be rejected from CO.</p> <hr/> |

|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>DISA</b>                  |                                                                                                                                                                                                                                                                                                                                                              |
| <b>Direct inward dialing</b> | Phone number under which the DISA function can be reached from external locations. The call number may be different for external and internal use.                                                                                                                                                                                                           |
| <b>Security mode</b>         | <p>In order to be able to use the DISA functions, the user must enter a password. With the Security mode options, one can establish whether the user must wait after entering the password or whether he/she must enter the pound symbol (#).</p> <p>Default value: After Timeout</p>                                                                        |
| <b>DISA internal</b>         |                                                                                                                                                                                                                                                                                                                                                              |
| <b>Phone number</b>          | DISA internal refers to usage at some other IP-networked node.                                                                                                                                                                                                                                                                                               |
| <b>Mobility Callback</b>     |                                                                                                                                                                                                                                                                                                                                                              |
| <b>Direct inward dialing</b> | The authentication via password is not required if a call recognized as a mobility number is made externally to a Mobility Callback DID number. In this case, the internal dial tone is switched on directly. This requires the device of the external subscriber to transmit its phone number. This phone number is then checked against the Mobility list. |

|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Intercept Position</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Day/night</b>                       | Call number of intercept position. The intercept position can be defined separately for Day and Night. In addition, it is also possible to enter any destination when activating the night service (variable night service).                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Central intercept position</b>      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Route</b>                           | Route index for the central intercept position in networked communication systems                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Call number</b>                     | Call number of the central intercept position in networked communication systems                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Intercept to intercept position</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>On RNA</b>                          | <p>The call follows the defined procedure for incoming calls. If the end of the table is reached and does not answer, the system checks to see whether or not intercept after timeout applies. In this case, the intercept position is called after the number of rings specified under Call Forwarding. Intercepts cannot extend beyond a hunt group. The call is forwarded to the first hunt group station and remains permanently in the hunt group.</p> <p>Default value: enabled</p>                                                                                                                                                  |
| <b>on Busy</b>                         | <p>If a line is busy, the system first checks to see whether or not a waiting call can be signaled. If it is not possible to signal a waiting call (call waiting rejection or intercept criterion), then the call follows the Call Management/Call Routing procedure. If the call cannot be signaled at any station, the system checks to see whether intercept or clear-down applies (B signal to CO). If an analog telephone with call waiting rejection is busy, the call is cleared down, regardless of trunk type. In the case of DTMF direct inward dial and MSI, the call is always intercepted.</p> <p>Default value: disabled</p> |
| <b>On Invalid</b>                      | <p>When a wrong number is dialed, the system checks to see whether intercept applies. In the case of DTMF direct dial, the call is always intercepted.</p> <p>Default value: enabled</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>On Incomplete</b>                   | <p>If the dialed station number is incomplete, the intercept position is called after the preset time has elapsed. The time can be set under the Time Parameters in the "End-of-selection for incomplete dialing" field.</p> <p>Default value: enabled</p>                                                                                                                                                                                                                                                                                                                                                                                 |

| Parameters                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>On unanswered recall</b>        | <p>If an external call is not picked up by the B subscriber after the A subscriber implements Transfer before answering to the B subscriber, and the call is still not picked up after a recall to the A subscriber is implemented, the intercept position is called after a defined period. The time can be set under the Time Parameters in the "End-of-selection for incomplete dialing" field. If this flag is not activated, the call is cleared down after the defined period.</p> <p>Default value: disabled</p> |
| <b>On rejection</b>                | <p>If an internal subscriber rejects a call with "Reject incoming call", the call follows the call management / call routing. If the call cannot be signaled at any station, the system checks to see whether intercept or clear-down applies (B signal to CO).</p> <p>Default value: enabled</p>                                                                                                                                                                                                                       |
| <b>Telephone lock intercept</b>    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Call number</b>                 | <p>If the telephone lock for a station is active and a trunk group code is dialed from that station, the call is immediately forwarded to the intercept destination entered here. This means that if a user dials a number that is not authorized, the call will be signaled on the station number assigned here. The Codelock intercept function is set individually for each station via station flags.</p>                                                                                                           |
| <b>Attendant code</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Internal call number</b>        | <p>This is the call number used by internal devices to reach the Intercept position.</p> <p>Value range: Free input of any digit, provided it is not already used in the dial plan.</p>                                                                                                                                                                                                                                                                                                                                 |
| <b>Call Number External</b>        | <p>This is the call number used by DID calls or calls from the network (CorNet-N or CorNet-NQ) to reach the Intercept position.</p>                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Hotline</b>                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Off-hook alarm time</b>         | <p>If a subscriber lifts the receiver, the hotline is automatically called once the off-hook alarm time has expired. However, this only happens if the subscriber does not enter any digits during this time. The off-hook alarm time is specified in seconds.</p>                                                                                                                                                                                                                                                      |
| <b>Destination call number 1-6</b> | <p>Six hotline destinations can be entered system-wide; the selection occurs per station (see Stations / Edit station parameters)</p>                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Attendant Console</b>           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Queued calls</b>                | <p>In the Queued Calls field, you define the maximum number of calls that can wait in the Attendant queue. If the number of stations waiting in the queue of the attendant reaches this numerical value, the calls are forwarded to a configurable overflow destination.</p> <p>Value range: 1-15</p>                                                                                                                                                                                                                   |
| <b>Wait time</b>                   | <p>Here you enter the number of seconds that a call can wait in the queue. After this time has expired, the call is are routed according to the call forwarding defined via the Call Management.</p>                                                                                                                                                                                                                                                                                                                    |

| Parameters                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Speed extending</b>                         | <p>If this flag is set, the attendant can transfer the call to another party by entering the station number for that party. This speed call transfer can only be used when the system-wide flag <b>DTMF automatic</b> has been disabled.</p> <p>Default value: disabled</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Extend Undialed Lines</b>                   | <p>An authorized subscriber (attendant console AC) can transfer an undialed trunk to an internal subscriber who does not have sufficient direct trunk access so that this subscriber can conduct exactly one external call. After the trunk is transferred to the subscriber without sufficient direct trunk access, toll restriction takes place based on an additional direct trunk access for transferred trunks. The outgoing external call is allowed only if this additional direct trunk access is sufficient, for example, if the subscriber dials a valid number according to the denied or allowed list for transferred trunks. The subscriber must dial the seizure code on a transferred trunk. A CO call privilege can be configured in the communication system for each trunk group via a reference subscriber. The default reference subscriber is the first logical subscriber port or the attendant console. The default setting is set to unrestricted trunk access for all trunk groups.</p> <p>Default value: disabled</p> |
| <b>Other criteria</b>                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Call waiting on Busy</b>                    | <p>If this flag is activated, the "Call Waiting" feature is enabled for all stations in the communication system.</p> <p>Default value: enabled</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Immediately camp on for attendant calls</b> | <p>Only relevant in CorNet networked systems. If the flag is set, call waiting is only allowed when an attendant console (system A) calls station B (system B). All other stations of system A cannot reach system B via call waiting. For the stations in System B, the condition for call waiting rejection (see Station view: Flags) applies to the respective stations. If the flag is not set, all calls to busy stations in another system are switched through via call waiting, provided the station has not turned on the call waiting rejection option. This flag must be set if you want to place the calling intercept on hold immediately and enable call waiting when a station is busy. If this flag is not set, the intercept receives the busy signal and is only placed on hold after a few seconds.</p> <p>Default value: disabled</p>                                                                                                                                                                                       |
| <b>Override by AC</b>                          | <p>If this flag is enabled, the intercept position is authorized for the "Override" feature. This enables the Attendant to override (i.e., intrude into) a call of an internal subscriber.</p> <p>Default value: enabled</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Parameters                              | Description                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>LDAP access</b>                      |                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>IP address of the LDAP server</b>    | IP address of the LDAP server from which the directory information is to be retrieved.                                                                                                                                                                                                                                                                                            |
| <b>Port number for LDAP access</b>      | Port number for LDAP access.<br>Default value: 389                                                                                                                                                                                                                                                                                                                                |
| <b>User name/password</b>               | Under Windows Server ADS, anonymous access is not supported. In this case, enter your user name and password for the LDAP connection here.<br>Value range: max. 48 characters                                                                                                                                                                                                     |
| <b>LDAP server parameters</b>           |                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Basic DN</b>                         | DN = Distinguished Name, search base for the search query to the LDAP server (ASCII, 100 characters), e.g., ou=com, cn=unify, cn=de                                                                                                                                                                                                                                               |
| <b>Search query</b>                     | Pattern for the search query to the LDAP server. The \$ character must be entered as a placeholder for the names to be found.<br>Note that a search pattern cannot start with a regular expression.<br>Value range: ASCII, 50 characters<br>Default value: cn=\$*                                                                                                                 |
| <b>Result attribute, Name</b>           | The result attribute name supports characters from the ISO-8859-1 character set with code values in the range from 0x20 to 0x80 (ASCII characters), as well as the characters Æ, Æ, Ñ, Ñ, Ö, Ö, Ø, Ü, ß, ä, ö, ö, ü. The display of characters depends on the language setting of the station and the phone being used.<br>Value range: ASCII, 24 characters<br>Default value: cn |
| <b>Result attribute, Station number</b> | Up to 25 dialed digits (0...9, *, #) and 6 characters for formatting (+,(), spaces, -) may be returned in the result attribute Station Number. The station number must be in the canonical call number format (e.g., +49 (89) 70070)<br>Value range: ASCII, 25 characters<br>Default value: telephoneNumber                                                                       |
| <b>Sort search results</b>              | The search results are sorted alphabetically by name.<br>Default value: enabled                                                                                                                                                                                                                                                                                                   |
| <b>LDAP Call Number Evaluation</b>      |                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>LDAP seizure code</b>                | The seizure code matches the dialed routing code.<br>Default value: 0 (default routing code of the first route)                                                                                                                                                                                                                                                                   |

| Parameters                        | Description                                                                                           |
|-----------------------------------|-------------------------------------------------------------------------------------------------------|
| <b>LDAP station number prefix</b> | The prefix specified here is placed before the found call number.<br>Value range: ASCII, 5 characters |

---

**NOTICE:** For the LDAP resources to be displayed you have to select the appropriate option under **Basic Settings > Display > Internal Phonebook** in the **Display** menu. For more information see chapter [28.3.1.3 Basic Settings > System > Display](#).

### 28.3.1.7 Basic Settings > System > Texts

Parameter Description of Tabs::

- **Edit System Texts**

| Parameters                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Reset to default values</b> | Resets the messages and answer texts to the predefined values for a given language. A reset occurs by selecting a language from the drop-down list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Info texts</b>              | Information texts are short messages that one station can send to another. The communication system supplies ten standard Info texts. Each of these standard texts can be overwritten. There are only ten possible messages available at any time. Users access this information texts via the Send Message? menu item on their system telephones. Stations with which have an alphanumeric keypad also have the option of creating their own messages; however, they can not change these default messages.<br><br>Value range: max. 24 alphanumeric characters                                                                                                               |
| <b>Answer texts</b>            | Short messages that are sent to callers when users are absent. Ten standard texts are available. Each of these standard texts can be overwritten. Stations with which have an alphanumeric keypad also have the option of creating their own messages; however, they can not change these default messages. For many situations, users will only need to add individual information to the existing messages. Texts with a colon give the station the opportunity to complete the message by adding a number or a date. Users access these answer texts via the Advisory Message On? menu item on their system telephones.<br><br>Value range: max. 24 alphanumeric characters |

### 28.3.1.8 Basic Settings > System > Flexible Menus

Flexible menus allow you to customize the menu items shown in the service menu of system telephones. If the check box is selected in the **Masking list**, the menu item is not displayed. This setting applies

system-wide to all system telephones. Hidden functions can still be activated with a code.

### 28.3.1.9 Basic Settings > System > Speed Dials

Up to 8000 directory entries can be manually created or modified. The speed dial destinations are central system speed dial numbers (SPDC). The entries in a column can be sorted by clicking on the corresponding column name.

Parameter Description of Tabs:

- **Change Speed Dial**

| Parameters          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Speed dial</b>   | Number that is selected by the subscriber. Speed dial numbers must have four digits (0000–7999; use leading zeros).                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Phone number</b> | Dialable call number of the desired destination, i.e., a seizure code or trunk code (e.g., 0, 9, 81 or 801).<br>Value range: max. 31 digits                                                                                                                                                                                                                                                                                                                                                           |
| <b>Name</b>         | Name for the speed dial destination, as stored in the internal directory and displayed when dialing the corresponding speed dial destination. Incoming calls (with CLIP) are compared to the stored speed-dialing destinations and displayed as the name of the speed-dialing destination, as long as the display parameter name or the name and calling ID is activated.<br>Value range: max. 16 characters                                                                                          |
| <b>Search</b>       | Entering a search term in the <b>Speed dial</b> , <b>Call number</b> or <b>Name</b> search fields and then pressing the return key causes all hits containing the specified search term to be displayed. For example, entering the call number 521 would display the matches +495213535 and +498967521, and entering the term co as the name would display Collins, Mcoin and Branco.<br>Pressing the return key with nothing entered in any of the search fields causes all entries to be displayed. |
| <b>Buttons</b>      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Apply</b>        | Add new entries or edit existing entries.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Undo</b>         | Undo changes to existing entries (before Apply).                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

Parameter Description of Tabs:

- **Import/Export CSV/XML file via HTTP**

| Parameters                          | Description                                                                                                                                                                                                                                                          |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Import CSV/XML file via HTTP</b> | Speed dial destinations can be imported via an XML file in UTF-8 format. Existing speed dial numbers are deleted before the import.<br>An XML template for importing speed-dial numbers can be found under <b>Service Center &gt; Documents &gt; CSV Templates</b> . |

| Parameters                      | Description                                                                                                                                                                                                                                                                   |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Export XML file via HTTP</b> | <p>Speed dial destinations can be exported as an XML file in UTF-8 format. The export always includes all the records.</p> <hr/> <p><b>NOTICE:</b> Import of speed-dial lists from CSV files is not recommended any more and it's only supported for old customers.</p> <hr/> |

### 28.3.1.10 Basic Settings > System > Service Codes

Features can be enabled or disabled via the phone by using service codes. Service codes are not supported in a Circuit call. The standard service codes can be changed, provided the assignment of the codes is consistent.

In addition the two codes used on Dial Pulse telephones and ISDN devices to replace the \* (star, default: 75) and the # (pound, default: 76) keys can also be changed (substitutions).

### 28.3.1.11 Basic Settings > System > HFA Registration Password

Parameter Description of Tabs:

- **HFA Registration Password**

| Parameters | Description                                                                                                                                                                                                                           |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | <p>The following prerequisites must be satisfied for this parameter to be effective: the system telephones must use the DLI of the system, and the DLI must be able to supply the system telephones with the required parameters.</p> |
|            | <p><b>Change HFA Registration Password</b></p> <p>The HFA registration password can be changed by the administrator</p>                                                                                                               |

| Parameters                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Parameters           | Description                                                                                                                      |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <b>General</b>       |                                                                                                                                  |
| <b>Customer name</b> | <p>Freely definable name for the customer; only for informational purposes (optional)</p> <p>Value range: max. 15 characters</p> |

| Parameters                  | Description                                                                                                                                                                                                                                                           |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Contract number</b>      | Freely definable string for informational purposes only (optional)<br>Value range: unlimited                                                                                                                                                                          |
| <b>System name</b>          | Freely definable name for the communication system. This string appears on the display of all system telephones.<br>Value range: max. 24 characters                                                                                                                   |
| <b>Gateway Location</b>     | Freely definable string to specify the physical location of the communication system. This information helps a service technician to find the communication system when physical access to the communication system is required. (optional)<br>Value range: unlimited |
| <b>Contact Address</b>      | Freely definable string to specify the person to be contacted if problems arise with the communication system. (optional)<br>Value range: unlimited                                                                                                                   |
| <b>System Country Code</b>  | Selection of the country in which the communication system is operated; changing the system country code requires a reboot, which is carried out automatically.                                                                                                       |
| <b>Gateway IP address</b>   | Displays the IP address of the communication system, e.g., 192.168.1.2.                                                                                                                                                                                               |
| <b>Gateway Subnet Mask</b>  | Displays the subnet mask of the communication system, e.g., 255.255.255.0.                                                                                                                                                                                            |
| <b>International Prefix</b> | Entry of the prefix for international calls, e.g., 00 in Germany or 011 in the U.S.                                                                                                                                                                                   |
| <b>National Prefix</b>      | Entry of the prefix for national calls, e.g., 0.                                                                                                                                                                                                                      |
| <b>Brand</b>                | Selection of the purchased product (OpenScape Business or Octopus or FX)                                                                                                                                                                                              |
| <b>Gateway Location</b>     |                                                                                                                                                                                                                                                                       |
| <b>Country code</b>         | Enter the country code prefix, e.g., 49 for Germany or 1 for the U.S.                                                                                                                                                                                                 |
| <b>Local area code</b>      | Enter the local area code (e.g., 89 for Munich)                                                                                                                                                                                                                       |
| <b>PABX number</b>          | Specifies the PABX number (central number without station DID), e.g., 7007                                                                                                                                                                                            |
| <b>Network Parameters</b>   |                                                                                                                                                                                                                                                                       |
| <b>Node ID</b>              | Each node in a networked system must be assigned a unique node ID. This enables the individual nodes in a networked system to be uniquely identified.<br>Value range: 1 to 100                                                                                        |
| <b>Internal dial tone</b>   |                                                                                                                                                                                                                                                                       |

| Parameters             | Description                                                                                                                                                                                                                 |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Continuous tone</b> | If this flag is set, the internal dial tone is not a tone sequence, but a continuous tone. The internal dial tone is heard immediately on picking up the handset and before any digit has been dialed.<br>Default: disabled |

### 28.3.1.13 Basic Settings > DynDNS > DynDNS Service

Parameter Description of Tabs::

- **Display DynDNS Configuration**
- **Edit DynDNS Configuration**

| Parameters                 | Description                                                                                                                                                                                                                        |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Activate DynDNS</b>     | The DynDNS service can be used to access the gateway from different locations without knowing the current IP address of the gateway. The DynDNS service can be enabled here.                                                       |
| <b>User-defined Domain</b> | Select this check box if you cannot find the DynDNS provider in the <b>Domain name</b> list.                                                                                                                                       |
| <b>User name</b>           | User name of the DynDNS account at a DynDNS provider. A new DynDNS account can be created at the Internet address <a href="http://www.dyndns.org/account/create.html">http://www.dyndns.org/account/create.html</a> , for example. |
| <b>Password</b>            | Password of the DynDNS account at a DynDNS provider. For security reasons, only wildcards are displayed when typing the password in this field.                                                                                    |
| <b>Retype Password</b>     | Repeat password of the user account with the DynDNS Service. For security reasons, only wildcards are displayed when typing the password in this field.                                                                            |
| <b>Hostname</b>            | Entry of the host name registered with the DynDNS provider without the domain name, e.g., myhost. The complete subdomain name is composed of the host name and the domain name, e.g., myhost.dyndns.org.                           |
| <b>Domain name</b>         | Selection of the DynDNS provider from a list (e.g., dyndns.org) or through manual entry of the DynDNS provider (if <b>User defined Domain</b> has been enabled).                                                                   |

| Parameters                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Update URL</b>             | <p>Here you can enter the update URL of a provider which does not appear on the list of DynDNS providers. The syntax of this URL depends on the DynDNS provider. In addition, customer-specific parameters (shown in <i>italics</i> in the example) must be supplemented.</p> <p>Example of an update URL:</p> <pre>http://www.anydns.info/update.php? user=&lt;username&gt;&amp;password=&lt;pass&gt;&amp;host=&lt;domain&gt;&amp;ip=&lt;ipaddr&gt;</pre> <p>Example of an update URL with base64-encoded authentication:</p> <pre>https://&lt;b64&gt;&lt;username&gt;:&lt;pass&gt;&lt;/b64&gt;@members.dyndns.org/nic/update? hostname=&lt;domain&gt;&amp;myip=&lt;ipaddr&gt;&amp;wildcard=NOCHG&amp;mx=NOCHG&amp; backmx=NOCHG</pre> <p>&lt;b64&gt;...&lt;/b64&gt; for Base64-encoded parameters</p> |
| <b>Last Update</b>            | Time when the DynDNS service was updated last.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>IP Address at DynDNS</b>   | IP address at the DynDNS provider to which requests for your configured DynDNS subdomain are routed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Own dynamic IP Address</b> | Displays the current IP address of the communication system, which was assigned by the Internet Service Provider.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Enable Wildcard</b>        | If you enable this option, any queries to subdomains such as any.myhost.dyndns.org will be routed to myhost.dyndns.org.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Mail Exchanger</b>         | The Mail Exchanger (MX record) indicates in the Domain Name Service to which IP address or to which domain name E-mails for the configured DynDNS subdomain are to be sent. The specified destination address must be the address of a mail server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Backup MX</b>              | If you enable this option, E-mails which are not delivered to the specified Mail Exchanger because it is temporarily not available, will be buffered by the DynDNS service and will finally be delivered once your Mail Exchanger is available again.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Use HTTPS for Update</b>   | If this option is enabled, the secure encrypted HTTPS connection is selected for updating.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

### 28.3.1.14 Basic Settings > DynDNS > Update Timer DNS Names

Parameter Description of Tabs::

- **Edit Update Timer**

| Parameters                                    | Description                                                                                                                                                                                                                                                                                                                             |
|-----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Update DNS Names</b>                       | This option applies only to VPN. After the time interval set under "Update Timer value for DNS Names" expires, the VPN component checks whether any DNS names in the VPN configuration are resolved into new IP addresses (VPN with dynamic IP addresses). If this is the case, the VPN will be reconfigured with the new IP addresses. |
| <b>Update Timer value for DNS names (sec)</b> | Number of seconds for the interval between two updates.<br>Value range: 60 to 1800, default value: 180                                                                                                                                                                                                                                  |

### 28.3.1.15 Basic Settings > Quality of Service

In the case of IP data traffic, the IP packets generated by the communication system are split into five groups. You can set which codepoint is to be used for marking the packets for four of these groups. The remaining data traffic is not prioritized (that is 00).

| Priority class                   | ToS value, binary | ToS value, hexadecimal |
|----------------------------------|-------------------|------------------------|
| <b>AF (Assured Forwarding)</b>   |                   |                        |
| AF11                             | 001-010-00        | 28                     |
| AF12                             | 001-100-00        | 30                     |
| AF13                             | 001-110-00        | 38                     |
| AF21                             | 010-010-00        | 48                     |
| AF22                             | 010-100-00        | 50                     |
| AF23                             | 010-110-00        | 58                     |
| AF31                             | 011-010-00        | 68                     |
| AF32                             | 011-100-00        | 70                     |
| AF33                             | 011-110-00        | 78                     |
| AF41                             | 100-010-00        | 88                     |
| AF42                             | 100-100-00        | 90                     |
| AF43                             | 100-110-00        | 98                     |
| <b>EF (Expedited Forwarding)</b> |                   |                        |
| EF                               | 101-110-00        | B8                     |
| <b>Best Effort (BE)</b>          |                   |                        |
| BE                               | 000-000-00        | 00                     |
| <b>CS (Class Selector)</b>       |                   |                        |
| CS3                              | 011-000-00        | 60                     |
| CS4                              | 100-000-00        | 80                     |
| CS5                              | 101-000-00        | A0                     |

| Priority class      | ToS value, binary | ToS value, hexadecimal |
|---------------------|-------------------|------------------------|
| CS6                 | 110-000-00        | C0                     |

Parameter Description of Tabs:

- **Edit Settings**

| Parameters                                                                                                    | Description                                                                                            |
|---------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|
| <b>SNTP Client</b>                                                                                            |                                                                                                        |
| Input of access data for an external time server (SNTP) for network-wide synchronization of the system clock. |                                                                                                        |
| <b>Administration Mode of the SNTP Client</b>                                                                 | Enable or disable connection of the communication system to the SNTP server<br>Default value: down     |
| <b>IP address/DNS name of External Time Server</b>                                                            | IP address or DNS name of the SNTP server<br>Default value: 0.de.pool.ntp.org                          |
| <b>Poll Interval for External Time Server</b>                                                                 | Interval for the synchronization of the date and time with the SNTP server.<br>Default value: 4 hours. |

### 28.3.1.19 Basic Settings > Port Management

The displayed ports are used to identify the network protocols and appropriate network services. Some of the ports used by the communication system itself can be changed here. This enables the network communication to be customized for each customer network if the ports are already being used elsewhere. If changes are to be made at the port administration, these changes must generally be made in all components (phones, systems, etc.) simultaneously in order to retain functionality.

Parameter Description of Tabs::

- **Edit Global Port Management Settings**

| Parameters           | Description                                                                                                    |
|----------------------|----------------------------------------------------------------------------------------------------------------|
| <b>Protocol Name</b> | Service.                                                                                                       |
| <b>Port Number</b>   | Port number of the service (configurable).                                                                     |
| <b>Port type</b>     | The port type is displayed for information purposes; Single: a single port; Min: lower limit for a port range. |
| <b>Services</b>      |                                                                                                                |
| <b>CSP</b>           | CSTA Service Provider, IP port for all applications that want to connect to the CSP.<br>Default value: 8800    |
| <b>HFA</b>           | Control of HFA clients (CorNet-TC server port).<br>Default value: 4060                                         |

| Parameters             | Description                                                                                     |
|------------------------|-------------------------------------------------------------------------------------------------|
| <b>HFA_EXT</b>         | Control of HFA clients (CorNet-TC server port) for System Device@Home.<br>Default value: 4062   |
| <b>HFA_TLS</b>         | CorNet-TC via TLS.<br>Default value: 4061                                                       |
| <b>HFA_TLS_EXT</b>     | CorNet-TC via TLS for System Device@Home.<br>Default value: 4063                                |
| <b>MEB_SIP</b>         | MediaExtensionBridge, call signaling for SIPQ trunking.<br>Default value: 15060                 |
| <b>RTP_MIN</b>         | RTP/RTCP and T.38 ports (MediaBasePort).<br>Default value: 29100                                |
| <b>SIP</b>             | Call signaling for SIP telephones and SIP-based trunking.<br>Default value: 5060                |
| <b>SIP_EXT</b>         | Call signaling for SIP telephones and ITSP trunking for SIP Device@Home.<br>Default value: 5070 |
| <b>SIPS</b>            | Secure call signaling for SIPQ trunking.<br>Default value: 5061                                 |
| <b>SIP_TLS_SUB</b>     | Secure call signaling for SIP stations.<br>Default value: 5062                                  |
| <b>SIP_TLS_SUB_EXT</b> | Secure call signaling for SIP stations for SIP Device@Home.<br>Default value: 5071              |
| <b>VSL_MULTISITE</b>   | Multi-site connections.<br>Default value: 8778                                                  |

| <b>Call Duration</b>                                          | Logging of call duration in hours, minutes, and seconds.<br>Default value: enabled                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>On Ringing</b>                                             | For incoming calls, a call record is created immediately after the start of the call so that additional information on the caller can be transmitted for a caller list, for example or via a PC-based evaluation of the record.<br>Default value: disabled                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Output MSN</b>                                             | Logging of the used MSN (only IDSN)<br>Default value: disabled                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Decimal format</b>                                         | (Not in the USA) Format of the Advice of Charges; to be configured individually for each country. In Germany, the decimal format is always used. This decimal format also means that the multiplier is shown in hundredths. The multiplier specifies the amount by which the call charge unit is multiplied in order to obtain the currency value (e.g., 0.06 euro instead of 6 cents).<br>Default value: enabled                                                                                                                                                                                                                               |
| <b>Display amounts instead of units</b>                       | Currency amounts are output instead of call charge units (e.g., 4.50 EUR instead of 75 units).<br>Default value: enabled                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Outgoing without connection</b>                            | Logging of outgoing calls that were not answered.<br>Default value: disabled                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Outgoing LCR number outgoing or dialed number incoming</b> | If this flag is activated, an additional phone number field is added to the call data record. It contains: <ul style="list-style-type: none"> <li>• for an outgoing call: the LCR phone number that was actually sent to the exchange following conversion by LCR or</li> <li>• for an incoming call: the internal phone number of the station required, that is, the first station dialed.</li> </ul> A call record is then output, even if a call is made for a busy station. This call record has the same format as the data record created for a free station except that the ring/call duration is set to "0".<br>Default value: disabled |
| <b>Call Detail Recording Central (CDRC)</b>                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Output : none</b>                                          | No transmission of connection data<br>Default value: HTTP                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Parameters                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Output: HTTPS</b>           | Transmission of connection data to the supplied Call Charge Manager (Accounting Manager) or some other accounting software<br>Default value: HTTP                                                                                                                                                                                                                                                                                            |
| <b>Output : LAN TCP Client</b> | Transmission of connection data to external server via TCP/IP<br>Default value: HTTP                                                                                                                                                                                                                                                                                                                                                         |
| <b>TCP client</b>              | Set IP address and port number of an external call charge server. If call charges have been incurred, a TCP/IP connection to the external call charge server (external application) is initiated by the communication system. When the connection has been set up, the call charge data is transmitted. The connection remains permanently open, and any other charges that occur are transmitted. transmitting each data record separately. |

### 28.3.1.21 Basic Settings > Call Charges > Call Charges - Factors

Parameter Description of Tabs::

- **Edit Factors**

| Parameters                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Call charge factor per direction</b> | The call charge information can be offered in the form of call charge units (pulse counts) or currency units (cash amounts). Both forms are supported, but only currency units are displayed. If the information is received in the form of call charge units, a conversion factor is used. These call charge factors are set fees per direction and apply to both trunk calls (outside calls) as well as incoming and outgoing calls in the internetwork. |
| <b>Routes</b>                           | Displays the existing routes in the system                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Multiplier</b>                       | This multiplier is used for the conversion of tariff units to currency amounts.<br>Value range: 0 to 65534, default value: 6                                                                                                                                                                                                                                                                                                                               |
| <b>Multi-ISDN</b>                       | Factor for converting currency amounts received or of Originals-based unit, and vice versa. Only for routes with the QSIG protocol.<br>Value range: 1 to 65535, default value: 6                                                                                                                                                                                                                                                                           |
| <b>Currency</b>                         | Abbreviation of the currency, e.g., EUR. This must be adjusted in line with the connected communication system. Currency string configuration is independent of the currency string shown on the telephone display. Note: This parameter is only significant for routes that use the QSIG protocol. This parameter is not applied for other protocols. The preset default setting must be retained in such cases.<br>Value range: max. 3 characters        |

| Parameters                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>charges</b>                         | You can use the charges column to define whether currency charges or call charge units are exchanged on the trunk. If this option is activated, the currency amount is sent and received (see the column Multi-ISDN). Otherwise, call charge units are sent and received. This must be adjusted in line with the connected communication system. If call charge pulses are to be exchanged on the route, an empty string should be configured as the currency. Note: This parameter is only significant for routes that use the QSIG protocol. This parameter is not applied for other protocols. The preset default setting must be retained in such cases. |
| <b>Advice of charge: No charges</b>    | No charges are received via the route (e.g., US CO trunks). The parameter is not relevant for routes with the QSIG protocol.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Advice of charge: Interim</b>       | Charges are only received while the connection is active, and not during cleardown.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Advice of charge: Final</b>         | Charges are only received after the connection has been cleared down.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Advice of charge: Interim/Final</b> | Charges are received while a connection is active and during connection cleardown.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Currency</b>                        | Currency code for the call charge display on telephones.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Computing accuracy</b>              | The computing accuracy of the communication system should be set to at least match that of the currency amounts transmitted by the CO. If the maximum of three decimal places is insufficient, the system automatically rounds up the number to the next unit. "Via call charge pulse" must be selected for routes with the QSIG protocol.                                                                                                                                                                                                                                                                                                                   |

### 28.3.1.22 Basic Settings > Call Charges > Call Charges - Account Codes

Parameter Description of Tabs::

- **Change Account Codes**

| Parameters                                             | Description                                                                                                                  |
|--------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <b>Checking procedure</b>                              |                                                                                                                              |
| <b>Checking procedure: No check</b>                    | The entered account codes are not checked. This option is not possible if there are routes with a mandatory entry procedure. |
| <b>Checking procedure : List check</b>                 | The entered account codes are checked for validity based on account code lists.                                              |
| <b>Checking procedure : Check number of characters</b> | The entered account codes are checked for the number of characters.                                                          |
| <b>Characters to be checked</b>                        | Valid number of characters for the account code.<br>Value range: 1 to 11, default value: 5                                   |

| Parameters                | Description                                                        |
|---------------------------|--------------------------------------------------------------------|
| <b>Account code lists</b> |                                                                    |
| <b>List</b>               | A maximum of 1000 account codes can be entered for the list check. |
| <b>Account code</b>       | Value range: max. 11 digits                                        |

### 28.3.1.23 Basic Settings > Announcement Player for Voicemails/Announcements

Parameter Description of Tabs:

- **Change announcement player for voicemails/announcements**

| Parameters                 | Description                             |
|----------------------------|-----------------------------------------|
| <b>Voicemail</b>           |                                         |
| <b>Prefix</b>              | Call number for the voicemail box.      |
| <b>Announcement Player</b> |                                         |
| <b>Call number</b>         | Call number of the announcement player. |

### 28.3.1.24 Basic Settings > Phone Parameter Deployment

Parameter Description of Tabs:

- **Edit Phone Parameter Deployment**

| Parameters                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Description                                                                                      |

Parameter Description of Tabs:

- **Device Info**

Following information for any device are mentioned here:

Call number, Display, Device Type, IP Address, MAC Address, Current SW Version, HW Version, PC Port, Codec Setting.

Parameter Description of Tabs:

- **Change Admin Password**

The administrator can configure the password for accessing to a phone's WBM.

| Parameters                                                                                                                                                                                                                     | Description |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------|
| The following prerequisites must be satisfied for this parameter to be effective: the system telephones must use the DLI of the system, and the DLI must be able to supply the system telephones with the required parameters. |             |
| <b>Change Admin Password</b><br>The default password can be changed centrally for all DLI connected devices by the administrator.                                                                                              |             |

| Parameters              | Description                                                                                              |
|-------------------------|----------------------------------------------------------------------------------------------------------|
| <b>Password</b>         | The password must be entered in this field.<br>The length of the password must be at least 6 characters. |
| <b>Confirm Password</b> | The password must be repeated in this field for verification purposes.                                   |

Parameter Description of Tabs:

- **Canonical Dial Settings**

The administrator can distribute in bulk the canonical dial settings to all Desk Phone CP HFA devices which have DLI configured.

Please note that the Canonical Dial Settings values, configured in WBM, will always overwrite the local (phone) settings.

| Parameters                                       | Description                                                                                                                                                                              |
|--------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Canonical Dial Settings</b>                   |                                                                                                                                                                                          |
| <b>Local country code</b>                        | Required - Internal code for phone location. If not set then conversion will not take place. Maximum length 5 characters.                                                                |
| <b>National prefix digit</b>                     | Needed - trunk prefix digit for PSTN dialling within the local country. Maximum length 5 characters.                                                                                     |
| <b>Local National code</b>                       | Needed - PSTN area code for the phone's location. Maximum length 6 characters.                                                                                                           |
| <b>Minimal local number length</b>               | Needed - PSTN local area length of numbers. Maximum length 2 characters.                                                                                                                 |
| <b>Local Enterprise node</b>                     | Optional - Local enterprise network code prefix for a phone as an extension. Maximum length 10 characters.                                                                               |
| <b>PSTN access code</b>                          | Optional – list of digits to get PSTN access. Maximum length 10 characters.                                                                                                              |
| <b>International access code</b>                 | Needed - list of PSTN access codes for the international gateway. Maximum length 5 characters.                                                                                           |
| <b>Operator code</b>                             | Optional - list of extensions numbers for operators. Maximum length 50 characters.                                                                                                       |
| <b>Emergency numbers</b>                         | Optional - list of numbers that are used for emergency calls. Maximum length 50 characters.                                                                                              |
| <b>Initial extension digits / Initial digits</b> | Optional - List of initial digits for extension in the local enterprise network (defined by the local enterprise node). Maximum length 50 characters.                                    |
| <b>Expect dial number</b>                        | Optional – Boolean to indicate when a PSTN access code + National prefix digit is retained and not converted into the International access code. True/False with default value as false. |
| <b>Canonical Dial</b>                            |                                                                                                                                                                                          |
| <b>Internal numbers</b>                          | Drop-down list with the following options: Local enterprise form (default), Always add node, Use external numbers. Integer.                                                              |

| Parameters                        | Description                                                                                                                       |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <b>External numbers</b>           | Drop-down list with the following options: Local public form (default), National public form, International public form. Integer. |
| <b>External access code</b>       | Drop-down list with the following options: Not required (default), For external numbers. Integer.                                 |
| <b>International gateway code</b> | Drop-down list with the following options: Use national code (default), Leave as +. Integer.                                      |
| <b>Canonical dial lookup</b>      |                                                                                                                                   |
| <b>Local code 1-5</b>             | Optional - a local node code in the enterprise network. Maximum length 10 characters.                                             |
| <b>International code 1-5</b>     | Optional - the international code equivalent for the Local code. Maximum length 30 characters.                                    |

### 28.3.1.25 Basic Settings > Power Management

Parameter Description of Tabs:

- **Power management on/off**

| Parameters                                                                                                                                                                                                                                                                                                                                                   | Description                                |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------|
| <b>Power Management</b><br>Power management can be enabled only if is the LAN interfaces of the system are in the Ethernet Link Mode <b>Auto</b> . In the low power mode, the LAN interfaces of the system automatically switch to the 100 Mbit/s full-duplex mode. The LAN interfaces of the connected infrastructure should also be in the autosense mode. |                                            |
| <b>Power management on/off</b>                                                                                                                                                                                                                                                                                                                               | Switches the system to the low power mode. |
| <b>Beginning of the low power mode</b>                                                                                                                                                                                                                                                                                                                       | Start time of the low power mode           |
| <b>End of the low power mode</b>                                                                                                                                                                                                                                                                                                                             | End time of the low power mode.            |
| <b>The IP bandwidth is reduced to 100 Mbit/s FDX</b>                                                                                                                                                                                                                                                                                                         | Displays the data rate in low power mode   |

| <b>Validity</b>             | There are two types of validation, the Front End Consistency Check and the Back End Consistency Check: a. The <b>Front End Consistency Check</b> validates data presented in the fields of Mass data wizard window by checking for inconsistencies and conflicts. An instant red indication is displayed in the Validity field under the respective numbers. On mouse over a pop up window indicates which is the exact conflict. b. The <b>Back End Consistency Check</b> validates data presented in the Mass Data wizard comparing them to data that are not viewable but exist in the database of the system. These include Group, MULAP, Voicemail, National and International Access, VSL numbers, Seizure Codes and Line Codes (i.e. trunk access). |
| <b>Callno</b>               | Internal call number of the station.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>DID</b>                  | DID number of the station.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Dual Mode No.</b>        | Mobile call number of the station.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>UC Mobile No.</b>        | Personal mobile number of UC Smart or UC Suite user. The number is in canonical format, e.g.: +49 89 7007 100.<br><br>This number is displayed in the <b>My Personal Details</b> view of the user on the <b>User Directory</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Last Name</b>            | Freely selectable last name for the station.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Device Type</b>          | The device type assigned to the user. Not editable field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Type</b>                 | Type of the station.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Type: No Port</b>        | Call number is not yet assigned to any station.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Type: System Client</b>  | A system client is an IP station that can use all the features of the communication system via CorNet-IP (formerly called HFA system client).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Type: SIP Client</b>     | A SIP client is an IP station that uses the SIP protocol. It can access only limited functionality of the communication system via SIP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Type: Deskshare User</b> | A Deskshare User is an IP user who can log in at another IP system telephone (mobile login) and then use this phone as his or her own phone (including the call number).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Fax Callno</b>           | If a fax box has been set up (e.g., with the UC clients myPortal for Desktop or myPortal for Outlook), the fax number at which fax messages from internal locations can be received by the subscriber should be entered here.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Fax DID</b>              | If a fax box has been set up (e.g., with the UC clients myPortal for Desktop or myPortal for Outlook), the fax number at which fax messages from external locations can be received by the subscriber should be entered here.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Parameter       | Description                                                                                                                                                    |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Access</b>   | Displays the physical interface at which the device is connected.                                                                                              |
| <b>Clip/Lin</b> | Sequence of digits to be displayed at the called party instead of the actual number for outgoing external calls (e.g., for E911 emergency services in the USA) |
| <b>Status</b>   | Displays the status of the device. Active or inactive.                                                                                                         |

## 28.3.2 Security

Security settings are grouped together under **Security**. These include settings for firewalls, filters, VPN, and SSL.

### 28.3.2.1 Security > Application Firewall

Parameter Description of Tabs:

- **Display Services**
- **Add Service**
- **Delete all Services**

| Parameters                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Application Firewall</b>                   | <p>The Application Firewall is used to restrict access to specific services such as FTP or LDAP. It is disabled by default and can be enabled by defining appropriate rules. The following services can either be blocked or restricted to specific IP addresses or IP address ranges by the Application Firewall:</p> <p><b>Service / Ports</b></p> <p>HTTPS / 443</p> <p>Postgres / 5432</p> <p>LDAP / 389</p> <p>Manager E / 7000</p> <p>ssh (locked by default) / 22</p> <p>FTP / 21, 40000 - 40040</p> <p>Only the listed services can be blocked via a selection menu in Expert mode. Telephone features such as SIP, HFA, etc. cannot be blocked using the Application Firewall. A service can be selected multiple times; each time, different IP restrictions can be specified.</p> |
| <b>Rule Name</b>                              | Given name for the rule                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Rule activated</b>                         | The rule is activated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Lower Limit of Source IP Address Range</b> | The lower limit of the blocked IP addresses.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Upper Limit of Source IP Address Range</b> | The upper limit of the blocked IP addresses.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

### 28.3.2.2 Security > Deployment and Licensing Client (DLSC)

To use DLS functions, for example, the communication system must allow the external DLS to access the configuration data. The communication system is then operated as Deployment and Licensing Client. The external DLS server is set up under > Mainboard > DHCP Mode > DHCP Server > Global Settings.

Parameter Description of Tabs::

- **DLSC Basic Configuration**
- **Contact DLSC**
- **Reset DLSC Bootstrapping**

| Parameters                                  | Description                                                                                                 |
|---------------------------------------------|-------------------------------------------------------------------------------------------------------------|
| <b>Status</b>                               |                                                                                                             |
| <b>Secure Communication with DLS Client</b> | Indicates whether (and to what extent) secure communication with the DLS client is enabled or disabled (0). |
| <b>DLS Client</b>                           |                                                                                                             |
| <b>Time interval for ContactMe Response</b> | Default value: 0                                                                                            |
| <b>PIN required for DLS Bootstrapping</b>   | Enhanced level of security via PIN entry on both sides                                                      |
| <b>Bootstrap PIN</b>                        | Value range: min. 8 to max. 32 characters                                                                   |
| <b>DLS Server</b>                           |                                                                                                             |
| <b>IP address of DLS server</b>             | Input of the IP address of the external DLS server.                                                         |
| <b>Port of DLS Server</b>                   | Port of the external DLS Server<br>Default value: 18443                                                     |
| <b>Secure Port of DLS Server</b>            | Display the port number for a secure connection                                                             |

### 28.3.2.3 Security > Deployment and Licensing Client (DLSC) > DLSC Client Certificate

Parameter Description of Tabs:

- **Certificate Information**

| Parameters                          | Description                                                                        |
|-------------------------------------|------------------------------------------------------------------------------------|
| <b>Certificate Type</b>             | Used to ensure secure initial contact between the communication system and the DLS |
| <b>Serial Number of Certificate</b> | Displays the specified serial number.                                              |

## Expert mode

| Parameters                                 | Description                                                                                                                                                                                                                                                   |
|--------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Serial Number of Certificate (hex)</b>  | Displays the specified serial number in hexademical form.                                                                                                                                                                                                     |
| <b>Type of Signature Algorithm</b>         | Displays the signature algorithm used<br>Value range: sha256RSA, sha512RSA                                                                                                                                                                                    |
| <b>Start Time of Validity Period (GMT)</b> | Displays the start of the certificate validity period. The time specified is interpreted as Greenwich Mean Time (GMT).                                                                                                                                        |
| <b>End Time of Validity Period (GMT)</b>   | Displays the end of the certificate validity period. The time specified is interpreted as Greenwich Mean Time (GMT).                                                                                                                                          |
| <b>CRL distribution point</b>              | Displays the optional URL from where the Certificate Revocation Lists (CRL) will be distributed                                                                                                                                                               |
| <b>Issued by CA</b>                        | The Certification Authority that has signed the certificate                                                                                                                                                                                                   |
| <b>Country (C)</b>                         | Two-digit country code                                                                                                                                                                                                                                        |
| <b>Organization (O)</b>                    | The full legal company name                                                                                                                                                                                                                                   |
| <b>Organization Unit (OU)</b>              | The Organizational Unit is whichever branch of the company is ordering the certificate                                                                                                                                                                        |
| <b>Common Name (CN)</b>                    | Fully Qualified Domain Name (FQDN)                                                                                                                                                                                                                            |
| <b>Subject Name</b>                        | Displays the name of the subject who requested the certificate according to the conventions of the X.509 standard (for example, enter DE for Germany in the Country (C) field)                                                                                |
| <b>Country (C)</b>                         | Two-digit country code                                                                                                                                                                                                                                        |
| <b>Organization (O)</b>                    | The full legal company name                                                                                                                                                                                                                                   |
| <b>Organization Unit (OU)</b>              | The Organizational Unit is whichever branch of the company is ordering the certificate                                                                                                                                                                        |
| <b>Common Name (CN)</b>                    | Fully Qualified Domain Name (FQDN)                                                                                                                                                                                                                            |
| <b>Alternative Subject Name</b>            | This optional information distinguishes between the Distinguished Name Format (such as the data under Subject Name) and Other Format (for example, the IP address entry). The input mask depends on the selected format                                       |
| <b>Public Key Encryption Data</b>          | Public key data of certificate used for encryption                                                                                                                                                                                                            |
| <b>Public Key Length</b>                   | Value range: 1024, 1536, 2048                                                                                                                                                                                                                                 |
| <b>Public Key</b>                          | Encryption using public keys that are confirmed by a third party in accordance with the X.509 standard. The high level of security is guaranteed by the fact that the decryption key must be individually redefined and is only saved at the user's facility. |
| <b>Fingerprint</b>                         | The public key used and the fingerprint are displayed in hexadecimal format.                                                                                                                                                                                  |

## 28.3.2.4 Security > Deployment and Licensing Client (DLSC) > DLSC CA Certificate

Parameter Description of Tabs:

- **Certificate Information**

| Parameters                                 | Description                                                                                                                                                                                                              |
|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Certificate Type</b>                    | Used to ensure secure initial contact between the communication system and the DLS.                                                                                                                                      |
| <b>Serial Number of Certificate</b>        | Displays the specified serial number.                                                                                                                                                                                    |
| <b>Serial Number of Certificate (hex)</b>  | Displays the specified serial number in hexademical form.                                                                                                                                                                |
| <b>Type of Signature Algorithm</b>         | Displays the signature algorithm used.<br>Value range: sha256RSA, sha512RSA                                                                                                                                              |
| <b>Start Time of Validity Period (GMT)</b> | Displays the start of the certificate validity period. The time specified is interpreted as Greenwich Mean Time (GMT).                                                                                                   |
| <b>End Time of Validity Period (GMT)</b>   | Displays the end of the certificate validity period. The time specified is interpreted as Greenwich Mean Time (GMT).                                                                                                     |
| <b>CRL distribution point</b>              | Displays the optional URL from where the Certificate Revocation Lists (CRL) will be distributed.                                                                                                                         |
| <b>Issued by CA</b>                        | The Certification Authority that has signed the certificate                                                                                                                                                              |
| <b>Country (C)</b>                         | Two-digit country code                                                                                                                                                                                                   |
| <b>Organization (O)</b>                    | The full legal company name                                                                                                                                                                                              |
| <b>Organization Unit (OU)</b>              | The Organizational Unit is whichever branch of the company is ordering the certificate                                                                                                                                   |
| <b>Common Name (CN)</b>                    | Fully Qualified Domain Name (FQDN)                                                                                                                                                                                       |
| <b>Subject Name</b>                        | Displays the name of the subject who requested the certificate according to the conventions of the X.509 standard (for example, enter DE for Germany in the Country (C) field).                                          |
| <b>Country (C)</b>                         | Two-digit country code                                                                                                                                                                                                   |
| <b>Organization (O)</b>                    | The full legal company name                                                                                                                                                                                              |
| <b>Organization Unit (OU)</b>              | The Organizational Unit is whichever branch of the company is ordering the certificate                                                                                                                                   |
| <b>Common Name (CN)</b>                    | Fully Qualified Domain Name (FQDN)                                                                                                                                                                                       |
| <b>Alternative Subject Name</b>            | This optional information distinguishes between the Distinguished Name Format (such as the data under Subject Name) and Other Format (for example, the IP address entry). The input mask depends on the selected format. |

| Parameters                        | Description                                                                                                                                                                                                                                                   |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Public Key Encryption Data</b> | Public key data of certificate used for encryption                                                                                                                                                                                                            |
| <b>Public Key Length</b>          | Value range: 1024, 1536, 2048                                                                                                                                                                                                                                 |
| <b>Public Key</b>                 | Encryption using public keys that are confirmed by a third party in accordance with the X.509 standard. The high level of security is guaranteed by the fact that the decryption key must be individually redefined and is only saved at the user's facility. |
| <b>Fingerprint</b>                | The public key used and the fingerprint are displayed in hexadecimal format.                                                                                                                                                                                  |
| <b>Certificate Type</b>           | Used to ensure secure initial contact between the communication system and the DLS.                                                                                                                                                                           |

### 28.3.2.5 Security > Signaling and Payload Encryption

Parameter Description of Tabs:

- **Edit Security Configuration**

| Parameters                            | Description                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Minimum length of the RSA key:</b> | Minimum length of the RSA key in the certificates. The higher the value, the more secure the key<br>Value range: 512, 1024, 2048<br>Default: 1024                                                                                                                                                                                                                                              |
| <b>Certificate validation</b>         | Switches the certificate validation on or off completely. We recommend that you do not switch off the certificate validation.<br>Default: on                                                                                                                                                                                                                                                   |
| <b>Subject name check</b>             | By checking the subject name in the certificate of a gateway, its identity can be checked. The subject name contains the IP address or the DNS name (DNS: Domain Name System) of the respective gateway<br>Default: disabled                                                                                                                                                                   |
| <b>CRL verification</b>               | Using a Certificate Revocation List (CRL), it is possible to determine whether a certificate was blocked/revoked and why. When a Certification Authority (CA) declares a certificate to be invalid, it enters the serial number of that certificate in its list. During certificate validation, this list can be checked at the Certification Authority via the Internet.<br>Default: disabled |

| Parameters                                     | Description                                                                                                                                                                                                                                                                                                             |
|------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Enforce Secure Renegotiation (RFC 5746)</b> | This procedure improves security during the renegotiation of the encryption parameters for TLS connections. It can only be used provided it is supported on all connected servers. (OpenScape Business, OpenScape 4000 and OpenScape Voice support this improved procedure; HiPath 3000 does not).<br>Default: disabled |
| <b>Maximum Re-Keying interval (hours)</b>      | This interval determines how long a specific key is to be used for the encryption of signaling and user data. After this period expires, a new key is defined.<br>Value range: 6 to 48<br>Default: 24                                                                                                                   |

### 28.3.2.6 Security > Signaling Encryption/Payload Encryption > SPE Certificate

Parameter Description of the Tab:

- **Import SPE certificate plus private key (PKCS#12 file)**

| Parameters                                                           | Description                                                           |
|----------------------------------------------------------------------|-----------------------------------------------------------------------|
| <b>Passphrase for decryption</b>                                     | Input of the passphrase that was used when creating the PKCS#12 file. |
| <b>File with certificate and private Key (PEM or PKCS#12 format)</b> | Selection of the file containing the certificate data to be imported. |

### 28.3.2.7 Security > Signaling Encryption/Payload Encryption > SPE CA Certificates

Up to 16 trusted CA certificates can be imported individually from a client PKI certificate authority (RA/CA), for example.

Parameter Description of the Tab:

- **Import trusted CA Certificate (X.509 file) for SPE**

| Parameters                                   | Description                                                                                                                            |
|----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <b>File with certificate (PEM or binary)</b> | Selection of the PEM or binary file to be imported.                                                                                    |
| <b>CRL Distribution Point (CDP) Protocol</b> | Protocol selection for the CRLs (certificate revocation lists)<br>Value range: LDAP or HTTP                                            |
| <b>CDP (e.g., without Idap://)</b>           | A CDP is an optional certificate extension. An imported certificate is only checked against the CRLs for which the CDP was configured. |

### 28.3.2.8 Security > VPN

Parameter Description of Tabs:

- **Display General Information**
- **Activate the Configured VPN Tables**
- **IPsec on / off**

| Parameters                       | Description                                                                                                                       |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <b>Encryption Algorithms</b>     | Used encryption algorithms<br>Value range: AES, 3DES                                                                              |
| <b>Hash Algorithms</b>           | Standardized cryptographic hash function used to compute a unique check value (digital signature)<br>Value range: MD5, SHA1, SHA2 |
| <b>Public Key Algorithms</b>     | Asymmetric encryption method<br>Value range: RSA                                                                                  |
| <b>Diffie-Hellman Groups</b>     | A method for exchanging keys<br>Value range: DH Group 2, DH Group 5                                                               |
| <b>Buttons</b>                   |                                                                                                                                   |
| <b>Activate Now</b>              | The VPN tables can be activated.<br>Observe the warnings!                                                                         |
| <b>Activate/Deactivate IPsec</b> | IPSec can be enabled or disabled.<br>Observe the warnings!                                                                        |

### 28.3.2.9 Security > VPN > Lightweight CA

Parameter Description of Tabs:

- **Generate CA Certificate**

| Parameters                          | Description                                                                                              |
|-------------------------------------|----------------------------------------------------------------------------------------------------------|
| <b>Name of the Certificate</b>      | Freely definable flat name for the generated certificate                                                 |
| <b>Serial Number of Certificate</b> | Input of a serial number that you specify. This number must be a positive integer.                       |
| <b>Type of Signature Algorithm</b>  | Selection of the signature algorithm to be used for this certificate<br>Value range: sha25RSA, sha512RSA |
| <b>Public key length</b>            | Selection of a key length used for this certificate<br>Value range: 2048                                 |

| Parameters                                 | Description                                                                                                                                                                                                                                                                                                         |
|--------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Start Time of Validity Period (GMT)</b> | Point of time as of which the certificate should be valid. The time specified is interpreted as Greenwich Mean Time (GMT).                                                                                                                                                                                          |
| <b>End Time of Validity Period (GMT)</b>   | Point of time until which the certificate should be valid. The time specified is interpreted as Greenwich Mean Time (GMT).                                                                                                                                                                                          |
| <b>Subject Name</b>                        | Input of the subject name data of the certificate applicant according to the conventions of the X.509 standard (e.g., DE for Germany in the Country (C) field).                                                                                                                                                     |
| <b>Alternative Subject Name</b>            | This optional information distinguishes between the Distinguished Name Format (such as the data under Subject Name) and some other format (for example, the IP address entry). The input mask depends on the selected format. If other format is selected, more than one SAN entries is possible to be configured.. |
| <b>Distinguished Name Format</b>           | This is usually also provided as the Common Name RDN within the Subject field of the main certificate                                                                                                                                                                                                               |
| <b>Other Format</b>                        | Other names, given as a General Name                                                                                                                                                                                                                                                                                |
| <b>Subject Alternative Name Extension</b>  | Value range: DNS Name, IP Address, E-mail Address, Uniform Resource Indicator, Other                                                                                                                                                                                                                                |
| <b>Alternative Subject Name</b>            | This optional information distinguishes between the Distinguished Name Format (such as the data under Subject Name) and Other Format (for example, the IP address entry). The input mask depends on the selected format. If other format is selected, more than one SAN entries is possible to be configured..      |
| <b>CRL Distribution Point Type</b>         | Value range: DNS Name, IP Address, E-mail Address, Uniform Resource Indicator, Other                                                                                                                                                                                                                                |
| <b>CRL Distribution Point</b>              | Specification of a URL from where the Certificate Revocation Lists (CRL) will be distributed.                                                                                                                                                                                                                       |
| <b>Generate Certificate</b>                |                                                                                                                                                                                                                                                                                                                     |

### 28.3.2.10 Security > VPN > Certificate Management

Parameter Description of Tabs::

- **View Certificate From File**

| Parameters            | Description                                                                 |
|-----------------------|-----------------------------------------------------------------------------|
| <b>PKCS#12 Format</b> | You must activate this field if the certificate is saved in a PKCS#12 file. |

| Parameters                       | Description                                                                                                                                                 |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Passphrase for decryption</b> | If you activate the PKCS#12 Format field, you must enter the same password in this field as used for file creation.                                         |
| <b>File with Certificate</b>     | Enter the path and the file name of the certificate in this field. Click on Browse if you are unsure of the storage location. A search dialog is displayed. |

### 28.3.2.11 Security > VPN > Certificate Management > Trusted CA Certificates > Active Certificates

Parameter Description of the Tab:

- **Import Trusted CA Certificate (X.509)**

| Parameters                                 | Description                                                                                                                                                                    |
|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Certificate Type</b>                    | Used to ensure secure initial contact between the communication system and the DLS                                                                                             |
| <b>Serial Number of Certificate</b>        | Displays the specified serial number.                                                                                                                                          |
| <b>Serial Number of Certificate (hex)</b>  | Displays the specified serial number in hexademical form.                                                                                                                      |
| <b>Type of Signature Algorithm</b>         | Displays the signature algorithm used<br>Value range: sha256RSA, sha512RSA                                                                                                     |
| <b>Start Time of Validity Period (GMT)</b> | Displays the start of the certificate validity period. The time specified is interpreted as Greenwich Mean Time (GMT).                                                         |
| <b>End Time of Validity Period (GMT)</b>   | Displays the end of the certificate validity period. The time specified is interpreted as Greenwich Mean Time (GMT).                                                           |
| <b>CRL distribution point</b>              | Displays the optional URL from where the Certificate Revocation Lists (CRL) will be distributed                                                                                |
|                                            |                                                                                                                                                                                |
| <b>Issued by CA</b>                        | The Certification Authority that has signed the certificate                                                                                                                    |
| <b>Country (C)</b>                         | Two-digit country code                                                                                                                                                         |
| <b>Organization (O)</b>                    | The full legal company name                                                                                                                                                    |
| <b>Organization Unit (OU)</b>              | The Organizational Unit is whichever branch of the company is ordering the certificate                                                                                         |
| <b>Common Name (CN)</b>                    | Fully Qualified Domain Name (FQDN)                                                                                                                                             |
|                                            |                                                                                                                                                                                |
| <b>Subject Name</b>                        | Displays the name of the subject who requested the certificate according to the conventions of the X.509 standard (for example, enter DE for Germany in the Country (C) field) |
| <b>Country (C)</b>                         | Two-digit country code                                                                                                                                                         |

| Parameters                        | Description                                                                                                                                                                                                                                                   |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Organization (O)</b>           | The full legal company name                                                                                                                                                                                                                                   |
| <b>Organization Unit (OU)</b>     | The Organizational Unit is whichever branch of the company is ordering the certificate                                                                                                                                                                        |
| <b>Common Name (CN)</b>           | Fully Qualified Domain Name (FQDN)                                                                                                                                                                                                                            |
| <b>Alternative Subject Name</b>   | This optional information distinguishes between the Distinguished Name Format (such as the data under Subject Name) and Other Format (for example, the IP address entry). The input mask depends on the selected format                                       |
| <b>Public Key Encryption Data</b> | Public key data of certificate used for encryption                                                                                                                                                                                                            |
| <b>Public Key Length</b>          | Value range: 1024, 1536, 2048                                                                                                                                                                                                                                 |
| <b>Public Key</b>                 | Encryption using public keys that are confirmed by a third party in accordance with the X.509 standard. The high level of security is guaranteed by the fact that the decryption key must be individually redefined and is only saved at the user's facility. |
| <b>Fingerprint</b>                | The public key used and the fingerprint are displayed in hexadecimal format.                                                                                                                                                                                  |

### 28.3.2.12 Security > VPN > Certificate Management > Trusted CA Certificates > Configured Certificates

Parameter Description of the Tab:

- **Import Trusted CA Certificate (X.509)**

| Parameters                     | Description                                                                                                                          |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <b>Name of the Certificate</b> | Enter the name to be assigned to the certificate.                                                                                    |
| <b>File with Certificate</b>   | Path and file name of the certificate. When you click Browse, a search dialog is displayed to find the storage location of the file. |

### 28.3.2.13 Security > VPN > Peer Certificates

Parameter Description of Tabs:

- **Generate Certificate Signing Request (CSR)**
- **Import Peer Certificate (PKCS#12)**

| Parameters                                | Description                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Certificate Request Name</b>           | A CA-signed peer certificate based on a CA certificate can be generated. This requires at least one CA certificate to have already been generated. The certificate generated is saved in a PKCS#12 file. PKCS#12 files (Personal Information Exchange Syntax Standard) save certificates with the private key. A PKCS#12 file therefore contains the necessary data for personal encryption and decryption. |
| <b>Type of Signature Algorithm</b>        | Select the signature algorithm to be used for this certificate.<br>Value range: sha25RSA, sha512RSA                                                                                                                                                                                                                                                                                                         |
| <b>Public key length</b>                  | Value range: 2048                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Subject Name</b>                       | Subject name data of the certificate applicant according to the conventions of the X.509 standard (e.g., DE for Germany in the Country (C) field).                                                                                                                                                                                                                                                          |
| <b>Country (C)</b>                        | Two-digit country code                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Organization (O)</b>                   | The full legal company name                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Organization Unit (OU)</b>             | The Organizational Unit is whichever branch of the company is ordering the certificate                                                                                                                                                                                                                                                                                                                      |
| <b>Common Name (CN)</b>                   | Fully Qualified Domain Name (FQDN)                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Alternative Subject Name</b>           | This optional information distinguishes between the Distinguished Name Format (such as the data under Subject Name) and Other Format (for example, the IP address entry). The input mask depends on the selected format. If other format is selected, more than one SAN entries is possible to be configured..                                                                                              |
| <b>Distinguished Name Format</b>          | This is usually also provided as the Common Name RDN within the Subject field of the main certificate                                                                                                                                                                                                                                                                                                       |
| <b>Country (C)</b>                        | Two-digit country code                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Organization (O)</b>                   | The full legal company name                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Organization Unit (OU)</b>             | The Organizational Unit is whichever branch of the company is ordering the certificate                                                                                                                                                                                                                                                                                                                      |
| <b>Common Name (CN)</b>                   | Fully Qualified Domain Name (FQDN)                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Other Format</b>                       | Other names, given as a General Name                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Subject Alternative Name Extension</b> | Value range: DNS Name, IP Address, E-mail Address, Uniform Resource Indicator, Other                                                                                                                                                                                                                                                                                                                        |
| <b>Subject Alternative Name</b>           | This optional information distinguishes between the Distinguished Name Format (such as the data under Subject Name) and Other Format (for example, the IP address entry). The input mask depends on the selected format.                                                                                                                                                                                    |
| <b>Import Peer Certificate [PKCS#12]</b>  |                                                                                                                                                                                                                                                                                                                                                                                                             |

| Parameters                             | Description                                                                            |
|----------------------------------------|----------------------------------------------------------------------------------------|
| <b>Name of the Certificate</b>         | Enter the name to be assigned to the certificate.                                      |
| <b>Passphrase for decryption</b>       | Password to decrypt the peer certificate<br>Value range: min. 7 and max. 32 characters |
| <b>File with Certificate</b>           | Click on Browse. A search dialog is displayed.                                         |
| <b>View Fingerprint of Certificate</b> | Click on this button to check the integrity of the certificate.                        |
| <b>Import Certificate from File</b>    | Click on this button to import a certificate.                                          |

### 28.3.2.14 Security > VPN > Services > Active Services

Parameter Description of the Tab:

- **Display IPsec Services**

| Parameters                    | Description                                                                                                    |
|-------------------------------|----------------------------------------------------------------------------------------------------------------|
| <b>Name of the Service</b>    | This field contains the name of the configured services.                                                       |
| <b>State in IP Stack</b>      |                                                                                                                |
| <b>Source Port</b>            | Displays the source port number. If "0" is displayed as the port, this corresponds to any (unknown) port.      |
| <b>Destination Port</b>       | Displays the destination port number. If "0" is displayed as the port, this corresponds to any (unknown) port. |
| <b>IP protocol</b>            | Displays the IP protocol used for the transmission.                                                            |
| <b>Associated 'pass' Rule</b> | Displays the associated "Pass" rule. The assignment of rules and services is performed under Rules.            |
| <b>Associated 'deny' Rule</b> | Displays the associated "Deny" rule. The assignment of rules and services is performed under Rules.            |

### 28.3.2.15 Security > VPN > Services > Configured Services

Parameter Description of Tabs::

- **Display IPsec Services**
- **Add IPsec Services**
- **Edit IPsec Services**
- **Rename IPsec Services**
- **Delete IPsec Services**

## Expert mode

| Parameters                 | Description                                                                                                                       |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <b>Name of the Service</b> | Input field for the name of the newly configured service. Enter a character string in this field.                                 |
| <b>Source Port</b>         | Number of the port to be used for the transmission of data on the transmit side. In this field, "0" indicates any (unknown) port. |
| <b>Destination Port</b>    | Number of the port to be used for the transmission of data on the receive side. In this field, "0" indicates any (unknown) port.  |
| <b>IP protocol</b>         | IP protocol to be used for the transmission<br>Value range: ICMP, TCP, UDP                                                        |
| <b>Name of the Service</b> | Input field for the name of the service to be configured.                                                                         |
| <b>Source Port</b>         | Number of the port to be used for the transmission of data on the transmit side. In this field, "0" indicates any (unknown) port. |
| <b>Destination Port</b>    | Number of the port to be used for the transmission of data on the receive side. In this field, "0" indicates any (unknown) port.  |
| <b>IP protocol</b>         | Select the IP protocol used for the transmission<br>Value range: ICMP, TCP, UDP                                                   |
| <b>Name of the Service</b> | Input field for the name of the service to be configured.                                                                         |
|                            | Deletion is only possible if no rule is assigned to the service.                                                                  |

### 28.3.2.16 Security > VPN > Tunnels > Active Tunnels

Parameter Description of Tabs::

- **Display General Tunnel Data**
- **Display Rules for all Tunnels**

| Parameters                                | Description                                                                                                                                                                                                             |
|-------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Name of the Tunnel</b>                 | This field contains the name of the configured tunnel.                                                                                                                                                                  |
| <b>State in IP Stack</b>                  | Status indicator in the IP stack.<br>Value range: active / not active                                                                                                                                                   |
| <b>Type of the Local Tunnel Endpoint</b>  | Displays the endpoint address at the sending end of the tunnel; you can specify a host name or a DNS name).                                                                                                             |
| <b>Local Tunnel Endpoint Address</b>      | Displays the endpoint address in the local tunnel.                                                                                                                                                                      |
| <b>Type of the Remote Tunnel Endpoint</b> | Displays the endpoint type of the remote tunnel.                                                                                                                                                                        |
| <b>Remote Tunnel Endpoint Address</b>     | Displays the recipient address of the remote tunnel. If the address of 0.0.0.0 is displayed, this means that the tunnel endpoint is unknown. In this case, the tunnel must be configured by the peer (e.g. teleworker). |

| Parameters                                            | Description                                                                                                                                                                                                                                                                                                                                           |
|-------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Suggested Lifetime of the Session Keys</b>         | Displays the accepted validity period for the session keys which will be used. When this period expires, no more data is exchanged within this session. New session keys are automatically negotiated to replace invalid session keys.                                                                                                                |
| <b>Suggested Lifetime of the Key Exchange Session</b> | Displays the accepted validity period for the key exchange session. Once the key exchange session has expired, new keys are automatically negotiated for it using the IKE protocol (encryption protocol).                                                                                                                                             |
| <b>Associated Rules: Associated Transmit Rule</b>     | Setup of Send Rules under VPN > Rules                                                                                                                                                                                                                                                                                                                 |
| <b>Associated Rules: Associated Receive Rule</b>      | Setup of Receive Rules under VPN > Rules                                                                                                                                                                                                                                                                                                              |
| <b>Tunnel Data</b>                                    |                                                                                                                                                                                                                                                                                                                                                       |
| <b>Name of the Tunnel</b>                             | This field contains the name of the configured tunnel.                                                                                                                                                                                                                                                                                                |
| <b>State in IP Stack</b>                              | Status indicator in the IP stack.<br>Value range: active / not active                                                                                                                                                                                                                                                                                 |
| <b>Type of the Local Tunnel Endpoint</b>              | Displays the endpoint address at the sending end of the tunnel; you can specify a host name or a DNS name).                                                                                                                                                                                                                                           |
| <b>Local Tunnel Endpoint Address</b>                  | Displays the endpoint address in the local tunnel.                                                                                                                                                                                                                                                                                                    |
| <b>Type of the Remote Tunnel Endpoint</b>             | Displays the endpoint type of the remote tunnel.                                                                                                                                                                                                                                                                                                      |
| <b>Remote Tunnel Endpoint Address</b>                 | Displays the recipient address of the remote tunnel. If the address of 0.0.0.0 is displayed, this means that the tunnel endpoint is unknown. In this case, the tunnel must be configured by the peer (e.g. teleworker).                                                                                                                               |
| <b>Rule Data</b>                                      |                                                                                                                                                                                                                                                                                                                                                       |
| <b>Destination</b>                                    | Status indicator in the Destination.<br>Value range: send/ receive                                                                                                                                                                                                                                                                                    |
| <b>Priority</b>                                       | Displays the priority for the processing sequence. The highest priority is specified with 1. Each rule associated with a direction must be assigned its own priority. A rule and the associated opposite-direction rule must always have the same priority. The rule for the opposite direction can only be created with the corresponding menu item. |
| <b>Rule-Based Action</b>                              | Displays how the IP packets are to be handled by the rule: "pass" means that IP packets are forwarded; "deny" means that no IP packets are forwarded.                                                                                                                                                                                                 |

| Parameters                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Displays the service to which the encryption is restricted. If the encryption is not to be restricted to one service, select "Any Service"                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Parameters                 | Description                                                                                                                                                                                                                       |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Name of the Service</b> | Input field for the name of the service to be configured.                                                                                                                                                                         |
| <b>Source Port</b>         | Displays the tunnel in the receive direction, to which this rule applies. IP packets received by the network are retrieved from this tunnel. Select No Tunnel Assignment if no tunnel is to be assigned in the receive direction. |
| <b>Destination Port</b>    | Displays the tunnel in the send direction, to which this rule applies. IP packets destined for the network are sent through this tunnel. Select No Tunnel Assignment if no tunnel is to be assigned in the send direction.        |
| <b>IP protocol</b>         | Select the IP protocol used for the transmission<br>Value range: ICMP, TCP, UDP                                                                                                                                                   |

### 28.3.2.17 Security > VPN > Tunnels > Configured Tunnels

Parameter Description of Tabs::

- **Display General Tunnel Data**
- **Display Rules for all Tunnels**
- **Add Tunnel / Edit Tunnel Data**
- **Key exchange data**

| Parameters                                | Description                                                                                                                                                                                                                             |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                           | Tunnel is the term used to describe the transportation of encrypted data packets to a defined endpoint. Active tunnels become configured tunnels when the configuration is enabled. A maximum of 256 tunnels can be set up per gateway. |
| <b>Name of the Tunnel</b>                 | This field contains the name of the configured tunnel.                                                                                                                                                                                  |
| <b>State in IP Stack</b>                  | Status indicator in the IP stack.<br>Value range: active / not active                                                                                                                                                                   |
| <b>Type of the Local Tunnel Endpoint</b>  | Displays the endpoint address at the sending end of the tunnel; you can specify a host name or a DNS name).                                                                                                                             |
| <b>Local Tunnel Endpoint Address</b>      | Displays the endpoint address in the local tunnel.                                                                                                                                                                                      |
| <b>Type of the Remote Tunnel Endpoint</b> | Displays the endpoint type of the remote tunnel.                                                                                                                                                                                        |
| <b>Remote Tunnel Endpoint Address</b>     | Displays the recipient address of the remote tunnel. If the address of 0.0.0.0 is displayed, this means that the tunnel endpoint is unknown. In this case, the tunnel must be configured by the peer (e.g. teleworker).                 |

| Parameters                                            | Description                                                                                                                                                                                                                                                                                                                                           |
|-------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Suggested Lifetime of the Session Keys</b>         | Displays the accepted validity period for the session keys which will be used. When this period expires, no more data is exchanged within this session. New session keys are automatically negotiated to replace invalid session keys.                                                                                                                |
| <b>Suggested Lifetime of the Key Exchange Session</b> | Displays the accepted validity period for the key exchange session. Once the key exchange session has expired, new keys are automatically negotiated for it using the IKE protocol (encryption protocol).                                                                                                                                             |
| <b>Associated Rules:<br/>Associated Transmit Rule</b> | Setup of Send Rules under VPN > Rules                                                                                                                                                                                                                                                                                                                 |
| <b>Associated Rules:<br/>Associated Receive Rule</b>  | Setup of Receive Rules under VPN > Rules                                                                                                                                                                                                                                                                                                              |
| <b>Tunnel Data</b>                                    |                                                                                                                                                                                                                                                                                                                                                       |
| <b>Name of the Tunnel</b>                             | This field contains the name of the configured tunnel.                                                                                                                                                                                                                                                                                                |
| <b>State in IP Stack</b>                              | Status indicator in the IP stack.<br>Value range: active / not active                                                                                                                                                                                                                                                                                 |
| <b>Type of the Local Tunnel Endpoint</b>              | Displays the endpoint address at the sending end of the tunnel; you can specify a host name or a DNS name).                                                                                                                                                                                                                                           |
| <b>Local Tunnel Endpoint Address</b>                  | Displays the endpoint address in the local tunnel.                                                                                                                                                                                                                                                                                                    |
| <b>Type of the Remote Tunnel Endpoint</b>             | Displays the endpoint type of the remote tunnel.                                                                                                                                                                                                                                                                                                      |
| <b>Remote Tunnel Endpoint Address</b>                 | Displays the recipient address of the remote tunnel. If the address of 0.0.0.0 is displayed, this means that the tunnel endpoint is unknown. In this case, the tunnel must be configured by the peer (e.g. teleworker).                                                                                                                               |
| <b>Rule Data</b>                                      |                                                                                                                                                                                                                                                                                                                                                       |
| <b>Destination</b>                                    | Status indicator in the Destination.<br>Value range: send/ receive                                                                                                                                                                                                                                                                                    |
| <b>Priority</b>                                       | Displays the priority for the processing sequence. The highest priority is specified with 1. Each rule associated with a direction must be assigned its own priority. A rule and the associated opposite-direction rule must always have the same priority. The rule for the opposite direction can only be created with the corresponding menu item. |
| <b>Rule-Based Action</b>                              | Displays how the IP packets are to be handled by the rule: "pass" means that IP packets are forwarded; "deny" means that no IP packets are forwarded.                                                                                                                                                                                                 |

|--------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Name of the Service</b>                                                     | Input field for the name of the service to be configured.                                                                                                                                                                         |
| <b>Source Port</b>                                                             | Displays the tunnel in the receive direction, to which this rule applies. IP packets received by the network are retrieved from this tunnel. Select No Tunnel Assignment if no tunnel is to be assigned in the receive direction. |
| <b>Destination Port</b>                                                        | Displays the tunnel in the send direction, to which this rule applies. IP packets destined for the network are sent through this tunnel. Select No Tunnel Assignment if no tunnel is to be assigned in the send direction.        |
| <b>IP protocol</b>                                                             | IP protocol to be used for the transmission<br>Value range: ICMP, TCP, UDP                                                                                                                                                        |
| <b>Name of the Tunnel</b>                                                      | This field contains the name of the newly configured tunnel.                                                                                                                                                                      |
| <b>Enable Remote Service via VPN : (can be activated via the service code)</b> | Check this box if the VPN tunnel is to be used for remote administration.                                                                                                                                                         |
| <b>Type of the Local Tunnel Endpoint</b>                                       | Select the endpoint address type at the sending end of the tunnel; you can specify a host name or a DNS name.                                                                                                                     |
| <b>Local Tunnel Endpoint Address</b>                                           | Enter the sender's address in a format suitable for the endpoint type.                                                                                                                                                            |
| <b>Type of the Remote Tunnel Endpoint</b>                                      | Type of endpoint address on the tunnel receive side (specification of IP address is supported).                                                                                                                                   |
| <b>Remote Tunnel Endpoint Address</b>                                          | Receive address in a format suitable for the endpoint type. In this field, 0.0.0.0 indicates that the tunnel endpoint is unknown. In this case, the tunnel must be configured by the peer (e.g. teleworker).                      |
| <b>Session Key Handling</b>                                                    | Under Session Key Handling, specify the procedure for the key exchange (Automatically, using IKE protocol).                                                                                                                       |
| <b>Suggested Encryption Algorithms</b>                                         | Which algorithms may be used<br>Value range: AES, 3DES                                                                                                                                                                            |
| <b>Suggested Hash Algorithms</b>                                               | Which hash algorithms (testing algorithms) may be used. The selected algorithms are offered by the initiator of IKE negotiation.<br>Value range: MD5, SHA1, SHA2                                                                  |
| <b>Suggested Lifetime of the Session Keys</b>                                  | Validity period for the session keys that are used. When this period expires, no more data is exchanged within this session. New session keys are automatically negotiated to replace invalid session keys                        |
| <b>Suggested Lifetime of the Key Exchange Session</b>                          | Validity period for the key exchange session. Once the key exchange session has expired, new keys are automatically negotiated for it using the IKE protocol                                                                      |

| Parameters                                       | Description                                                                                                                                                                                                                     |
|--------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Suggested Data Volume of the Session Keys</b> | Maximum data volume for the session keys. If the data volume is exceeded, new session keys are automatically negotiated using the IKE protocol. If "unlimited" is selected, the amount of data is unrestricted                  |
| <b>Activate Perfect Forward Secrecy</b>          | It is recommended to always select this option, since it activates improved security mechanisms for data transfer via the tunnel                                                                                                |
| <b>VPN Peer Authentication Method</b>            | VPN subscriber authentication method. The possible options include Digital Signatures (authentication using certificates) and Pre-Shared Keys (authentication using self-defined manual keys)                                   |
| <b>Pre-Shared Key</b>                            | This field is only available if the authentication method is set to Pre-Shared keys. The password to be used by the VPN subscribers at both endpoints of the tunnel must be entered here. At least 12 characters should be used |
| <b>Reenter Pre-Shared Key</b>                    | This field is only available if the authentication method is set to Pre-Shared keys.                                                                                                                                            |
| <b>List of CA Certificates</b>                   | These options are only available if the authentication method is set to Digital signatures. For authentication, VPN subscribers can use any certificate that has been issued (signed) by one of the selected CA certificates    |
| <b>Suggested Diffie-Hellman Groups</b>           | VPN subscribers can exchange keys by any of the selected methods                                                                                                                                                                |

---

**NOTICE:** The addition/deletion of a VPN tunnel must subsequently be enabled under "VPN> Activate the Configured VPN Tables".

---

### 28.3.2.18 Security > VPN > Rules > Active Rules

Parameter Description of the Tab:

- **Display Rules**

| Parameters               | Description                                                                                                                                                                                                                                                            |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Priority</b>          | Displays the priority for the processing sequence as a digit. The highest priority is specified with 1. Each rule associated with a direction must be assigned its own priority. A rule and the associated opposite-direction rule must always have the same priority. |
| <b>Service</b>           | Displays the service to which the encryption is restricted. If the encryption is not restricted to one service, "Any Service" is displayed.                                                                                                                            |
| <b>Rule-Based Action</b> | Displays how the IP packets are to be handled by this rule: "pass" means that IP packets are forwarded; "deny" means that no IP packets are forwarded.                                                                                                                 |

## Expert mode

| Parameters                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Encryption Required</b>                  | Displays the encryption. The encryption procedure is defined by the assigned tunnel.                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Rule State</b>                           | Status indicator in rule.<br>Value range: Enabled / Disabled                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>State in IP Stack</b>                    | Status indicator in the IP stack.<br>Value range: Enabled / Disabled                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Source Address</b>                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Type</b>                                 | Displays the type of the source address.<br>Value range: Host, Subnet, IP Address Range, DNS Name                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Address (Lowest in Range)</b>            | Displays the source and destination address in a format suitable for the selected type. The input mask depends on the address type selected. If any IP address is to be used, 0.0.0.0 is displayed. NAT must be deactivated at the interface to the destination network if 0.0.0.0 is specified as the destination IP address for transmitting packets in a tunnel. Alternatively, you can specify an IP address between 0.0.0.1 and 255.255.255.254 to transmit packets in a tunnel. |
| <b>Subnet Mask / Highest Addr. in Range</b> | It is set in case that a range of source/destination addresses need to be set for transmission                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Destination Address</b>                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Type</b>                                 | Displays the type of the destination address.<br>Value range: Host, Subnet, IP Address Range, DNS Name                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Address (Highest in Range)</b>           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Subnet Mask / Highest Addr. in Range</b> | It is set in case that a range of source/destination addresses need to be set for transmission                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Tunnels for Encryption</b>               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Tunnel on Receive Side</b>               | Displays the tunnel in the receive direction, to which this rule applies. IP packets received by the network are retrieved from this tunnel. Display: No Tunnel Assignment (if no tunnel was assigned in the receive direction).                                                                                                                                                                                                                                                      |
| <b>Tunnel on Transmit Side</b>              | Displays the tunnel in the send direction, to which this rule applies. IP packets received by the network are retrieved from this tunnel. Display: No Tunnel Assignment (if no tunnel was assigned on the transmit side).                                                                                                                                                                                                                                                             |

### 28.3.2.19 Security > VPN > Rules > Configured Rules

Rules define how IP packets are to be handled. The rule action Pass means that the IP packet is to be transported further (passed

through). The rule action Deny means that the IP packet will not be transported further (i.e., will be ignored). You can also select whether or not the IP packet will use an encrypted VPN tunnel. The communication system can manage 640 rules, of which 6 rules are preset (default rules) and 634 are free for allocation.

Parameter Description of Tabs::

- **Display Rules**
- **Add Rule**
- **Edit Rule**
- **Add Rule for Opposite Direction**
- **Delete Rule**

| Parameters                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Priority</b>                             | Displays the priority for the processing sequence as a digit. The highest priority is specified with 1. Each rule associated with a direction must be assigned its own priority. A rule and the associated opposite-direction rule must always have the same priority.                                                                                                                                                                                                                |
| <b>Service</b>                              | Displays the service to which the encryption is restricted. If the encryption is not restricted to one service, "Any Service" is displayed.                                                                                                                                                                                                                                                                                                                                           |
| <b>Rule-Based Action</b>                    | Displays how the IP packets are to be handled by this rule: "pass" means that IP packets are forwarded; "deny" means that no IP packets are forwarded.                                                                                                                                                                                                                                                                                                                                |
| <b>Encryption Required</b>                  | Displays the encryption. The encryption procedure is defined by the assigned tunnel.                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Rule State</b>                           | Status indicator in the rule.<br>Value range: enabled/ disabled                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>State in IP Stack</b>                    | Status indicator in the IP stack.<br>Value range: Enabled / Disabled                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Source Address</b>                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Type</b>                                 | Displays the type of the source address.<br>Value range: Host, Subnet, IP Address Range, DNS Name                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Address (Lowest in Range)</b>            | Displays the source and destination address in a format suitable for the selected type. The input mask depends on the address type selected. If any IP address is to be used, 0.0.0.0 is displayed. NAT must be deactivated at the interface to the destination network if 0.0.0.0 is specified as the destination IP address for transmitting packets in a tunnel. Alternatively, you can specify an IP address between 0.0.0.1 and 255.255.255.254 to transmit packets in a tunnel. |
| <b>Subnet Mask / Highest Addr. in Range</b> | It is set in case that a range of source/destination addresses need to be set for transmission                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Destination Address</b>                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Parameters                                  | Description                                                                                                                                                                                                                      |

| <b>Address (Highest in Range)</b>           |                                                                                                                                                                                                                                  |
| <b>Subnet Mask / Highest Addr. in Range</b> | It is set in case that a range of source/destination addresses need to be set for transmission                                                                                                                                   |
| <b>Tunnels for Encryption</b>               |                                                                                                                                                                                                                                  |
| <b>Tunnel on Receive Side</b>               | Displays the tunnel in the receive direction, to which this rule applies. IP packets received by the network are retrieved from this tunnel. Display: No Tunnel Assignment (if no tunnel was assigned in the receive direction). |
| <b>Tunnel on Transmit Side</b>              | Displays the tunnel in the send direction, to which this rule applies. IP packets received by the network are retrieved from this tunnel. Display: No Tunnel Assignment (if no tunnel was assigned on the transmit side).        |

### 28.3.2.20 Security > VPN > Public Key Infrastructure (PKI)

The PKI server designates a server that can issue, distribute and verify digital certificates. The certificates issued within a PKI (Public Key Infrastructure) are used to protect communications. When using certificates (digital signatures), an attempt is made to download the CRL via the PKI URL configured by the PKI server.

Parameter Description of Tabs::

- **Display PKI Servers**
- **Add PKI Server**

| Parameters                    | Description                                                                 |
|-------------------------------|-----------------------------------------------------------------------------|
| <b>Name of the PKI Server</b> | Enter an easily recognizable name for the server.                           |
| <b>PKI Server Type</b>        | Select the task of the server (you can choose between LDAP and Enrollment). |
| <b>URL of the PKI Server</b>  | Enter the URL of the server (for example: LDAP://139.21.92.144:389).        |

### 28.3.2.21 Security > SSL > Certificate Generation

Administrative access is encrypted over HTTPS using the TLS 1.2 protocol. Certificates are used to authenticate the connection. By default, a self-signed certificate is used. A customer-specific certificate issued by a certificate authority (CA) can be used to enhance security. The communication system uses the certificates generated or imported by the WBM for authentication at the

admin client. Such certificates can be imported into the browser as trusted certificates to avoid warning messages in the browser when connecting to the SSL server.

Parameter Description of Tabs:

- **Generate CA Certificate**
- **Generate Self-Signed Certificate**

| Parameters                                                                                                                                                                                                                                                                                                     | Description                                                                                           |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------|
| <b>Name of the Certificate</b>                                                                                                                                                                                                                                                                                 | Name of the certificate to be generated.                                                              |
| <b>Serial Number of Certificate</b>                                                                                                                                                                                                                                                                            | Serial number for the certificate. | <b>Alternative Subject Name</b>                                                                                                                                                                                                                                                                                |                                                                                                       |
| This optional information distinguishes between the Distinguished Name Format (such as the data under Subject Name) and Other Format (for example, the IP address entry). The input mask depends on the selected format. If other format is selected, more than one SAN entries is possible to be configured.. |                                                                                                       |
| <b>Distinguished Name Format</b>                                                                                                                                                                                                                                                                               | This is usually also provided as the Common Name RDN within the Subject field of the main certificate |
| <b>Other Format</b>                                                                                                                                                                                                                                                                                            | Other names, given as a General Name                                                                  |

| Parameters                                | Description                                                                                                                    |
|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <b>Subject Alternative Name Extension</b> | (optional)Value range, default value: DNS Name, IP Address, E-mail Address, Uniform ResourceIndicator, Other                   |
| <b>Subject Alternative Name</b>           |                                                                                                                                |
| <b>CRL Distribution Point Type</b>        | Value range: DNS Name, IP Address, E-mail Address, Uniform Resource Indicator, Other                                           |
| <b>CRL Distribution Point</b>             | The location from which certificate revocation lists (CRL) are to be distributed can be optionally specified here (with a URL) |

### 28.3.2.22 Security > SSL > Certificate Management

Parameter Description of the Tab:

- **View Certificate From File**

| Parameters                       | Description                                                                                                                      |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <b>PKCS#12 Format</b>            | This field must be activated if the certificate is saved in a PKCS#12 file.                                                      |
| <b>Passphrase for decryption</b> | If the PKCS#12 Format field was activated, the same password that was used when creating the file must be entered in this field. |
| <b>File with Certificate</b>     | Enter the path and file name of the certificate. If necessary, click Browse to specify the location.                             |

### 28.3.2.23 Security > SSL > Certificate Management > Server Certificates

Parameter Description of Tabs:

- **Generate Certificate Signing Request (CSR)**
- **Import Server Certificate (PKCS#12)**
- **View a Certificate**
- **Remove Certificate**
- **Export Certificate (X.509)**
- **Import Updated Certificate (X.509)**
- **Activate Certificate**

| Parameters                         | Description                                                                              |
|------------------------------------|------------------------------------------------------------------------------------------|
| <b>Certificate Request Name</b>    | Name of the certificate to be generated.                                                 |
| <b>Type of Signature Algorithm</b> | Signature algorithm to be used for this certificate<br>Value range: sha256RSA, sha512RSA |
| <b>Public Key Length</b>           | Value range: 2048                                                                        |

| Parameters                                                                                                                                                                                                                                                                                                     | Description                                                                                                                                                                                     |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Subject Name</b>                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                                 |
| Subject name data of the certificate applicant according to the conventions of the X.509 standard (e.g., DE for Germany in the Country (C) field). All four fields must be filled.                                                                                                                             |                                                                                                                                                                                                 |
| <b>Country (C)</b>                                                                                                                                                                                                                                                                                             | Two-digit country code                                                                                                                                                                          |

| <b>Subject Alternative Name</b>                                                                                                                                                                                                                                                                                | (optional)                                                                                                                                                                                      |
| <b>Name of the Certificate</b>                                                                                                                                                                                                                                                                                 | Name of the certificate to be imported.                                                                                                                                                         |
| <b>Passphrase for decryption</b>                                                                                                                                                                                                                                                                               | Password that was used when the file was created.<br>Value range: 7 to 32 characters                                                                                                            |
| <b>File with Certificate</b>                                                                                                                                                                                                                                                                                   | Enter the required certificate in the <b>File with Certificate</b> field or select it using Browse. The <b>Fingerprint</b> of the certificate must be displayed first and can then be imported. |

### 28.3.2.24 Security > Web Security

Parameter Description of the Tab:

- **Web Access Filter**

| Parameters                         | Description                                                                                                                                                                                                                                                                                                                                             |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Web Clients</b>                 | Only in conjunction with UC Suite: Enabling and disabling web access from mobile phones and mobile applications (myPortal for Mobile/Tablet, myPortal to go, Application Launcher and 3rd party applications via a Web Service)<br><br>Info: Use of web clients in conjunction with UC Smart via Expert mode > Applications > UC Smart > Basic Settings |
| <b>Access via HTTPS</b>            | Only encrypted connections allowed.                                                                                                                                                                                                                                                                                                                     |
| <b>Access via HTTP</b>             | Unencrypted connections are allowed.                                                                                                                                                                                                                                                                                                                    |
| <b>Save login data for devices</b> | When enabled, login credentials do not need to be entered whenever the application is started                                                                                                                                                                                                                                                           |

### 28.3.2.25 Security > SQL Security

Parameter Description of the Tab:

- **SQL Access Password**

| Parameters              | Description                                                     |
|-------------------------|-----------------------------------------------------------------|
| <b>Generate New</b>     | An encrypted SQL password, not known to the user, is generated. |
| <b>Activate default</b> | The default SQL password is activated.                          |

## 28.3.3 Network Interfaces

Functions such as the configuration of the individual interfaces are grouped together under **Network Interfaces**. The interfaces can be configured separately.

### 28.3.3.1 Network Interfaces > Mainboard > Host Name

Parameter Description of Tabs::

- **Editing the Host Name**

| Parameters       | Description                                                                                                                                                                                                                                                                                                                                |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Host Name</b> | Host name of the communication system - optional. Example: <code>commsystem</code><br><br>If the name and IP address of the communication system are stored on a DNS server, name resolution can occur. The name of the communication system is composed of the host name and the domain name. Example: <code>commsystem.mynet.home</code> |

### 28.3.3.2 Network Interfaces > Mainboard > LAN 1 (WAN)

Parameter Description of Tabs:

- **Show LAN 1 Mode**
- **Edit LAN 1 Interface**
- **Edit ACD**

| Parameters                                                                | Description                                                                                                                                                                                                                                                                            |
|---------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Internet Service Provider Selection</b>                                | Selection to determine how access to an ISP (Internet Service Provider) via the WAN interface occurs.                                                                                                                                                                                  |
| <b>Internet Service Provider Selection: Not configured or disabled</b>    | The WAN interface is not used.                                                                                                                                                                                                                                                         |
| <b>Internet Service Provider Selection: LAN Connection Type TCP/IP</b>    | The WAN interface is used for access to an ISP, which is already configured in an external Internet router. The communication system and Internet router do not need to be on the same LAN segment, but the WAN interface must be connected to the LAN segment of the Internet router. |
| <b>Internet Service Provider Selection: T-Online, T-DSL Business, ...</b> | The communication system functions as an Internet router. The WAN interface is used for access to a preconfigured ISP.                                                                                                                                                                 |
| <b>Internet Service Provider Selection: Provider PPPoE</b>                | The communication system functions as an Internet router. The WAN interface is used for access to an ISP using PPPoE. PPPoE is the protocol most commonly used by DSL modems.                                                                                                          |
| <b>Internet Service Provider Selection: Provider PPTP</b>                 | The communication system functions as an Internet router. The WAN interface is used for access to an ISP using PPTP. This variant is common in Austria, for example.                                                                                                                   |
| <b>Internet access via an external Router</b>                             | Access to the Internet occurs via an external router.<br>This flag is internally used by the <b>Internet Configuration</b> wizard and should not be changed.                                                                                                                           |
| <b>Automatic Address Configuration (via DHCP)</b>                         | An external DHCP server (possibly the DHCP server of the Internet router) assigns an IP address to the communication system.                                                                                                                                                           |
| <b>Accept IP Address of the Default Router</b>                            | The external DHCP server communicates the IP address of the default router (e.g., the Internet router) to the communication system.                                                                                                                                                    |
| <b>Accept IP Address of the DNS Server</b>                                | The external DHCP server communicates the IP address of the DNS server to the communication system.                                                                                                                                                                                    |
| <b>Accept IP Address of the SNTP Server</b>                               | The external DHCP server communicates the IP address of the SNTP server to the communication system.                                                                                                                                                                                   |
| <b>IP address</b>                                                         | IP address of the LAN interface.                                                                                                                                                                                                                                                       |
| <b>Subnet Mask:</b>                                                       | Netmask of the LAN segment.                                                                                                                                                                                                                                                            |

## Expert mode

| Parameters                                     | Description                                                                                                                                                            |
|------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>MAC Address</b>                             | Displays the MAC address of the LAN interface.                                                                                                                         |
| <b>Ethernet Link Mode</b>                      | WAN interface mode.                                                                                                                                                    |
| <b>Ethernet Link Mode: Auto</b>                | Automatic switching between 100 and 1000 Mbps full duplex mode.                                                                                                        |
| <b>Ethernet Link Mode: 100HDX</b>              | 100 Mbps, full duplex.                                                                                                                                                 |
| <b>Ethernet Link Mode: 100FDX</b>              | 100 Mbps, full duplex.                                                                                                                                                 |
| <b>Ethernet Link Mode: 1000FDX</b>             | 1000 Mbps, full duplex.                                                                                                                                                |
| <b>NAT</b>                                     | NAT (Network Address Translation) is turned on. This task is usually already assumed by the external router.                                                           |
| <b>Bandwidth Control for Voice Connections</b> | This field enables bandwidth control for voice connections.                                                                                                            |
| <b>Bandwidth for Downloads</b>                 | Value of the full download bandwidth in Kbps provided by the ISP.                                                                                                      |
| <b>Bandwidth for Uploads</b>                   | Value of the full upload bandwidth in Kbps provided by the ISP.                                                                                                        |
| <b>Bandwidth Used for Voice/Fax (%)</b>        | Percentage of bandwidth available for voice/fax connections.<br>Value range, default value: 0 - 100, 80                                                                |
| <b>IEEE802.1p/q Tagging</b>                    | If this check box is selected, a "type of service" is included in the Ethernet packets (Layer 2) for prioritization purposes The option is deactivated by default.     |
| <b>IEEE802.1p/q VLAN ID</b>                    | Enter the VLAN's ID number if the used switch has problems with the default value "0".                                                                                 |
| <b>Layer 2 QoS Class</b>                       |                                                                                                                                                                        |
| <b>Signaling Data</b>                          | Priority class for the connection setup. 0 = lowest priority / 7 = highest priority.<br>Value range, default value: 0 - 7, 3                                           |
| <b>Fax/Modem Payload</b>                       | Priority class for the fax and modem data of the IP connection. 0 = lowest priority / 7 = highest priority.<br>Value range, default value: 0 - 7, 5                    |
| <b>Network Control</b>                         | Priority class for the network control data (transfer of SNMP traps, for example). 0 = lowest priority / 7 = highest priority.<br>Value range, default value: 0 - 7, 0 |
| <b>Voice Payload</b>                           | Priority class for the voice data of the IP connection. 0 = lowest priority / 7 = highest priority.<br>Value range, default value: 0 - 7, 5                            |

| Parameters                                                                                                           | Description                                                                                                                                                                      |
|----------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Internet Access Data for ...</b>                                                                                  |                                                                                                                                                                                  |
| <b>Connection ID / User Name / T-Online number / Subuser Number/Suffix / Internet Access Account / DSL-Login ...</b> | Access data of the Internet Service Provider.                                                                                                                                    |

| <b>Reenter Password</b>                                                                                              | Password for access to the Internet Service Provider.                                                                                                                            |
| <b>IP parameters</b>                                                                                                 |                                                                                                                                                                                  |
| <b>Remote IP Address of the PPP Connection</b>                                                                       | IP address of the ISP server, if the ISP uses a static IP address.                                                                                                               |
| <b>Local IP Address of the PPP Connection</b>                                                                        | IP address that was assigned by your ISP for Internet access.                                                                                                                    |
| <b>IP Address Negotiation</b>                                                                                        | Selection to determine how the connection partners should negotiate the IP address at connection setup.                                                                          |
| <b>IP Address Negotiation: configured IP address</b>                                                                 | Only the configured IP address is possible.                                                                                                                                      |
| <b>IP Address Negotiation: accept any IP address</b>                                                                 | Any address proposed by the partner is accepted.                                                                                                                                 |
| <b>IP Address Negotiation: request new IP address</b>                                                                | A new IP address is requested at each connection.                                                                                                                                |
| <b>DNS Request</b>                                                                                                   |                                                                                                                                                                                  |
| <b>Internet Access with DNS Request</b>                                                                              | The DNS server is determined automatically.                                                                                                                                      |
| <b>IP Address of primary DNS Server</b>                                                                              | A special DNS server is selected.                                                                                                                                                |
| <b>General PPP Parameters</b>                                                                                        |                                                                                                                                                                                  |
| <b>Default Router</b>                                                                                                | The PPP connection created here is used as the routing destination.                                                                                                              |
| <b>IP Header Compression</b>                                                                                         | The TCP header is compressed. UDP and RTP headers are always compressed.                                                                                                         |
| <b>Send LCP Echo Request</b>                                                                                         | An LCP echo request is sent. This function is used to check if the connection is still active.                                                                                   |
| <b>Automatic PPP Reconnection</b>                                                                                    | The PPP connection is automatically reestablished after a connection cleardown (for example, in the case of ISP access with a flat rate and a forced disconnect after 24 hours). |
| <b>PPTP Parameter</b>                                                                                                |                                                                                                                                                                                  |

## Expert mode

| Parameters                                           | Description                                                                                                                                                                                          |
|------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Local IP Address of the Control Connection</b>    | IP address that was assigned by your ISP for the PPTP connection.                                                                                                                                    |
| <b>Remote IP Address of the Control Connection</b>   | IP address of your ISP's server for the PPTP connection.                                                                                                                                             |
| <b>Remote subnet mask for the control connection</b> | Subnet mask that was assigned by your ISP for the PPTP connection.                                                                                                                                   |
| <b>Short Hold</b>                                    |                                                                                                                                                                                                      |
| <b>Short Hold</b>                                    | The "short hold" operating mode is turned on for the PPP connection. The following entry is only possible when short-hold mode is enabled.                                                           |
| <b>Short Hold Time (sec)</b>                         | Length of time without data transmissions after which the PPP connection should be cleared. The short hold timer is only triggered by outgoing packets.<br>Value range, default value: 10 - 9999, 60 |
| <b>Authentication</b>                                |                                                                                                                                                                                                      |
| <b>PPP Authentication</b>                            | PPP authentication is enabled. The setting must be made in accordance with the specifications of the ISP.                                                                                            |
| <b>PPP User Name</b>                                 | Freely selectable user name to be used for authentication via PAP or CHAP.                                                                                                                           |
| <b>PAP Authentication Mode</b>                       | Activation and type of PAP authentication for the PPP connection: Not used, PAP Client, PAP Host.                                                                                                    |
| <b>PAP Password</b>                                  | Password for PAP authentication.                                                                                                                                                                     |
| <b>CHAP Authentication Mode</b>                      | Activation and type of CHAP authentication for the PPP connection: Not used, CHAP Client, CHAP Host, CHAP Client and Host.                                                                           |
| <b>CHAP Password</b>                                 | Password for CHAP authentication.                                                                                                                                                                    |
| <b>Data Compression</b>                              |                                                                                                                                                                                                      |
| <b>DEFLATE Data Compression</b>                      | For the compression of PPP data packets with the compression algorithm DEFLATE.                                                                                                                      |
| <b>COMPRESS Data Compression</b>                     | For the compression of PPP data packets with the compression algorithm COMPRESS.                                                                                                                     |
| <b>Address Translation</b>                           |                                                                                                                                                                                                      |
| <b>NAT</b>                                           | NAT (Network Address Translation) is turned on. The following protocols are supported: TCP, UDP and ICMP (only in passive mode).                                                                     |
| <b>Address Mapping</b>                               | will be dropped according to Mr. Naendorf                                                                                                                                                            |
| <b>Router Settings</b>                               |                                                                                                                                                                                                      |

| Parameters                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Full-Time Circuit</b>                       | Depending on the tariff model, the full-time circuit (permanent connection) to the ISP can be enabled or disabled. The full-time circuit should be disabled for a time-based tariff model and enabled for a flat rate tariff model.                                                                                                                                                                              |
| <b>Short Hold Time (sec)</b>                   | If Full-Time Circuit is disabled (time-based tariff model), enter the duration of inactivity after which the connection is to be dropped (e.g., 60 seconds).<br>Value range, default value: 10 - 9999, 60                                                                                                                                                                                                        |
| <b>Forced Disconnect at (hour:min)</b>         | If Full-Time Circuit is enabled (flat-rate tariff model), enter the time at which the Internet connection is to be deactivated (e.g., 04:59).                                                                                                                                                                                                                                                                    |
| <b>Connection Time</b>                         | Displays the elapsed connection time in days-hours-minutes-seconds.                                                                                                                                                                                                                                                                                                                                              |
| <b>QoS Parameters of Interface</b>             |                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Bandwidth for Downloads</b>                 | Value of the full download bandwidth in Kbps provided by the ISP.                                                                                                                                                                                                                                                                                                                                                |
| <b>Bandwidth for Uploads</b>                   | Value of the full upload bandwidth in Kbps provided by the ISP.                                                                                                                                                                                                                                                                                                                                                  |
| <b>Bandwidth Control for Voice Connections</b> | Bandwidth control prevents the transmission rates available from being overbooked with voice connections within a multi-link connection. In other words, when header compression is active, a maximum of 5 voice connections are permitted over a B channel. This field enables bandwidth control for voice connections. Only voice connections with routes configured in the voice gateway are considered here. |
| <b>Bandwidth Used for Voice/Fax (%)</b>        | Percentage of bandwidth available for voice/fax connections.<br>Value range, default value: 0 - 100, 80                                                                                                                                                                                                                                                                                                          |

| Parameters                                    | Description                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Internet access via an external Router</b> | Access to the Internet occurs via an external router.                                                                                                                                                                                                                                                                                                                     |
| <b>Interface Is Active</b>                    | The LAN interface is enabled.                                                                                                                                                                                                                                                                                                                                             |
| <b>IP address</b>                             | IP address of the communication system.                                                                                                                                                                                                                                                                                                                                   |
| <b>Subnet Mask:</b>                           | Subnet mask of the LAN segment in which the communication system is located.                                                                                                                                                                                                                                                                                              |
| <b>MAC Address</b>                            | Displays the MAC address of the communication system.                                                                                                                                                                                                                                                                                                                     |
| <b>Ethernet Link Mode</b>                     | LAN interface mode.                                                                                                                                                                                                                                                                                                                                                       |
| <b>Ethernet Link Mode: Auto</b>               | Automatic switching between 100 and 1000 Mbps full duplex mode. In this mode, you can enable the power management.<br><br>After migration to V2R3 or later Apply on top must be pressed for the desired ethernet link through the network interface page in order the value to be set to Auto.<br><br>Otherwise, the systems must be set to Auto or 100 before migration. |
| <b>Ethernet Link Mode: 100HDX</b>             | 100 Mbps, full duplex. Power management cannot be enabled in this mode.                                                                                                                                                                                                                                                                                                   |
| <b>Ethernet Link Mode: 100FDX</b>             | 100 Mbps, full duplex. Power management cannot be enabled in this mode.                                                                                                                                                                                                                                                                                                   |
| <b>Ethernet Link Mode: 1000FDX</b>            | 1000 Mbps, full duplex. Power management cannot be enabled in this mode.                                                                                                                                                                                                                                                                                                  |
| <b>IEEE802.1p/q Tagging</b>                   | If this check box is selected, a "type of service" is included in the Ethernet packets (Layer 2) for prioritization purposes The option is deactivated by default.                                                                                                                                                                                                        |
| <b>IEEE802.1p/q VLAN ID</b>                   | Enter the VLAN's ID number only if the used switch has problems with the default value "0".                                                                                                                                                                                                                                                                               |
| <b>Layer 2 QoS Class</b>                      |                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Signaling Data</b>                         | Priority class for the connection setup. 0 = lowest priority / 7 = highest priority.<br><br>Value range, default value: 0 - 7, 3                                                                                                                                                                                                                                          |
| <b>Fax/Modem Payload</b>                      | Priority class for the fax and modem data of the IP connection. 0 = lowest priority / 7 = highest priority.<br><br>Value range, default value: 0 - 7, 5                                                                                                                                                                                                                   |
| <b>Network Control</b>                        | Priority class for the network control data (transfer of SNMP traps, for example). 0 = lowest priority / 7 = highest priority.<br><br>Value range, default value: 0 - 7, 0                                                                                                                                                                                                |

| Parameters           | Description                                                                                                            |
|----------------------|------------------------------------------------------------------------------------------------------------------------|
| <b>Voice Payload</b> | Priority class for the voice data. 0 = lowest priority / 7 = highest priority.<br>Value range, default value: 0 - 7, 5 |

### 28.3.3.4 Network Interfaces > Mainboard > LAN 3 (Admin)

Parameter Description of Tabs::

- **Edit LAN 3 Interface**

| Parameters                                        | Description                                                                                                                         |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <b>Interface Is Active</b>                        | The LAN interface is enabled.                                                                                                       |
| <b>Automatic Address Configuration (via DHCP)</b> | An external DHCP server assigns an IP address to the communication system.                                                          |
| <b>Accept IP Address of the Default Router</b>    | The external DHCP server communicates the IP address of the default router (e.g., the Internet router) to the communication system. |
| <b>Accept IP Address of the DNS Server</b>        | The external DHCP server communicates the IP address of the DNS server to the communication system.                                 |
| <b>Accept IP Address of the SNTP Server</b>       | The external DHCP server communicates the IP address of the SNTP server to the communication system.                                |
| <b>IP address</b>                                 | IP address of the LAN interface.                                                                                                    |
| <b>Subnet Mask:</b>                               | Netmask of the LAN segment.                                                                                                         |
| <b>MAC Address</b>                                | Displays the MAC address of the LAN interface.                                                                                      |
| <b>Ethernet Link Mode</b>                         | LAN interface mode.                                                                                                                 |
| <b>Ethernet Link Mode: Auto</b>                   | Automatic switching between 100 and 1000 Mbps full duplex mode.                                                                     |
| <b>Ethernet Link Mode: 100HDX</b>                 | 100 Mbps, full duplex.                                                                                                              |
| <b>Ethernet Link Mode: 100FDX</b>                 | 100 Mbps, full duplex.                                                                                                              |
| <b>Ethernet Link Mode: 1000FDX</b>                | 1000 Mbps, full duplex.                                                                                                             |

### 28.3.3.5 Network Interfaces > Mainboard > FTP Server

Parameter Description of Tabs::

- **Edit FTP Server Parameters**

| Parameters                      | Description                                                                                                                                        |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Enable FTP Server</b>        | If this check box is selected, the internal FTP server is released.                                                                                |
| <b>Download User 'Phone'</b>    |                                                                                                                                                    |
| <b>Name</b>                     | Name for the access of IP phones to the FTP server to download the latest software updates. The name cannot be changed.                            |
| <b>New password</b>             | Password for the access of IP phones to the FTP server. If the predefined password is changed, the password must also be changed at the IP phones. |
| <b>Confirm Password</b>         | Password for the access of IP phones to the FTP server.                                                                                            |
| <b>Download User 'ftpadmin'</b> |                                                                                                                                                    |
| <b>Name</b>                     | Name of administrator access to the FTP server. The name cannot be changed.                                                                        |
| <b>New password</b>             | Password for administrator access to the FTP server.                                                                                               |
| <b>Confirm Password</b>         | Password for administrator access to the FTP server.                                                                                               |

### 28.3.3.6 Network Interfaces > Mainboard > DHCP Mode

Parameter Description of Tabs::

- **Edit DHCP Mode**

| Parameters              | Description                                                                                                                                                                                                                                                                             |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>No DHCP</b>          | Enabling this radio button disables the internal DHCP server.                                                                                                                                                                                                                           |
| <b>DHCP Server</b>      | Enabling this radio button enables the internal DHCP server.                                                                                                                                                                                                                            |
| <b>DHCP Relay Agent</b> | Enabling this radio button causes the communication system to act as a DHCP relay agent. The DHCP requests of the IP stations are forwarded from the communication system to the actual DHCP server. The DHCP server and the IP stations do not have to be in the same network segment. |

### 28.3.3.7 Network Interfaces > Mainboard > DHCP Mode > DHCP Server > Global Parameters

The network-specific data is transmitted from the DHCP server to the IP stations.

Parameter Description of Tabs::

- **Edit Global Parameters**

| Parameters                | Description                                                                                                             |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>Enable DHCP Server</b> | Indicates that the internal DHCP server is enabled and that its global parameters can be configured. Cannot be changed. |

| Parameters                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Subnet Mask:</b>                     | The subnet mask defines the size of the subnet. Example: 255.255.255.0.                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Broadcast Address</b>                | With the broadcast address, all IP stations of a network or subnet can be addressed by the DHCP server (optional). Example: 0.0.0.0.                                                                                                                                                                                                                                                                                                                         |
| <b>Default Gateway</b>                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Gateway 1</b>                        | IP address under which the default gateway can be reached.<br>If an Internet router is used in the network, the Internet router is the default gateway. Example: 192.168.1.1.<br>If the communication system is directly connected to an Internet modem, the communication system is the default gateway. Example: 192.168.1.2.                                                                                                                              |
| <b>Gateway 2</b>                        | IP address under which a second default gateway (router) can be reached (optional).                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Gateway 3</b>                        | IP address under which a third default gateway (router) can be reached (optional).                                                                                                                                                                                                                                                                                                                                                                           |
| <b>DNS Server</b>                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Domain Name</b>                      | Domain name of the internal network, max. 80 characters, e.g., mynet.home (optional).                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Server 1</b>                         | IP address under which the DNS server can be reached.<br>If the communication system is directly connected to an Internet modem, the default value 0.0.0.0 must not be changed. The communication system uses it to automatically connect to a DNS server from the Internet.<br>An external DNS server can also be entered. Example: the DNS server of the Internet router (192.168.1.1) or a DNS server from the Internet (google-public-dns-a.google.com). |
| <b>Server 2</b>                         | IP address under which a second DNS server can be reached (optional).                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Server 3</b>                         | IP address under which a third DNS server can be reached (optional).                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Lease time in hours (0 infinite)</b> | Maximum validity period in hours, 0 = infinite lifetime (default: 1 hour).                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Enable Dynamic DNS Update</b>        | If this check box is enabled, the DNS server may be dynamically updated. Default: not enabled.<br><br><div style="border: 1px solid black; padding: 5px;"><b>NOTICE:</b> If Dynamic DNS Update option is enabled, it is mandatory to configure <b>Domain Name</b> in IP Address Pool respective Domain name field.</div>                                                                                                                                     |

| Parameters                 | Description                                                                                                                                              |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Use Internal DLI</b>    | If this check box is selected, the internal DLI is used. If is check box is cleared, the parameters for an external DLS server appear. Default: enabled. |
| <b>External DLS Server</b> |                                                                                                                                                          |
| <b>IP address</b>          | IP address under which the external DLS server can be reached.                                                                                           |
| <b>Port</b>                | Port through which the external DLS server can be reached.                                                                                               |

### 28.3.3.8 Network Interfaces > Mainboard > DHCP Mode > DHCP Server > IP Address Pools

Parameter Description of Tabs::

- **Display IP Address Pools**
- **Add IP Address Pool**
- **Edit IP Address Pool**
- **Delete IP Address Pool**

| Parameters             | Description                                                                                                                                                                                                                                                                                                                                |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Subnet address</b>  | The subnet address defines the maximum IP address range.<br>Example: 192.168.1.0.                                                                                                                                                                                                                                                          |
| <b>Subnet Mask:</b>    | The subnet mask defines the size of the subnet. Default setting: 255.255.255.0.                                                                                                                                                                                                                                                            |
| <b>address range</b>   |                                                                                                                                                                                                                                                                                                                                            |
| <b>Address range 1</b> | Lower and upper limits of the IP address range of the subnet.<br>Example: from 192.168.1.50 to 192.168.1.254.                                                                                                                                                                                                                              |
| <b>Address range 2</b> | Lower and upper limits of a second IP address range within the same subnet (optional).                                                                                                                                                                                                                                                     |
| <b>Address range 3</b> | Lower and upper limits of a third IP address range within the same subnet (optional).                                                                                                                                                                                                                                                      |
| <b>Default Gateway</b> |                                                                                                                                                                                                                                                                                                                                            |
| <b>Gateway 1</b>       | IP address under which the default gateway can be reached.<br><br>If an Internet router is used in the network, the Internet router is the default gateway. Example: 192.168.1.1.<br><br>If the communication system is directly connected to an Internet modem, the communication system is the default gateway.<br>Example: 192.168.1.2. |
| <b>Gateway 2</b>       | IP address under which a second default gateway (router) can be reached (optional).                                                                                                                                                                                                                                                        |
| <b>Gateway 3</b>       | IP address under which a third default gateway (router) can be reached (optional).                                                                                                                                                                                                                                                         |

| Parameters                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Broadcast Address</b>                | With the broadcast address, all IP stations of a network or subnet can be addressed by the DHCP server (optional). Default: 0.0.0.0.                                                                                                                                                                                                                                                                                                                                 |
| <b>Domain Name</b>                      | Domain name of the internal network, max. 80 characters, e.g., mynet.home (optional).                                                                                                                                                                                                                                                                                                                                                                                |
| <b>DNS Server</b>                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Server 1</b>                         | IP address under which the DNS server can be reached.<br><br>If the communication system is directly connected to an Internet modem, the default value 0.0.0.0 must not be changed. The communication system uses it to automatically connect to a DNS server from the Internet.<br><br>An external DNS server can also be entered. Example: the DNS server of the Internet router (192.168.1.1) or a DNS server from the Internet (google-public-dns-a.google.com). |
| <b>Server 2</b>                         | IP address under which a second DNS server can be reached (optional).                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Server 3</b>                         | IP address under which a third DNS server can be reached (optional).                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Lease time in hours (0 infinite)</b> | Maximum validity period in hours, 0 = infinite lifetime (default: 1 hour).                                                                                                                                                                                                                                                                                                                                                                                           |

### 28.3.3.9 Network Interfaces > Mainboard > DHCP Mode > DHCP Server > Static IP Addresses

Parameter Description of Tabs::

- **Display Static IP Address**
- **Add Static IP Address**
- **Edit Static IP Address**
- **Delete Static IP Address**

| Parameters               | Description                                                                                                              |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------|
| <b>Hostname</b>          | Name or description of the IP station (e.g., PC or server) that is to receive a fixed IP address. Example: Print Server. |
| <b>IP address</b>        | Desired fixed IP address. Example: 192.168.1.10.                                                                         |
| <b>Client Identifier</b> | MAC address of the IP station.                                                                                           |
| <b>Subnet Mask:</b>      | Netmask of the subnet. Example: 255.255.255.0.                                                                           |
| <b>Default Gateway</b>   |                                                                                                                          |

| Parameters                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Gateway 1</b>                        | IP address under which the default gateway can be reached.<br><br>If an Internet router is used in the network, the Internet router is the default gateway. Example: 192.168.1.1.<br><br>If the communication system is directly connected to an Internet modem, the communication system is the default gateway. Example: 192.168.1.2.                                                                                                                              |
| <b>Default Gateway 1</b>                | IP address under which a second default gateway (router) can be reached (optional).                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Default Gateway 1</b>                | IP address under which a third default gateway (router) can be reached (optional).                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Broadcast Address</b>                | With the broadcast address, all IP stations of a network or subnet can be addressed by the DHCP server (optional). Example: 0.0.0.0.                                                                                                                                                                                                                                                                                                                                 |
| <b>Domain Name</b>                      | Domain name of the internal network, max. 80 characters, e.g., mynet.home (optional).                                                                                                                                                                                                                                                                                                                                                                                |
| <b>DNS Server</b>                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Server 1</b>                         | IP address under which the DNS server can be reached.<br><br>If the communication system is directly connected to an Internet modem, the default value 0.0.0.0 must not be changed. The communication system uses it to automatically connect to a DNS server from the Internet.<br><br>An external DNS server can also be entered. Example: the DNS server of the Internet router (192.168.1.1) or a DNS server from the Internet (google-public-dns-a.google.com). |
| <b>Server 2</b>                         | IP address under which a second DNS server can be reached (optional).                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Server 3</b>                         | IP address under which a third DNS server can be reached (optional).                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Lease time in hours (0 infinite)</b> | Maximum validity period in hours, 0 = infinite lifetime (default: 1 hour).                                                                                                                                                                                                                                                                                                                                                                                           |

### 28.3.3.10 Network Interfaces > Mainboard > DHCP Mode > DHCP Server > Last active Leases

The IP address assigned by a DHCP server remains valid for an IP station until the "lease period" expires, even if the IP station is turned off during that time. The last active assignments are displayed here.

Parameter Description of Tabs::

- **Display Lease**
- **Delete Lease**

| Parameters            | Description                                                                                                     |
|-----------------------|-----------------------------------------------------------------------------------------------------------------|
| <b>IP address</b>     | IP address assigned to the IP station by the DHCP server.                                                       |
| <b>MAC Address</b>    | MAC address of the IP station to which an IP address was assigned.                                              |
| <b>Client ID</b>      | Client ID of the IP station. If the client ID is not available, the MAC address of the IP station is displayed. |
| <b>Hostname</b>       | Name or call number of the IP station to which an IP address was assigned.                                      |
| <b>Start of lease</b> | Start time of the assignment. The IP station is assigned an IP address as of this point in time.                |
| <b>End of lease</b>   | Ending time of the assignment. After this period, the IP station needs to send a new request for an IP address. |

### 28.3.3.11 Network Interfaces > Mainboard > DHCP Mode > DHCP Server > All Leases

The IP address assigned by a DHCP server remains valid for an IP station until the "lease period" expires, even if the IP station is turned off during that time. All assignments are displayed here.

Parameter Description of Tabs::

- **Display Lease**
- **Delete Lease**

| Parameters            | Description                                                                                                     |
|-----------------------|-----------------------------------------------------------------------------------------------------------------|
| <b>IP address</b>     | IP address assigned to the IP station by the DHCP server.                                                       |
| <b>MAC Address</b>    | MAC address of the IP station to which an IP address was assigned.                                              |
| <b>Client ID</b>      | Client ID of the IP station. If the client ID is not available, the MAC address of the IP station is displayed. |
| <b>Hostname</b>       | Name or call number of the IP station to which an IP address was assigned.                                      |
| <b>Start of lease</b> | Start time of the assignment. The IP station is assigned an IP address as of this point in time.                |
| <b>End of lease</b>   | Ending time of the assignment. After this period, the IP station needs to send a new request for an IP address. |

### 28.3.3.12 Network Interfaces > Application Board > Host Name

Parameter Description of Tabs::

- **Editing the Host Name**

| Parameters       | Description                                                                                                                                                                                                                                                                                                           |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Host Name</b> | <p>Host name of the Application Board - freely selectable. Example: applboard</p> <p>If the name and IP address of the Application Board are stored on a DNS server, name resolution can occur. The name of the Application Board is composed of the host name and the domain name. Example: applboard.mynet.home</p> |

### 28.3.3.13 Network Interfaces > Application Board > LAN 1

Parameter Description of Tabs::

- **Edit Lan 1 Interface**

| Parameters                                        | Description                                                                                                                                                                                                                                                             |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Interface Is Active</b>                        | If this check box is selected, the LAN 1 interface of the Application Board is active.                                                                                                                                                                                  |
| <b>Automatic Address Configuration (via DHCP)</b> | If this check box is selected, the IP address and subnet mask are automatically assigned by the DHCP server for the LAN 1 interface. In addition, it is also possible to select whether further network-specific parameters are to be transferred from the DHCP server. |
| <b>Accept IP Address of the Default Router</b>    | If this check box is selected, the IP address of the default router is taken over by the DHCP server.                                                                                                                                                                   |
| <b>Accept IP Address of the DNS Server</b>        | If this check box is selected, the IP address of the DNS server is taken over by the DHCP server.                                                                                                                                                                       |
| <b>Accept IP Address of the SNTP Server</b>       | If this check box is selected, the IP address of the SNTP server is taken over by the DHCP server.                                                                                                                                                                      |
| <b>IP address</b>                                 | IP address under which the Application Board can be reached.                                                                                                                                                                                                            |
| <b>Subnet Mask:</b>                               | Subnet mask under which the Application Board can be reached.                                                                                                                                                                                                           |
| <b>MAC Address</b>                                | MAC address of the Application Board (not editable).                                                                                                                                                                                                                    |
| <b>Ethernet Link Mode</b>                         | Mode of the LAN 1 interface.                                                                                                                                                                                                                                            |
| <b>Ethernet Link Mode: Auto</b>                   | Automatic switching between 100 and 1000 Mbps full duplex mode. In this mode, you can enable the power management.                                                                                                                                                      |
| <b>Ethernet Link Mode: 100HDX</b>                 | 100 Mbps, full duplex. Power management cannot be enabled in this mode.                                                                                                                                                                                                 |
| <b>Ethernet Link Mode: 100FDX</b>                 | 100 Mbps, full duplex. Power management cannot be enabled in this mode.                                                                                                                                                                                                 |
| <b>Ethernet Link Mode: 1000FDX</b>                | 1000 Mbps, full duplex. Power management cannot be enabled in this mode.                                                                                                                                                                                                |

### 28.3.3.14 Network Interfaces > Application Board > LAN 2

Parameter Description of Tabs:

- **Edit Lan 2 Interface**

| Parameters                           | Description                                                                                                                               |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Interface Is Active</b>           | If this check box is selected, the LAN 2 interface of the Application Board is active.                                                    |
| <b>IP address</b>                    | IP address under which the Application Board can be reached.                                                                              |
| <b>Subnet Mask:</b>                  | Subnet mask under which the Application Board can be reached.                                                                             |
| <b>MAC Address</b>                   | MAC address of the Application Board (not editable).                                                                                      |
| <b>Max. Data Packet Size (Bytes)</b> | Maximum packet length in bytes applicable for the IP protocol. Values between 576 and 1500 are permitted.                                 |
| <b>Ethernet Link Mode</b>            | Mode of the LAN 2 interface.                                                                                                              |
| <b>Ethernet Link Mode: Auto</b>      | Full duplex mode. In this mode, you can enable the power management.                                                                      |
| <b>Ethernet Link Mode: 100HDX</b>    | 100 Mbps full duplex. Power management cannot be enabled in this mode.                                                                    |
| <b>Ethernet Link Mode: 100FDX</b>    | 100 Mbps, full duplex. Power management cannot be enabled in this mode.                                                                   |
| <b>Ethernet Link Mode: 1000FDX</b>   | 1000 Mbps, full duplex. Power management cannot be enabled in this mode.                                                                  |
| <b>IEEE802.1p/q Tagging</b>          | If this check box is selected, the Ethernet format used by the Application Board is set. The option is deactivated by default.            |
| <b>IEEE802.1p/q VLAN ID</b>          | Enter a value that differs from the default value "0" as the VLAN's ID number if the switch used has problems with the default value "0". |
| <b>Layer 2 QoS Class</b>             |                                                                                                                                           |
| <b>Signaling data</b>                | Priority class for the connection setup.<br>0 = lowest priority / 7 = highest priority.                                                   |
| <b>Fax/Modem Payload</b>             | Priority class for the fax and modem data of the IP connection.<br>0 = lowest priority / 7 = highest priority.                            |
| <b>Network Control</b>               | Priority class for the network control data (transfer of SNMP traps, for example).<br>0 = lowest priority / 7 = highest priority.         |
| <b>Voice Payload</b>                 | Priority class for the voice data of the IP connection.<br>0 = lowest priority / 7 = highest priority.                                    |

## 28.3.4 Routing

Routing tables are managed under **Routing**. In small networks, a routing table can be set up manually on every router by the administrator. In larger networks, this task is automated with the help of a protocol that distributes routing information in the network.

### 28.3.4.1 Routing > IP Routing > Mainboard > Static Routes

The communication system supports static routes only. Static routes connect two IP devices with each other. They are created manually.

Depending on the application, it may be necessary to set a different routes for the system (mainboard) and the UC Booster Card (Application Board).

Parameter Description of Tabs::

- **Display Static Route Table**
- **Add Static Route**
- **Edit Static Route**
- **Delete Static Route**

| Parameters                       | Description                                                                                                   |
|----------------------------------|---------------------------------------------------------------------------------------------------------------|
| <b>Route Index:</b>              | The route index is automatically assigned and only displayed for information purposes. It cannot be modified. |
| <b>Route Name:</b>               | Name or description of the static route; freely selectable.                                                   |
| <b>Destination Network/Host:</b> | IP address of the destination network.                                                                        |
| <b>Subnet Mask:</b>              | Subnet mask of the destination network.                                                                       |
| <b>Route Gateway:</b>            | IP address of the next router on this route or IP address of the local or remote interface of a PSTN peer.    |

### 28.3.4.2 Routing > IP Routing > Mainboard > Default Router

Depending on the application, it may be necessary to set a different default routing for the system (mainboard) and the UC Booster Card (Application Board).

Parameter Description of Tabs::

- **Edit Default Router**

| Parameters                 | Description                                        |
|----------------------------|----------------------------------------------------|
| <b>Default Routing via</b> | Enable or disable IP routing via a default router. |
| <b>No interface</b>        | Disable IP routing via a default router.           |
| <b>LAN</b>                 | Enable IP routing via a default router.            |

| Parameters                          | Description                                                                                                                                                                          |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>IP Address of Default Router</b> | IP address of the default router, provided <b>LAN</b> is selected as the interface in the <b>Default Routing via</b> field. Example: IP address of the Internet router, 192.168.1.1. |

### 28.3.4.3 Routing > IP Routing > Mainboard > DNS Server

You can display, and where applicable, edit the IP address of the DNS server. The setting is necessary for trunking with dynamic IP addresses.

Parameter Description of Tabs::

- **Edit DNS Settings**

| Parameters                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>IP Address of DNS Server</b> | <p>IP address under which the DNS server can be reached.</p> <p>If the communication system is directly connected to an Internet modem, the default value 0.0.0.0 must not be changed. The communication system uses it to automatically connect to a DNS server from the Internet.</p> <p>An external DNS server can also be entered. Example: the DNS server of the Internet router (192.168.1.1) or a DNS server from the Internet (google-public-dns-a.google.com).</p> <p>In case of an OpenScape Business S system, a system reboot is necessary in order the changes to be applicable.</p> |

### 28.3.4.4 Routing > IP Routing > Application Board > Static Routes

Depending on the application, it may be necessary to set a different routes for the system (mainboard) and the UC Booster Card (Application Board).

Parameter Description of Tabs:

- **Display Static Route Table**
- **Add Static Route**
- **Edit Static Route**
- **Delete Static Route**

| Parameters                       | Description                                                                                                         |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------|
| <b>Route Index:</b>              | The route index is automatically assigned and only displayed for information purposes. It cannot be modified.       |
| <b>Route Name:</b>               | <p>Name or description of the static route; freely selectable (optional)</p> <p>Value range: max. 35 characters</p> |
| <b>Destination Network/Host:</b> | IP address of the destination network.                                                                              |

| Parameters            | Description                                                                                                |
|-----------------------|------------------------------------------------------------------------------------------------------------|
| <b>Subnet Mask:</b>   | Subnet mask of the destination network.                                                                    |
| <b>Route Gateway:</b> | IP address of the next router on this route or IP address of the local or remote interface of a PSTN peer. |

### 28.3.4.5 Routing > IP Routing > Application Board > Default Router

Depending on the application, it may be necessary to set a different default routing for the system (mainboard) and the UC Booster Card (Application Board).

Parameter Description of Tabs::

- **Change Default Router**

| Parameters                          | Description                                                                                                     |
|-------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| <b>Default Routing via</b>          | Enable or disable IP routing via a default router.                                                              |
| <b>No interface</b>                 | Disable IP routing via a default router.                                                                        |
| <b>LAN</b>                          | Enable IP routing via a default router.                                                                         |
| <b>IP Address of Default Router</b> | IP address of the default router, provided LAN is selected as the interface in the "Default Routing via" field. |

### 28.3.4.6 Routing > NAT

NAT rules for network address translation can be displayed, added, edited and deleted. The NAT Table Editor allows you to edit all existing and new NAT entries at once for network address translation.

Parameter Description of Tabs::

- **Add NAT**
- **NAT Table Editor**

| Parameters              | Description                                                                                            |
|-------------------------|--------------------------------------------------------------------------------------------------------|
| <b>NAT Rule Active</b>  |                                                                                                        |
| <b>Description</b>      |                                                                                                        |
| <b>Local IP Address</b> | Local destination address on the LAN.                                                                  |
| <b>Local port</b>       | Enter the port number of the active LAN protocol.                                                      |
| <b>Global Port</b>      | Port number of the active protocol.                                                                    |
| <b>Protocol</b>         | Transport protocol to be used. The set transport protocol applies both for local and global addresses. |

| Parameters           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Protocol: TCP</b> | TCP (Transmission Control Protocol)<br><br>TCP is a reliable, connection-oriented protocol for the transmission of IP packets. Before transfer starts, a virtual channel is set up between the two terminal points. Data can be transmitted in both directions on this channel. TCP is mainly used in the WorldWideWeb and in e-mail and peer-to-peer networks. It is also used for call signaling in IP telephony because it can detect and automatically rectify data losses during transmission.                                                                                                                     |
| <b>Protocol: UDP</b> | UDP (User Datagram Protocol)<br><br>UDP is a reliable, connectionless protocol for the transmission of IP packets. In contrast to TCP/peer scenarios, a virtual channel is not set up before transfer starts so that the PCs can start transferring data without delay. In UDP, the port number of the service that should receive the data is included when addressing voice packets. It is mainly used in the DNS sector and for voice transmission in IP telephony. However, since a connectionless protocol does not check if the peer actually received the data, this option can result in voice transfer losses. |

### 28.3.4.7 Routing > PSTN

These parameters are used to set up an IP remote connection (dial-up) via the traditional telephone network.

Parameter Description of Tabs::

- **Edit Global PSTN Data**

| Parameters                                      | Description                                                                                                                                                                                                                                                                                                  |
|-------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Router Call Number(Internal Call Number)</b> | Used to select the DID number of the system. All applications that use the router function can be reached from an external location via this DID number. External routing partners that do not transfer a station number must each use different call numbers. These station numbers are configured as MSNs. |
| <b>Redialing</b>                                |                                                                                                                                                                                                                                                                                                              |
| <b>Number of Redial Attempts</b>                | Number of redial attempts that should be made by the system to set up a connection<br>Value range: 0 to 255                                                                                                                                                                                                  |
| <b>Pause between Redial Attempts (sec)</b>      | Interval between redial attempts in seconds.<br>Value range: 1 - 1,000                                                                                                                                                                                                                                       |
| <b>Scripting</b>                                |                                                                                                                                                                                                                                                                                                              |

| Parameters                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Identification of User 1 for Scripting</b> | First part of account credentials to log in at Internet providers. The Internet provider requires host, user identification and password entries, for example, Host=ERT005, User=KJUMBERT, Password=123456. The entries are therefore as follows:<br>Identification of User 1 for Scripting: HOST:ERT005 - Identification of User 2 for Scripting: USER:KJUMBERT - New Password for Scripting: PASSWORD:123456. |
| <b>Identification of User 2 for Scripting</b> | Second part of account credentials to log in at Internet providers.                                                                                                                                                                                                                                                                                                                                             |
| <b>New Password for Scripting</b>             | Password to log in at Internet Providers.                                                                                                                                                                                                                                                                                                                                                                       |

### 28.3.4.8 Routing > PSTN > PPP Log

Parameter Description of Tabs:

- **Load via HTTP**

| Parameters  | Description                                                                                                                                                                                  |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Load</b> | The PPP log file can be loaded via HTTP. Depending on your browser settings, you will be prompted to select whether the downloaded log file should be saved or opened in the default editor. |

### 28.3.4.9 Routing > PSTN > PSTN Partner

Parameter Description of Tabs::

- **Add PSTN Peer**
- **Display PSTN Peer**
- **Edit PSTN Peer**

| Parameters                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Peer Name</b>                            | PSTN Peer Name.<br><br>The following PSTN peers are available: <ul style="list-style-type: none"> <li>• Default PSTN - not configurable</li> <li>• PSTN Peer 1: default for CLA, reconfigurable function</li> <li>• PSTN Peer 2: default for ISDN, reconfigurable function</li> <li>• PSTN Peer 3: name and function freely configurable</li> <li>• PSTN Peer 4: name and function freely configurable</li> </ul> Value range: 1 to 14 characters |
| <b>PSTN Connection Type</b>                 | Setup of the PSTN Connection: (Default selection: Enabled).                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>PSTN Connection Type: Not configured</b> | PSTN peers can be preconfigured. However, this setting prevents a connection being set up over this PSTN peer.                                                                                                                                                                                                                                                                                                                                    |

| Parameters                                            | Description                                                                                                                                                                                                                                                       |
|-------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>PSTN Connection Type: Active</b>                   | PSTN peer is enabled. This setting allows a connection to be set up via this PSTN peer.                                                                                                                                                                           |
| <b>PSTN Connection Type: DSL Fallback</b>             | Use of the DSL access for the PSTN connection (the default router is the DSL access)                                                                                                                                                                              |
| <b>IP parameters</b>                                  |                                                                                                                                                                                                                                                                   |
| <b>IP Address of PSTN Peer</b>                        | IP address of the host PC on the peer side, to which the PSTN connection is established.                                                                                                                                                                          |
| <b>IP Address of Local PSTN Interface</b>             | IP address of the local communication system, which is used for the PSTN connection.                                                                                                                                                                              |
| <b>IP Address Negotiation</b>                         | Negotiation of the IP address between the connection partners when setting up the connection.                                                                                                                                                                     |
| <b>IP Address Negotiation: configured IP address</b>  | Only the configured IP address of the PSTN peer is accepted.                                                                                                                                                                                                      |
| <b>IP Address Negotiation: accept any IP address</b>  | No IP address negotiation                                                                                                                                                                                                                                         |
| <b>IP Address Negotiation: request new IP address</b> | The IP address is negotiated                                                                                                                                                                                                                                      |
| <b>General PPP Parameters</b>                         |                                                                                                                                                                                                                                                                   |
| <b>Default Router</b>                                 | The PSTN peer set up here should not only be preconfigured, but also used as a routing destination. There can only be one default router. This is either the DSL access or the PSTN peer set up here.                                                             |
| <b>Internet Access with DNS Request</b>               | The access is to be used for Internet access. Only one Internet access per system may be activated (either a PSTN partner or a DSL connection).                                                                                                                   |
| <b>Service Entry</b>                                  | The Call no. test function should be disabled when calling the MSN of the PSTN peer. The Service Entry function can only be activated if the PSTN peer has an MSN number and a PAP or CHAP authentication has been activated.                                     |
| <b>MSN/DID Number(Internal Call Number)</b>           | Configuration of the MSN number. A station number transferred by the partner must be configured, as otherwise the call is rejected. If, on the other hand, the partner has configured call numbers but does not transfer any, a connection will be set up anyway. |
| <b>B channels</b>                                     | Number of used B channels.<br>Value range: 1 or 2                                                                                                                                                                                                                 |

| Parameters                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Callback</b>                         | A call is rejected, and the peer is then called back immediately. This prevents unauthorized peers from dialing in. The calling station must use the ISDN connection's D channel to transfer the station number and must permit dial-in via the system. This station number must be configured for the outgoing direction at the PSTN peer. If callback is enabled, only outgoing connections from this peer are accepted. A connection cannot be set up if the peer is also a gateway and if callback is also enabled for this connection, since neither of the peers accepts an incoming connection setup. In the case of such a faulty configuration where only "callback without redial" is enabled, this can be detected, and a continuous connection setup can be suppressed. However, the problem is not detected if redial is enabled. |
| <b>V.34 Peer</b>                        | Accept a V.34 Peer (e.g., a modem).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Automatic PPP Reconnection</b>       | The PPP connection is automatically reestablished after a connection cleardown (for example, in the case of ISP access with flat rate and a forced disconnect after 24 hours).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Send LCP Echo Request</b>            | An LCP echo request is sent. This function is used to check if the connection is still active.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Short Hold</b>                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Short Hold</b>                       | The "short hold" operating mode is turned on for the PPP connection. The following entries are only possible when short-hold mode is active.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Short Hold Time (sec)</b>            | Length of time without data transmissions after which the PPP connection should be cleared. The Short Hold Timer is only triggered by outgoing packets.<br>Value range: 10 to 9999                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Short Hold Charge Pulse Analysis</b> | Optimization of the short-hold mode, taking the charge pulse into account. Charge pulse analysis is performed for calls over PPP (evaluation of facility messages with AoC info elements). If the Internet service provider does not supply call charge information, then the default timeout value is set to 0 seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Authentication</b>                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Header Compression</b>                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>IP Header Compression</b>                   | The compression of the IP/TCP or IP/UDP/RTP header is enabled. Header compression improves data transmission in Voice-over-PPP scenarios. All voice packets with UDP port numbers in the set range are compressed.                                                                                                                                                                                                                                  |
| <b>Data Compression</b>                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>DEFLATE Data Compression</b>                | Compression using the DEFLATE algorithm                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>COMPRESS Data Compression</b>               | Compression with the COMPRESS algorithm                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Address Translation</b>                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>NAT</b>                                     | NAT (Network Address Translation) is turned on. The following protocols are supported: TCP, UDP and ICMP (only in passive mode).                                                                                                                                                                                                                                                                                                                    |
| <b>Address Mapping</b>                         | Address mapping is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>QoS Parameters of Interface</b>             |                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Bandwidth Control for Voice Connections</b> | Bandwidth control prevents the transmission rates available from being overbooked with voice connections within a multi-link connection. In other words, when header compression is active, a maximum of 5 voice connections (G.729 / 60 msec or G.723/60 msec) are permitted over a B channel. This field enables bandwidth control for voice connections. Only voice connections with routes configured in the voice gateway are considered here. |
| <b>Bandwidth Used for Voice/Fax (%)</b>        | Percentage of bandwidth available for voice/fax connections. Value range, default value: 0 - 95, 80                                                                                                                                                                                                                                                                                                                                                 |

|--------------|------------------------------------------------------------------------------------|
| <b>Apply</b> | The values for the selected PSTN partners are reset to the factory default values. |

Parameter Description of Tabs::

- **Add Call Number**
- **Change station number**
- **Delete Call Number**

| Parameters                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Call number</b>                         | The call number at which the PSTN peer can be reached. It must be unique within the entire configuration and can comprise up to 22 decimal digits (0 to 9). Hyphens are permitted. Up to five call numbers can be configured for each PSTN peer. A station number is checked as it is being transferred, and calls are only accepted if a PSTN peer is assigned appropriate call authorization for the incoming station number. |
| <b>Call direc.</b>                         | The connection occurs under the phone number entered above.                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Call direc.: Blocked</b>                | The number cannot be used.                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Call direc. : incoming</b>              | The peer may make calls but may not be called.                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Call Direction: outgoing</b>            | The peer may be called but may not make calls.                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Call direc. : Incoming and Outgoing</b> | The peer may be called and can also make calls.                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Delete</b>                              | The dialed station number will be deleted.                                                                                                                                                                                                                                                                                                                                                                                      |

## 28.3.5 LCR

The Least Cost Routing features such as classes of service, dial plans, routing tables, and dial rules are grouped under **LCR**.

### 28.3.5.1 LCR > LCR flags

Parameter Description of the Tab:

- **Edit LCR Flags**

| Parameters                                                                     | Description                                                                                                                                            |
|--------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>LCR Flags</b>                                                               |                                                                                                                                                        |
| <b>Activate LCR</b>                                                            | LCR is activated and thus enables least cost routing.                                                                                                  |
| <b>Reset LCR data</b>                                                          |                                                                                                                                                        |
| <b>Delete the configured LCR data and initialize the LCR with default data</b> | If this radio button is selected, the configured LCR entries (dial plans, routing tables, dial rules) are deleted and replaced by the default entries. |

---

**INFO:** An invalid configuration in the LCR could potentially prevent or restrict outgoing connections.

### 28.3.5.2 LCR > Classes Of Service

Parameter Description of the Tab:

- **Edit LCR Classes of Service**

| Parameters           | Description                                                                                                                                                                     |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Index</b>         | Hierarchical index list                                                                                                                                                         |
| <b>Phone number</b>  | Station number                                                                                                                                                                  |
| <b>Name</b>          | Name of the station                                                                                                                                                             |
| <b>Access groups</b> | Every subscriber is assigned to an LCR class of service (COS) group. By default, all subscribers are entered with the maximum LCR Class of Service (15)<br>Value range: 1 to 15 |

---

**INFO:** A subscriber can only seize a route if his or her COS is greater than or equal to the LCR COS in the routing table.

---

### 28.3.5.3 LCR > Dial Plan

Parameter Description of Tabs::

- **Change Dial Plan**
- **Display Dial Plan**

| Parameters       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Dial Plan</b> | The dial plan is searched for patterns that match the dialed digits. The result is used as a criterion for selecting the route table. At the same time, the system checks if the subscriber's class of service matches for this route. For external connections, each call number including the code (up to a maximum of 24 characters incl. field separators) is checked in the dial plan. The dial plan then determines a route table for the station; the station is assigned this table for the connection setup. Up to 16 routes are created via a single route table. The Dialing rules table defines how the digits selected by the station are converted and dialed by the communication system. |
| <b>Name</b>      | The Name column can be used to assign a name to each profile, e.g., local call, long-distance call, international, etc. Depending on the version of the communication system, the Name column may or may not be displayed. A meaningful name should be selected when assigning names. Multiple instances of the same name may be used. Appropriate names are automatically assigned via the Dial Rule wizard.                                                                                                                                                                                                                                                                                            |

| Parameters              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Dialed digits</b>    | Using this scheme, the call number is evaluated in order to branch to the appropriate route table. The field delimiters C and - as well as the placeholders X, N and Z can be used. Fixed digits 0...9 - Field delimiters (evaluation through the dial rule); X - placeholder for a digit from 0...9; N - placeholder for a digit from 2..9; Z - placeholder for one or more digits until end of dialing; C - simulated dial tone (can be entered a maximum of 3 times) |
| <b>Route table</b>      | The Route table column is used to specify which route table is to be used for the profile. The arrow links to the definition of the respective route table.<br>Value range: 1 to 254, of which 1 to 15 preset                                                                                                                                                                                                                                                           |
| <b>Acc. code</b>        | The checkbox for this column is selected/cleared to determine whether or not an account code entry is mandatory after the seizure code (in the U.S.: after end-of-dialing). When the checkbox is cleared, the account code is not required until the dial plan has been dialed completely if it has been configured for the route.                                                                                                                                      |
| <b>Toll restriction</b> | When selected, the dialed digits are subject to toll restriction (class of service). This applies to networking, as well as to standalone communication systems. With this, individual call numbers can be removed from the toll restriction. If the toll restriction should be applied, the known rules for Allowed/Denied Lists apply.                                                                                                                                |
| <b>Emergency</b>        | If a number that was configured as an emergency number (emergency column checkbox selected) is dialed, and no free line is available, then a line that is being used for a non-emergency number (emergency column checkbox cleared) is disconnected and then made available automatically for the emergency number.                                                                                                                                                     |

### 28.3.5.4 LCR > Routing Table

Parameter Description of Tabs:

- **Change Routing Table**

| Parameters             | Description                                                                                                                                                                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Route tables</b>    | Call numbers defined in the dial plan are assigned an action (choice) here via the route tables.<br>Value range: 254 route tables                                                                                                                                                                                          |
| <b>Index</b>           | The route table is searched from top to bottom in hierarchical order. The system checks to determine whether the route is free and the station has the requisite LCR class of service. If this is the case, dialing occurs in accordance the outdial rule and schedule entered in the route table.<br>Value range: 1 to 16 |
| <b>Dedicated Route</b> | The fixed route that was assigned to the subscriber (e.g., via the route assignment of the multisite management) is used.                                                                                                                                                                                                  |

| Parameters                                | Description                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Route</b>                              | For details on the route to be assigned, see "Trunks/Routing > Routes"<br><br>Default value: Route name configured in the system                                                                                                                                                                                                                                                                          |
| <b>Dial Rule</b>                          | LCR outdial rules can be used to convert the phone numbers entered into random new digit strings for additional processing. Access to different carriers is enabled via digit translation. Definition under "Dial Rule".<br><br>Value range: 254 dial rules                                                                                                                                               |
| <b>min. COS</b>                           | COS describes the minimum LCR class-of-service needed by a station in order to use the associated route. It is thus possible to stipulate, for example, that one station is only permitted to place calls via a specific carrier or during certain times, while other stations have the option of using alternative routes. The value for the maximum class of service is 15.<br><br>Value range: 1 to 15 |
| <b>Warning</b>                            | If the first route selection in the route table is busy, the LCR function advances to the next (possibly more expensive) route configured in the route group table. The system can notify the user of this with an audible signal, an optical signal, or both.<br><br>Value range: None, Tone, Display, Display + Tone                                                                                    |
| <b>Dedicated Gateway</b>                  | This parameter defines the way in which the destination partner node is identified in an IP internetwork.<br><br>Value range: No, Forced, Multi-location                                                                                                                                                                                                                                                  |
| <b>Dedicated Gateway: No</b>              | The partner node is identified by the destination call number.                                                                                                                                                                                                                                                                                                                                            |
| <b>Dedicated Gateway: Forced</b>          | Routed is forced via the gateway that is defined by its node ID in the <b>GW Node ID</b> column.                                                                                                                                                                                                                                                                                                          |
| <b>Dedicated Gateway: Multi-location</b>  | Caller-based determination of the partner node: Routing occurs via the gateway that was assigned to the respective caller via the Multigateway wizard or in the <b>Stations &gt; Edit workpoint client data &gt; Secondary system ID</b> input mask. For callers without a related entry, routing occurs via the gateway that is defined by its node ID in the <b>GW node ID</b> column (default).        |
| <b>GW Node ID</b>                         | Specifies the gateway node ID for the <b>Forced</b> or <b>Multi-location</b> options of the <b>Dedicated Gateway</b> parameter.                                                                                                                                                                                                                                                                           |
| <b>Buttons</b>                            |                                                                                                                                                                                                                                                                                                                                                                                                           |
| Blue arrow in the <b>Dial Rule</b> column | Displays the page with the <b>Dial Rule</b> parameters.                                                                                                                                                                                                                                                                                                                                                   |

### 28.3.5.5 LCR > Dial Rule

Parameter Description of the Tab:

- **Edit Outdial Rule**

| Parameters              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                         | LCR outdial rules can be used to convert the phone numbers entered into random new digit strings for additional processing. Access to different carriers is enabled via digit translation. The dial rule used is defined by the route table entry.                                                                                                                                                                                                                 |
| <b>Rule Name</b>        | Freely definable name of the dial rule; some dial rules are predefined<br>Value range: max. 16 characters                                                                                                                                                                                                                                                                                                                                                          |
| <b>Dial rule format</b> | Program for the digits to be dialed. The individual program steps are processed from left to right. The characters for the program code represent the following functions:                                                                                                                                                                                                                                                                                         |
| <b>A</b>                | Repeat remaining fields (transmit). The letter "A" causes all subsequent digit fields to be transmitted. The point of reference is the last field delimiter in the field of dialed digits in the dial plan. If "A" is entered without an explicit reference, it designates all digits after the access code, i.e., "A" is then equivalent to "E2A"                                                                                                                 |
| <b>B</b>                | It is used for the multi-gateway network when a station number of type TON (Type Of Number) that was called from outside is "unknown" and must be routed to the multi-gateway node. To ensure that this station number is unique, it is extended to national or international in accordance with the TON in the LCR. This is required when the DID numbers are not unique and need to be configured in the national or international format.                       |
| <b>D (n)</b>            | Dial digit sequence (1 to 25 digits). "D" may occur multiple times and at any position in the string.                                                                                                                                                                                                                                                                                                                                                              |
| <b>E (n)</b>            | Transmit field contents (1 to 10). "E" may occur multiple times and at any position in the string. "E" can also appear in any order with relation to (n). A specific field can be addressed multiple times, including in sequence. With the exception of "E1" (access code), this letter may be surrounded by any other parameters. With digit-by-digit dialing (as opposed to en-bloc dialing), the last element in the outdial rule must not be E(n), but E(n)A. |
| <b>M (n)</b>            | Authorization code (1 to 16). This letter must not be in the final position.                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>P (n)</b>            | P (n) can occur more than once in the string and can be placed in any position. P (n) can be surrounded by any other parameters.(1 to 60 times the system-wide pause unit).                                                                                                                                                                                                                                                                                        |
| <b>S</b>                | Switch, changes signaling methods from DP to DTMF (with CONNECT, PROGRESS or CALL PROC with PI). The letter "S" may occur in the string only once and must not be in the final position. The "C" parameter cannot be used after "S".                                                                                                                                                                                                                               |
| <b>C</b>                | Carrier "C" can be inserted in the string only once. The subsequent characters are transmitted without a dial pause and are used for single stage, two-stage, DICS (not for U.S.), BRI, and PRI carrier access.                                                                                                                                                                                                                                                    |

| Parameters                                      | Description                                                                                                                                                                                                                                                                                                     |
|-------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>U</b>                                        | Use subaddress signaling method. The letter "U" may occur in the string only once and must not be in the final position. The "S", "P", "M", and "C" parameters cannot be used after "U".                                                                                                                        |
| <b>N (n) (only for the U.S.!)</b>               | Network SFG (1 to 5) or Band Number (1).                                                                                                                                                                                                                                                                        |
| <b>L (for U.S. only!):</b>                      | "L" must only occur at the end of a string of characters. "L" causes the call to be handled as an emergency call.                                                                                                                                                                                               |
| <b>Network provider's method of access</b>      | Selection of the respective network provider                                                                                                                                                                                                                                                                    |
| <b>Unknown</b>                                  | No explicit specification about a network carrier.                                                                                                                                                                                                                                                              |
| <b>Main network supplier</b>                    | When seizing a trunk using the main network supplier, simplified dialing into the public network is performed by en-bloc dialing or by dialing individual digits.                                                                                                                                               |
| <b>MCL Single Stage</b>                         | With MCL Single Stage, a prefix is used to dial the desired network carrier, and the station number is then dialed. Dialing occurs in the D channel for ISDN or as normal dialing for MSI.                                                                                                                      |
| <b>MCL Two-Stage</b>                            | With MCL Two Stage, a prefix is used to dial the desired network carrier. After a synchronization phase, a configurable authorization code is initially sent, followed by the destination call number as DTMF digits. With synchronization during timeout, you must program a pause of 2 to 12 seconds.         |
| <b>Corporate Network</b>                        | A corporate network is directly connected to OpenScape Business. The LCR function determines the appropriate trunk group based on the station number dialed and then routes the call either via the trunk group in the public exchange or via the trunk group in the corporate network.                         |
| <b>Dial-In Control Server</b>                   | With this type of LCR, the desired network carrier is dialed with a prefix via a dial-in control server, and the call number and configurable authorization code are transmitted in the subaddress. Dialing occurs in the D channel.                                                                            |
| <b>Primary Rate Interface (PRI) (U.S. only)</b> | In the case of the Primary Rate Interface, the selection of the network carrier or of a calling service is encoded in SETUP message using following information elements: Network Specific Facility, Operator System Access and Transit Network Selection.                                                      |
| <b>Type</b>                                     | Type Of Number [TON];fFor each dial rule, the following types of number from "Called Party Number" can be selected from the drop-down list: PABX number, local area code, country code. "Unknown" is the default entry. The type of number is only set in E.164. In a network, parameters are set to "Unknown". |

### 28.3.5.6 LCR > Multisite

Parameter Description of the Tab:

- **Change area**

| Parameters             | Description                                                                                                                                                                                          |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Area Code</b>       | Enter the area code for a site (incl. a leading zero, e.g., 069 for Frankfurt and 030 for Berlin). Different area codes or even the same area code may be entered.                                   |
| <b>Area</b>            | Entry of the name for a site (e.g., the cities matching the area codes, i.e., Frankfurt and Berlin, for example, or department designations such as Service and Sales if the area code is the same). |
| <b>Dedicated Route</b> | Selection of the route or ITSP registration for this site.                                                                                                                                           |
| <b>Delete</b>          | Deletes the selected site entries.                                                                                                                                                                   |
| <b>Buttons</b>         |                                                                                                                                                                                                      |
| <b>Save</b>            | Saves the changes.                                                                                                                                                                                   |

Parameter Description of the Tab:

- **Edit stations/groups**

| Parameters             | Description                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Area</b>            | Selection of the site for the station or group.                                                                                                                                                                                                                                                                                                                                                       |
| <b>Dedicated Route</b> | Selection of the route or ITSP registration for the station or group.                                                                                                                                                                                                                                                                                                                                 |
| <b>Search</b>          | <p>Search for stations and groups by entering the search term in the search fields <b>Call no</b>, <b>DID</b> or <b>Name</b> and then pressing the Return key. All stations and groups are listed if all search fields are left empty, and the Return key is pressed.</p> <p>The <b>Type</b> option can be used to display all station types (e.g., <b>SIP Clients</b> or <b>System Clients</b>).</p> |

## 28.3.6 Voice Gateway

The functions for IP telephony are grouped together under **Voice Gateway**.

### 28.3.6.1 Voice Gateway > SIP Parameters

Parameter Description of Tabs::

- **Edit SIP Parameters**

| Parameters                    | Description                                                                                                    |
|-------------------------------|----------------------------------------------------------------------------------------------------------------|
| <b>SIP Transport Protocol</b> |                                                                                                                |
| <b>SIP via TCP</b>            | "Transmission Control Protocol". TCP is a mandatory transport protocol for SIP and cannot be deactivated here. |

| Parameters                                             | Description                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>SIP via UDP</b>                                     | "User Datagram Protocol". UDP is the default transport protocol for SIP, but may be disabled if no endpoint/trunk/ITSP is using it. It is strongly recommended to keep UDP enabled.                                                                                                                                                                                                    |
| <b>SIP via TLS</b>                                     | "Transport Layer Security". TLS is the secure transport protocol for SIP and cannot be deactivated here.                                                                                                                                                                                                                                                                               |
| <b>SIP registrar</b>                                   |                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Period of registration (sec)</b>                    | Interval (in seconds) at which the registration of a SIP endpoint must be repeated. The value of the interval must not be set too high because registration is used to determine if an endpoint is out of service. (Registration period for ITSP trunks is configured in the ITSP profiles).<br>Value range, default value: 10 - 86400, 120                                            |
| <b>RFC 3261 Timer Values</b>                           |                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Transaction Timeout (msec)</b>                      | Specifies the wait time, in milliseconds, before a retransmission of the invite response for timer D for the RFC 3261 specification. This setting is relevant for the invite client transaction.<br>Value range, default value: 2000 - 64000, 32000                                                                                                                                    |
| <b>SIP Session Timer</b>                               |                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>RFC 4028 support</b>                                | RFC 4028 defines an expansion of the Session Initiation Protocol (SIP). This expansion allows a periodic refresh of SIP sessions. The user agents and the proxies can use the refresh to determine, whether the SIP session is still active. The configuration option here is used to control the session refresh on the trunking interface (for ITSPs see the corresponding profile). |
| <b>Session Expires (sec)</b>                           | Defines the duration of a SIP session interval. The default value is "1800".<br>The configured value is used for trunking and ITSP interfaces.<br>Value range, default value: 90 - 65535, 1800                                                                                                                                                                                         |
| <b>Minimal SE (sec)</b>                                | Defines the shortest duration of a SIP session interval that is allowed.<br>The configured value is used for trunking and ITSP interfaces.<br>Value range, default value: 90 - 65535, 90                                                                                                                                                                                               |
| <b>DNS Records</b>                                     |                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Blocking time for unreachable destination (sec)</b> | This timer is used to control the Blacklist of the SIP stack. If a SIP server resolved through DNS is unreachable it will be blocked for the time configured here. The default value is 60 sec. In cases where redundant servers are used (e.g. DNS results in multiple servers) a higher value is recommended (e.g. 900).                                                             |
| <b>Provider Calls</b>                                  |                                                                                                                                                                                                                                                                                                                                                                                        |

| Parameters                             | Description                                                                                                                                                                    |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Maximum possible Provider Calls</b> | The number of simultaneous calls via all activated providers is displayed here. This value is configured during setup depending on available bandwidth and ITSP configuration. |

### 28.3.6.2 Voice Gateway > ITSP Loc-ID Settings

Parameter Description of Tabs:

- Add ITSP Location Info

The ITSP location Info is used in the SIP protocol to inform the receiver of an emergency call about the geographical origin of the call. In the SIP protocol the format of location-ID info is defined RFC4119 & RFC5139 (XML coded Location object in the MIME body). The ITSP Loc-ID allows for defining all fields defined in the relevant RFCs whereas in your specific deployment only a subset of these data needs to be configured. (e.g. in Switzerland only the NAM field is used to define a location). The data required to define a location are provided by your ITSP.

| Parameters         | Description                                                 |
|--------------------|-------------------------------------------------------------|
| <b>Loc-ID Name</b> | The name of the Location ID.                                |
| <b>Country</b>     | The country is identified by the two-letter ISO 3166 code.  |
| <b>A1</b>          | National subdivisions (state, region, province, prefecture) |
| <b>A2</b>          | County, parish, gun, district                               |
| <b>A3</b>          | City, township, shi                                         |
| <b>A4</b>          | City division, borough, city district, ward, chou           |
| <b>A5</b>          | Neighborhood, block                                         |
| <b>A6</b>          | Street                                                      |
| <b>PRD</b>         | Leading street direction                                    |
| <b>POD</b>         | Trailing street suffix                                      |
| <b>STS</b>         | Street suffix                                               |
| <b>HNO</b>         | House number, numeric part only                             |
| <b>HNS</b>         | House number suffix                                         |
| <b>LMK</b>         | Landmark or vanity address                                  |
| <b>LOC</b>         | Additional location information                             |
| <b>FLR</b>         | Floor                                                       |
| <b>NAM</b>         | Name (residence, business or office occupant).              |
| <b>PC</b>          | Postal code                                                 |
| <b>ROOM</b>        | Room                                                        |

| Parameters                        | Description                                                     |
|-----------------------------------|-----------------------------------------------------------------|
| <b>PLC</b>                        | Place - type                                                    |
| <b>PCN</b>                        | Postal community name                                           |
| <b>POBOX</b>                      | Post office box                                                 |
| <b>ADDCODE</b>                    | Additional Code                                                 |
| <b>SEAT</b>                       | Seat (desk, cubicle, workstation)                               |
| <b>RD</b>                         | Primary road or street                                          |
| <b>RDSEC</b>                      | Road section                                                    |
| <b>RDBR</b>                       | Road branch                                                     |
| <b>RDSUBBR</b>                    | Road sub-branch                                                 |
| <b>PRM</b>                        | Road pre-modifier                                               |
| <b>POM</b>                        | Road post-modifier                                              |
| <b>Activate Advanced Settings</b> | When activated the advanced parameter fields can be configured. |
| <b>BLD</b>                        | Building (structure)                                            |
| <b>UNIT</b>                       | Unit (apartment, suite)                                         |

### 28.3.6.3 Voice Gateway > Codec Parameters

Parameter Description of Tabs:

- **Edit Codec Parameters**

| Parameters                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Codec</b>                             | The parameters for the G.711 A-law, G.711 $\mu$ -law, G.729A and G.729AB codecs can be edited.                                                                                                                                                                                                                                                                                                                                |
| <b>Codec: G.711 A-law</b>                | G.711 (A-law and $\mu$ -law): voice encoding at 56 or 64 Kbps - very high voice quality. G.711 is also used in fixed networks (ISDN). The A-law method is a digitization technique that is used primarily in Europe for analog audio signals in the telecommunications sector.                                                                                                                                                |
| <b>Codec: G.711 <math>\mu</math>-law</b> | G.711 (A-law and $\mu$ -law): voice encoding at 56 or 64 Kbps - very high voice quality. G.711 is also used in fixed networks (ISDN). In North America and Japan, the $\mu$ -law method, which is similar to the A-law, but not compatible, is used. In order to communicate, e.g., during a telephone conversation between Europe and the United States, the digital data must be translated through appropriate converters. |
| <b>Codec: G.729A</b>                     | Voice encoding at 8 Kbps.                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Codec: G.729AB</b>                    | Voice encoding at 8 Kbps. Speech pauses filled in with comfort noise.                                                                                                                                                                                                                                                                                                                                                         |

| Parameters                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Priority</b>                                    | The audio codecs can be assigned priorities between 1 (high) and 4 (low). The communication automatically tries to use the audio codec with the highest priority available for every connection. Using an audio codec with low voice compression (good voice quality) increases network load. In the case of intensive IP telephony, this can lead to diminished voice quality in a network already overloaded by data transfers.                                                                                                                                                                                                                                                                                          |
| <b>Voice Activity Detection</b>                    | Enable Voice Activity Detection (VAD). This can reduce network load during long voice pauses.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Frame Size</b>                                  | You can specify a frame size (IP packet size) of 10 to 90 msec for every codec. This specifies the sampling rate at which the audio codec splits the voice signal into IP packets. While a higher value (90 msec, for instance) results in a better relationship between payload and the IP packet overhead, it also increases the transfer delay. The adjustable values depend on the codecs. For networking of OpenScape Business with OpenScape Voice via SIP-Q V2: Cordless IP and OpenScape Mobile Connect only support a frame size of 20 ms for the G.711 codec. If one of these two products is present in the internetwork, the frame size must be to 20 ms here.<br>Value range, default value: 10 - max. 90, 20 |
| <b>Enhanced DSP Channels</b>                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Use G.711 only</b>                              | Only the G.711 A-law and G.711 $\mu$ -law protocols are used. With G.711, fewer DSP resources are required, so more simultaneous calls are possible.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>T.38 Fax</b>                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>T.38 Fax</b>                                    | Defines whether or not the T.38 Fax protocol is to be used.<br><br>For system with Booster Card and/or Booster Server: When this flag is activated, error correction is performed in the T.38 protocol. A pop up window is displayed to notify the user that a manual System or OCAB / Booster Server restart is required.                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Use FillBitRemoval</b>                          | Defines whether or not fill bits should be deleted on sending and restored on receiving when using the T.38 Fax protocol. This makes it possible to save bandwidth.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Max. UDP Datagram Size for T.38 Fax (bytes)</b> | Shows the maximum size of a T.38 UDP datagram in bytes.<br>Value range, default value: 1 - 1472, 1472                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Error Correction Used for T.38 Fax (UDP)</b>    | Defines which method is to be used for error correction.<br>Values: t38UDPFEC, t38UDPRedundancy<br><br>For system with Booster Card and/or Booster Server: When an option is selected, a pop up window is displayed to notify the user that a manual System or OCAB / Booster Server restart is required.<br><br>Default value: t38UDPRedundancy                                                                                                                                                                                                                                                                                                                                                                           |
| <b>T.30 Fax</b>                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Parameters                                                              | Description                                                                                                                                                                                                                                                                                       |
|-------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Enable ECM</b>                                                       | For system with Booster Card and/or Booster Server: When this flag is activated, error correction is performed in the T.30 protocol. A pop up window is displayed to notify the user that a manual System or OCAB / Booster Server restart is required.<br>Default value: enabled                 |
| <b>VoIP compatibility mode</b>                                          | For system with Booster Card and/or Booster Server: This flag should be activated if you encounter problems with fax transmission in VoIP networks. A pop up window is displayed to notify the user that a manual System or OCAB / Booster Server restart is required.<br>Default value: disabled |
| <b>Misc.</b>                                                            |                                                                                                                                                                                                                                                                                                   |
| <b>ClearChannel</b>                                                     | A ClearChannel is an open channel in which the endpoints are responsible for the protocol in the channel. The parameter defines whether or not the ClearChannel interface functionality is to be enabled.                                                                                         |
| <b>Frame Size</b>                                                       | You can set the sampling rate in this field. Possible settings are 10, 20, 30, 40, 50, and 60 milliseconds (msec).<br>Value range, default value: 10 - 60, 20                                                                                                                                     |
| <b>RFC2833</b><br>RFC2833 defines how the tone signals are transmitted. |                                                                                                                                                                                                                                                                                                   |
| <b>Transmission of Fax/Modem Tones according to RFC2833</b>             | Outband transmission (via SIP signaling); recommended operating mode to transmit tones securely                                                                                                                                                                                                   |
| <b>Transmission of DTMF Tones according to RFC2833</b>                  | Outband transmission (via SIP signaling); recommended operating mode to transmit tones securely                                                                                                                                                                                                   |
| <b>Payload Type for RFC2833</b>                                         | Adaptation may be required, depending on the communication partner<br>Value range, default value: 96 - 126, 98                                                                                                                                                                                    |
| <b>Redundant Transmission of RFC2833 Tones according to RFC2198</b>     | Serves to increase the transmission reliability                                                                                                                                                                                                                                                   |

#### 28.3.6.4 Voice Gateway > Destination Codec Parameters

Priorities for the use of audio codecs can be defined for specific communication partners.

Parameter Description of Tabs::

- **Add Destination Codec Parameters**

| Parameters                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Codec: G.711 A-law</b>                | G.711 (A-law and $\mu$ -law): voice encoding at 56 or 64 Kbps - very high voice quality. G.711 is also used in fixed networks (ISDN). The A-law method is a digitization technique that is used primarily in Europe for analog audio signals in the telecommunications sector.                                                                                                                                                    |
| <b>Codec: G.711 <math>\mu</math>-law</b> | G.711 (A-law and $\mu$ -law): voice encoding at 56 or 64 Kbps - very high voice quality. G.711 is also used in fixed networks (ISDN). In North America and Japan, the $\mu$ -law method, which is similar to the A-law, but not compatible, is used. In order to communicate, e.g., during a telephone conversation between Europe and the United States, the digital data must be translated through appropriate converters.     |
| <b>Codec: G.729A</b>                     | Voice encoding at 8 Kbps.                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Codec: G.729AB</b>                    | Voice encoding at 8 Kbps. Speech pauses filled in with comfort noise.                                                                                                                                                                                                                                                                                                                                                             |
| <b>Priority</b>                          | The audio codecs can be assigned priorities between 1 (high) and 4 (low). The communication automatically tries to use the audio codec with the highest priority available for every connection. Using an audio codec with low voice compression (good voice quality) increases network load. In the case of intensive IP telephony, this can lead to diminished voice quality in a network already overloaded by data transfers. |
| <b>Destination</b>                       |                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Destination Address Type</b>          | Displays the type of destination to which the set priorities of the audio codecs are to be assigned.                                                                                                                                                                                                                                                                                                                              |
| <b>IP address</b>                        | IP address of the destination to which the set priorities of the audio codecs apply (e.g., networked node, SIP server)                                                                                                                                                                                                                                                                                                            |

### 28.3.6.5 Voice Gateway > Internet Telephony Service Provider

Parameter Description of Tabs:

- **Add Internet Telephony Service Provider**
- **Edit Internet Telephony Service Provider**
- **Delete Internet Telephony Service Provider**

| Parameters             | Description                                                                                                                                                                                   |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Base Template</b>   | Selection of an empty template (default) or a predefined sample configuration for a particular service provider. This can be adapted to meet individual requirements and saved as a new ITSP. |
| <b>Provider Name</b>   | Desired name of the ITSP. The configured ITSP will appear in the list of ITSPs under this name.                                                                                               |
| <b>Enable Provider</b> | The ITSP is activated.                                                                                                                                                                        |

| Parameters                                       | Description                                                                                                                                                                                                                                                                                                                                            |
|--------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Provider Identifier in System</b>             | Assignment of a unique designation in the system. A maximum of 8 ITSPs may be active simultaneously.<br>Value range: Providers 1-8                                                                                                                                                                                                                     |
| <b>Domain Name</b>                               | Gateway Domain Name of the ITSP Often not identical with the web domain name.                                                                                                                                                                                                                                                                          |
| <b>Transport protocol</b>                        | Desired transport protocol. udp or tcp can be selected.                                                                                                                                                                                                                                                                                                |
| <b>Transport security</b>                        | The possible values are <b>traditional (udp or tcp)</b> for traditional call using udp/tcp or <b>secure (tls)</b> for secure call using TLS.<br>Default value: traditional (udp or tcp)                                                                                                                                                                |
| Media security                                   | The possible values are <b>RTP only</b> (only AVP profile is supported) or <b>SDES only</b> (only SAVP profile is supported).<br>Default value: RTP only                                                                                                                                                                                               |
| <b>Provider Registrar</b>                        |                                                                                                                                                                                                                                                                                                                                                        |
| <b>Use Registrar</b>                             | Must be selected if the trunk works with registration (default = off).                                                                                                                                                                                                                                                                                 |
| <b>IP Address / Host name</b>                    | Host name or IP address of the external Registrar server.                                                                                                                                                                                                                                                                                              |
| <b>Port</b>                                      | Port number of the external Registrar server, e.g., 5060. Enter port 00 if the ITSP uses DNSSRV.                                                                                                                                                                                                                                                       |
| <b>Reregistration Interval at Provider (sec)</b> | Interval (in seconds) at which ITSP registration is repeated. The value of the interval must not be 0 and must not be set too high because on repeating the registration at the ITSP, a dropped connection can also be detected, and an alternate route (via ISDN or an alternate Provider) may be selected if required.<br>Default value: 120 seconds |
| <b>Provider Proxy</b>                            |                                                                                                                                                                                                                                                                                                                                                        |
| <b>IP Address / Host name</b>                    | Domain name or IP address of the proxy server (e.g., sip-voice.de). The entry is mandatory and is usually identical to the provider registrar entry.                                                                                                                                                                                                   |
| <b>Port</b>                                      | Port number of the proxy server (e.g., 5060). As a rule, this is identical with the Provider port number. Enter port 0 if the ITSP uses multiple servers and DNSSRV.                                                                                                                                                                                   |
| <b>Provider Outbound Proxy</b>                   |                                                                                                                                                                                                                                                                                                                                                        |
| <b>Use Outbound Proxy</b>                        | Only set if the ITSP uses an outbound proxy that is different from the provider proxy.                                                                                                                                                                                                                                                                 |
| <b>IP Address / Host name</b>                    | Domain name or IP address of the outbound proxy.                                                                                                                                                                                                                                                                                                       |
| <b>Port</b>                                      | Port number of the outbound proxy. Enter port 0 if the ITSP uses multiple servers and DNSSRV.                                                                                                                                                                                                                                                          |

Parameter Description of Tabs:

- **Edit STUN Configuration**

| Parameters                                         | Description                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>STUN Mode</b>                                   | This setting applies globally to all ITSPs, provided STUN is enabled for them. Whether STUN is needed or not depends on the ITSP infrastructure and the Internet router used. STUN is not required if the ITSP resolves NAT traversal on its own network. STUN ensures that the publicly accessible IP address is used in SIP messages instead of the internal IP address. |
| <b>STUN Mode: Always</b>                           | STUN is always active.                                                                                                                                                                                                                                                                                                                                                     |
| <b>STUN Mode: Automatic</b>                        | The NAT type of the router to the Internet is checked automatically. If STUN is required, it is enabled. If no STUN is required or possible, STUN is disabled. This is the recommended default setting.                                                                                                                                                                    |
| <b>STUN Mode: Use static IP</b>                    | If the ITSP requires static IP authentication, a static IP address (public IP address) is required in the DSL modem or Internet router. The static IP address and port must be specified in addition.                                                                                                                                                                      |
| <b>STUN Mode: Use static IP, Public IP Address</b> | Static IP address of the DSL modem or the Internet router.                                                                                                                                                                                                                                                                                                                 |
| <b>STUN Mode: Use static IP, Public SIP Port</b>   | Port of the DSL modem or the Internet router.                                                                                                                                                                                                                                                                                                                              |
| <b>STUN Mode: Port Preserving router</b>           | If none of the STUN modes mentioned above work, this mode should be tried. Some modems and Internet routers do not change the RTP port for NAT and need this mode for proper operation.                                                                                                                                                                                    |
| <b>Detected Nat-Type</b>                           | If an ITSP is active, the NAT type will be shown here.                                                                                                                                                                                                                                                                                                                     |
| <b>Default STUN Server</b>                         |                                                                                                                                                                                                                                                                                                                                                                            |
| <b>IP address / Host name</b>                      | IP address or host name of the STUN server (e.g., <code>stun.serviceprovider.com</code> ).<br><br>This STUN server is used for SIP@Home when no ITSP is being used or if the used ITSP does not offer any STUN server.                                                                                                                                                     |
| <b>Port</b>                                        | Port of the STUN server (e.g., 3478)                                                                                                                                                                                                                                                                                                                                       |

|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Internet Telephony Station</b> | Access data of the account assigned by the ITSP. Depending on the ITSP, different designations are used for this, for example: SIP User, SIP ID, etc. You may also need to enter the ITSP customer number here. If static IP authentication is used, the PABX number must be entered here. |
| <b>Authorization name</b>         | Authorization name assigned by the ITSP. This is often identical to the Internet telephony subscriber.                                                                                                                                                                                     |
| <b>Password</b>                   | Password assigned by the ITSP. Depending on the ITSP, different designations are used for this, for example: Password, SIP Password, etc.                                                                                                                                                  |
| <b>Confirm Password</b>           | Password assigned by the ITSP. Depending on the ITSP, different designations are used for this, for example: Password, SIP Password, etc.                                                                                                                                                  |

Parameter Description of Tabs:

- **Add MSN Entry**
- **Edit MSN Entry**
- **Delete MSN Entry**
- **Delete All MSN Entries**

| Parameters                                                                                                 | Description                                                                                                                                                                                                            |
|------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Internet Telephony Phone Number / Internet Telephony Phone Number / Internet Telephony Phone Number</b> | (Single) Call number assigned by the ITSP.                                                                                                                                                                             |
| <b>DID / Internal call number</b>                                                                          | Assigned internal call number.                                                                                                                                                                                         |
| <b>Default Entry</b>                                                                                       | Activation as a default entry allows users who do not have their own Internet telephony phone number to make calls via this number. The option can be selected only for an MSN. (only for voice call support, not fax) |
| <b>Internet Telephony Station / Internet telephony station</b>                                             | Displays the Internet telephony station                                                                                                                                                                                |

Parameter Description of Tabs:

- **Add DID Range**
- **Edit DID Range**
- **Delete DID Range**

| Parameters                                    | Description                                               |
|-----------------------------------------------|-----------------------------------------------------------|
| <b>PABX number</b>                            | Head number assigned by the ITSP (without the DID number) |
| <b>Direct inward dialing band from ... to</b> | Range of DID numbers assigned by the ITSP                 |

| Parameters                                                         | Description                                                                                                                                               |
|--------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Begin of internal Call Number range</b>                         | First internal number as of which an automatic assignment of call numbers is desired.                                                                     |
| <b>Assign direct inward dialing band automatically to stations</b> | If selected, the DID numbers are assigned automatically in ascending order to the internal call numbers, and the corresponding MSN entries are generated. |

### 28.3.6.6 Voice Gateway > Networking > Nodes

Parameter Description of Tabs::

- **Add Networking Node**
- **Edit Networking Node**
- **Delete Networking Node**

| Parameters                               | Description                                                                                                                                                                                                              |
|------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Node ID</b>                           | Only for manual configuration without a wizard, e.g., for open numbering: entry of a node number that is unique in the network.                                                                                          |
| <b>IP address</b>                        | Only for manual configuration without a wizard, e.g., for open numbering: IP address of the node                                                                                                                         |
| <b>Node Monitoring</b>                   | The selection of node monitoring causes a periodic review of the communication with the node. As a prerequisite, node monitoring must also be enabled in the other node.                                                 |
| <b>Security Level of Node Encryption</b> | Encryption for voice communication with the node is enabled by selecting "secure". To do this, "Signaling and Payload Encryption" must be additionally configured in the system.<br><br>Value range: traditional, secure |

### 28.3.6.7 Voice Gateway > Networking > Routing

Parameter Description of Tabs::

- **Add Call Number**
- **Delete all station numbers**

| Parameters          | Description                                                                                                                  |
|---------------------|------------------------------------------------------------------------------------------------------------------------------|
| <b>Node ID</b>      | Selects the node number                                                                                                      |
| <b>Phone number</b> | Only for manual configuration without a wizard, e.g., for open numbering: entry of the code via which the node is reachable. |

### 28.3.6.8 Voice Gateway > SIPQ-Interconnection

SIP-Q Interconnection is used to define the parameters for two possible external SIP-Q routes. Any external SIP server such as

OpenScape 4000 or OpenScape Voice can be connected via these routes. Relevant examples are included in the existing templates.

Parameter Description of Tabs:

- **Add SIPQ-Interconnection**
- **Edit SIPQ-Interconnection**
- **Delete SIPQ-Interconnection**

| Parameters                           | Description                                                                                                                                                            |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Base Template</b>                 | Template to be used as a base.                                                                                                                                         |
| <b>Name</b>                          | Name of the external SIP server (template name).                                                                                                                       |
| <b>Enable Trunk</b>                  | The connection to the external SIP server is activated.<br>Default value: disabled                                                                                     |
| <b>Trunk Identifier in System</b>    | Selection between two external SIPQ-Interconnections. If present, one of the two SIPQ-Interconnections is always occupied by the UC Booster Card or UC Booster Server. |
| <b>Remote Domain Name</b>            | Host name or IP address of the external SIP server. The value is typically identical to the value at <b>IP Address / Host name</b> .                                   |
| <b>SIP Server</b>                    |                                                                                                                                                                        |
| <b>IP Address / Host name</b>        | Host name or IP address of the external SIP server.                                                                                                                    |
| <b>Port</b>                          | SIP port of the external SIP server.<br>Value range: 0 or 1024 to 65535, default value: 5060                                                                           |
| <b>Secure Transport</b>              | When connected to OpenScape 4000 or OpenScape Voice, encrypted SIP signaling can be activated (Signaling and Payload Encryption feature).<br>Default value: disabled   |
| <b>SIP Registrar</b>                 |                                                                                                                                                                        |
| <b>Use Provider Registrar</b>        | The external SIP server requires registration.<br>Default value: disabled                                                                                              |
| <b>IP Address / Host name</b>        | Host name or IP address of the Registrar server.                                                                                                                       |
| <b>Port</b>                          | Port number of the Registrar server.<br>Value range: 0 or 1024 to 65535, default value: 5060                                                                           |
| <b>Reregistration Interval (sec)</b> | Interval (in seconds) at which the registration is repeated.<br>Value range: 30 to 86400, default value: 300                                                           |
| <b>Outbound Proxy/Inbound Proxy</b>  |                                                                                                                                                                        |

| Parameters                                 | Description                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Use Provider Outbound/Inbound Proxy</b> | <p>Activation of the outbound proxy: Some redundancy scenarios (e.g., with OpenScape Branch Proxy) require the handling of SIP signaling via an outbound proxy.</p> <p>Activation of the inbound proxy: In some redundancy scenarios (e.g., with OpenScape Voice), the incoming signaling occurs from a separate SIP server (inbound proxy).</p> <p>Default values: disabled in both cases</p> |
| <b>IP Address / Host name</b>              | Host name or IP address of the outbound or inbound proxy.                                                                                                                                                                                                                                                                                                                                      |
| <b>Port</b>                                | <p>Port number of the outbound or inbound proxy.</p> <p>Value ranges: 0 or 1024-65535</p>                                                                                                                                                                                                                                                                                                      |

Parameter Description of Tabs:

- **Add SIPQ-Interconnection User**
- **Edit SIPQ-Interconnection User**
- **Delete SIPQ-Interconnection User**

| Parameters                        | Description                                                            |
|-----------------------------------|------------------------------------------------------------------------|
| <b>UserId</b>                     | Entry of the user ID for access to the SIP server.                     |
| <b>Authorization name / Realm</b> | Entry of the authorization name or realm for access to the SIP server. |
| <b>Password</b>                   | Entry of the password for access to the SIP server.                    |
| <b>Confirm Password</b>           | Repetition of the password for access to the SIP server.               |

### 28.3.6.9 Voice Gateway > Native SIP Server Trunk

The parameters for the 10 possible external Native SIP routes are defined here. Any external SIP server can be connected via these routes.

Parameter Description of Tabs:

- **Add Native SIP Server Trunk**
- **Edit Native SIP Server Trunk**
- **Delete Native SIP Server Trunk**

| Parameters           | Description                                                                                   |
|----------------------|-----------------------------------------------------------------------------------------------|
| <b>Base Template</b> | Template to be used as a base.                                                                |
| <b>Trunk Name</b>    | Name of the external SIP server (template name).                                              |
| <b>Enable Trunk</b>  | <p>The connection to the external SIP server is activated.</p> <p>Default value: disabled</p> |

| Parameters                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Trunk Identifier in System</b> | Choice of 10 external Native SIP connections. Grayed out items are occupied by already configured ITSPs (max 8 ITSPs possible - in this case, there are 2 Native SIP connections left).                                                                                                                                                                                                                                                                                                                |
| <b>Remote Domain Name</b>         | <p>Host name or IP address of the external SIP server. The value is typically identical to the value at <b>IP Address / Host name</b>.</p> <p>Example:</p> <p>The configured <b>Remote Domain Name</b> is used in the Host part of From and PAI/PPI-header fields (see below):</p> <p>From: sip: +49...@DomainName</p> <p>P-Asserted-Identity: sip: +49...@DomainName</p>                                                                                                                              |
| <b>Transport protocol</b>         | Selection of the UDP or TCP protocol.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Transport security</b>         | Select between traditional UDP or TCP and secure TLS.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Media security</b>             | Select between RTP only and SDES only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>SIP Server</b>                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>IP Address / Host name</b>     | Host name or IP address of the external SIP server.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Port</b>                       | <p>SIP port of the external SIP server.</p> <p>Default value: 5060, enter port 0 if the ITSP uses DNSSRV</p>                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Registrar</b>                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Use Registrar</b>              | Must be selected if the trunk works with registration (default = off)                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>IP Address / Host name</b>     | Host name or IP address of the external registrar server                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Port</b>                       | <p>Port of the external registrar server</p> <p>default value: 5060, enter port 0 if DNSSRV is used</p>                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Reregistration Interval</b>    | The interval at which a registration is repeated (default = 600)                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>STUN server</b>                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Use STUN</b>                   | Must be selected if the trunk works with STUN (default = off)                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>IP Address / Host name</b>     | Host name or IP address of the STUN server                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Port</b>                       | Port of the STUN server                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Extended SIP data</b>          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Show extended SIP data</b>     | By enabling this flag some additional configuration parameters are available to control the SIP stack and to adapt the content of SIP header fields                                                                                                                                                                                                                                                                                                                                                    |

If no P-Asserted-Identity is present, the user part of the From: header field is taken.</p> |

| Parameters                           | Description                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Contact URI contains:</b>         | <p>This parameter is used to configure the user part content of the contact-URI</p> <p><b>Contact: sip:UserPart@HostPart:port</b></p> <p>Possible settings:</p> <ul style="list-style-type: none"> <li>• Call number: user part of the Contact URI contains the call number</li> <li>• Registration AOR: the Contact URI contains the account=user part of registration.</li> </ul> |
| <b>TCP port used in Contact URI:</b> | <p>This parameter is used to configure the tcp-port used in the host part of the contact-URI</p> <p><b>Contact: sip:UserPart@HostPart:port</b></p> <p>Possible settings:</p> <ul style="list-style-type: none"> <li>• ephem.src-port: By default the ephemeral tcp src port is used</li> <li>• SIP server port: The SIP server port is used in the contact-URI</li> </ul>           |

Parameter Description of Tabs:

- **Add Native SIP Server Trunk User**
- **Edit Native SIP Server Trunk User**
- **Delete Native SIP Server Trunk User**

| Parameters                | Description                                                   |
|---------------------------|---------------------------------------------------------------|
| <b>UserId</b>             | Entry of the user ID for access to the SIP server.            |
| <b>Authorization name</b> | Entry of the authorization name for access to the SIP server. |
| <b>Password</b>           | Entry of the password for access to the SIP server.           |
| <b>Confirm Password</b>   | Repetition of the password for access to the SIP server.      |

## 28.3.7 Station

Functions for all stations are grouped together under **Station**. These include the name and phone number of the subscriber, for instance, as well as key programming information.

### 28.3.7.1 Station > Station > UP0 Stations

Parameter Description of Tabs:

- **Change Station**

| Parameters     | Description                          |
|----------------|--------------------------------------|
| <b>Call no</b> | Internal call number of the station. |
| <b>DID</b>     | DID number of the station.           |

| Parameters                              | Description                                                                                                                                                                                                                                                                                                 |
|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>First Name</b>                       | Freely selectable first name for the station.<br>Value range: max. 32 characters.                                                                                                                                                                                                                           |
| <b>Last Name</b>                        | Freely selectable last name for the station.<br>Value range: max. 32 characters.                                                                                                                                                                                                                            |
| <b>Display</b>                          | Freely selectable name for the station.<br>By default, it is created using the First Name and Last Name parameters depending on display name algorithm.<br>Value range: max. 16 characters                                                                                                                  |
| <b>Name</b>                             | Freely selectable name for the station.<br>Value range: max. 16 characters                                                                                                                                                                                                                                  |
| <b>Clip/Lin</b>                         | Sequence of digits to be displayed at the called party instead of the actual number for outgoing external calls (e.g., for E911 emergency services in the USA)<br>Value range: max. 16 digits                                                                                                               |
| <b>Active</b>                           | Indicates whether the station is operational.                                                                                                                                                                                                                                                               |
| <b>Device type</b>                      | Displays the device associated with the subscriber.                                                                                                                                                                                                                                                         |
| <b>Fax Call no.</b>                     | If a fax box has been set up (e.g., with the UC clients myPortal for Desktop or myPortal for Outlook), the fax number at which fax messages from internal locations can be received by the subscriber should be entered here.                                                                               |
| <b>Fax DID</b>                          | If a fax box has been set up (e.g., with the UC clients myPortal for Desktop or myPortal for Outlook), the fax number at which fax messages from external locations can be received by the subscriber should be entered here.                                                                               |
| <b>Access</b>                           | Displays the physical interface at which the device is connected.                                                                                                                                                                                                                                           |
| <b>ITSP Loc-ID</b>                      | The ITSP Location ID of a station.                                                                                                                                                                                                                                                                          |
| <b>Search</b>                           | You can also have selected subscribers displayed by entering a search term in the <b>Search</b> fields and pressing the Return key. The subscribers who match the search term are displayed. If you leave all the <b>Search</b> fields empty and press the Enter key, all subscribers will be listed again. |
| <b>Items per page</b>                   | Selection to determine whether 10, 25, 50 or 100 items are to be displayed per page.                                                                                                                                                                                                                        |
| <b>Buttons</b>                          |                                                                                                                                                                                                                                                                                                             |
| Blue arrow in the <b>Call no</b> column | Brings up the page with the <b>Edit station parameters, Edit station flags, Edit workpoint client data</b> and <b>Edit Group/CFW</b> tabs.                                                                                                                                                                  |
| >                                       | Moves one page forward.                                                                                                                                                                                                                                                                                     |
| <                                       | Moves one page back.                                                                                                                                                                                                                                                                                        |
| >                                       | Moves to the end of the list.                                                                                                                                                                                                                                                                               |

| Parameters | Description                         |
|------------|-------------------------------------|
| <          | Moves to the beginning of the list. |

Parameter Description of Tabs:

- **UP0 Master/Slave**

This tab appears only for OpenScape Business X8, since the slave ports are managed dynamically in this system. For OpenScape Business X1/X3/X5, the slave ports are assigned statically (i.e., are fixed)

| Parameters               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Call no</b>           | Internal call number of the station.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>DID</b>               | DID number of the station.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Name</b>              | Freely selectable name for the station.<br>Value range: max. 16 characters, no umlauts or special characters                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Access</b>            | Displays the physical interface at which the device is connected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Add Slave Zone</b>    | If this check box is selected, a slave port is preassigned to the selected master port. After saving the selection with <b>Apply</b> the call number, DID number and name of the slave system telephone can be configured in advance.<br><br>When the slave system telephone is then connected to the slave adapter of the master system telephone, it is assigned the previously selected slave port. If the slave system telephone is connected without a predefined slave port, the next available port (as of port 384) is automatically used. |
| <b>Delete Slave Zone</b> | If this check box is selected, the preconfiguration of the slave system telephone is deleted.<br><br>If a slave system telephone is already connected to the slave adapter of the master system telephone, the check box is grayed out, and the preconfiguration cannot be deleted.                                                                                                                                                                                                                                                                |
| <b>Search</b>            | You can also have selected subscribers displayed by entering a search term in the <b>Search</b> fields and pressing the Return key. The subscribers who match the search term are displayed. If you leave all the <b>Search</b> fields empty and press the Enter key, all subscribers will be listed again.                                                                                                                                                                                                                                        |
| <b>Items per page</b>    | Selection to determine whether 10, 25, 50 or 100 items are to be displayed per page.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Buttons</b>           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Call no</b>             | Internal call number of the station.                                                                                                                                                                                         |
| <b>DID</b>                 | DID number of the station.                                                                                                                                                                                                   |
| <b>First Name</b>          | Freely selectable first name for the station.<br>Value range: max. 32 characters.                                                                                                                                            |
| <b>Last Name</b>           | Freely selectable last name for the station.<br>Value range: max. 32 characters.                                                                                                                                             |
| <b>Display</b>             | Freely selectable name for the station.<br>By default, it is created using the First Name and Last Name parameters depending on display name algorithm.<br>Value range: max. 16 characters, no umlauts or special characters |
| <b>Type</b>                | Type of the station.                                                                                                                                                                                                         |
| <b>Type: No Port</b>       | This call number is not yet assigned to any station.                                                                                                                                                                         |
| <b>Type: System Client</b> | A system client is an IP station that can use all the features of the communication system via CorNet-IP (formerly called HFA system client)                                                                                 |

| Parameters                              | Description                                                                                                                                                                                                                                                                                                |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type: RAS User</b>                   | A RAS user (Remote Access Service user) is granted Internet access to the IP network via the ISDN connection. This allows the communication system to be remotely serviced and licensed.                                                                                                                   |
| <b>Type: SIP Client</b>                 | A SIP client is an IP station that uses the SIP protocol. It can access only limited functionality of the communication system via SIP.                                                                                                                                                                    |
| <b>Type: Deskshare User</b>             | A Deskshare User is an IP user who can log in at another IP system telephone (mobile login) and then use this phone as his or her own phone (including the call number).                                                                                                                                   |
| <b>Clip/Lin</b>                         | Sequence of digits to be displayed at the called party instead of the actual number for outgoing external calls (e.g., for E911 emergency services in the USA)                                                                                                                                             |
| <b>Active</b>                           | Indicates whether the station is operational.                                                                                                                                                                                                                                                              |
| <b>Fax Call no.</b>                     | If a fax box has been set up (e.g., with the UC clients myPortal for Desktop or myPortal for Outlook), the fax number at which fax messages from internal locations can be received by the subscriber should be entered here.                                                                              |
| <b>Fax DID</b>                          | If a fax box has been set up (e.g., with the UC clients myPortal for Desktop or myPortal for Outlook), the fax number at which fax messages from external locations can be received by the subscriber should be entered here.                                                                              |
| <b>ITSP Loc-ID</b>                      | The ITSP Location ID of a station.                                                                                                                                                                                                                                                                         |
| <b>Search</b>                           | You can also have selected subscribers displayed by entering a search term in the <b>Search</b> fields and pressing the Enter key. The subscribers who match the search term are displayed. If you leave all the <b>Search</b> fields empty and press the Enter key, all subscribers will be listed again. |
| <b>Items per page</b>                   | Selection to determine whether 10, 25, 50 or 100 items are to be displayed per page.                                                                                                                                                                                                                       |
| <b>Buttons</b>                          |                                                                                                                                                                                                                                                                                                            |
| Blue arrow in the <b>Call no</b> column | Brings up the page with the <b>Edit station parameters, Edit station flags, Edit workpoint client data</b> and <b>Edit Group/CFW</b> tabs.                                                                                                                                                                 |
| >                                       | Moves one page forward.                                                                                                                                                                                                                                                                                    |
| <                                       | Moves one page back.                                                                                                                                                                                                                                                                                       |
| >                                       | Moves to the end of the list.                                                                                                                                                                                                                                                                              |
| <                                       | Moves to the beginning of the list.                                                                                                                                                                                                                                                                        |

Parameter Description of Tabs:

- **Device Info**

| Parameters     | Description                          |
|----------------|--------------------------------------|
| <b>Call no</b> | Internal call number of the station. |
| <b>Display</b> | Station name.                        |

| Parameters                | Description                                                                          |
|---------------------------|--------------------------------------------------------------------------------------|
| <b>Device type</b>        | Displays the device type associated with the station.                                |
| <b>IP Address</b>         | IP address of the associated device; direct link to the WBM of the IP telephone      |
| <b>MAC Address</b>        | MAC address of the associated telephone                                              |
| <b>Current SW version</b> | Software version of the associated device (if available).                            |
| <b>HW version</b>         | Hardware version of the associated device (if available).                            |
| <b>Items per page</b>     | Selection to determine whether 10, 25, 50 or 100 items are to be displayed per page. |
| <b>Buttons</b>            |                                                                                      |
| >                         | Moves one page forward.                                                              |
| <                         | Moves one page back.                                                                 |
| >                         | Moves to the end of the list.                                                        |
| <                         | Moves to the beginning of the list.                                                  |

Parameter Description of Tabs:

- **Secondary Gateway**

| Parameters                  | Description                                                                                                                                           |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Call number</b>          | Internal call number of the station.                                                                                                                  |
| <b>Name</b>                 | Station name.                                                                                                                                         |
| <b>NodeId</b>               | Each node in a networked system must be assigned a unique node ID. This enables the individual nodes in a networked system to be uniquely identified. |
| <b>Fallback telephony</b>   | Indicates if the feature is activated.                                                                                                                |
| <b>Fallback Call No</b>     | The call number of the station that will be used in case of a failure event.                                                                          |
| <b>Fallback Call No DID</b> | The internal call number of the station that will be used in case of a failure event.                                                                 |

Parameter Description of Tabs:

- **Fallback Hosting**

| Parameters                  | Description                                                                          |
|-----------------------------|--------------------------------------------------------------------------------------|
| <b>Call number</b>          | Internal call number of the station.                                                 |
| <b>Name</b>                 | Station name.                                                                        |
| <b>Primary NodeId</b>       | The unique node ID to which the station is originally configured.                    |
| <b>Fallback Call No</b>     | The call number of the station that will be used in case of a failure event.         |
| <b>Fallback Call No DID</b> | The internal call number of the station that will be used in case of a failure event |

Parameter Description of Tabs:

- **Change Station**

| Parameters          | Description                                                                                                                                                                                                                                                                                                 |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Call no</b>      | Internal call number of the station.<br><br><b>NOTICE:</b> Call numbers starting with a star (*) cannot be used as fax destinations.                                                                                                                                                                        |
| <b>DID</b>          | DID number of the station.                                                                                                                                                                                                                                                                                  |
| <b>First Name</b>   | Freely selectable first name for the station.<br>Value range: max. 32 characters.                                                                                                                                                                                                                           |
| <b>Last Name</b>    | Freely selectable last name for the station.<br>Value range: max. 32 characters.                                                                                                                                                                                                                            |
| <b>Display</b>      | Freely selectable name for the station.<br>By default, it is created using the First Name and Last Name parameters depending on display name algorithm.<br>Value range: max. 16 characters, no umlauts or special characters                                                                                |
| <b>Clip/Lin</b>     | Sequence of digits to be displayed at the called party instead of the actual number for outgoing external calls (e.g., for E911 emergency services in the USA)<br>Value range: max. 16 digits                                                                                                               |
| <b>Active</b>       | Indicates whether the station is operational.                                                                                                                                                                                                                                                               |
| <b>Device type</b>  | Displays the device associated with the subscriber.                                                                                                                                                                                                                                                         |
| <b>Fax Call no.</b> | If a fax box has been set up (e.g., with the UC clients myPortal for Desktop or myPortal for Outlook), the fax number at which fax messages from internal locations can be received by the subscriber should be entered here.                                                                               |
| <b>Fax DID</b>      | If a fax box has been set up (e.g., with the UC clients myPortal for Desktop or myPortal for Outlook), the fax number at which fax messages from external locations can be received by the subscriber should be entered here.                                                                               |
| <b>Access</b>       | Displays the physical interface at which the device is connected.                                                                                                                                                                                                                                           |
| <b>ITSP Loc-ID</b>  | The ITSP Location ID of a station.                                                                                                                                                                                                                                                                          |
| <b>Search</b>       | You can also have selected subscribers displayed by entering a search term in the <b>Search</b> fields and pressing the Return key. The subscribers who match the search term are displayed. If you leave all the <b>Search</b> fields empty and press the Enter key, all subscribers will be listed again. |

| Parameters                              | Description                                                                                                                                                |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Items per page</b>                   | Selection to determine whether 10, 25, 50 or 100 items are to be displayed per page.                                                                       |
| <b>Buttons</b>                          |                                                                                                                                                            |
| Blue arrow in the <b>Call no</b> column | Brings up the page with the <b>Edit station parameters</b> , <b>Edit station flags</b> , <b>Edit workpoint client data</b> and <b>Edit Group/CFW</b> tabs. |
| >                                       | Moves one page forward.                                                                                                                                    |
| <                                       | Moves one page back.                                                                                                                                       |
| >                                       | Moves to the end of the list.                                                                                                                              |
| <                                       | Moves to the beginning of the list.                                                                                                                        |

#### 28.3.7.4 Station > Station > ISDN Stations

Parameter Description of Tabs:

- **Change Station**

| Parameters          | Description                                                                                                                                                                                                                   |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Call no</b>      | Internal call number of the station.                                                                                                                                                                                          |
| <b>DID</b>          | DID number of the station.                                                                                                                                                                                                    |
| <b>First Name</b>   | Freely selectable first name for the station.<br>Value range: max. 32 characters.                                                                                                                                             |
| <b>Last Name</b>    | Freely selectable last name for the station.<br>Value range: max. 32 characters.                                                                                                                                              |
| <b>Display</b>      | Freely selectable name for the station.<br>By default, it is created using the First Name and Last Name parameters depending on display name algorithm.<br>Value range: max. 16 characters, no umlauts or special characters  |
| <b>Clip/Lin</b>     | Sequence of digits to be displayed at the called party instead of the actual number for outgoing external calls (e.g., for E911 emergency services in the USA)<br>Value range: max. 16 digits                                 |
| <b>Active</b>       | Indicates whether the station is operational.                                                                                                                                                                                 |
| <b>Device type</b>  | Displays the device associated with the subscriber.                                                                                                                                                                           |
| <b>Fax Call no.</b> | If a fax box has been set up (e.g., with the UC clients myPortal for Desktop or myPortal for Outlook), the fax number at which fax messages from internal locations can be received by the subscriber should be entered here. |

| <b>Station type: Loudspeaker</b>                               | For paging via the a/b port                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Station type: Answering Machine</b>                         | <p>Only for analog: if an answering machine is connected to this interface, this setting enables a call to be taken over from the answering machine from any device even though the answering machine has already accepted the call. To do this, the terminal must be programmed with the internal call number of the analog station.</p> <p>Besides being selected for answering machines, this entry should also be selected for virtual ports where no physical equipment has been set up. This prevents the communication system from checking the operating status of the port.</p> <p>Only for virtual ports: If a station without access was configured as a type of answering machine in Manager E, the port must be additionally configured as a virtual port. Otherwise, it will not be visible as a station in the WBM.</p> |
| <b>Station type: P.O.T. MW LED</b>                             | <p>For standard analog telephones (P.O.T = Plain Old Telephone) with a message-waiting LED</p> <p>Not for U.S.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Station type: Door station with pulsed loop</b>             | When using a pulsed loop device with the door opener function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Station type: Modem</b>                        | Call override is not possible with this setting. It is intended for modems.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|                                                   | When a fax or modem station is deleted (i.e., the call number and DID are deleted), the extension type must also be reset to the default (standard).                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Language</b>                                   | Language for the menu control of the device (system telephone).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Call signaling internal</b>                    | Every station can be assigned one of a total of eight possible internal ringing tones here. This means that in addition to the external ringing tone, an internal ringing tone is assigned here and subsequently transmitted for internal calls.<br><br>Default value: Ring type 1                                                                                                                                                                                                                                                                          |
| <b>Call signaling external</b>                    | Three different ring types for signaling external calls can be selected here: – System Phones: Ring type 1 = External call (e.g., double ring), Ring type 2 = External call CO 2 (e.g., triple ring), Ring type 3 = External call CO 3 (e.g., short/long/short) – Analog telephones for Germany: Ring type 1 = External call, Ring type 2 = Automatic recall, Ring type 3 = Door bell ring – Analog telephones for other countries: Ring type 1 = External call, Ring type 2 = External call, Ring type 3 = External call<br><br>Default value: Ring type 1 |
| <b>Class of Service (LCR)</b>                     | A subscriber can only seize a route if his or her COS is greater than or equal to the LCR COS in the route table, i.e., a subscriber with a COS 7 cannot seize a route with COS 8. By default, all subscribers are entered with the maximum LCR Class of Service (15).<br><br>Default value: 15                                                                                                                                                                                                                                                             |

| <b>Stations - ...</b>               |                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Type</b>                         | Type of the station.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Call number</b>                  | Internal call number of the station.                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Name</b>                         | Station name.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Station flags</b>                |                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Override class of service on</b> | When this flag is activated, the subscriber can intrude into (i.e., override) an internal subscriber's ongoing connection. The subscribers involved are notified of the busy override by a warning tone and a display message.<br>Default value: Disabled                                                                                                                                                                                           |
| <b>Override Do Not Disturb</b>      | When this flag is activated, the following applies: when the subscriber calls a station for which Do Not Disturb has been activated, he or she can override Do Not Disturb. After five seconds, the call is signaled at the called station. If the flag is disabled, the Do Not Disturb function cannot be overridden. Subscribers who call a station for which Do Not Disturb has been activated receive the busy tone.<br>Default value: Disabled |

| Parameters                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>FWD external permitted</b>                | <p>When this flag is activated, the subscriber can activate call forwarding to an external destination. Charges incurred for the execution of an external call forwarding are allocated to the subscriber who activated the call forwarding.</p> <p>Default value: Enabled</p>                                                                                                                                                                                                                                                       |
| <b>Prevention of voice calling off</b>       | <p>When this flag is activated, the station can be called directly. This enables an internal call to be set up without lifting the handset. The loudspeaker on the called station is activated automatically in the process.</p> <p>Default value: Enabled</p>                                                                                                                                                                                                                                                                       |
| <b>DISA class of service</b>                 | <p>When this flag is activated, external subscribers can activate or deactivate functions of the communication system via DISA (Direct Inward System Access) and set up outbound external connections just like any other internal subscribers. This also includes activating and deactivating call forwarding, the Do Not Disturb feature and the lock code, for example.</p> <p>Default value: Disabled</p>                                                                                                                        |
| <b>Transit allowed via Hook-on</b>           | <p>When this flag is activated, the subscriber can transfer an external call to another external subscriber by hanging up. Example: The subscriber is the conference controller and hangs up: if there are other internal subscribers still in the conference, the longest participating internal subscriber automatically becomes the conference controller. If there are only external participants remaining in the conference, the conference is terminated, and all connections are cleared.</p> <p>Default value: Disabled</p> |
| <b>System telephone lock reset</b>           | <p>When this flag is activated, the subscriber can reset the individual lock code of other internal subscribers to the default code.</p> <p>Default value: Disabled</p>                                                                                                                                                                                                                                                                                                                                                              |
| <b>CLIP analog</b> (only for analog devices) | <p>When this flag is activated, the caller's phone number is shown on the phone display of the analog station. As a prerequisite, the analog phone of the subscriber must support CLIP (Calling Line Identification Presentation).</p> <p>Default value: Enabled</p>                                                                                                                                                                                                                                                                 |

| Parameters                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>MCID access</b>                  | <p>When this flag is activated, the subscriber can have malicious external callers identified via the ISDN Central Office. As a prerequisite, the "Trace call" (Malicious Call Identification, MCID) feature must have been applied for and activated by the network provider. After the "Trace call" feature has been activated by the network provider, the following must be noted: for each incoming call from the ISDN CO, the release of the connection to the called station is delayed for a specific timeout period after the caller hangs up. This timeout enables the called station to activate the "Trace call" feature. The ISDN trunk availability is somewhat reduced as a result.</p> <p>Default value: Disabled</p> |
| <b>Entry in telephone directory</b> | <p>When this flag is activated, the name and number of the subscriber will be displayed in the system directory (including ODS).</p> <p>Default value: Enabled</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Editing the Telephone Number</b> | <p>When this flag is activated, the subscriber can edit the digits of the call number entered via the keypad before the digit transmission. This requires a system phone with a display.</p> <p>Default value: Disabled</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>No group ringing on busy</b>     | <p>When this flag is enabled, the following applies: The status of the station with group ringing programmed (i.e., the primary station) determines whether or not group ringing occurs. If the primary station is free, all stations included in the group are called immediately. If call waiting is enabled at the primary station: all stations included in the group are called after a delay of 5 seconds. If the primary station cannot receive a call or if call waiting is inactive: group ringing does not take place.</p> <p>Default value: Disabled</p>                                                                                                                                                                   |
| <b>Associated dialing/ services</b> | <p>Associated dialing: when this flag is activated, the subscriber can dial a number on behalf of another internal subscriber as if that station itself were dialing. Associated services: When this flag is activated, the subscriber can control features on behalf of another internal subscriber as if that station itself were controlling these features. This includes activating and deactivating call forwarding, group ringing and the lock code, for example.</p> <p>Default value: Disabled</p>                                                                                                                                                                                                                           |
| <b>Call waiting rejection on</b>    | <p>When this flag is activated, subscribers who are conducting a call are not informed about other incoming calls via a call waiting tone or a display message.</p> <p>Default value: Enabled</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Parameters                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Discreet call</b>                     | <p>When this flag is activated, the subscriber can discreetly join an existing voice call of another internal subscriber. He or she can silently monitor the call and speak with the internal subscriber without the other party hearing this conversation. This is only possible in the case of a two-party call. Discreet calling is not possible with consultation calls or conferences.</p> <p>Default value: Disabled</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Discreet Call Lock</b>                | <p>When this flag is activated, the station cannot be called discreetly.</p> <p>Default value: Disabled</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>DTMF-based feature activation</b>     | <p>Only relevant for Mobility Entry stations: This flag must be set in order to be able to activate features during a call (i.e., in the talk state). The code receiver remains active. (Attention: limited resources)</p> <p>Default value: Disabled</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Headset</b>                           | <p>When this flag is activated, the station can be equipped with a headset that plugs into the handset connection. Setting the flag enables the user to accept a call by pressing a headset button on the system telephone without lifting the handset. When a headset is connected to the system telephone connection, it is recognized automatically by the communication system; an authorization enable is not necessary in this case. When this flag is set, calls cannot be released by pressing the speaker key; a disconnect key must be programmed so that calls can be released.</p> <p>Default value: Disabled</p>                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Last destination mailbox active</b>   | <p>If this flag is activated and the called party is not available, the call is forwarded to the substitute mailbox, and the caller's number is displayed on the substitute telephone.</p> <p>Default value: Disabled</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Call prio./immed. tone call wait.</b> | <p>When this flag is activated (Call priority/immediate tone call waiting), calls through this station are signaled with a higher priority to partners. The priority is set to be the same as the priority of external calls. In other words, the prioritized calls are thus queued before existing internal calls, but after existing external calls. Note that existing first calls (not waiting calls) are usually never displaced, regardless of their ring type. If the same priority is also to be set for an internal call in another node, then the station flag "Call prio./immed. tone call wait." (Area: Circuit flags, Call prio./immed. tone call wait.) must be likewise set for the corresponding trunk. If this flag is set, the caller receives a ring tone immediately instead of a busy tone. This has no impact on the acoustic signaling. The prioritized calls are still signaled like an internal call. This feature is important for phonemail connections.</p> <p>Default value: Disabled</p> |

| Parameters                                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Voice recording</b>                                             | <p>If the flag is activated, the subscriber can activate voice recording during a call. In addition, the <b>Warning tone during voice recording</b> switch under Flags can be used to specify whether or not a warning tone should be output on starting the voice recording. Furthermore, a suitable Live Recording device must be configured under PhoneMail.</p> <p>Default value: Disabled</p>                                                                                                                                                                                                                                                                                                                                   |
| <b>Compress display data</b>                                       | <p>When this flag is enabled, the display outputs are compressed for improved performance. If the display on a UP0/E terminal changes, the communication system only updates the data that differs from the previous display. If an application (e.g., Smartset/TAPI) is connected via an RS 232 adapter (data or control adapter), this feature must be deactivated. The flag must be deactivated for applications that obtain the call number information from the telephone's display, (i.e., uncompressed output with call number instead of compressed output with name). Names are generally displayed only when the flag "Calling ID only" under "Display name/call number" is deactivated.</p> <p>Default value: Enabled</p> |
| <b>Door release DTMF</b>                                           | <p>If this flag is enabled, the station can open a door with the DTMF/MFV code signaling when a door relay is connected to the relevant port.</p> <p>Default value: Disabled</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Autom. connection, CSTA</b> (only for OpenStage SIP telephones) | <p>When the flag is enabled, the following applies: speakerphone mode is activated on the associated SIP telephone when dialing or answering calls via myPortal or myAttendant. The information contained in the documentation of the SIP telephone must be observed, since additional settings on the SIP phone may be required for the proper use of the feature. When the flag disabled, the call setup occurs only after lifting the handset.</p> <p>Default value: Enabled</p>                                                                                                                                                                                                                                                  |
| <b>Disable handsfree microphone</b>                                | <p>If this flag is activated, the handsfree microphone cannot be used. This flag is only supported by OpenStage phones.</p> <p>Default value: Disabled</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Forced Number Presentation</b>                                  | <p>If this flag is activated, the caller's phone number appears on the display of the called party instead of his or her name.</p> <p>Default value: Disabled</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Usage</b> (for specific countries only)                         | <p>This drop-down list can be used to configure the output current of the interfaces of an analog board (in mA, e.g., 27 mA for China).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Operating Mode</b>                                              | <p>In this drop-down list, an operating mode can be selected for the subscriber line.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Parameters                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Missed Calls List</b>         | When this flag is activated, the missed calls list is activated for the subscriber at his or her telephone (only for phones with a display).<br><br>Calls that were not answered by the subscriber are provided with a time stamp (time and date) and added to a chronologically sorted list. Only the calls which also contain a phone number or name are recorded. If a subscriber calls more than once, only the time stamp for the entry is updated, and a call counter for that caller is incremented. |
| <b>Central busy signaling</b>    | This flag must be set (see also QSIG features) for subscribers who have busy signaling on a centralized communication system. Does not apply to the USA. The implementation of central busy signaling is contingent on a maximum number of 100 stations per node.                                                                                                                                                                                                                                           |
| <b>Display of Emergency text</b> | If this flag is activated, a configurable Emergency text is shown on the phone's display in emergency mode.                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Call Supervision</b>          | When this flag is activated, the subscriber can silently monitor (i.e., listen in on) the conversation of any internal subscriber. The microphone of the party listening in is automatically muted. The monitored subscriber is not notified via a signal tone or display message. When you start and end call supervision, you may encounter a lapse of up to two seconds of the conversation. Default value: Disabled                                                                                     |
| <b>Buttons</b>                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| >                                | Moves to the next station. If the stations matching the search term entered in the <b>Search</b> fields were previously filtered, it is possible to move between only those specific stations.                                                                                                                                                                                                                                                                                                              |
| <                                | Skips back one station.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Call number</b>    | Internal call number of the station.                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Name</b>           | Station name.                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Parameters</b>     |                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Status message</b> | For system clients only: this flag activates the "keep-alive" mechanism for system telephones. If a system phone fails, for example, it is flagged as inactive after four minutes. The flag must not be enabled when setting up a system telephone as a home client or when using the "Short-Hold" feature. Disabling this flag reduces the message traffic between the communication system and the system telephones. |

| Parameters                          | Description                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Authentication active</b>        | <p>If you want the IP client to be able to identify itself at the communication system with a password, authentication must be activated and a password set. This is an advantage especially for clients that are not connected to the internal LAN, but that dial in from outside.</p> <p>For SIP clients only: You have to enter a password. The same password must be used in device.</p> |
| <b>New password</b>                 | <p>Password for authentication.</p> <p>For SIP clients only: If device password has been already set, same password must be used upon Apply to keep device registration on.</p>                                                                                                                                                                                                              |
| <b>Confirm password</b>             | Password to repeat the authentication.                                                                                                                                                                                                                                                                                                                                                       |
| <b>SIP User ID / Username</b>       | Only for SIP clients: freely selectable user name for authentication of the SIP subscriber, e.g., "SIP-120". The value defined here must also be entered at the SIP telephone.                                                                                                                                                                                                               |
| <b>Realm</b>                        | Only for SIP clients: freely selectable names for the associated zone, e.g., "OSBIZ-SIP". This value must be the same for all SIP clients. The value defined here must also be entered at the SIP telephone.                                                                                                                                                                                 |
| <b>Fixed IP address</b>             | For SIP clients only: entering a fixed IP address ensures that only one SIP client can log on to the system with this IP address. If this flag is activated, the IP address and the call number are verified. If this flag is not activated, only the call number is verified.                                                                                                               |
| <b>IP Address</b>                   | Only for SIP clients: IP address of the SIP client (e.g., the IP address of the SIP telephone)                                                                                                                                                                                                                                                                                               |
| <b>Type</b>                         | Only for system clients: A mobile IP client (Mobile option) is not permanently assigned to any IP phone. The call no. of a mobile IP client can be used by a subscriber to log on to any IP terminal (that permits this) via the logon procedure (*9419) (provided the option Mobile blocked is not activated).                                                                              |
| <b>Type: Mobile</b>                 | Only for system clients: No IP device is permanently assigned to the subscriber. The feature is only supported from the third station port onwards.                                                                                                                                                                                                                                          |
| <b>Type: Non-mobile</b>             | Only for system clients: The call number is permanently assigned to the IP device of the subscriber. When using a WLx phone, the option Non mobile must be set before registering the WLx phone with the communication system.                                                                                                                                                               |
| <b>Type: Non-mobile and blocked</b> | Only for system clients: A subscriber cannot log into this IP device with a mobile system client.                                                                                                                                                                                                                                                                                            |
| <b>Blocked for Deskshare User</b>   | Only for system clients: This system phone can be shared by multiple subscribers (Desksharing).                                                                                                                                                                                                                                                                                              |

| Parameters                                     | Description                                                                                                                                                                                                                                                                                                                                                |
|------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Secondary system ID</b>                     | This parameter has two different functions:<br>1. For all stations: defines the multi-location gateway assigned to the station.<br>2. Only for system clients: If the "Emergency" flag has been set (under the "Stations/ IP Clients/Secondary Gateway") for networked systems, the node ID of the failover system for system clients can be entered here. |
| <b>Internet registration with internal SBC</b> | Enables the SIP@Home feature. This makes it possible for an external STUN-enabled SIP phone to register at OpenScape Business over the Internet and thus be used as an internal telephone.                                                                                                                                                                 |
| <b>Buttons</b>                                 |                                                                                                                                                                                                                                                                                                                                                            |
| >                                              | Moves to the next station. If the stations matching the search term entered in the <b>Search</b> fields were previously filtered, it is possible to move between only those specific stations.                                                                                                                                                             |
| <                                              | Skips back one station.                                                                                                                                                                                                                                                                                                                                    |

Parameter Description of Tabs:

- **Edit Group/CFW**

| Parameters                  | Description                                                                                                                                         |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Stations - ...</b>       |                                                                                                                                                     |
| <b>Type</b>                 | Type of the station.                                                                                                                                |
| <b>Call number</b>          | Internal call number of the station.                                                                                                                |
| <b>Name</b>                 | Station name.                                                                                                                                       |
| <b>Call forwarding</b>      |                                                                                                                                                     |
| <b>Day destination</b>      | Displays the call forwarding destinations for incoming external calls during the day (see the wizard User Telephony/Call Forwarding)                |
| <b>Night destination</b>    | Displays the call forwarding destinations for incoming external calls during the night (see the wizard User Telephony/Call Forwarding).             |
| <b>Internal destination</b> | Displays the call forwarding destinations for incoming internal calls (see the wizard User Telephony/Call Forwarding).                              |
| <b>Class of Service</b>     |                                                                                                                                                     |
| <b>Day</b>                  | Every subscriber can be assigned a class of service for day. There are 15 classes of service to choose from (see Telephony/Classes of Service).     |
| <b>Night</b>                | Every subscriber can be assigned one class of service for night. There are 15 classes of service to choose from (see Telephony/Classes of Service). |
| <b>Call Pickup</b>          |                                                                                                                                                     |

| Parameters     | Description                                                                                                                                                                                    |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>   | Every station can be assigned to a call pickup group. You can choose between 32 call pickup groups (120 with OpenScape Business S; see also Incoming Calls / Call Pickup).                     |
| <b>Buttons</b> |                                                                                                                                                                                                |
| >              | Moves to the next station. If the stations matching the search term entered in the <b>Search</b> fields were previously filtered, it is possible to move between only those specific stations. |
| <              | Skips back one station.                                                                                                                                                                        |

### 28.3.7.10 Station > Station > UC Applications

The functions of the UC solutions UC Smart and UC Suite are shown here. It is recommended that the basic settings be configured under "Setup > Basic Installation> Basic Installation> Change preconfigured call and functional numbers".

Depending on the UC solution being used, different functions are displayed.

Parameter Description of Tabs:

- **Change Station**

| Parameters        | Description                                                                                                                                                                                                                  |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Call no</b>    | Call number of the service                                                                                                                                                                                                   |
| <b>DID</b>        | DID number of the service                                                                                                                                                                                                    |
| <b>First Name</b> | Freely selectable first name for the service.<br>Value range: max. 32 characters.                                                                                                                                            |
| <b>Last Name</b>  | Freely selectable last name for the service.<br>Value range: max. 32 characters.                                                                                                                                             |
| <b>Display</b>    | Freely selectable name for the service.<br>By default, it is created using the First Name and Last Name parameters depending on display name algorithm.<br>Value range: max. 16 characters, no umlauts or special characters |
| <b>Type</b>       | Depending on the UC solution:<br>UC Smart: MeetMe / Conference<br>UC Suite: Auto-Attendant / Fax / Contact Center Fax / Park / MeetMe / Conference / Fax Group                                                               |

| Parameters                              | Description                                                                                                                                                                                                                                                                                          |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Clip/Lin</b>                         | Sequence of digits to be displayed at the called party instead of the actual number for outgoing external calls (e.g., for E911 emergency services in the USA)<br><br><b>NOTICE:</b> CLIP is not supported for UC fax. It is only supported for analog fax.                                          |
| <b>Active</b>                           | Indicates whether the service is operational.                                                                                                                                                                                                                                                        |
| <b>ITSP Loc-ID</b>                      | The ITSP Location ID of a station.                                                                                                                                                                                                                                                                   |
| <b>Search</b>                           | You can also have selected services displayed by entering a search term in the <b>Search</b> fields and pressing the Return key. The services that match the search term are displayed. If you leave all the <b>Search</b> fields empty and press the Return key, all services will be listed again. |
| <b>Items per page</b>                   | Selection to determine whether 10, 25, 50 or 100 items are to be displayed per page.                                                                                                                                                                                                                 |
| <b>Buttons</b>                          |                                                                                                                                                                                                                                                                                                      |
| Blue arrow in the <b>Call no</b> column | Brings up the page with the <b>Edit station parameters, Edit station flags, Edit workpoint client data</b> and <b>Edit Group/CFW</b> tabs.                                                                                                                                                           |
| >                                       | Moves one page forward.                                                                                                                                                                                                                                                                              |
| <                                       | Moves one page back.                                                                                                                                                                                                                                                                                 |
| >                                       | Moves to the end of the list.                                                                                                                                                                                                                                                                        |
| <                                       | Moves to the beginning of the list.                                                                                                                                                                                                                                                                  |

### 28.3.7.11 Station > Station > Profiles/Templates

User profiles (with user parameters, station flags, Groups/RNA, etc.) can be set up here as an way to create default settings for multiple users simultaneously.

Parameter Description of Tabs:

- **Edit All Profiles**

| Parameters      | Description                  |
|-----------------|------------------------------|
| <b>Profiles</b> | Displays the profile number. |
| <b>Name</b>     | Input of any profile name.   |

Parameter Description of Tabs:

- **Display All Profile Users**

| Parameters      | Description                  |
|-----------------|------------------------------|
| <b>Profiles</b> | Displays the profile number. |

## Expert mode

| Parameters            | Description                                              |
|-----------------------|----------------------------------------------------------|
| <b>Name</b>           | Displays the profile name.                               |
| <b>Member Call no</b> | Displays the internal call number of the profile member. |
| <b>Member Name</b>    | Displays the name of the profile member.                 |

Parameter Description of Tabs:

- **Add/Delete Profile member**

| Parameters             | Description                                                                      |
|------------------------|----------------------------------------------------------------------------------|
| <b>Profiles - ...</b>  | Displays the profile number.                                                     |
| <b>Name</b>            | Displays the assigned profile name.                                              |
| <b>Profile Members</b> |                                                                                  |
| <b>Selection</b>       | List of subscribers available in the system.                                     |
| <b>Members</b>         | List of subscribers assigned to the profile.                                     |
| <b>Buttons</b>         |                                                                                  |
| <b>Add</b>             | Add selected subscribers from the selection list to the list of profile members. |
| <b>Delete</b>          | Delete selected member from the list of profile members.                         |

Parameter Description of Tabs:

- **Import/Export Profile**

| Parameters                               | Description                                                                                      |
|------------------------------------------|--------------------------------------------------------------------------------------------------|
| <b>Load Profile via HTTP</b>             |                                                                                                  |
| <b>Remote File Name (PC File System)</b> | Load an existing profile file in XML format                                                      |
| <b>Export Profile via HTTP</b>           |                                                                                                  |
| <b>File name</b>                         | Display the file name under which the profile is output (XML format)                             |
| <b>Action</b>                            | Download the profile                                                                             |
| <b>Buttons</b>                           |                                                                                                  |
| <b>Reset Default Values</b>              | The profile values for all subscribers assigned to this profile are reset to the default values. |

Parameter Description of Tabs:

- **Import/Export All Profiles**

| Parameters                               | Description                                                                  |
|------------------------------------------|------------------------------------------------------------------------------|
| <b>Load All Profiles via HTTP</b>        |                                                                              |
| <b>Remote File Name (PC File System)</b> | Load an existing profile file. Multiple profiles may be stored in this file. |

| Parameters                          | Description                                                                                   |
|-------------------------------------|-----------------------------------------------------------------------------------------------|
| <b>Export All Profiles via HTTP</b> |                                                                                               |
| <b>File name</b>                    | Display the file name under which the profiles are stored.                                    |
| <b>Action</b>                       | Download the profile in a profile file.                                                       |
| <b>Buttons</b>                      |                                                                                               |
| <b>Reset Default Values</b>         | The profile values for all profiles and assigned subscribers are reset to the default values. |

Parameter Description of Tabs:

- **Edit station parameters:** see > Station > Stations > Station Parameters
- **Edit station flags:** see > Station > Stations > Station Parameters
- **Edit Group/CFW:** see > Station > Stations > Station Parameters

### 28.3.7.12 Station > Station > DID Extensions

Displays an overview of the configured DID numbers with the associated subscribers.

Parameter Description of Tabs:

- **Display DDI Extensions**

| Parameters                                  | Description                              |
|---------------------------------------------|------------------------------------------|
| <b>Call no</b>                              | Displays the call number of the station. |
| <b>Name</b>                                 | Displays the name of the station.        |
| <b>DID</b>                                  | Displays the DID number of the station.  |
| <b>(additional fields can be displayed)</b> |                                          |

### 28.3.7.13 Station > Station > Mobility Entry

It is recommended to set up mobile users via the "User Telephony > Mobile Phone Integration" wizard.

Parameter Description of Tabs:

- **Change Station**

| Parameters     | Description                                                                                                                             |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <b>Call no</b> | Input of the internal extension number of the Mobility user (e.g., 777). This internal call number must not have already been assigned. |

| Parameters                              | Description                                                                                                                                                                                                                                                                                                             |
|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>DID</b>                              | Input of the internal DID number of the Mobility user. This internal DID number must not have already been assigned.                                                                                                                                                                                                    |
| <b>First Name</b>                       | Freely selectable first name for the Mobility user.<br>Value range: max. 32 characters.                                                                                                                                                                                                                                 |
| <b>Last Name</b>                        | Freely selectable last name for the Mobility user.<br>Value range: max. 32 characters.                                                                                                                                                                                                                                  |
| <b>Display</b>                          | Freely selectable name for the Mobility user.<br>By default, it is created using the First Name and Last Name parameters depending on display name algorithm.<br>Value range: max. 16 characters, no umlauts or special characters                                                                                      |
| <b>Type</b>                             | Displays the type of Mobility user.                                                                                                                                                                                                                                                                                     |
| Device Type                             | Displays the system telephone type associated with the image file.                                                                                                                                                                                                                                                      |
| Clip/Lin                                | Sequence of digits to be displayed at the called party instead of the actual number for outgoing external calls (e.g., for E911 emergency services in the USA) Value range: max. 16 digits                                                                                                                              |
| Access                                  | Displays the physical interface at which the device is connected.                                                                                                                                                                                                                                                       |
| <b>Mobile Callno</b>                    | Input of the mobile phone number. The entry must include the leading dialout prefix (i.e., the CO code), e.g., 0016012345678.                                                                                                                                                                                           |
| <b>Web Feature ID</b>                   | The Web Feature ID defines how the subscriber should log in at the mobile web client (user name). Choice between "no" (Mobility Entry user without myPortal to go) and "automatic" (internal call number of the subscriber or Mulap) or selection of the station number of the client or phone from the drop-down list. |
| <b>Search</b>                           | You can also have selected subscribers displayed by entering a search term in the <b>Search</b> fields and pressing the Return key. The subscribers who match the search term are displayed. If you leave all the <b>Search</b> fields empty and press the Enter key, all subscribers will be listed again.             |
| <b>Items per page</b>                   | Selection to determine whether 10, 25, 50 or 100 items are to be displayed per page.                                                                                                                                                                                                                                    |
| <b>Buttons</b>                          |                                                                                                                                                                                                                                                                                                                         |
| Blue arrow in the <b>Call no</b> column | Brings up the page with the <b>Edit station parameters, Edit station flags, Edit workpoint client data</b> and <b>Edit Group/CFW</b> tabs.                                                                                                                                                                              |
| >                                       | Moves one page forward.                                                                                                                                                                                                                                                                                                 |
| <                                       | Moves one page back.                                                                                                                                                                                                                                                                                                    |
| >                                       | Moves to the end of the list.                                                                                                                                                                                                                                                                                           |
| <                                       | Moves to the beginning of the list.                                                                                                                                                                                                                                                                                     |

Parameter Description of Tabs:

- **Edit Subscriber**

| Parameters                             | Description                                                                                                                                                                                                                                                                                                 |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Callno</b>                          | Input of the internal extension number of the Skype for Business Client Mobility User (e.g., 777). This internal call number must not have already been assigned.                                                                                                                                           |
| <b>DID</b>                             | Direct inward dialing number of the Skype for Business Client.                                                                                                                                                                                                                                              |
| <b>First Name</b>                      | Freely selectable first name for the station.<br>Value range: max. 32 characters.                                                                                                                                                                                                                           |
| <b>Last Name</b>                       | Freely selectable last name for the station.<br>Value range: max. 32 characters.                                                                                                                                                                                                                            |
| <b>Display</b>                         | Freely selectable name for the station.<br>By default, is created using the First Name and Last Name parameters depending on display name algorithm.<br>Value range: max. 16 characters, no umlauts or special characters.                                                                                  |
| <b>Type</b>                            | Displays the type of Mobility User, which in this case is always SfB Station.                                                                                                                                                                                                                               |
| <b>SfB Call Number</b>                 | The Skype for Business Client call number.                                                                                                                                                                                                                                                                  |
| <b>Search</b>                          | You can also have selected subscribers displayed by entering a search term in the <b>Search</b> fields and pressing the Return key. The subscribers who match the search term are displayed. If you leave all the <b>Search</b> fields empty and press the Enter key, all subscribers will be listed again. |
| <b>Items per page</b>                  | Selection to determine whether 10, 25, 50 or 100 items are to be displayed per page.                                                                                                                                                                                                                        |
| <b>Buttons</b>                         |                                                                                                                                                                                                                                                                                                             |
| Blue arrow in the <b>Callno</b> column | Brings up the page with the <b>Edit station parameters, Edit station flags, Edit workpoint client data</b> and <b>Edit Group/CFW</b> tabs.                                                                                                                                                                  |
| >                                      | Moves one page forward.                                                                                                                                                                                                                                                                                     |
| <                                      | Moves one page back.                                                                                                                                                                                                                                                                                        |
| >                                      | Moves to the end of the list.                                                                                                                                                                                                                                                                               |
| <                                      | Moves to the beginning of the list.                                                                                                                                                                                                                                                                         |

### 28.3.7.16 Station > Station > Overview of Stations

Lists all stations of the communication system sorted by call number (default). Clicking on a different column heading sorts the list by the selected column in ascending order; a second click sorts it in descending order.

Parameter Description of Tabs:

- **Change Station**

| Parameters                              | Description                                                                                                                                                                                                                                                                                                 |

| <b>DID</b>                              | DID number of the station.                                                                                                                                                                                                                                                                                  |
| <b>First Name</b>                       | Freely selectable first name for the station.<br>Value range: max. 32 characters.                                                                                                                                                                                                                           |
| <b>Last Name</b>                        | Freely selectable last name for the station.<br>Value range: max. 32 characters.                                                                                                                                                                                                                            |
| <b>Display</b>                          | Freely selectable name for the station.<br>By default, it is created using the First Name and Last Name parameters depending on display name algorithm.<br>Value range: max. 16 characters, no umlauts or special characters                                                                                |
| <b>Device type</b>                      | Displays the type of station.                                                                                                                                                                                                                                                                               |
| <b>Active</b>                           | Indicates whether the station is operational.                                                                                                                                                                                                                                                               |
| <b>Access</b>                           | Displays the physical interface at which the device is connected.                                                                                                                                                                                                                                           |
| <b>Search</b>                           | You can also have selected subscribers displayed by entering a search term in the <b>Search</b> fields and pressing the Return key. The subscribers who match the search term are displayed. If you leave all the <b>Search</b> fields empty and press the Enter key, all subscribers will be listed again. |
| <b>Items per page</b>                   | Selection to determine whether 10, 25, 50 or 100 items are to be displayed per page.                                                                                                                                                                                                                        |
| <b>Buttons</b>                          |                                                                                                                                                                                                                                                                                                             |
| Blue arrow in the <b>Call no</b> column | Brings up the page with the <b>Edit station parameters, Edit station flags, Edit workpoint client data</b> and <b>Edit Group/CFW</b> tabs.                                                                                                                                                                  |
| >                                       | Moves one page forward.                                                                                                                                                                                                                                                                                     |
| <                                       | Moves one page back.                                                                                                                                                                                                                                                                                        |
| >                                       | Moves to the end of the list.                                                                                                                                                                                                                                                                               |
| <                                       | Moves to the beginning of the list.                                                                                                                                                                                                                                                                         |

### 28.3.7.17 Station > Key Programming

Parameter Description of Tabs:

- **Program Keys**

Key programming is supported only for UP0 phones and HFA clients. Search function (by Callno, DID, First Name, Last Name, Display and Device Type filelds) is available.

| Parameters            | Description                                                                                       |
|-----------------------|---------------------------------------------------------------------------------------------------|
| <b>Selection list</b> | Selection of subscriber's telephone.                                                              |
| <b>Shift Layer</b>    | If a key has been set up with the "Shift Layer" function, the second level can be programmed here |
| <b>telephone</b>      | Clicking on the key area of the phone opens the current key assignment.                           |
| <b>Keypad</b>         | Displays the key function (function key label)                                                    |
| <b>Key button</b>     | Selection of the desired function                                                                 |

Parameter Description of Tabs::

- **Copy keypad for other stations**

| Parameters                                    | Description                                                                                                                     |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <b>Copies the key layout from the station</b> | Selection of the station whose key layout is to be copied for the selected stations                                             |
| <b>All stations</b>                           | Copy the key layout to all stations.                                                                                            |
| <b>Selection field</b>                        | Copy the key layout to the selected stations                                                                                    |
| <b>Station</b>                                | Displays the internal call number and the name of the station.                                                                  |
| <b>Device Type</b>                            | Displays the phone type of the subscriber.<br>Device type cannot be changed for already Active stations.                        |
| <b>Copy the device type from station</b>      | Selection of the station whose device type is to be copied for the selected stations                                            |
| <b>to the following station(s)</b>            | Selection of the station(s) in which the device type will be copied. Filtering by the device type of the stations is available. |

## 28.3.8 Cordless

Functions for the integrated cordless solution for the operation of cordless telephones (DECT phones) via the communication system are grouped together under **Cordless**. The base stations and DECT phones (internal stations with HFA features) are configured here.

### 28.3.8.1 Cordless > System-wide

Parameter Description of Tabs:

- **Edit system-wide data**

| Parameters                                                                                                                                                                                                                                                                                                                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <p>These parameters can be used to disable the echo handling set under <b>Trunks &gt; Parameters/General Flags</b> for mobile stations on a node-wide basis. The settings are made in accordance with the line settings of the calls. Potential improvements by general deactivation or line-specific activation must be tested in individual cases.</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Echo Suppressor</b>                                                                                                                                                                                                                                                                                                                                   | <p>The Echo Suppressor (ES) inserts an attenuator in the receive direction of the DECT phone, depending on its transmit level. If the echo suppressor is turned on in cases where there is loud extraneous noise, it is conceivable that the receive signal may be further dampened. This could adversely affect the clarity of the call. In the "<b>not active</b>" mode, the receive direction of the DECT phone is not attenuated when the DECT phone has a high transmit level. In the case of analog trunk switching and loud environments, this setting can offer improved clarity of the trunk station at the DECT phone.</p> <p>Default: Automatic</p> |

| Parameters                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Echo Canceller</b>          | <p>The Echo Canceller (EC) eliminates unwanted signal echoes caused by a 4/2-wire conversion (fork) on the land line. If the Echo Canceller is activated without an echo, errors may occur, since the Echo Canceller attempts to adapt to a non-existent echo. In the "<b>not active</b>" mode, the activation of this parameter is prevented, and the Echo Canceller is always off.</p> <p>Default: Automatic</p>                                                                                                         |
| <b>Artificial Echo</b>         | <p>The Artificial Echo Path (AE) echoes back an attenuated voice signal (24dB) from the land line to the remote subscriber. This may be needed in the case of an international connection, for example, to provide an inserted echo canceller with a certain preload. In the "<b>not active</b>" mode, the activation of this parameter is prevented, and the Artificial Echo is always off.</p> <p>Default: Automatic</p>                                                                                                 |
| <b>PP Deviation Control</b>    | <p>Echoes often occur when VoIP calls are made using DECT phones. The "PP Deviation Control" function can be activated to suppress/minimize these echoes. This function affects all DECT handsets connected to the communication system. The activation or deactivation only takes effect for a handset when it is turned off and turned back on. In the "<b>not active</b>" mode, echo suppression does not work, and echoes can occur when VoIP connections are made using DECT handsets.</p> <p>Default: not active</p> |
| <b>Economic Mode</b>           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Economic Mode</b>           | <p>The ECO mode can be enabled system-wide for all DECT phones. In ECO mode, the transmit power of DECT phones is either reduced by a fixed value (static) or every DECT phone adjusts its transmit power independently to the received signal strength (adaptive).</p> <p>Default: not active</p>                                                                                                                                                                                                                         |
| <b>Economic Mode: Off</b>      | The ECO Mode is disabled system-wide.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Economic Mode: On</b>       | The ECO mode (static) is enabled system-wide. The transmit power of the DECT phones is reduced by a fixed value.                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Economic Mode: Adaptive</b> | The ECO mode (adaptive) is enabled system-wide. Every individual DECT phone adjusts its transmit power independently to the received signal strength. During a handover, the system first switches to the high transmit power and then reduces the transmit power, depending on the reception.                                                                                                                                                                                                                             |

### 28.3.8.2 Cordless > SLC

Parameter Description of Tabs:

- **Change DECT Station**

| Parameters         | Description                                                                                                                                                                                                                                                                       |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Call no</b>     | Call number of the DECT phone.                                                                                                                                                                                                                                                    |
| <b>DID</b>         | Direct inward dialing number of the DECT phone.                                                                                                                                                                                                                                   |
| <b>Name</b>        | Name of the DECT phone.                                                                                                                                                                                                                                                           |
| <b>Active</b>      | Logon status of the DECT phone:<br>Green: The DECT phone is active.<br>Red: The board lockout switch was set for a logged-on DECT phone.<br>Yellow: The DECT phone was automatically logged off on changing the PIN.<br>Gray: No DECT phone has ever been logged on at this port. |
| <b>Mobile code</b> | PIN code to log on the DECT phone. The mobile code must be unique throughout the system.                                                                                                                                                                                          |
| <b>Access</b>      | Name, number and slot of the S <sub>0</sub> extension cable.                                                                                                                                                                                                                      |
| <b>Slot</b>        | Displays the slot of the plugged in SLC board.                                                                                                                                                                                                                                    |
| <b>Buttons</b>     |                                                                                                                                                                                                                                                                                   |
| <b>Delete</b>      | The DECT phone is removed from the system. In other words, the call number, DID number and name are deleted, and the associated TDM user license is released.                                                                                                                     |

Parameter Description of Tabs:

- **Add DECT Station**

| Parameters                   | Description                                                                                                                                                                                                                                                                                  |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System ID</b>             | If the communication system is not part of an internetwork (node ID = 0), the system identifier is preset to 1.<br><br>If the communication system belongs to an internetwork (node ID > 0), the system ID must match the node ID ( <b>Cordless</b> > <b>Multi SLC</b> > <b>System ID</b> ). |
| <b>Slot</b>                  | Slot of the plugged SLC board.                                                                                                                                                                                                                                                               |
| <b>SLC No.</b>               | Unique system-wide ID number of the SLC board.<br><br>Range of values: 1-15,17-31,33-47,...,127. Multiples of 16 are not allowed.                                                                                                                                                            |
| <b>Number of DECT phones</b> | Number of already configured DECT phones of this SLC board.                                                                                                                                                                                                                                  |
| <b>SLC Call number</b>       | Unique system-wide call number of the S <sub>0</sub> extension line.                                                                                                                                                                                                                         |
| <b>Access</b>                | Name, number and slot of the S <sub>0</sub> extension cable.                                                                                                                                                                                                                                 |
| <b>Add DECT Station</b>      |                                                                                                                                                                                                                                                                                              |

| Parameters                   | Description                                                                                                                                                                                                                                                                     |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Number of DECT phones</b> | <p>If the number of DECT phones is less than the size allowed in the system (which depends on the version), an additional number of DECT phones can be added for this SLC board here.</p> <p>The newly added DECT phones are displayed under the <b>Edit DECT Stations</b>.</p> |

### 28.3.8.3 Cordless > Multi-SLC

Parameter Description of Tabs:

- **Edit Multi-SLC**

| Parameters             | Description                                                                                                                                                     |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>SLC No.</b>         | <p>Unique system-wide ID number of the SLC board.</p> <p>Range of values: 1-15,17-31,33-47,...,127. Multiples of 16 are not allowed.</p>                        |
| <b>Node ID</b>         | Displays the node ID (if configured). If the communication system is part of an internetwork, all configured SLC boards of the internetwork are displayed here. |
| <b>SLC Call number</b> | Unique system-wide call number of the S <sub>0</sub> extension line of the SLC board.                                                                           |

### 28.3.8.4 Cordless > Base Stations

Parameter Description of Tabs:

- **Edit base station**

| Parameters                | Description                                                                                                                                                                                                                                                                               |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Slot</b>               | Displays the slot in which the SLC board of base station is inserted. Slot 2 is displayed for the mainboard (SLUC).                                                                                                                                                                       |
| <b>Type</b>               | <p>Type of base station.</p> <p>In the case of an SLC board, the type is only displayed; for SLUC, the type can be selected. If the type is changed from <b>No Port</b> to <b>Base station</b>, 16 DECT phones are automatically preconfigured, and an SLC networking line is set up.</p> |
| <b>Type: Base station</b> | Base station connected.                                                                                                                                                                                                                                                                   |
| <b>Type: No Port</b>      | No base station connected.                                                                                                                                                                                                                                                                |
| <b>Name</b>               | Name of the base station.                                                                                                                                                                                                                                                                 |
| <b>Level</b>              | <p>Level of the base station.</p> <p>Range of values: 50% and 100%; default value: 100%</p>                                                                                                                                                                                               |
| <b>Status</b>             | Status of the base station.                                                                                                                                                                                                                                                               |

| Parameters         | Description                                                                                                                                                       |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Master port</b> | For an SLC board, the ports to which the base station is connected are displayed. For an SLUC board, all ports with the connected terminal devices are displayed. |

## 28.3.9 Incoming calls

Call Management (CM) functions are grouped together under **Incoming calls**. These include settings for groups, for instance, and call forwarding-no answer.

### 28.3.9.1 Incoming Calls > Groups/Hunt groups

For the initial configuration of group calls and hunt groups, it is recommended that the **Group Call / Hunt Group** wizard be used.

Parameter Description of Tabs:

- **Edit Group Call Numbers**
- **Display Used Groups**
- **Display all group members**
- **Add group**
- **Delete group**
- **Edit group parameters**
- **Display members**
- **Add member**
- **Edit member order**
- **Check Basic MULAPs**
- **Check MULAP Preference**

| Parameters        | Description                                                                                                                                                                        |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Index</b>      | Consecutive number that is assigned by the communication system.                                                                                                                   |
| <b>Call no.</b>   | Phone number of the group call, hunt group, basic MULAP, executive MULAP or voicemail group                                                                                        |
| <b>DID</b>        | DID number of the group call, hunt group, basic MULAP, executive MULAP or voicemail group                                                                                          |
| <b>First Name</b> | Freely selectable first name for the group call, hunt group, basic MULAP, executive MULAP or voicemail group.<br>Value range: max. 16 characters, no umlauts or special characters |
| <b>Last Name</b>  | Freely selectable last name for the group call, hunt group, basic MULAP, executive MULAP or voicemail group.<br>Value range: max. 16 characters, no umlauts or special characters  |

| Parameters                   | Description                                                                                                                                                                                                                                                 |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Display</b>               | Name of the group call, hunt group, basic MULAP, executive MULAP or voicemail group<br><br>By default, it is created using the First Name and Last Name parameters depending on display name algorithm.                                                     |
| <b>Type</b>                  | Definition of the group type<br><br>Default value: Group<br><br>For more information see: <a href="#">Table: Type options</a>                                                                                                                               |
| <b>Ring type</b>             | Defines the acoustic signaling of incoming external calls to the group<br><br>Default value: 1<br><br>Only the default setting is possible for analog phones. Changes have no effect.                                                                       |
| <b>Ring type: 1</b>          | Two rings                                                                                                                                                                                                                                                   |
| <b>Ring type: 2</b>          | Three rings                                                                                                                                                                                                                                                 |
| <b>Ring type 3</b>           | short-long-short ring                                                                                                                                                                                                                                       |
| <b>Tel. directory</b>        | When this flag is activated (Display Yes), the call number of the group appears in the internal directory.<br><br>Default value: Enabled                                                                                                                    |
| <b>Mulap as group member</b> | When this flag is activated, the MULAP group can be added as a member in Groups.                                                                                                                                                                            |
| <b>Group member</b>          |                                                                                                                                                                                                                                                             |
| <b>Group</b>                 | Number (index) of the group                                                                                                                                                                                                                                 |
| <b>Member</b>                | Number (index) of the member within the group                                                                                                                                                                                                               |
| <b>Call number</b>           | Call number of the group member                                                                                                                                                                                                                             |
| <b>Name</b>                  | Name of the group member                                                                                                                                                                                                                                    |
| <b>Parameters</b>            | Enabled parameters of the group member                                                                                                                                                                                                                      |

| <p><b>NOTICE:</b> If a MULAP is member of a Linear hunt group, Cyclical hunt group or simple group, the following conversions are allowed:</p> <p>1) Group -&gt; Linear/Cyclical hunt group<br/> 2) Linear hunt group -&gt; Cyclical hunt group<br/> 3) Cyclical hunt group -&gt; Linear hunt group</p> |                                                                                                                                                                                                                                                                                                                                                         |
| <b>Type: Linear hunt group</b>                                                                                                                                                                                                                                                                          | An inbound call is always signaled first at the first member of a hunt group. Further signaling is performed on the basis of the sequence in which the members are entered in the group table.                                                                                                                                                          |
| <b>Type: Cyclical hunt group</b>                                                                                                                                                                                                                                                                        | An inbound call is always signaled first at the member that follows the subscriber who answered the last call. Further signaling is performed on the basis of the sequence in which the members are entered in the group table.                                                                                                                         |
| <b>Type: Group</b>                                                                                                                                                                                                                                                                                      | Group call of type Group: Incoming calls are simultaneously signaled at all available group members. Available group members are subscribers who are not busy. If all group members are busy, a call is signaled by a camp-on tone. Call signaling continues at all group members (camp-on tone at busy group members) even if the subscriber hangs up. |
| <b>Type: RNA</b>                                                                                                                                                                                                                                                                                        | Group call of type RNA: Incoming calls are simultaneously signaled at all group members. If a group member is busy, the entire group call is marked as busy (only the busy members are signaled for the incoming call). Callers of the group receive the busy signal.                                                                                   |

| Parameters                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type: Basic MULAP</b>     | Incoming calls are indicated visually at all phones associated with the basic MULAP (Multiple Line Appearance). The subscriber can also set whether or not incoming calls should also be acoustically signaled for each individual member. The status of the Basic MULAP changes to busy and other callers hear the busy signal when a call is answered. The Basic MULAP phone number is shown on the called party's display for outgoing calls via the Basic MULAP trunk.                                                                                                                                                                                               |
| <b>Type: Executive MULAP</b> | You can configure Executive MULAPs if you want to use restricted executive and secretary functions. If a caller rings the Executive MULAP phone number, the call is visually signaled at all phones belonging to the Executive MULAP. Incoming calls are also signaled acoustically for members with secretary functions.                                                                                                                                                                                                                                                                                                                                                |
| <b>Type: Call waiting</b>    | Group call of type Call Waiting: Incoming calls are simultaneously signaled at all available group members. Available group members are subscribers who are not busy. A call is signaled by a camp-on tone for busy group members.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Type: Voicemail</b>       | Voicemail group: A voicemail group enables a specific group of subscribers to access voicemails. When a call is placed to the call number of a voicemail group, the call is sent directly to the voicemail box (i.e., the voicemail) of the group and not to the group members. After a voicemail is left in the voicemail box of the group, it is forwarded to the voicemail boxes of all members. All members receive the voicemail simultaneously. Whenever a member deletes a voicemail, this voicemail is also deleted from the voicemail boxes of all members and the voicemail box of the group. The personal voicemails of all members are not affected by this. |

### 28.3.9.2 Incoming Calls > Group Members

Parameter Description of Tabs::

- **Edit member**
- **Delete member**

| Parameters          | Description                                                                                                             |
|---------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>Group</b>        | Number (index) of the group                                                                                             |
| <b>Group member</b> | Number (index) of the group member                                                                                      |
| <b>Phone number</b> | Call number of the group member                                                                                         |
| <b>First Name</b>   | Freely selectable first name for the group member.<br>Value range: max. 16 characters, no umlauts or special characters |
| <b>Last Name</b>    | Freely selectable last name for the group member.<br>Value range: max. 16 characters, no umlauts or special characters  |

| Parameters                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

### 28.3.9.3 Incoming Calls > Team/top

For the initial configuration of Team and Top groups, it is recommended that the **Team Configuration** and **Executive / Secretary** wizards be used.

Parameter Description of Tabs::

- **Display All Team/top**
- **Display Used Team/top**
- **Add Team/top Group**
- **Edit Team/top Group**
- **Delete Team/top Group**
- **Edit Team/top Group**
- **Display Team/top Members**
- **Add Team/top Member**
- **Edit Team/top Member**
- **Delete Team/top Member**
- **Display Fax Boxes**
- **Add Fax Box**

| Parameters        | Description                                                                                                                                          |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Index</b>      | Consecutive number that is assigned by the communication system.                                                                                     |
| <b>First Name</b> | <p>Freely selectable first name for the Team/Top group.</p> <p>Value range: max. 16 characters, no umlauts or special characters</p>                 |
| <b>Last Name</b>  | <p>Freely selectable last name for the Team/Top group.</p> <p>Value range: max. 16 characters, no umlauts or special characters</p>                  |
| <b>Name</b>       | <p>Name of th Team/Top group</p> <p>By default, it is created using the First Name and Last Name parameters depending on display name algorithm.</p> |
| <b>Type</b>       | Definition of the group type                                                                                                                         |

| Parameters                                             | Description                                                                                                                                                                                                                                                                           |
|--------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type: Team</b>                                      | A Team Group offers several convenient team functions. The station numbers of all team members are programmed on MULAP keys (trunk keys). Every team member can thus access all trunks (for instance, for call pickup) and can also conduct calls simultaneously via multiple trunks. |
| <b>Type: Top</b>                                       | A Top Group offers convenient Executive and Secretary functions (Top function) for up to three executives and up to three secretaries.                                                                                                                                                |
| <b>Team as group member</b>                            | This flag is configurable only when the Team Group has members with the same station type, which results in a single MULAP group below this Team Group. When this flag is activated, the MULAP group can be added as a member in Groups.                                              |
| <b>Key assignment to team</b>                          | Definition for the setup of MULAP keys of Team Group members                                                                                                                                                                                                                          |
| <b>Key assignment to team: to first/second console</b> | When this flag is activated, an automatic setup of MULAP keys occurs on the first or second add-on device (key module or BLF) of the Team telephone.                                                                                                                                  |
| <b>Key assignment to team: to first free key</b>       | When this flag is activated, an automatic setup of MULAP keys occurs on the first free key of the Team telephone.                                                                                                                                                                     |
| <b>Key assignment to top</b>                           | Definition for the setup of MULAP keys of Top Group members                                                                                                                                                                                                                           |
| <b>Key assignment to top: to first/second console</b>  | When this flag is activated, an automatic setup of MULAP keys occurs on the first or second add-on device (key module or BLF) of the Top telephone.                                                                                                                                   |
| <b>Key assignment to top: to first free key</b>        | When this flag is activated, an automatic setup of MULAP keys occurs on the first free key of the Top telephone.                                                                                                                                                                      |
| <b>Group member</b>                                    |                                                                                                                                                                                                                                                                                       |
| <b>Group</b>                                           | Number (index) of the group                                                                                                                                                                                                                                                           |
| <b>Members</b>                                         | Number (index) of the member within the group                                                                                                                                                                                                                                         |
| <b>Type</b>                                            | Definition of the member type                                                                                                                                                                                                                                                         |
| <b>Call no.</b>                                        | Call number of the group member (changes in a MULAP group to ** Call no and is internally accessible under this ** Call no.)                                                                                                                                                          |
| <b>Name</b>                                            | Name of the group member                                                                                                                                                                                                                                                              |
| <b>MULAP call no.</b>                                  | MULAP group number                                                                                                                                                                                                                                                                    |
| <b>MULAP DID</b>                                       | DID number of the MULAP group                                                                                                                                                                                                                                                         |
| <b>MULAP name</b>                                      | MULAP group name. This is the MULAP name that is displayed on the phone display when this Team group is called. The MULAP name is the same for all Team group members that have the same type.                                                                                        |

| Parameters                           | Description                                                                                                                                                                                                                                                                                                                   |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>UCD flags</b>                     |                                                                                                                                                                                                                                                                                                                               |
| <b>Allow UCD applications</b>        | When this flag is activated, the Uniform Call Distribution (UCD) feature is released throughout the system<br><br>Default value: Enabled                                                                                                                                                                                      |
| <b>Agents permanently available</b>  | When this flag is activated, all UCD agents are permanently available agents. A permanently available agent will then remain available for calls, faxes and e-mails even when he or she does not accept a call, fax or e-mail.<br><br>Default value: Disabled                                                                 |
| <b>Automatic wrap-up time</b>        |                                                                                                                                                                                                                                                                                                                               |
| <b>Wrap-up time (cycles)</b>         | The automatic wrap-up time for all UCD agents is defined on a system-wide basis in ring cycles, that is, in increments of five seconds. During the wrap-up time, an agent is temporarily removed from the call distribution in order to allow the agent some time to wrap up the call just completed.<br><br>Default value: 0 |
| <b>Priorities for internal calls</b> |                                                                                                                                                                                                                                                                                                                               |
| <b>Priorities, internal</b>          | System-wide definition of priority for internal calls based on 10 priority levels (1 = high, 10 = low).<br><br>Default value: 10                                                                                                                                                                                              |
| <b>Priorities for external calls</b> |                                                                                                                                                                                                                                                                                                                               |
| <b>Slot / line</b>                   | Displays the board, the slot and the number of the line (B channel). Priorities are assigned on the basis of trunks for external calls (per B channel), regardless of whether IP or TDM lines are involved.                                                                                                                   |
| <b>Priority</b>                      | Defines the priority for external calls received on the relevant line (B channel). The definition is based on 10 priority levels (1 = high, 10 = low).<br><br>Default value: 1                                                                                                                                                |

Parameter Description of Tabs:

- **Display UCD Groups**

| Parameters                    | Description                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Call number</b>            | Call number of the UCD group                                                                                                                                                                                                                                                                                                                                        |
| <b>MSN</b>                    | DID number of the UCD group                                                                                                                                                                                                                                                                                                                                         |
| <b>Name</b>                   | Name of the UCD group                                                                                                                                                                                                                                                                                                                                               |
| <b>Prim. ring cycles</b>      | <p>Definition of the primary ring cycle: This is defined in ring cycles, that is, in increments of five seconds. This setting specifies how long a call remains in the queue if not accepted by the agent longest in "available" state. The call is then forwarded to the next available agent.</p> <p>Default value: 3 Cycles</p>                                  |
| <b>sec. ring cycles</b>       | <p>Definition of the secondary ring cycle: This is defined in ring cycles, that is, in increments of five seconds. This setting specifies how long a call remains in the queue if not accepted by the next available agent.</p> <p>Default value: 3 Cycles</p>                                                                                                      |
| <b>Queued Calls</b>           | <p>Definition of the maximum number of queued calls: When the maximum number of queued calls is reached, further calls can be forwarded to an overflow destination (which may be an external destination, another UCD group, an internal station or a group).</p> <p>Default value: 10 (Default value of the last UCD group: 72)</p>                                |
| <b>AICC</b>                   | <p>Definition of the Automatic Incoming Call Connection (AICC). This setting applies to all agents in a UCD group, irrespective of whether or not the agent's phone features a headset.</p> <p>Default value: No</p>                                                                                                                                                |
| <b>AICC: yes</b>              | The agents in this UCD group can accept calls without any additional operating steps. An audible tone notifies the agent via the headset about an incoming call that is then automatically put through.                                                                                                                                                             |
| <b>AICC: no</b>               | The agents in this UCD group can accept incoming calls only when using conventional operations (for example, by lifting the handset).                                                                                                                                                                                                                               |
| <b>Ann. change</b>            | <p>Definition of possible announcement changes</p> <p>Default value: once</p>                                                                                                                                                                                                                                                                                       |
| <b>Ann. change : single</b>   | The queued caller will receive a one-time announcement.                                                                                                                                                                                                                                                                                                             |
| <b>Ann. change : cyclical</b> | The last announcement and the second to last announcement in the configuration are repeated cyclically.                                                                                                                                                                                                                                                             |
| <b>Overflow time</b>          | <p>Definition of the overflow time in seconds: If a queued call is not accepted by the UCD application within the overflow time, the call is processed further by the communication system in accordance with the Call Management specifications.</p> <p>This setting is relevant only when an external UCD application is connected.</p> <p>Default value: 600</p> |

| Parameters                     | Description                                                                                                                                 |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Announcement Delay Time</b> | Definition of the announcement delay in seconds: after this time has elapsed, a queued caller receives an announcement.<br>Default value: 0 |

Parameter Description of the Tab:

- **Edit UCD Group Parameters**

| Parameters                    | Description                                                                                                                                                                                                                                                                             |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Dest. index</b>            | For each UCD group, up to seven destinations (index 1 to 7) for announcements can be defined. The announcements of the destinations are played to the queued caller sequentially.                                                                                                       |
| <b>Announcement equipment</b> | Announcement for the relevant destination index.                                                                                                                                                                                                                                        |
| <b>Wait time</b>              | The announcement can be played either cyclically (max 9 cycles with 5 sec each = 45 sec) or in an continuous loop.<br>After this time, the announcement of the next index is played to the caller in the queue (not in the case of a <b>continuous</b> loop).<br>Default value: endless |

Parameter Description of the Tab:

- **Add-Delete UCD Group Members**

| Parameters       | Description                                                                                                        |
|------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Selection</b> | List of all UCD agent IDs.<br>The UCD agent IDs do not correspond to the call numbers in the communication system. |
| <b>Members</b>   | List of UCD agent IDs of the selected UCD group                                                                    |
| <b>Buttons</b>   |                                                                                                                    |
| <b>Add</b>       | Adds the selected UCD agent IDs of the UCD group.                                                                  |
| <b>Delete</b>    | Deletes the selected UCD agent IDs from the UCD group.                                                             |

Parameter Description of the Tab:

- **Assign Stations**

| Parameters      | Description                                                                  |
|-----------------|------------------------------------------------------------------------------|
| <b>Agent ID</b> | List of UCD agent IDs of the selected UCD group.                             |
| <b>Stations</b> | List of stations that can be assigned to the UCD agent IDs of the UCD group. |

### 28.3.9.6 Incoming Calls > Call Forwarding

Parameter Description of Tabs::

- **Call dest. list - Definition**

| Parameters                                                                                                                                                                                                                                                                                   | Description                                                                                                                                                                                                                                          |

| Parameters      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Call no</b>  | Call number of the subscriber or group.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Name</b>     | Name of the subscriber or group.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Type</b>     | Subscriber Type, e.g., U <sub>P0</sub> , system client, AB, ISDN, SIP.                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Day</b>      | Call destination list number to be used for incoming external calls during business hours (day service)<br>Default value: 14                                                                                                                                                                                                                                                                                                                                                      |
| <b>Night</b>    | Call destination list number to be used for incoming external calls during night service<br>Default value: 15                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Internal</b> | Number of the call destination list for incoming internal calls<br>Default value: 16                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Search</b>   | Entering a search term in the <b>Call no</b> or <b>Name</b> search fields and then pressing the return key causes all hits containing the specified search term to be displayed. For example, entering the call number 521 would display the matches +495213535 and +498967521, and entering the term co as the name would display Collins, Mcoin and Branco.<br><br>Pressing the return key with nothing entered in any of the search fields causes all entries to be displayed. |

Parameter Description of Tabs:

- **Members of dest. list**

| Parameters                                         | Description                                                                           |
|----------------------------------------------------|---------------------------------------------------------------------------------------|
| <b>Show all members with call destination list</b> | Displays all subscribers or groups that are using the selected call destination list. |

Parameter Description of Tabs:

- **Copy call dest. lists**

| Parameters              | Description                                                                                         |
|-------------------------|-----------------------------------------------------------------------------------------------------|
| <b>Call dest. list</b>  | Selects the call destination list to which subscribers are to be assigned.<br>Value range: 1 to 740 |
| <b>Day</b>              | Call destination list to be used for incoming external calls during business hours (day service)    |
| <b>Night</b>            | Call destination list to be used for incoming external calls during night service                   |
| <b>Internal</b>         | Call destination list for incoming internal calls                                                   |
| <b>Call dest. lists</b> |                                                                                                     |
| <b>Selection</b>        | List of all subscribers.                                                                            |

| Parameters     | Description                                                                         |
|----------------|-------------------------------------------------------------------------------------|
| <b>Members</b> | List of subscribers to whom the call destination list is assigned.                  |
| <b>Buttons</b> |                                                                                     |
| <b>Add</b>     | Transfers the selected subscribers from the Selection window to the Members window. |
| <b>Delete</b>  | Deletes the selected subscribers from the Members window.                           |

## 28.3.10 Trunks/Routing

The functions for trunks and routes are grouped together under **Trunks/Routing**.

### 28.3.10.1 Trunks/Routing > Trunks

Parameter Description of Tabs:

- **Display all lines**
- **Change Route**

| Parameters                                | Description                                                                                                                                                                                                                                                                       |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Trunk</b>                              | Display of the physical CO trunk connected to the communication system.                                                                                                                                                                                                           |
| <b>Box-SI-Pt-Li or Box/Slot/Port/Line</b> | Displays the card type and the slot and port number (physical port) where a specific trunk is connected to the communication system.                                                                                                                                              |
| <b>Code</b>                               | Display or setup of the seizure code On entering this number, the communication system seizes the trunk assigned to it. It is used to test the trunk or to program a line key. If CSTA applications are used, the value for this parameter should be set.                         |
| <b>Route</b>                              | Display or selection of the route that is assigned to the trunk (none or Trk. Grp 1 to Trk. Grp 12). If "none" is set in this column for an active trunk, system behavior will not be stable. Also, the system can receive a call on this trunk but the call cannot be forwarded. |
| <b>Status</b>                             | Displays the line status. Inactive lines are flagged with an asterisk.                                                                                                                                                                                                            |
| <b>Type</b>                               | Displays the line type. Inactive lines are designated as "No Port".                                                                                                                                                                                                               |

Parameter Description of Tabs:

- **display ringing assignment all lines**

| Parameters                                | Description                                                                                                                          |
|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <b>Trunk</b>                              | Display of the physical CO trunk connected to the communication system.                                                              |
| <b>Box-SI-Pt-Li or Box/Slot/Port/Line</b> | Displays the card type and the slot and port number (physical port) where a specific trunk is connected to the communication system. |

## Expert mode

| Parameters            | Description                                                     |
|-----------------------|-----------------------------------------------------------------|
| <b>Day call no.</b>   | Displays the call number assigned for day service               |
| <b>Day name</b>       | Displays the name of the assigned call number for day service   |
| <b>Night call no.</b> | Displays the call number assigned for night service             |
| <b>Night name</b>     | Displays the name of the assigned call number for night service |

Parameter Description of Tabs:

- **Add line**

| Parameters    | Description                   |
|---------------|-------------------------------|
| <b>Number</b> | Number of trunks to be added. |

Parameter Description of Tabs:

- **Change direction**

| Parameters      | Description                                                                                                                           |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <b>Line</b>     | Displays the number of the line.                                                                                                      |
| <b>outgoing</b> | Outgoing calls may be made on the line.<br><br><div><b>NOTICE:</b> Emergency calls can be made even if the flag is deactivated.</div> |
| <b>incoming</b> | Incoming calls may be received on the line.                                                                                           |

Parameter Description of Tabs:

- **change line**
- **delete line**

| Parameters                         | Description                                                                                          |
|------------------------------------|------------------------------------------------------------------------------------------------------|
| <b>Trunk</b>                       | Displays the lines number.                                                                           |
| <b>Box/Slot/Port/Line</b>          | Displays the physical port of the line (Box/Slot/Port/Line).                                         |
| <b>Code</b>                        | Display or entry of the seizure code                                                                 |
| <b>Route</b>                       | Display or selection of the route that is assigned to the trunk (none or Trk. Grp 1 to Trk. Grp 12). |
| <b>Ringing assignment per line</b> |                                                                                                      |
| <b>Day call no.</b>                | Day service call number for incoming connections that are not DID-capable                            |
| <b>Night call no.</b>              | Night service call number for incoming connections that are not DID-capable                          |

Parameter Description of Tabs:

- **Change ISDN Flags**

| Parameters                         | Description                                                                                                                                                                                                                                                  |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Protocol: Description</b>       | Each protocol template entry comprises the items Interface, Protocol and Additional info: S0 Basic access 2B+D via S0 interface, BRI Basic access 2B+D via U2B1Q interface (USA), S2 Primary multiplex access 30B+D, T1 Primary multiplex access 23B+D (USA) |
| <b>Logical/Physical</b>            | Logical or physical numbering of the channels                                                                                                                                                                                                                |
| <b>Slave B-channel neg: Master</b> | Setting of master/slave within Layer 3. For connections, one side must be set as the slave and the other side as the master.                                                                                                                                 |
| <b>Up B-channel alloc: Down</b>    | Definition of B-channel numbering (must be the same in both systems)                                                                                                                                                                                         |
| <b>S0 CHI format: S2M</b>          | Protocol format CHI, to be defined as S0 (short format) or S2M (long format)                                                                                                                                                                                 |
| <b>Unsymmetric/Symmetric</b>       | Symmetrical or non-symmetrical use of L3 protocol elements                                                                                                                                                                                                   |
| <b>Automatic/Fixed</b>             | Auto-negotiation or fixed assignment of symmetry                                                                                                                                                                                                             |
| <b>1 CR length: 2</b>              | Protocol format call reference length                                                                                                                                                                                                                        |
| <b>Alarm signaling</b>             | Use of alarm signaling in the layer 3 protocol                                                                                                                                                                                                               |
| <b>Protocol timers</b>             | Use of the layer 3 timer                                                                                                                                                                                                                                     |
| <b>PRI quickstart</b>              | Use of the PRI QuickStart procedure                                                                                                                                                                                                                          |
| <b>IE_TNS</b>                      | Use of the information element Transit Network Selection                                                                                                                                                                                                     |
| <b>IE_OSA</b>                      | Use of the information element Open Service Access                                                                                                                                                                                                           |
| <b>CIDL</b>                        | Use of call and link ID signaling in the network                                                                                                                                                                                                             |
| <b>Userside/Networkside</b>        | Layer 2 protocol setting. Mirrored setting required on the opposite side                                                                                                                                                                                     |
| <b>Network/Subscriber</b>          | Layer 2 protocol setting. Mirrored setting required on the opposite side                                                                                                                                                                                     |
| <b>PP/PMP</b>                      | Point-to-point or point-to-multipoint setting, only relevant for S0                                                                                                                                                                                          |
| <b>Permanent active</b>            | Layer 2 permanently active                                                                                                                                                                                                                                   |
| <b>Active TEI verify</b>           | Enables TEI check                                                                                                                                                                                                                                            |
| <b>Userside/Networkside</b>        | Layer 1 protocol setting. Mirrored setting required on the opposite side                                                                                                                                                                                     |
| <b>PP/PMP</b>                      | Layer 1 protocol setting. Same settings required on both sides                                                                                                                                                                                               |
| <b>S Bus type: L</b>               | Short/long bus (ranges)                                                                                                                                                                                                                                      |
| <b>Permanent active</b>            | Layer 1 protocol setting. Same settings required on both sides                                                                                                                                                                                               |
| <b>CRC4 check</b>                  | Layer 1 protocol setting, only relevant for S2M, same setting required on both sides                                                                                                                                                                         |

| Parameters            | Description                                                                          |
|-----------------------|--------------------------------------------------------------------------------------|
| <b>CRC4 reporting</b> | Layer 1 protocol setting, only relevant for S2M, same setting required on both sides |

Parameter Description of Tabs:

- **Change B-Channel**

| Parameters       | Description                                      |
|------------------|--------------------------------------------------|
| <b>B channel</b> | Displays the B channel number.                   |
| <b>Outbound</b>  | Outgoing calls may be made on the B-channel.     |
| <b>Incoming</b>  | Incoming calls may be received on the B-channel. |

Parameter Description of Tabs:

- **Change Direction**

| Parameters      | Description                                 |
|-----------------|---------------------------------------------|
| <b>Line</b>     | Displays the line number.                   |
| <b>Outgoing</b> | Outgoing calls may be made on the line.     |
| <b>Incoming</b> | Incoming calls may be received on the line. |

### 28.3.10.2 Trunks/Routing > Trunk group

Parameter Description of Tabs:

- **Change Route**

| Parameters                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Route Name</b>                | Route name. The entered name replaces the default route number in the Routes list.                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Seizure codes</b>             | The assignment codes for each route are entered here. The routing codes entered must be collision free, both mutually and within the communication system's entire call number plan. Use the Check button to test for collisions. The seizure code is the code that causes the switching system to provide a line to the station that dialed the code. Seizure codes only work if LCR has not been activated.                                                                            |
| <b>CO code (2nd. trunk code)</b> | A second trunk code (CO code) is defined if the communication system is a subsystem of another communication system or is networked with several other communication systems. It is only relevant for networking routes (route type = PABX). In this case, the second trunk code is the seizure code for the main system. Within a network, the codes for the trunk seizure, the route seizure code(s) and the second CO code must be configured uniformly. The default in Germany is 0. |
| <b>Gateway Location</b>          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Parameters                                                                                                 | Description                                                                                                                                                                                                                                                       |
|------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Country code</b>                                                                                        | Displays the country code of the own gateway location. | <b>Digit transmission: Digit-by-digit</b>  | The digits are transmitted in sync with dialing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Digit transmission: en-bloc sending</b> | During en-block digit transmission (block dialing per route), the dialed digits are buffered by the communication system. Dialing only takes place when a timer has elapsed after the last digit has been dialed, when the end-of-dial code # has been entered or if an exact match in the dial rule is found. In the case of PRI in the USA block dialing to the central office is mandatory. LCR must be activated to be able to select en-bloc digit transmission. The type of digit transmission is automatically set to en-bloc digit transmission in the route table if at least one route of the LCR route table is configured with en-bloc digit transmission.                                                                                                                                                                                                      |
| <b>Mobile Extension Number (MEX)</b>       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>MEX Number</b>                          | <p>If the ITSP being used supports the "Mobile Extension (MEX)" feature, the MEX number (8 positions, with only digits) provided by the ITSP must be entered here. This feature can only be used only with an Internet telephony DID connection (SIP like ISDN).</p> <p>It is used integrate mobile phones/smartphones into the communication system. The user of the mobile phone can be reached via the One Number Service under a single phone number, which is also communicated to the other party. When a subscriber is conducting a call with his or her mobile phone, the office number of the subscriber is displayed to the other party, so the number of the subscriber's mobile phone remains unknown. In addition, other internal subscribers can check the presence status of such subscribers even if they are currently talking on their mobile phones.</p> |
| <b>Trusted External User</b>               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Trusted External User</b>               | User that can be assigned to external collaboration platform such as MS Teams for making phone calls.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

Parameter Description of Tabs:

- **Change Routing Parameters**

| Parameters                                             | Description                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Routing flags</b>                                   |                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Digit repetition on</b>                             | When an outgoing route is seized with digit repetition activated, the routing code is sent before the call number. This only applies if LCR is deactivated (see Settings   Least Cost Routing).                                                                                                                                                                                                |
| <b>Analysis of second dial tone / Trunk monitoring</b> | Analysis of Second Dial Tone alerts the communication system to detect an additional dial tone. This feature is used with tandem communication system applications. This evaluation is country-dependent, e.g., in Belgium after 00 and in France after 16 or 19. This is not relevant in Germany. This only applies to network providers who send a second dial tone for international calls. |

| Parameters                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Intercept per direction</b>                       | This flag is necessary for QSIG networking. When this flag is set, the communication system checks whether a diversion request has been received by the remote station, or whether the communication system has implemented forward switching to the central intercept position. The remote station receives a message which advises whether or not a diversion should be implemented for this call. If intercept is activated for a route, all calls forwarded to this route are intercepted at this intercept position. To implement this feature, day and night numbers must be configured for each route (see Ringing assignment per line). Furthermore, an intercept position should not be entered for the day/night service (see Intercept/Attendant). |
| <b>Over. service 3.1 kHz audio</b>                   | For all outgoing calls on ISDN, Over. service 3.1 kHz audio is the default setting. This is the standard transmission type for outgoing calls on an Integrated Services Digital Network (ISDN) line). A connection from the communication system to a digital CO with an analog modem must be identified as a data service. This flag should be set to avoid problems during FAX operation.<br><br>In some cases, a network operator may not support the 3.1 kHz audio bearer service. This can cause the fax transmission to certain external telephone numbers to fail. One possible solution is to disable the <b>Over. service 3.1 kHz audio</b> flag.                                                                                                    |
| <b>Add direction prefix incoming</b>                 | When this option is activated on system telephones with incoming seizure, the call number display is supplemented by the route code.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Add direction prefix outgoing</b>                 | When this option is activated with outgoing seizure, the call number display is supplemented with the access code.<br><br>Info: changing this parameter affects the caller identification and must therefore be coordinated with the network providers. (Clip no screening)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Call No. with international / national prefix</b> | If this flag is enabled, the national or international code for the phone number (e.g., 02302..., 00492302...) must be added as a prefix for the ITSP.<br><br>Default: enabled                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Ring-back-tone to CO</b>                          | If this flag is set, a 'Ring-back tone' will be sent to the ISDN central office on an incoming call. This is a special protocol handling required for the provider Global One and Sovintel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Segmentation</b>                                  | This area defines the system behavior when sending ISDN messages in which the maximum Layer 2 user data length (260 bytes) is exceeded.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Segmentation: yes</b>                             | The message to be sent is split into 260-byte segments and sent individually. The receiving communication system must support the segmentation and collect and arrange the individual segments into a message.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Segmentation: no</b>                              | Segmentation is not needed, since the underlying Layer 2 can transport messages of any length.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Parameters                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Segmentation: Truncate Message</b> | The message to be sent is truncated to less than 260 bytes by eliminating the less important portions (such as names, for example) and then sent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Deactivate UUS per route</b>       | User-to-User Signaling (UUS) can be deactivated with this flag. This suppresses the transmission of the name and phone number of the A station in the UUI element (user-to-user information, UUI) for external call forwarding (FWD ext.). This flag must be manually deactivated for Telefonica.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Always use DSP</b>                 | If this flag is set, a connection to the Internet telephony service provider is only possible via a DSP (digital signal processor). If this flag is not set, then there is a Direct Payload connection to the Internet telephony service provider. This flag must be set for the route of the OpenScape Voice network. This flag may not be set in the case of fax transmissions (T.38) via an external device (e.g., Mediatrix 4102).                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Name in CO</b>                     | This flag is configured for CO that support calling party name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Analog trunk seizure</b>           | Here various times can be selected which determine when dialing begins when using analog dial-up lines (MSI). If no pause is set, the communication system waits until it recognizes a dial tone. Note for Brazil: When using DTMF signaling from analog terminals in conjunction with analog trunks and digit outputting after dial tone detection, there might be problems with the toll restriction when the country code is set to Brazil. In this case, the DTMF signals from the analog terminals go directly to the analog trunks ("1A procedure" is not used). Because of this, the DTMF signals which are dialed before the dial tone is received are lost. Consequently, for such cases, least cost routing (LCR) must be enabled for the dialing method and toll restriction to operate properly at the device. |
| <b>Trunk call pause</b>               | The CO call pause determines the period of time that elapses before a call is recognized as being completed once the user has hung up. This option applies only to MSI lines. For a trunk call with, for example, 1 second on and 4 seconds off, a trunk call pause of 6 seconds should be configured. In some COs, however, a 10-second ring pause applies. In such cases, a trunk call pause of 13 seconds must be programmed. Otherwise, no call diversion can be implemented. In the United States, this cycle is two seconds on, two seconds off, for a total of six seconds. The six-second option is the default, so you will not need to make any changes here. Setting range: 2 to 13 seconds.                                                                                                                    |
| <b>Type of Seizure</b>                | This field specifies the criteria that apply if the communication system needs to seize an outgoing line.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Type of seizure: cyclical</b>      | The communication system starts its cyclical search for a free line with the next line number based on the last outgoing line seized in this route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Type of seizure: linear</b>        | The communication system always begins its search with the lowest line number assigned to this route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Parameters                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Route type</b>                              | There are two options for Route type. The type of route can be set either as CO (Central Office) or as PABX (Private Automatic Branch Exchange).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Route type: CO</b>                          | Lines assigned to this route are subject to toll restriction. When LCR is active, the toll restriction is regulated by the Dial plan (COS column).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Route type: PABX</b>                        | Toll restriction is only performed if there is a second CO code assigned to this route. When LCR is active, the toll restriction is regulated by the Dial plan (COS column). The route type also has a bearing on the default text of the route name (see Routes) as well as on the procedure used for recognizing the dial tone on MSI lines.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>No. and type, outgoing</b>                  | The administrator can configure the "PABX number, incoming" and "PABX number, outgoing" separately, divided into portions for the country code, local area code and PABX number (= connection number in the local network). This is needed for the implementation of the "CLIP no screening" feature. If no "PABX number outgoing" has been configured, the communication system will always use the data of the "PABX number incoming" setting. In the case of an incoming seizure on an ISDN line, the communication system truncates the PABX number (left-aligned) from the received phone number and interprets remaining portion as the Direct Inward Dialing number. For call number information to the PSTN, the communication system automatically inserts the PABX number (or the portion defined in the configuration) as the leading portion of the call number. This does not apply to dialing information (destination address). The call numbers of internal stations that are sent to the remote station can be composed as follows: |
| <b>No. and type, outgoing: Unknown</b>         | only DID number (default setting)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>No. and type, outgoing: PABX number</b>     | PABX number + DID number                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>No. and type, outgoing: Local area code</b> | + Local area code + PABX number + DID number                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>No. and type, outgoing: Internal</b>        | Only for networked systems: number prefixes may not be added for closed numbering plans. Call number prefixes are suppressed here.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Call number type</b>                        | The settings in the "No. and type, outgoing" area also affect calls coming from an extension in a partner system (a networked node). Due to this setting, the caller's number that is received from the networked node and forwarded to the Central Office is extended for the outgoing route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Parameters                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Call number type: Internal</b>              | In this case, only the internal call number is transmitted. If the destination is an external station, either no number is transmitted or only that of the Attendant Console. The internal call number can be displayed when the destination is an internal station on another node.                                                                                                                                                                                                                                                                                                                        |
| <b>Call number type: Direct inward dialing</b> | In this case, only the DID number is transmitted. The internal call number is not provided for display at internal destinations in other nodes. The call number information is sufficient for external destinations.                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Call number type: Internal / DID</b>        | This setting is useful for networking purposes. Both the internal call number and the DID call number are transmitted to the destination station. If an internal station is called within the network, the internal call number of the caller can be displayed for this station. If the internal destination station has activated call forwarding to an external destination, for example, a DID number can also be transmitted in this case.                                                                                                                                                              |
| <b>Rerouting</b>                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Change route</b>                            | When this flag is turned on, it is also possible to route D-channel information via other routes. This option enables alternative routing via other routes. The option may be activated only when the call number plan is unambiguous. (Closed numbering or unique seizure codes in a network. The system making the request must also support this.). If rerouting is implemented, rerouting with change route active must also be set for the corresponding route. This option is only available for CorNet NQ networking, and must be activated in the same way in both networked communication systems. |
| <b>Route optimize active</b>                   | To optimize use of the B-channel, call forwarding can be performed on the basis of the protocol in accordance with the specification "Call Forwarding/Partial Rerouting". If partial rerouting is rejected, forward switching is used.                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Route optimize active: No</b>               | When you select this option, Rerouting is deactivated. For call forwarding, the connection is always set up via two B-channels.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Rerouting active: If route is known</b>     | When you select this option, rerouting is only active if the route is known and a successful "handshake" procedure takes place between the two networked communication systems.                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Route optimize active: Always</b>           | If the setup for the incoming call is coming in on the same route as the call forwarding destination route, the call will be rejected (call deflection feature is used) by the communication system if this option is activated. In case of networked systems this option Always must be activated in the same way in both networked communication systems.                                                                                                                                                                                                                                                 |

| <b>Numbering plan</b><br>Defines the Numbering Plan parameter in outgoing messages |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Called Party Number</b>                                                         | System check = defined by the system; ISDN numbering plan, Private numbering plan, Unknown numbering plan = preset manually                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>All others</b>                                                                  | e.g., Calling Party No., Redirecting No, etc. System check = defined by the system. ISDN numbering plan, Private numbering plan, Unknown numbering plan = preset manually                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Site</b>                                                                        | The Site (location) parameter determines how the Location parameter is set in the Q931 info element CAUSE and Progress Indicator. System check = defined by the system; alternatively, the setting "Private network and station" or "Always station" can be made manually.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>COLP</b>                                                                        | <p>If this flag is set, the number of the called party will be shown to the caller in the case of an external incoming CO connection. The calling party can see if the call has been forwarded or picked up by somebody else. This feature needs to be turned on by the central office as well. This feature is only available on digital Lines (BRI or PRI). If the flag is set and an external incoming call is forwarded or intercepted, the updated call number is signaled to the CO in the connect message output by the communication system. If the COLP feature is activated in the CO, the updated call number is also displayed for the caller.</p> <p>Info: This flag does not affect the call number display for external outgoing connections.</p> |
| <b>Notify send</b>                                                                 | This message is used for the transmission of status information about the current connection. The message can be sent from the network as well as the subscriber side to notify the other party (network or subscriber) about an interrupted connection, for example, or that call forwarding is active. If the notify feature is not supported by the CO, the notify message can be suppressed by resetting this flag. If this option is activated, a "Notify" message is transmitted if a call is on hold or parked, for example. Notify send is only evaluated in the DSS1, NI1 and MCI protocols. In the SIP-Q, CorNet-NQ and QSIG the notification is always sent.                                                                                          |
| <b>without CLIP</b>                                                                | If this flag is set, the calling party information to the public network will be suppressed for outgoing calls on a BRI or PRI line. This flag can be activated or deactivated on a per route basis. In addition, the station has the option to suppress the called party information on a per call basis via an access code or the system telephone menu.                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>No SETUP ACK.</b>                                                               | If this flag is set, the setup acknowledgment message from the communication system to the Central Office is suppressed. Relevant for special COs. Example: Fujitsu's Fetex150 COs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Parameters                         | Description                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>no DIV.LEG-Info</b>             | If this flag is set, the standard diverting LEG information signal (call number of the redirecting party) is not sent to the CO. The DIV. LEG info should be suppressed if problems occur in the case of external call forwarding (CF ext.).                                                                                                                                      |
| <b>With sending complete</b>       | If this flag is set, the optional information "All digits sent" is output by the system once all dialed digits have been transmitted.                                                                                                                                                                                                                                             |
| <b>Internal call like external</b> | If this flag is set, network-internal calls are acoustically signaled in the same way as external calls.                                                                                                                                                                                                                                                                          |
| <b>Without CCNR</b>                | If this flag is set, an incoming ISDN call with CCNR (Call Completion on No Reply) is signaled so that the system can accept a callback request. This means the caller can initiate a callback if the station does not reply. In some cases the message is not supported by the ISDN provider. In this case the switch must be activated to prevent the system from sending CCNR. |

### 28.3.10.3 Trunks/Routing > QSIG Features

In a network consisting of several communication systems, any connection information that occurs (CDRC data) in the PBX satellite systems is sent to a fixed communication system in the network. For this purpose, the call number of the destination system (call number of central recording system) to which the connection data is sent is configured in each communication system.

Parameter Description of Tabs::

- **Edit QSIG Features**

| Parameters                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Own system data</b>             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>System number</b>               | <p>This data identifies your own communication system in the network. This data applies to both central busy signaling and connection data routing.</p> <p>In a network consisting of several communication systems, each communication system has its own system number. If the communication system is networked with such communication systems, and you wish to use the QSIG features, the system numbers must also be administered here for compatibility reasons.</p> <p>Value range: 1 to 255</p> |
| <b>Group number</b>                | <p>In the communication systems, subscribers can be classified into groups, which then receive a unique group number. This type of grouping does not exist in the communication system. However, for compatibility reasons, the group number must also be administered here.</p> <p>Value range: 1 to 40</p>                                                                                                                                                                                             |
| <b>Inter-system busy signaling</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Parameters                       | Description                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System no. target system</b>  | <p>This data defines a communication system where centralized busy signaling is used. This can be either the PABX or a PABX satellite system.</p> <p>System number of the communication system that is configured for central busy signaling.</p> <p>Value range: 1 to 255</p>                                                                                                                                  |
| <b>Call no. target system</b>    | <p>Call number of the communication system that is configured for central busy signaling. Enter the PABX number and not the station number in this field. The fact that no extension is entered for this PABX number must be taken into account in the LCR dial plan!</p> <p>Example: If the call number of the destination system is 999 the dial plan entry must be -999 (and not -999XXX and not -999Z).</p> |
| <b>Connection data - Routing</b> |                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Call no. target system</b>    | <p>This data defines a communication system where centralized connection data recording takes place. This can be either the PABX or a PABX satellite system.</p> <p>Call number of the communication system that is set up as a central recording system (see also the note above for Call no. target system).</p>                                                                                              |

#### 28.3.10.4 Trunks/Routing > Assign MSN

Parameter Description of Tabs::

- **Display MSN**
- **Edit MSN**

| Parameters   | Description                                                      |
|--------------|------------------------------------------------------------------|
| <b>MSN</b>   | Display or entry of the MSN (point-to-multipoint call number).   |
| <b>Trunk</b> | Displays the assignment of the trunk on which the MSN is active. |

#### 28.3.10.5 Trunks/Routing > ISDN Parameters

The reference clock (ISDN clock) synchronizes operations on CO trunks within a specific network or within the Central Office. Normally, the communication system automatically selects the trunk to be used as a reference clock for all of the communication systems within a given network or CO. However, if the reference clock line is missing or malfunctions, then you must configure one or more other trunks as the reference clock line.

The communication system chooses the trunk in the following order:

- 1) Allowed list
- 2) S<sub>2M</sub> CO trunk

- 3) S<sub>0</sub> CO trunk
- 4) S<sub>2M</sub> tie trunk (only slave configuration)
- 5) S<sub>0</sub> tie trunk

Parameter Description of Tabs:

- **ISDN Clock**

| Parameters           | Description                                                                                                                                                                                                                          |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Index</b>         | The positions reflect the priorities 1-4 (for the Allowed list) and 1-16 (for the Denied list).                                                                                                                                      |
| <b>Allowed Lists</b> | If the Allowed list contains entries, the automatic line selection of the communication system is overridden. The ISDN ports (max 4 possible) entered in the Allowed list are used first in the search for the reference clock line. |
| <b>Denied Lists</b>  | The ISDN ports (max 16 possible) entered in the Denied list are skipped in the search for the reference clock line.                                                                                                                  |

## 28.3.11 Classes of Service

The functions for the classes of service for CO trunks are grouped together under **Classes of Service**. They control subscriber access to external calls that may be subject to toll charges.

### 28.3.11.1 Classes of Service > Stations

Parameter Description of the Tab:

- **Show all stations**

| Parameters                          | Description                                                                                                                                                                |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Call No., Call number</b>        | Station number of the subscriber.                                                                                                                                          |
| <b>Name</b>                         | Name of the subscriber.                                                                                                                                                    |
| <b>Day</b>                          | Selected COS group for the Day service.                                                                                                                                    |
| <b>Night</b>                        | Selected COS group for the Night service.                                                                                                                                  |
| <b>Class of Service Group Day</b>   | Displays the COS group for the Day service. The selection you make refers to the <b>COS Day</b> table, where the COS group is linked to the actual classes of service.     |
| <b>Class of Service Group Night</b> | Displays the COS group for the Night service. The selection you make refers to the <b>COS Night</b> table, where the COS group is linked to the actual classes of service. |

### 28.3.11.2 Classes of Service > Day: Class of Service Groups

Parameter Description of Tabs::

- **Edit Names**
- **Edit COS Group**
- **Day: Display COS Members**

| Parameters                                        | Description                                                                                                                                                                                                                                            |
|---------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Class of Service Group</b>                     | Freely selected name for COS groups 1 to 15; assignment of CO call privileges per route (trunk) for day and night, respectively When configuring the stations, access to external call numbers can be restricted by assigning class of service groups. |
| <b>Class of Service</b>                           | Assignment of classes of service to the individual COS groups for day service. All restrictions are effective only for the lines for a route of the type CO.                                                                                           |
| <b>Class of Service Group: Internal</b>           | The subscriber may only make internal calls.<br>Default value: default in COS group 1                                                                                                                                                                  |
| <b>Class of Service Group: Outward-restricted</b> | The subscriber may only answer (not make) external calls.<br>Default value: default in COS group 2                                                                                                                                                     |
| <b>Class of Service Group: Allowed list</b>       | The subscriber may only dial the external numbers defined in the Allowed list. Outward-restricted trunk access applies if no call number is entered.<br>Default value: default in COS group 4                                                          |
| <b>Class of Service Group: Denied list</b>        | The subscriber is not permitted to dial the external numbers defined in the Denied list. Unrestricted trunk access applies if no call number is entered.<br>Default value: default in COS groups 3, 5, 6                                               |
| <b>Class of Service Group: Unrestricted</b>       | Subscribers can answer and set up incoming and outgoing external calls without restriction.<br>Default value: default in COS groups 7 through 15                                                                                                       |
| <b>Display COS Members</b>                        | Displays call numbers and names of the members of the selected COS group.                                                                                                                                                                              |

### 28.3.11.3 Classes of Service > Night: Class of Service Groups

Parameter Description of Tabs::

- **Edit Names**
- **Edit COS Group**
- **Night: Display COS Members**

| Parameters                    | Description                                                                                                                                                                                                                                            |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Class of Service Group</b> | Freely selected name for COS groups 1 to 15; assignment of CO call privileges per route (trunk) for day and night, respectively When configuring the stations, access to external call numbers can be restricted by assigning class of service groups. |

| Parameters                                        | Description                                                                                                                                                                                              |
|---------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Class of Service</b>                           | Assignment of classes of service to the individual COS groups for night service. All restrictions are effective only for the lines for a route of the type CO.                                           |
| <b>Class of Service Group: Internal</b>           | The subscriber may only make internal calls.<br>Default value: default in COS group 1                                                                                                                    |
| <b>Class of Service Group: Outward-restricted</b> | The subscriber may only answer (not make) external calls.<br>Default value: default in COS group 2                                                                                                       |
| <b>Class of Service Group: Allowed list</b>       | The subscriber may only dial the external numbers defined in the Allowed list. Outward-restricted trunk access applies if no call number is entered.<br>Default value: default in COS group 4            |
| <b>Class of Service Group: Denied list</b>        | The subscriber is not permitted to dial the external numbers defined in the Denied list. Unrestricted trunk access applies if no call number is entered.<br>Default value: default in COS groups 3, 5, 6 |
| <b>Class of Service Group: Unrestricted</b>       | Subscribers can answer and set up incoming and outgoing external calls without restriction.<br>Default value: default in COS groups 7 through 15                                                         |
| <b>Display COS Members</b>                        | Displays call numbers and names of the members of the selected COS group.                                                                                                                                |

#### 28.3.11.4 Classes of Service > Allowed Lists

Parameter Description of Tabs::

- **Display Speed Dials**
- **Add Call Number**

| Parameters          | Description                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>List 1-6</b>     | Display/Add/Edit/Delete an allowed number. The Allowed list contains the phone numbers that may be called by the subscriber. Up to 6 Allowed lists can be created. Your first Allowed list can have up to one hundred entries, and the remaining five lists can have a maximum of ten entries.                                                                                                                         |
| <b>Phone number</b> | Call numbers can contain up to 27 digits, which can include the numbers 0 through 9 and the symbols * and #. The complete telephone number does not need to be listed. To permit users to dial (toll free) 0800xxx numbers, for example, only 0800 needs to be entered here. Since these lists are only for outgoing external calls, it is not necessary to include the trunk seizure code with the numbers you enter. |

### 28.3.11.5 Classes of Service > Denied Lists

Parameter Description of Tabs::

- **Display Speed Dials**
- **Add Call Number**
- **Edit Analysis Filter**

| Parameters                                                                                                                                                                                                                                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>List 1-6</b>                                                                                                                                                                                                                                         | Display/Add/Edit/Delete a denied number. The Denied list contains the phone numbers that cannot be called by the subscriber. Up to six Denied lists can be created. The first Denied list can have up to fifty entries, while the remaining five lists can have a maximum of ten entries each.                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Phone number</b>                                                                                                                                                                                                                                     | Call numbers can contain up to 27 digits, which can include the numbers 0 through 9 and the symbols * and #. The complete telephone number does not need to be listed. For example, to prohibit users from dialing (toll-based) 0900xxx numbers, you would only need to enter "0900" here. Entering a # sign at the start of a denied number prevents the toll restriction from being bypassed for system telephones when an analog CO line is to be seized using DTMF signaling or when switching to DTMF during the dialing. Since these lists are only for outgoing external calls, it is not necessary to include the CO access code with the numbers you enter. |
| <b>Edit Analysis Filter</b><br>You can use exception filters for any Denied list to define which digits should not be compared with the corresponding Denied list. The communication system excludes the set range of digits before the digit analysis. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>From digit ... To digit</b>                                                                                                                                                                                                                          | The analysis filter is active in this numeric range (1-25) within the phone number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Character</b>                                                                                                                                                                                                                                        | By prohibiting the characters * and #, subscribers are prevented from entering these characters to bypass the toll restriction.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

### 28.3.11.6 Classes of Service > Blacklist

Parameter Description of Tabs:

- **Display List**
- **Add Call Number**

| Parameters         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Call number</b> | Call numbers can contain up to 25 digits, which can include the numbers 0 through 9 and the character +. The '+' character refers to the international prefix that is configured in the system and must be entered in the first position. The first character of each entry can be '+' or any digit. The telephone numbers are numerically sorted in the Blacklist. Blacklist entries must be entered in international (e.g., 004989) or in canonical international format (e.g., +4989). |

| Parameters                   | Description                                                                                                                                          |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Block Anonymous calls</b> | Enabling this flag blocks the calls with no originator number or with existing originator number but restricted presentation.                        |
| <b>Blacklist feature on</b>  | Enabling this flag blocks the added call numbers.<br>Blacklist feature is based only n calling party number (call originator) given by the provider. |

### 28.3.11.7 Classes of Service > Night Service

Parameter Description of the Tab:

- **Edit night service**

| Parameters                                  | Description                                                                                                                                                                                                                                                                 |
|---------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Authorized station for night service</b> | If you want particular stations to have the ability to switch the communication system to night mode, you must enter these stations to the list of stations in the Authorized Station for Night Service list. A maximum of 5 stations can be entered.<br>Default value: 100 |
| <b>Station</b>                              | List of all stations present in the communication system.                                                                                                                                                                                                                   |
| <b>Authorized station</b>                   | List of authorized stations that can enable night mode.                                                                                                                                                                                                                     |
| <b>Add &gt;&gt;</b>                         | Adds the selected station to the authorized stations list                                                                                                                                                                                                                   |

### 28.3.11.8 Classes of Service > CON Group Assignment

Parameter Description of Tabs::

- **Edit Group Assignment**
- **Trunk to Group**
- **Group Speed Dial Range**

| Parameters                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>CON Group Assignment</b> | Assignment of a CON group (1-64) to a subscriber. You can assign a CON group to individual stations in the communication system via the CON Group Assignment. When coding the connection matrix, you can then access these stations and define which stations can reach which other stations. All stations are assigned to CON group 1 by default. This provides all stations with unrestricted access to all other stations.<br>Value range: 1 - 64 |

| Parameters                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Trunk to Group</b>         | <p>Assignment of a trunk to the CON group. You can assign a CON group to individual lines in the communication system via the CON Group Assignment. When coding the connection matrix, you can then access these groups and define which subscribers can access which lines. All CO trunks are assigned to CON group 1 by default. All stations thus have unrestricted access to all trunks (both inbound and outbound).</p> <p>Value range: 1 - 64</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Group Speed Dial Range</b> | <p>Every CON group is assigned a range of speed dials (SSD). If a user selects a speed dialing system number, the system determines whether or not this user is authorized to select that speed dialing system number by determining the associated ITR group. The number is dialed if this speed dialing system number belongs to the range of speed dialing system numbers assigned to the relevant CON group. An error message is issued if the speed dialing system number does not belong to the assigned group. The speed-dial number ranges can overlap in the CON group. Individual speed dialing system numbers may not be entered in the ITR groups and multiple speed dialing system number groups may not be entered in an ITR group. For example, the following are allowed: CON 1: 0-99; CON 2: 50-150; CON 3: 200-500. And the following are not allowed: CON 1: 0, 5, 10; CON 2: 50-100, 300-500.</p> <p>Value range: 0-7999</p> |

### 28.3.11.9 Classes of Service > CON Matrix

Parameter Description of Tabs::

- **Edit the CON Matrix**

| Parameters        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>CON matrix</b> | <p>If you want to selectively edit one connection method between two CON groups, click in the field at the intersection point of these CON groups in the CON matrix. Click repeatedly in the field to release or block the connection methods in one direction, the other direction, or both directions. To use the connection matrix, you must first assign each station to a group via Group assignment. By default all stations and all trunks are in Group 1. Since Group 1 is coded with unlimited access, by default, every station has access to every other station and to all trunks.</p> |
| <b>Grid</b>       | <p>Note that the matrix shows one list of groups vertically across the top and another list of groups horizontally down the left-hand side. At each conjunction there is a box. The type of arrow in this box indicates the relationship of the two groups to one another. An empty field means that no connection is possible. A connection matrix with no arrows results in a totally disabled communication system.</p>                                                                                                                                                                         |

| Parameters                 | Description                                                                                                         |
|----------------------------|---------------------------------------------------------------------------------------------------------------------|
| <b>Block all</b>           | The CON matrix suppresses traffic between stations and trunks within the same group (subsystem) and between groups. |
| <b>Release all</b>         | The CON matrix allows traffic between stations and trunks within the same group (subsystem) and between groups.     |
| <b>Group-internal only</b> | The CON matrix allows traffic only between stations and trunks within the same group (subsystem).                   |

### 28.3.11.10 Classes of Service > Autom. night service

Parameter Description of Tabs::

- **Display all days**
- **Edit day**

| Parameters                                                                         | Description                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, Sunday, Special Day</b> | Day which is configured via the schedule. The schedule covers the entire week (Monday through Sunday) as well as special days. Special days are holidays or special days such as company holidays.                                                                                                                                                                                             |
| <b>Zone</b>                                                                        | The schedule for a day can be split into up to 4 zones (time intervals). These zones can be defined sequentially and without gaps, that is, the end time of the first interval may be identical to the start time of the second interval, for example. However, an interval cannot have the same start and end times. The minimum length of an interval is 15 minutes.<br><br>Value range: 1-4 |
| <b>Begins</b>                                                                      | Start time for the zone. If the first interval for a day begins at 0.00 hours, then the start time must be entered as 00:00.                                                                                                                                                                                                                                                                   |
| <b>End</b>                                                                         | End time for the zone. If the last interval for a day ends at 24.00 hours (12 p.m.), the end time must be entered as 23:59 (11:59).                                                                                                                                                                                                                                                            |
| <b>Night call no.</b>                                                              | Night phone number for the zone. If no call number is entered for the night call number, night service per line is activated in the system. The destinations for this are set under <b>Lines/networking &gt; change line &gt; Ringing assignment per line</b> . The timers entered via the automatic night service apply for all trunks.                                                       |
| <b>OK</b>                                                                          | The zone will be created.                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Delete</b>                                                                      | The defined zone will be deleted.                                                                                                                                                                                                                                                                                                                                                              |
| <b>Copy Service</b>                                                                | You can copy the zones set up to one or more other days by selecting the day you want, to the special day by selecting the respective flag, all to all by selecting <b>Check all</b> . When you hit <b>Apply</b> , the zone settings in the days you have selected will be overwritten with the zones set up in the current day.                                                               |

### 28.3.11.11 Classes of Service > Special Days

Parameter Description of the Tab:

- **Edit Special Days**

| Parameters  | Description                                                                 |
|-------------|-----------------------------------------------------------------------------|
| <b>Day</b>  | When you select a date in the calendar, this is automatically entered here. |
| <b>Name</b> | Name for this special day (e.g., Whit Monday)                               |

### 28.3.12 Auxiliary Equipment

The functions for auxiliary equipment such as Music on Hold (MoH) or for connecting an entrance telephone/door opener at the system ports (trunks) are grouped together under **Auxiliary Equipment**.

#### 28.3.12.1 Auxiliary Equipment > Announcements/Music On Hold > Announcements and Music on Hold

Parameter Description of Tabs:

- **Edit Announcements**

| Parameters                        | Description                                                                                                                                            |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type of ann.</b>               | Type of announcement parameter allows you to choose among three possible options. The music for this feature can be supplied internally or externally. |
| <b>Type of ann.: None</b>         | Select this option for no playback.                                                                                                                    |
| <b>Type of ann.: Start / Stop</b> | Select this option for a single playback.                                                                                                              |
| <b>Type of ann.: Continuous</b>   | Select this option for continuous playback.<br>This option is not supported in embedded systems.                                                       |

Parameter Description of Tabs:

- **Edit Music on Hold**

| Parameters         | Description                                                                                                                                   |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type of MOH</b> | Type of MOH parameter allows you to choose among three possible options. The music for this feature can be supplied internally or externally. |

| Parameters                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type of MOH: No Music On Hold</b>         | If this option is selected, the Music on Hold feature will be deactivated completely. This does not apply when an external call is transferred by a transfer before answer; the caller then hears the ring tone.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Type of MOH: MOH without ringing tone</b> | If this option is selected, in the case of an unmasked transfer, the caller will hear Music on Hold while the transfer takes place, as well as while the call is being transferred by the transferring party and the external connection is ringing at the transferred destination.                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Type of MOH: MOH with ringing tone</b>    | <p>If this option is selected, in the case of an unmasked transfer, the caller will hear Music on Hold while the transfer takes place. As soon as the call is transferred through by the transferring party and the external connection is ringing at the transferred destination, the caller will hear a ring tone.</p> <p>The MOH with ringing tone option should always be set in a network system in order to provide the customer with a uniform environment.</p> <p>If the caller is reaching the system through Internet Telephony Service Provider(ITSP), this option will not apply and the caller will hear Music On Hold during transfer.</p> |

Access and Type activation via Manager E.

The input format for Music On Hold is a wave file with PCM and 16 bits. Supported sample rates are 8, 22.05, 24, 32, 40, 44.1 and 48 kHz in mono or stereo. The preferred format is PCM, 16 bits, 8kHz, mono. The recommendation is to use the preferred input format and limit the length of the wave files to about 2 min. It is possible to set one MOH for day and one for night. A reset is required.

### 28.3.12.2 Auxiliary Equipment > Entrance Telephone (Door Opener)

Parameter Description of Tabs:

- **Edit Door Opener**

| Parameters     | Description                                                                                                                |
|----------------|----------------------------------------------------------------------------------------------------------------------------|
| <b>Station</b> | Selection of the phone number / connection port of the entrance telephone. The Station port type must be P.O.T or No Port. |

| Parameters         | Description                                                                                                                                                                                                                                                                                                                                                     |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Destination</b> | Selection of the phone number / connection port of the entrance telephone ring destination. A station number or a group number can be specified as the ring destination at which a special ring is signaled when the doorbell button is pressed. The call is signaled in accordance with the call forwarding algorithms defined in "Settings - Incoming calls". |
| <b>Door opener</b> | Activates the door opener function. By setting this flag, a door opener connected at the TFE-S can be activated for the stations.                                                                                                                                                                                                                               |
| <b>DTMF</b>        | Setting this flag enables the door opener to be activated remotely with a DTMF transmitter.                                                                                                                                                                                                                                                                     |
| <b>FWD</b>         | Setting this flag enables external forwarding of the entrance telephone ring destination.                                                                                                                                                                                                                                                                       |

### 28.3.12.3 Auxiliary Equipment > SmartVM

Parameter Description of Tabs:

- **Edit SmartVM Mailboxes**

| Parameters                    | Description                                                                                                                                                                                             |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Mailbox call no.</b>       | Input of the mailbox call numbers. A mailbox is identified by means of the mailbox call number. If a mailbox is to be assigned to a station, the mailbox must have the same call number as the station. |
| <b>Name</b>                   | Displays the mailbox name. The name corresponds to the name of the subscriber (if available). In the case of a group, the group name is displayed.                                                      |
| <b>Greeting</b>               | Selects the greeting. The usability of the items offered will depend on the selected phone menu (TUI). With the OSO TUI, only Greeting 1 is supported for standard mailboxes.                           |
| <b>Greeting: Greeting 1-4</b> | The selection of Greetings 1-4 depends on the type of the mailbox:<br>Standard mailbox: Greeting 1 or 2 (only Greeting 1 with OSO TUI)<br>Attendant mailbox: Greeting 1, 2, 3 or 4                      |
| <b>Greeting: Day/Night</b>    | The greeting depends on the Day/Night mode:<br>Day - Greeting 1 / Night - Greeting 2                                                                                                                    |
| <b>Greeting: Type of Call</b> | Only for standard mailbox: Greeting depends on the status of the subscriber:<br>Call not accepted - Greeting 1 / Busy - Greeting 2                                                                      |
| <b>Greeting: None</b>         | No greeting is played. However, the mailbox remains active, e.g., to forward the call to the intercept position.                                                                                        |

| Parameters            | Description                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Recording</b>      | If this flag is enabled, the mailbox is a standard mailbox. It can then no longer be an Attendant mailbox. If the flag is disabled (default), the mailbox does not have the option of recording a message. The subscriber can activate the recording when checking his or her voicemail box for the first time. This ensures that no messages can be recorded before the mailbox has been activated by the user.<br>Default: enabled |
| <b>AutoAttendant</b>  | If this flag is enabled, the mailbox is an Attendant mailbox (AutoAttendant). It can then no longer be a standard mailbox. A maximum of 100 mailboxes can be configured as Attendant mailboxes. When a standard mailbox is converted to an Attendant mailbox, all existing messages of the mailbox are deleted.<br>Default: disabled                                                                                                 |
| <b>Password Reset</b> | If this flag is enabled, the password of the mailbox is reset to 123456. The subscriber must change the password at the next access to his or her mailbox.<br>Default: disabled                                                                                                                                                                                                                                                      |

Parameter Description of Tabs:

- **Edit SmartVM Parameters**

| Parameters                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>General parameters</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Max. mailbox no. length</b>         | Maximum length of voicemail box call number.<br>Value range: 2 - 16 positions; default value: 3 positions                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Max. message length (min)</b>       | Maximum length of the recording time for a message.<br>Range of values: 1 or 2 minutes; default value: 2 minutes                                                                                                                                                                                                                                                                                                                                                             |
| <b>Call number length delimitation</b> | For outgoing connections that are initiated by the SmartVM (AutoAttendant suffix dialing and AutoAttendant speed dialing), only call numbers up to the specified length can be dialed. In cases where longer call numbers have been configured, no connection is established. By default, the call number length restriction corresponds to the (internal) call number length of the mailbox, so only internal dialing is allowed.<br>Value range: 2 to 30, default value: 3 |
| <b>General fax intercept</b>           | Entry of the fax intercept destination to which the SmartVM should normally send incoming faxes. If no fax intercept destination is specified, incoming faxes will be rejected.<br>Value range: max. 16 digits                                                                                                                                                                                                                                                               |
| <b>Standard lang.</b>                  | Selects the language of the user prompts. Applies to all mailboxes. If user prompts in the desired language are not available, the language is set to UK English (enuk).                                                                                                                                                                                                                                                                                                     |
| <b>Telephone User Interface</b>        | Selects the phone menu structure of the voicemail box (Telephone User Interface, TUI). The selection applies to all voicemail boxes.                                                                                                                                                                                                                                                                                                                                         |

| <b>Allow callback from VM to know number only</b>                                                                         | When external UserA calls UserB, UserB has call forward to his voice mail, external UserA leaves a voice message, UserB call the SmartVM, enter his password and while listens to the message dials the digit '8'. By dialing this number there is a callback to UserB.<br><br>If this flag is enabled callback occurs if the the number of userB belongs to the known numbers. Known numbers are the Mobile phone number and the Home/external phone number of the profile details of User Management(Applications-UC Smart-User Management)<br><br>Default: enabled |
| <b>AA VP Behavior</b><br>Setting for whether the AutoAttendant should automatically play announcements for certain cases. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>VP Before Transfer</b>                                                                                                 | If this flag is enabled, the following announcement is played for "VP Before Transfer":<br><br>"Please wait, you are being connected..."<br><br>Default: disabled                                                                                                                                                                                                                                                                                                                                                                                                     |

| Parameters                | Description                                                                                                                                                                                                                                                                                                     |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>VP Transfer Result</b> | <p>If this flag is enabled, one of the following prompts is played for "VP Transfer Result":</p> <p>"The station number does not exist."</p> <p>"The station is busy."</p> <p>"The station is not responding."</p> <p>Default: enabled</p>                                                                      |
| <b>VP Intercept</b>       | <p>If this flag is enabled, one of the following announcements is played for "VP Intercept":</p> <p>"You are being connected with the operator. Please wait."</p> <p>"You are being connected with the mailbox of the subscriber."</p> <p>"Please wait, you are being connected..."</p> <p>Default: enabled</p> |
| <b>VP Before Release</b>  | <p>If this flag is enabled, one of the following prompts is played for "VP Before Release":</p> <p>"Please call later."</p> <p>"Thank you. Goodbye."</p> <p>"The mailbox number is not valid."</p> <p>Default: enabled</p>                                                                                      |

Parameter Description of Tabs:

- **Edit Automatic Attendant Parameters**

| Parameters                        | Description                                                                                                                                                                                                                                      |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Call number</b>                | Call number of the AutoAttendant (default: 352).                                                                                                                                                                                                 |
| <b>Intercept after announcem.</b> | <p>If this flag is enabled, the call is intercepted to the intercept position (e.g., the attendant console) after the greeting. No speed-dialing destination can be dialed during the announcement of the greeting.</p> <p>Default: disabled</p> |
| <b>no suffix-dialing</b>          | <p>If this flag is activated, the caller can only be redirected to other destinations by the dialing of speed-dial destinations. The caller cannot dial any multi-digit call number.</p> <p>Default: disabled</p>                                |

Parameter Description of Tabs:

- **Edit Speed Dial/Intercept Dest. Day**
- **Edit Speed Dial/Intercept Dest. Night**
- **Edit Speed Dial/Intercept Dest. 3**
- **Edit Speed Dial/Intercept Dest. 4**

| Parameters               | Description                                                                                                                                               |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Select</b>            | Selection of an internal subscriber (1st. half of the list) or a voicemail box (2nd. half of the list) as a speed dial destination or intercept position. |
| <b>Action</b>            | Displays the 10 possible speed dial destinations and the intercept position.                                                                              |
| <b>Call number</b>       | Call number of the selected subscriber or the selected voicemail box.                                                                                     |
| <b>Name</b>              | Name of the selected subscriber or the selected voicemail box.                                                                                            |
| <b>Type</b>              | Selects the type of the call number.                                                                                                                      |
| <b>Type: Call number</b> | In this case, the selected subscriber is called with the assigned speed dial number.                                                                      |
| <b>Type: Mailbox</b>     | In this case, the selected voicemail box is called with the assigned speed dial number.                                                                   |

### 28.3.13 Payload

The functions for displaying and configuring port types and protocols are grouped together under **Payload**.

#### 28.3.13.1 Payload > Devices

Parameter Description of Tabs::

- **Display Global Device Settings**
- **Reset Device Settings to Factory Settings**

| Parameters                                          | Description                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Global Gateway of Type G.711</b>                 | Devices is the collective name for stations, features, and functions that require channels. The information displayed includes the codec type of the global gateway, the maximum number of licensed B channels available, and the maximum number of LAN clients on a channel for music on hold (calls above this number are not put through). |
| <b>Max. No. of B Channels Supported by Hardware</b> |                                                                                                                                                                                                                                                                                                                                               |
| <b>No. of LAN Clients per MoH Channel</b>           |                                                                                                                                                                                                                                                                                                                                               |

Resetting the device settings requires a restart of the communication system.

#### 28.3.13.2 Payload > Media Stream Control (MSC)

Parameter Description of Tabs::

- **Edit MSC Jitter Parameters**

| Parameters                                   | Description                                                                                                                                                                                                                                                                                                        |
|----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                              | The Media Stream Control (MSC) monitors and administers the media streams that are routed via the communication system. It provides for the transfer of media data between networks via gateways(TDM/IP).                                                                                                          |
| <b>Traffic Statistics (SNMP Only)</b>        | Required for access to the data of the per-call statistics of the system via SNMP.                                                                                                                                                                                                                                 |
| <b>RTCP Packet Generation Interval (sec)</b> | Report interval in seconds for RTCP packets (Real-time Transport Control Protocol). This interval is used for the negotiation and compliance of Quality of Service (QoS) parameters through the periodic exchange of control messages between senders and receivers.<br><br>Value range: 5 to 10, default value: 5 |

Parameter Description of Tabs::

- **Reset MSC Settings to Factory Defaults**

| Parameters                                    | Description                               |
|-----------------------------------------------|-------------------------------------------|
| <b>Reset MSC Settings to Factory Defaults</b> | Restore all original settings of the MSC. |

### 28.3.13.3 Payload > HW Modules

Manage the DSP modules of the communication system

Parameter Description of Tabs:

- **Display All HW Modules**
- **Edit DSP Settings**
- **Edit DSP Jitter Settings**

| Parameters              | Description                                                                                                                                                                                                                                                                      |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>HW Type</b>          | Displays the DSPs (Digital Signal Processors) used in the communication system. Possible options are: <ul style="list-style-type: none"> <li>• <b>Onboard</b> = Integrated DSP of the mainboard</li> <li>• <b>OCCB X-1</b> = DSP of an OCCB subboard (OCCB1 or OCCB3)</li> </ul> |
| <b>Firmware version</b> | Current firmware version of each individual DSP                                                                                                                                                                                                                                  |
| <b>API Version</b>      | Current API (Application Programming Interface) version of each individual DSP                                                                                                                                                                                                   |
| <b>General</b>          |                                                                                                                                                                                                                                                                                  |
| <b>IP Address</b>       | IP address of the DSP module (can be changed if the IP address is already used).<br><br><b>Note:</b> The last octet of IP address cannot be .1 (xxx.xxx.xxx.1)                                                                                                                   |
| <b>Port</b>             | Port number of the DSP module                                                                                                                                                                                                                                                    |

| Parameters                                  | Description                                                                                                                                                                                                                                                                                                       |
|---------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Status display</b>                       | Used to detect the availability of DSPs<br>Default value: Status messages                                                                                                                                                                                                                                         |
| <b>Echo Cancellor</b>                       | Enabling this flag suppresses the echo effect in voice transmissions.<br>Default value: Enabled                                                                                                                                                                                                                   |
| <b>DTMF Outband Signaling</b>               | When this flag is activated, DTMF signals are transmitted in a separate signaling channel (outband transmission).<br>Default value: Disabled                                                                                                                                                                      |
| <b>Fax Parameter</b>                        |                                                                                                                                                                                                                                                                                                                   |
| <b>Number of Redundancy Packets</b>         | Defines the number of redundancy packets: the higher the value, the lower the risk of packet loss during fax transmission. Higher values, however, also require a higher bandwidth.<br>Default value: 2                                                                                                           |
| <b>Maximum Network Jitter (hex msec)</b>    | Defines the maximum network jitter in milliseconds: the higher the value, the greater the possible round-trip delay of data packets in networks. Only hexadecimal values consisting of the digits 0 to 9 and A to F are allowed. Avoid making any changes to this parameter.<br>Default value: 00C8               |
| <b>Fax/Modem Tone Detection Timeout (s)</b> | Defines the time in seconds for the detection of fax tones during calls: this ensures that the T.38 fax protocol is used. After the preset time has elapsed, no more fax tones are detected. A value of 0 means that fax tone detection is enabled for the entire duration of the connection.<br>Default value: 0 |
| <b>DSP Jitter</b>                           |                                                                                                                                                                                                                                                                                                                   |
| <b>Jitter Buffer Type</b>                   | Definition of the Jitter buffer type<br>Default value: Adaptive                                                                                                                                                                                                                                                   |
| <b>Jitter Buffer Type: Static</b>           | The average delay of the jitter buffer always remains the same.                                                                                                                                                                                                                                                   |
| <b>Jitter Buffer Type: Adaptive</b>         | The jitter buffer aligns with the average delay when receiving data. It attempts to keep the delay as low as possible while keeping data packet loss to a minimum.                                                                                                                                                |
| <b>Average Delay for Voice (ms)</b>         | Defines the time in milliseconds during which an IP packet should be held in the jitter buffer in the case of IP-based voice transmission.<br><b>INFO:</b> In the case of the <b>Jitter Buffer Type Adaptive</b> , the value defined here is only a start value.<br>Default value: 40                             |

| Parameters                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Maximum Delay for Voice (ms)</b>   | <p>Defines the maximum delay for voice in milliseconds</p> <p><b>Jitter Buffer Type Static:</b> Enter the maximum number of milliseconds permitted for a delay before the jitter buffer intervenes in the data stream when receiving IP packets as part of a voice transmission. The recommended value for the static jitter buffer is 80 for most environments.</p> <p><b>Jitter Buffer Type Adaptive:</b> Enter the maximum number of milliseconds for the average delay for voice. Outgoing packets are lost if the actual delay measured is greater. The recommended value for the adaptive jitter buffer is 120 for most environments.</p> <p><b>Note:</b> This value must always be greater than the value specified in the "Average Delay for Voice (ms)" field.</p> <p>Default value: 120</p> |
| <b>Minimum Delay for Voice (ms)</b>   | <p>Defines the minimum delay for voice in milliseconds</p> <p><b>Jitter Buffer Type Adaptive:</b> Enter the minimum number of milliseconds permitted for the average delay for voice. The average delay is always greater than or equal to this value.</p> <p>Default value: 20</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Packet Loss / Delay Preference</b> | <p>Defines the ratio between packet loss and propagation delays for data packets</p> <p><b>Jitter Buffer Type Adaptive:</b> Specify a value between 0 and 8 depending on what seems more acceptable in the event of large propagation delays - loss of packets or even greater delays. A value of 0 means minimal packet loss and greater propagation delays. A value of 8 means minimal propagation delays and a higher risk of packet loss. The recommended value for most environments is 4.</p> <p>Default value: 4</p>                                                                                                                                                                                                                                                                           |
| <b>Average Delay for Data (msec)</b>  | <p>Defines the average delay for data in milliseconds</p> <p>Enter the average number of milliseconds a data packet should be held in the jitter buffer for data transmissions. The recommended value for most environments is 60.</p> <p>Default value: 60</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Maximum Delay for Data (msec)</b>  | <p>Defines the maximum delay for data in milliseconds</p> <p>Enter the maximum number of milliseconds permitted for a delay before the jitter buffer intervenes when receiving IP packets as part of a data transmission. The recommended value for most environments is 200.</p> <p><b>INFO:</b> Higher values (from about 2000) have no effect. As soon as a packet has entered the buffer, it will leave the buffer again. Although values under 100 msec are possible, they are not recommended in practice.</p> <p>Default value: 200</p>                                                                                                                                                                                                                                                        |

## 28.3.14 Statistics

The functions for displaying statistics are grouped together under **Statistics**.

### 28.3.14.1 Statistics > Gateway Statics > Mainboard > Device Statistics

Parameter Description of Tabs::

- **Display SCN Statistics**
- **Display LAN Statistics**

| Parameters                                  | Description                                                                                                                                                                                                                                                                                                                          |
|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Device Type</b>                          | Displays the existing LAN and SCN (Switched Circuit Network) components.                                                                                                                                                                                                                                                             |
| <b>No. of Currently Used Resources</b>      | Displays the currently allocated resources of a component (configured and used channels).                                                                                                                                                                                                                                            |
| <b>Total</b>                                | Displays the sum of the currently allocated resources.                                                                                                                                                                                                                                                                               |
| <b>auto refresh</b>                         | The display is automatically updated every 60 seconds.                                                                                                                                                                                                                                                                               |
| <b>Seconds until next automatic refresh</b> | Displays a countdown timer, starting at 60 seconds.                                                                                                                                                                                                                                                                                  |
| <b>DDS1 Subscriber</b>                      | As soon as a mobile telephone moves into the area of a different radio switching location ("current-location cordless board"), an extension connection is switched using a DSS1 connection initiated by the cordless board. So, DSS1 Subscriber refers to the number or mobile phones or DSS1 connections established in the switch. |
| <b>HFA / IP Networking Voice</b>            | This SCN component, shows the number of DSP channels that are occupied, when gateway calls are established.                                                                                                                                                                                                                          |
| <b>Music on Hold</b>                        | When the DMC interworking feature is active in an IP network, gateway connections are set up over DMC channels. From the user's perspective, a DMC channel is a gateway channel that provides a gateway connection.                                                                                                                  |
| SIU                                         | Signalling Unit (SIU) reserves a DSP channel used to detect or generate system tones, such as DTMF tones                                                                                                                                                                                                                             |
| DMC                                         | Displays a countdown timer, starting at 60 seconds.                                                                                                                                                                                                                                                                                  |
| H.323 (RTP)                                 | Displays the used resources in case of a voice call.                                                                                                                                                                                                                                                                                 |
| T.38 Fax                                    | Displays the used resources in case of a fax connection.                                                                                                                                                                                                                                                                             |
| <b>PPP</b>                                  | Displays the used resources in case of a Point-to-Point connection.                                                                                                                                                                                                                                                                  |

### 28.3.14.2 Statistics > Gateway Statistics > Mainboard > MSC Statistics

Parameter Description of Tabs::

- **Display Overall Statistics**

MSC statistics are statistics of the media stream, which is implemented on digital signal processors between IP and TDM (Media Stream Control). The MSC overall statistics offer an overview of the statistical data for all registered calls. It provides information on the sent and unsent RTP/TCP packets, the packets received and not received, and the number of bytes sent and received.

Parameter Description of Tabs::

- **Display Per-Call Statistics**

The MSC Per-Call Statistics show the connection data and parameters used for each connection involving conversions using digital signal processors in tabular form. It is used for error analysis by experts.

### 28.3.14.3 Statistics > SNMP Statistics

Parameter Description of Tabs:

- **Display Statistics Table**
- **Display Statistics**

| Parameters                | Description                                                                                                         |
|---------------------------|---------------------------------------------------------------------------------------------------------------------|
| <b>ifTable Statistics</b> | SNMP statistics for individual interfaces (if = interface) of the communication system (e.g., Ethernet interfaces). |
| <b>IP Statistics</b>      | Details and errors associated with IP routing                                                                       |
| <b>TCP Statistics</b>     | Details and errors associated with the TCP protocol                                                                 |
| <b>UDP Statistics</b>     | Details and errors associated with the UDP protocol                                                                 |

### 28.3.14.4 Statistics > Telephony Statistics > System Texts

Parameter Description of Tabs:

- **Display System Texts**

| Parameters                 | Description                                                                           |
|----------------------------|---------------------------------------------------------------------------------------|
| <b>Available languages</b> | Displays the telephone user interface languages available in the communication system |

### 28.3.14.5 Statistics > Telephony Statistics > UCD Agents

Parameter Description of Tabs:

- **Display UCD Agents**

| Parameters              | Description                                                     |
|-------------------------|-----------------------------------------------------------------|
| <b>Count UCD agents</b> |                                                                 |
| <b>Total</b>            | Total number of UCD agents logged into the communication system |
| <b>Available</b>        | Number of available UCD agents                                  |
| <b>UCD agent state</b>  |                                                                 |
| <b>Phone number</b>     | Call number of the UCD agent                                    |
| <b>Name</b>             | Name of the UCD agent                                           |
| <b>ID</b>               | ID of the UCD agent                                             |
| <b>UCD group</b>        | UCD group to which the UCD agent is assigned.                   |
| <b>Status</b>           | Status of the UCD agent                                         |

### 28.3.14.6 Statistics > Telephony Statistics > Trunk Status

Parameter Description of Tabs:

- **Display Trunk Status**

| Parameters          | Description                                                                                                                                                                                                                                                                                                                                                   |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Date</b>         | Date of status query or date of last status change for trunk                                                                                                                                                                                                                                                                                                  |
| <b>Time</b>         | Time of status query or time of last status change for trunk                                                                                                                                                                                                                                                                                                  |
| <b>Slot/Port</b>    | Displays the board, the slot and the interface (port) or the LAN Interface                                                                                                                                                                                                                                                                                    |
| <b>Route</b>        | Displays the route name, to get a better hint to which ITSP a line belongs.                                                                                                                                                                                                                                                                                   |
| <b>Trunk Number</b> | Trunk code                                                                                                                                                                                                                                                                                                                                                    |
| <b>Comment</b>      | Trunk status (the most recent status of the trunk is displayed.)<br>Possible line statuses: <ul style="list-style-type: none"> <li>• <b>Idle</b> (line idle)</li> <li>• <b>Alerting</b> (call is pending)</li> <li>• <b>Connected to:</b> (connected to the displayed phone number)</li> <li>• <b>Line shutdown</b></li> <li>• <b>Line failure</b></li> </ul> |

### 28.3.14.7 Statistics > Telephony Statistics > Forwarding

Parameter Description of Tabs:

- **Display Forwarding**

| Parameters                         | Description                                                                                                                                                                                                                           |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Call forwarding</b>             |                                                                                                                                                                                                                                       |
| <b>Status</b>                      | Status of call forwarding: <ul style="list-style-type: none"> <li>• <b>Off</b> (no call forwarding rules active)</li> <li>• When call forwarding has been enabled, the call forwarding type and destination are displayed.</li> </ul> |
| <b>Forwarding destination from</b> | Indicates whether the called party is the forwarding destination of a call forwarded by another subscriber. The call number and name of the forwarding subscriber are displayed.                                                      |
| <b>Ringling group on</b>           |                                                                                                                                                                                                                                       |
| <b>Stations included</b>           | The number and name of the stations included in the ringing group                                                                                                                                                                     |
| <b>Connection of</b>               | Indicates whether the station is the ringing group destination of another station. The call number and name of the primary station are displayed.                                                                                     |

### 28.3.14.8 Statistics > Telephony Statistics > Stations

Parameter Description of Tabs:

- **Display Station Parameters**
- **Display Activated Features**

| Parameters                   | Description                                                                                                                                                                                                                                                                                     |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Phone number</b>          | Station number                                                                                                                                                                                                                                                                                  |
| <b>Name</b>                  | Name of the station                                                                                                                                                                                                                                                                             |
| <b>Direct inward dialing</b> | DID number of the station                                                                                                                                                                                                                                                                       |
| <b>Device type</b>           | Type of phone (e.g., OpenStage 60)                                                                                                                                                                                                                                                              |
| <b>Clip/Lin</b>              | Location Identification Number LIN<br>For U.S. and Canada only: the enhanced E911 emergency service transmits geographical information on the caller in addition to the phone number when an emergency call is dispatched. Every station number with a valid DID number must be assigned a LIN. |
| <b>Access</b>                | For analog and U <sub>P0/E</sub> phones: the board, the slot and the port number are displayed. Additional information which is only displayed for U <sub>P0/E</sub> phones: master or slave.<br><br>For IP phones: the LAN interface, the type and the number are displayed                    |
| <b>Parameters</b>            |                                                                                                                                                                                                                                                                                                 |
| <b>Extension Type</b>        | Station type, such as Standard or Fax<br><br>Default value: Standard                                                                                                                                                                                                                            |

| Parameters                                  | Description                                                                    |
|---------------------------------------------|--------------------------------------------------------------------------------|
| <b>Language</b>                             | Language setting of the telephone                                              |
| <b>Call signaling internal</b>              | Call type for the signaling of internal calls<br>Default value: Ring type 1    |
| <b>Call signaling external</b>              | Call type for the signaling of external calls<br>Default value: Ring type 1    |
| <b>Class of Service (LCR)</b>               | Class of Service for Least Cost Routing (LCR)<br>Default value: 15             |
| <b>Licence Type</b>                         | License type of the station                                                    |
| <b>Features</b>                             |                                                                                |
| <b>Do Not Disturb</b>                       | Status of the Do not Disturb feature<br>Default value: off                     |
| <b>Answer text</b>                          | Status of the Answer text feature<br>Default value: off                        |
| <b>Lock code</b>                            | Status of the Lock code feature<br>Default value: off                          |
| <b>Suppress calling ID</b>                  | Status of the Suppress calling ID feature<br>Default value: off                |
| <b>Ringing group on</b>                     | Status of the Ringing group on feature<br>Default value: off                   |
| <b>Disable incoming ringing</b>             | Status of the Ringer cutoff feature<br>Default value: off                      |
| <b>Out of Hunt group/<br/>Group ringing</b> | Status of the Group Call/Hunt Group feature<br>Default value: off              |
| <b>Call waiting tone</b>                    | Status of the Silent camp-on (call waiting tone) feature<br>Default value: off |
| <b>Direct answering</b>                     | Status of the Direct answering feature<br>Default value: off                   |
| <b>Call waiting terminating</b>             | Status of the Call waiting terminating feature<br>Default value: off           |

| <b>FWD</b>                                  | Status of the Call Forwarding (CF) feature<br>Default value: off               |

## 28.4 Applications

Functions for configuring the Application Server for Unified Communications and Web Services are grouped together under **Applications**.

### 28.4.1 Application Selection

The functions for selecting the Unified Communications solution are grouped under **Application Selection**.

#### 28.4.1.1 Application Selection

Parameter Description of Tabs:

- **Application Selection**

| Parameters                         | Description                                                                                                                                                                                                                                      |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Select application packages</b> | Choice of application packages with UC Smart or with UC Suite. For the application package with UC Suite on the OpenScape Business UC Booster Server, the IP address of the UC Booster Server (IP address of the Linux server) is also required. |
| <b>Application Selection</b>       | Display of the supported components, depending on the selected application package, including the IP address of the server used.                                                                                                                 |

### 28.4.2 Active Directory Integration Service

The relevant functions for integration of the Active Directory are grouped under **Active Directory Integration Service**.

#### 28.4.2.1 Active Directory Integration Service

Parameter Description of Tabs:

- **Active Directory Integration Service**

| Parameters         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Sync Type</b>   | <p>The values that sync type can have are the following:</p> <ul style="list-style-type: none"> <li>• <b>empty</b><br/>No synchronization of the user with the Active Directory service is done.</li> <li>• <b>did</b><br/>Automatic synchronization of the user with Active Directory. The DID number is used as a synchronization key.</li> <li>• <b>forced</b><br/>Manual synchronization of the user with an Active Directory user. With forced synchronization, it is possible to synchronize an Active Directory user with multiple OpenScape Business users.</li> <li>• <b>mulap_member</b><br/>The automatically synchronized user is a member of a mulap group.</li> </ul> |
| <b>Search</b>      | <p>The empty fields on top of the screen can be used for searching for a specific user when the number of users is too big to fit in one screen.</p> <p>In fields <b>First Name</b>, <b>Last Name</b>, <b>Display Name</b>, and <b>DID</b>, a "starts with" search is conducted. In field <b>Active Directory User</b> a "contains" search is conducted. Search is initiated after pressing the button <b>Search</b>.</p>                                                                                                                                                                                                                                                           |
| <b>Edit</b>        | You can use this button to configure the synchronization of the specified user. The available actions when you select <b>Edit</b> are the following buttons that appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Save Data</b>   | You can select a specific AD user and force the synchronization with the specific OpenScape Business user. You can synchronize in this way different DID numbers to the same AD user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Reset</b>       | Try to sync the OpenScape Business user with any Active Directory user. This action can be used, for example, if the user synchronization is stopped.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Do not Sync</b> | Stop the synchronization of the specified OpenScape Business user. Already synchronized data for the user are not removed, but further synchronization with AD is discontinued.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Security                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Enable / Disable UC Smart             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Active                                | UC Smart and UC Suite cannot be active simultaneously. (Additional parameters appear after activation)                                                                                                                                                                                                                                                                                                                                                                                                    |
| Access Rules                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| HTTP                                  | UC Smart clients basically access the system with encryption using HTTPS (recommended) or without encryption using HTTP (not recommended). The selection is made in the application itself. The authorization for one or both of these protocols is granted here.                                                                                                                                                                                                                                         |
| HTTPS                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Password Policy                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Force user to choose secure password  | Password policy for UC Smart clients. The default password must be changed at the first login, and the new password must comply with policy selected here (see question mark button). The password is stored in the client; otherwise, it is requested whenever the client is started.                                                                                                                                                                                                                    |
| Save login data for devices           | The login data is additionally stored in the phone.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| System-wide initial UC Smart password | <p>A system-wide initial password affects all configured UC Smart users who have never logged into UC Smart or who have not changed their initial password. Each affected user must then assign a custom password.</p> <p><b>INFO:</b> The initial assignment of a system-wide UC Smart password presents a security risk, especially if the individual users do not promptly assign a personal password. Alternatively, the assignment of individual initial passwords for each user is recommended.</p> |

### 28.4.3.2 UC Smart > User Management

Parameter Description of Tabs:

- **User Management**

| Parameters      | Description                                                                 |
|-----------------|-----------------------------------------------------------------------------|
| <b>User</b>     | List of all existing users; the selected user must obtain a UC User license |
| <b>Settings</b> |                                                                             |
| <b>Users</b>    | Displays the internal phone number of the user.                             |
| <b>Name</b>     | Displays the name of the user.                                              |
| <b>Password</b> | The password of the user of the UC Smart client can be set here.            |
| <b>Language</b> | Language of UC Smart Assistant                                              |

| Parameters                                 | Description                                                                                                                                                                 |
|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>The user must assign a new password</b> | (display only)                                                                                                                                                              |
| <b>UC Smart Assistant access</b>           | Authorization for access to UC Smart Assistant by the user                                                                                                                  |
| <b>Configured as Mobility stations</b>     | (display only)                                                                                                                                                              |
| <b>Voicemail licence</b>                   | (display only)                                                                                                                                                              |
| <b>Associated Services</b>                 | (display only)                                                                                                                                                              |
| <b>Profile details</b>                     |                                                                                                                                                                             |
| <b>Mobile phone number</b>                 | Mobile phone number of the subscriber in canonical format (e.g., + 49 173 1234567).                                                                                         |
| <b>Private/External phone number</b>       | Additional phone number of the subscriber in canonical format (e.g., + 49 89 987654321).                                                                                    |
| <b>E-mail Address</b>                      | E-mail address of the subscriber.                                                                                                                                           |
| <b>Voicemail to e-mail</b>                 | Enable/disable the e-mail notification when a new voice message is received.                                                                                                |
| <b>Presence visibility</b>                 | Setting that determines whether the presence status is visible to both internal and external subscribers or just to internal subscribers or not visible to any subscribers. |
| <b>Licence information</b>                 | Display of licenses available in the system for each application                                                                                                            |

### 28.4.3.3 UC Smart > Status

Parameter Description of Tabs:

- **Status**

| Parameters                | Description                                                        |
|---------------------------|--------------------------------------------------------------------|
| <b>Application Server</b> | Displays the status of the integrated UC Smart application server. |
| <b>Active Sessions</b>    | Displays the number of active connections per UC Smart client.     |

## 28.4.4 OpenScape Business, UC Suite

Under **OpenScape Business UC Suite** you will find a group of unified communications functions such as conferencing, departments and groups, configuring the external directory, holiday and other schedules, the Contact Center and the server settings for the UC Suite.

### 28.4.4.1 OpenScape Business, UC Suite

| Parameters                         | Description                                                                                                                                 |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <b>OpenScape Business UC Suite</b> | Configuration of the UC Suite, including the myPortal, myAgent, myAttendant and myReports clients, voice and fax messages and conferencing. |

#### 28.4.4.2 OpenScape Business, UC Suite > User Directory

If you want to change your first and last name, this has to be done by the administrator. Otherwise, the changes will not be kept after a synchronization happens. A synchronization happens when the system restarts or any settings are changed by the administrator.

A subscriber who is member of a MULAP group is not displayed in the user directory. If the subscriber is member of a hunt group, he/she is displayed in the user directory.

| Parameters                        | Description                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Search</b>                     | Search for a UC Suite user.                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Symbol for presence status</b> | <p>The administrator can change the presence status for every user and set their return date and time in Day-Month-Year (DD/MM/YY) and 24-hour (HH:MM) format respectively.</p> <p>A grey figure is currently not logged into the UC Suite.</p> <hr/> <p><b>NOTICE:</b> Every member of a hunt group is considered as system directory user and is displayed in greyed out color.</p> <hr/> |
| <b>Edit</b>                       | <p>Edit settings of the selected UC Suite user.</p> <hr/> <p><b>NOTICE:</b> Due to a known browser compatibility issue, the layout of the <b>Edit User</b> window may differ when using Firefox. The layout is consistent with IE/Chrome/Edge.</p> <hr/>                                                                                                                                    |
| <b>Reset User</b>                 | Reset the settings of a user to default values. All the user's voicemail messages, personal greetings for the voicemail box, journal entries, scheduled conferences, e-mails and faxes are deleted in the process.                                                                                                                                                                          |
| <b>Unlock User</b>                | Users who have been locked (e.g., after multiple incorrect password entries) can be unlocked here; displayed through the lock symbol. The administrator can be notified about the lock by the system via e-mail.                                                                                                                                                                            |
| <b>Personal Details</b>           | Personal data of the user                                                                                                                                                                                                                                                                                                                                                                   |

| Parameters                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Personal Details: My Picture</b>          | Is automatically scaled<br>Supported file formats: BMP, JPG/JPEG/JFIFI, PNG.<br>Maximum file size: 10MB                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Personal Details: User Level</b>          | Can be set only by the administrator for contact centers: if the agent is to be permanently available, select the <b>Permanently available agent</b> check box. The agent will then remain available for calls, faxes and e-mails even when he or she does not accept a call, fax or e-mail. When a user is configured as an agent, the rights of the agent are defined by selecting the appropriate class of service for that agent (i.e., the authorization level as an Agent, Supervisor or Administrator), from the <b>Level</b> drop-down list . An agent with the authorization level of a Supervisor or Administrator has elevated privileges. |
| <b>My Preferences</b>                        | User-specific settings of the client.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>My Preferences: Appearance</b>            | Skin colors of the user interface; language of the user interface; usage or not of classic traypop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>My Preferences: Notifications</b>         | Settings for screen pops.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>My Preferences: Presence</b>              | Settings for presence status.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>My Preferences: Outlook Connectivity</b>  | Generate Calendar Appointments: automatically transfer presence status into Outlook calendar; Calendar Integration: control of presence status through Outlook/iCal appointments (the first keyword in the subject line controls the presence)                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>My Preferences: Hot Keys</b>              | Define hotkeys for call functions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>My Preferences: Miscellaneous</b>         | Auto-reset presence status to "Office" after end of appointment, enable recording of client logs, define method of transfer, retention period for journal entries (maximum value is 30 days), programming function keys of the phone, enable live search and include LDAP contacts in directories' live search, specify an answer message.                                                                                                                                                                                                                                                                                                            |
| <b>Call Rules</b>                            | Rules for incoming calls                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Call Rules: Forwarding Destinations</b>   | Define forwarding destinations for each presence status (status-based call forwarding)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Call Rules: Rules Engine</b>              | Define complex call rules, based on the presence status (rule-based call forwarding)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Communications</b>                        | Handling of user-specific messages                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Parameters                                                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Communications: VoiceMail Settings</b>                                          | Option of recording of voice messages in each presence status; setting the voicemail language<br><br>Default value: disabled                                                                                                                                                                                                                                                                                                                      |
| <b>Communications: VM Notification</b>                                             | Notification service for new voicemail - see My Personal Details e-mail address. Prerequisite: the mail server and own e-mail address is configured under Service Center > E-mail Forwarding. "Outbound" generates a user outcall to the specified phone number (in canonical format). For the SMS phone number, see My Personal Details. For SMS templates, see the section in Templates.                                                        |
| <b>Communications: Fax Notification</b>                                            | Notification service for new fax messages - see My Personal Details e-mail address. Prerequisite: the mail server and own e-mail address is configured under Service Center > E-mail Forwarding. "Outbound" generates a user outcall to the specified phone number (in canonical format) either within business hours only or 24 hours a day. For the SMS phone number, see My Personal Details. For SMS templates, see the section in Templates. |
| <b>Communications: Missed Call Notifications</b>                                   | Notification service for new missed calls - see My Personal Details e-mail address. Prerequisite: the mail server and own e-mail address is configured under Service Center > E-mail Forwarding.                                                                                                                                                                                                                                                  |
| <b>VoiceMail Profiles</b>                                                          | Profile for personal AutoAttendant                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Busy, No answer, Meeting, Sick, Break, Out of Office, Vacation, Lunch, Home</b> | A caller can be redirected to a forwarding destination by post-dialing digit from 0 through 9 (suffix dialing) or can leave a message. As a prerequisite, an announcement is required for each presence status.                                                                                                                                                                                                                                   |
| <b>Profiles: Skip Dynamic Greeting</b>                                             | The automatic announcement of the presence status is skipped; instead, a caller hears only the announcement of the name and then the Personal AutoAttendant                                                                                                                                                                                                                                                                                       |

### 28.4.4.3 OpenScape Business, UC Suite > Departments

Parameter Description of Tabs:

- **Departments**

| Parameters             | Description                                                                                                                                                                                                     |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Department Name</b> | Departments classify subscribers in the internal directory into groups based on their organizational affiliation. This enables the an automatic assignment of users to departments in myAttendant, for example. |
| <b>Hunt Group</b>      | (internal numbering with no further significance)                                                                                                                                                               |
| <b>Add</b>             | Add a new department.                                                                                                                                                                                           |
| <b>Edit</b>            | Edit a selected department.                                                                                                                                                                                     |
| <b>Remove</b>          | Remove the selected departments.                                                                                                                                                                                |

### 28.4.4.4 OpenScape Business, UC Suite > Groups

A voicemail group enables a specific group of subscribers to access voicemails. When a call is placed to the call number of a voicemail group, the call is sent directly to the voicemail (i.e., the voicemail box) of the group and not to the group members.

A fax group (fax box group) enables a specific group of subscribers to access fax messages. The fax box of the group is reached directly via the call number of the fax group.

Favorites groups allow you to create groups with contacts and assign them to the users.

Parameter Description of Tabs:

- **VoiceMail Groups**
- **Fax group**
- **Favorite Groups**

**Table 64:**

| Parameters              | Description                       |
|-------------------------|-----------------------------------|
| <b>VoiceMail groups</b> |                                   |
| <b>Edit</b>             | Edit the selected voicemail group |

| Parameters                | Description                                                                      |
|---------------------------|----------------------------------------------------------------------------------|
| <b>Remove</b>             | Remove the selected voicemail groups                                             |
| <b>VoiceMail groups</b>   | Name of the voicemail group                                                      |
| <b>Pilot</b>              | Call number of the voicemail group                                               |
| <b>Type</b>               | Type of voicemail group                                                          |
| <b># Users</b>            | Number of members in the voicemail group                                         |
| <b># Message</b>          | Number of new voicemails for the voicemail group                                 |
| <b>Users</b>              | Members of the voicemail group                                                   |
| <b>Fax group</b>          |                                                                                  |
| <b>Edit</b>               | Edit the selected fax group                                                      |
| <b>Fax Group</b>          | Name of the fax group                                                            |
| <b>Pilot</b>              | Call number of the fax group                                                     |
| <b># Users</b>            | Number of members in the fax group                                               |
| <b># Faxes</b>            | Number of new fax messages for the fax group                                     |
| <b>Multi-Users</b>        | If it is a fax group, <b>Yes</b> is displayed. Otherwise <b>No</b> is displayed. |
| <b>Favorite Groups</b>    |                                                                                  |
| <b>Add</b>                | Add a new favourite group                                                        |
| <b>Edit</b>               | Edit the selected favourite group                                                |
| <b>Remove</b>             | Remove the selected favourite groups                                             |
| <b>Group Name</b>         | Name of the favorite group                                                       |
| <b>Number of Contacts</b> | Number of the contacts that have been added to the group                         |
| <b>Editable</b>           | Select if the user can edit or not the favorite group.                           |

#### 28.4.4.5 OpenScape Business UC Suite > Templates

Parameter Description of Tabs:

- **SMS Provider**

| Parameters            | Description                                                                                                                                                                                                                                                                |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Add</b>            | Add a new Template. Enter the Template's name and the author's name. Placeholders, which can be selected individually under "VSL Fields", can be inserted into the Recipient, Subject or Body fields, respectively.                                                        |
| <b>Edit</b>           | Edit the selected Template. Change the Template's name and the author's name. Edit also Recipient, Subject and Body fields. Placeholders, which can be selected individually under "VSL Fields", can be inserted into the Recipient, Subject or Body fields, respectively. |
| <b>Remove</b>         | Remove the selected Template.                                                                                                                                                                                                                                              |
| <b>Set To Default</b> | Set the selected Template as default.                                                                                                                                                                                                                                      |

#### 28.4.4.6 OpenScape Business UC Suite > External Directory

Parameter Description of Tabs:

- **External directory**

| Parameters    | Description                                                                                                  |
|---------------|--------------------------------------------------------------------------------------------------------------|
| <b>Add</b>    | Manual addition of individual contacts to the external directory. The characters must match the UTF-8 format |
| <b>Edit</b>   | Edit a selected contact of the external directory.                                                           |
| <b>Remove</b> | Remove the selected contacts of the external directory                                                       |

Parameter Description of Tabs:

- **Import External Directory**

| Parameters                   | Description                                                                                                                                                                                                                                                                                   |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Import from</b>           | Choose whether the import of contacts information will be done from a local file or from a public Windows folder.                                                                                                                                                                             |
| <b>File Upload</b>           | Click <b>Choose File</b> to select the file to be uploaded to the system.                                                                                                                                                                                                                     |
| <b>Public Windows Folder</b> | Enter the <b>Filename, Username, Domain, Password</b> of the public windows folder to be uploaded to the system and click <b>Test</b> to test it.                                                                                                                                             |
| <b>Options</b>               | This area offers various options regarding the formatting of the csv file that is going to be imported. Additionally there is an option that clears the existing data before executing the import. Finally, another one option declares the way that duplicates are handled during an import. |

Parameter Description of Tabs:

- **Export External Directory**

| Parameters                   | Description                                                                                                                                       |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Export to</b>             | Choose where the exported file will be saved, locally or in a public Windows folder.                                                              |
| <b>Public Windows Folder</b> | Enter the <b>Filename, Username, Domain, Password</b> of the public windows folder to be uploaded to the system and click <b>Test</b> to test it. |

### 28.4.4.7 OpenScape Business UC Suite > External Providers Config

Parameter Description of Tabs:

- **LDAP Providers**

| <b>Title, First Name, Last Name, Business 1, Business 2, Home Ph, Mobile, Company, Company Ph., Postal Address, State or Province Name, Country Name, Postcode, E-mail, Pager, Facsimile Phone Number and City</b> | <p>During the configuration of an external offline directory, the administrator can adapt the mapping of fields to the names of the used LDAP server. Deleted fields are ignored when searching for names via phone numbers. The search always occurs with the last 4 positions of the phone number preceded by a wildcard. You can deactivate the search for names via phone numbers for incoming calls. Enter the corresponding field name of the LDAP server in each case.</p> <hr/> <p><b>NOTICE:</b> LDAP field mapping depends on the corresponding field name by the use of external LDAP server.</p> <hr/> |

## 28.4.4.8 OpenScape Business UC Suite > Contact Center

Parameter Description of Tabs:

- **Schedule**
- **Queue**
- **Grade of Service**
- **VIP Caller Priorities**
- **VIP Call List**
- **Preferred Agents**
- **Contact Center Breaks**
- **Simple Wrapup**
- **Multiple Wrapup**
- **Queue Bindings**

### Schedule

A schedule is used to define how incoming calls are to be handled on certain days and at specific times. For each queue, a schedule can be defined with rules (Call Control Vectors or CCVs) to determine how incoming calls are to be handled on specific dates and at specific times. A schedule, in turn, must have at least one rule (called a Call Control Vector or CCV) assigned to it. The rules determine how incoming calls for a queue are to be handled during the time period to which the schedule applies. Rules apply only to calls and not to faxes and e-mails.

For detailed information on configuring schedules, see [Configuration Procedure](#)

| Parameters           | Description                                                                                                                                                                                                                                                                                                       |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Schedule</b>      | Schedule Name                                                                                                                                                                                                                                                                                                     |
| <b>Queue</b>         | Name of the queue to which the schedule is assigned.                                                                                                                                                                                                                                                              |
| <b>Hunt Group</b>    | Hunt group identifier of the UCD group, which was set up during the basic configuration of the Contact Center.                                                                                                                                                                                                    |
| <b>Schedule</b>      |                                                                                                                                                                                                                                                                                                                   |
| <b>Schedule Name</b> | Schedule Name                                                                                                                                                                                                                                                                                                     |
| <b>Default CCV</b>   | Displays the default rule for the schedule, which applies to a queue 24 hours a day and 365 days in the year when assigned.<br><br>If different rules are to be applied at certain times (breaks, weekends, holidays, vacations, etc.), these can be assigned to the schedule as exception rules (Exception CCV). |
| <b>Queues</b>        |                                                                                                                                                                                                                                                                                                                   |
| <b>Queue Name</b>    | Name of the queue to which this schedule is assigned.                                                                                                                                                                                                                                                             |
| <b>Queue Active</b>  | Indicates whether the queue is active or inactive.                                                                                                                                                                                                                                                                |
| <b>Exceptions</b>    |                                                                                                                                                                                                                                                                                                                   |

| Parameters         | Description                                                                                                                                                                                                                                                                          |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>CCV</b>         | Name of the exception rule (exception CCV).<br><br>Exception rules define how incoming calls received during certain exceptional times (break, weekend, holiday, vacation, etc.) are to be handled. Holiday schedules have precedence over the other schedules and rules of a queue. |
| <b>Description</b> | Descriptive text for the exception rule                                                                                                                                                                                                                                              |
| <b>Type</b>        | Type of the exception rule                                                                                                                                                                                                                                                           |
| <b>Start Date</b>  | Date for the beginning of the exception rule                                                                                                                                                                                                                                         |
| <b>End Date</b>    | Date for the end of the exception rule                                                                                                                                                                                                                                               |
| <b>Start Time</b>  | Time for the beginning of the exception control                                                                                                                                                                                                                                      |
| <b>End Time</b>    | Time for the end of the exception rule                                                                                                                                                                                                                                               |
| <b>Occurs</b>      | The frequency the exception rule is scheduled                                                                                                                                                                                                                                        |

### Queue

Queues are the basis of the Contact Center. Calls, faxes and e-mails for a queue can be handled, depending on the skill levels of agents, the priorities and waiting periods. Announcements can be played for waiting callers.

For detailed information on configuring queues, see [Configuration Procedure](#)

| Parameters                    | Description                                                                                                    |
|-------------------------------|----------------------------------------------------------------------------------------------------------------|
| <b>Queue</b>                  | Queue Name                                                                                                     |
| <b>Queue Active</b>           | Indicates whether the queue is active or inactive.                                                             |
| <b>Hunt Group</b>             | Hunt group identifier of the UCD group, which was set up during the basic configuration of the Contact Center. |
| <b>General Settings</b>       |                                                                                                                |
| <b>Queue Name</b>             | Queue Name                                                                                                     |
| <b>Queue Active</b>           | Definition of the queue status                                                                                 |
| <b>Queue Active: Inactive</b> | The queue is not active.                                                                                       |
| <b>Queue Active: Active</b>   | The queue is active.                                                                                           |
| <b>Hunt Group</b>             | Hunt group identifier of the UCD group, which was set up during the basic configuration of the Contact Center. |
| <b>Phone Switch</b>           | Displays the CSP entry                                                                                         |
| <b>Schedule</b>               | Displays the assigned schedule                                                                                 |

| Parameters                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Queue Alarm Count</b>            | <p>Alarm threshold number</p> <p>If the number of calls waiting in the queue exceeds the number specified here, the queue symbol for the agent changes from green to orange.</p> <p>Default value: 3 calls</p>                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Queue Alarm Time</b>             | <p>Alarm threshold time in seconds</p> <p>If the waiting time for a queued call specified here is exceeds the time specified here, the corresponding item in the list of Contact Center calls for the agents changes to red.</p> <p>Default value: 5 seconds</p>                                                                                                                                                                                                                                                                                                                                            |
| <b>Missed Call Timeout</b>          | <p>Missed call timeout in seconds</p> <p>If a call is not answered after the time specified here, it is forwarded to the next free agent.</p> <p>Default value: 5 seconds</p>                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Abandoned Call Threshold</b>     | <p>Threshold value for abandoned calls in seconds</p> <p>The time specified here determines whether or not an abandoned call is included in the statistics (i.e., in a report). Calls abandoned after the specified time has elapsed are included in the statistics.</p> <p>The abandoned calls threshold filter is not available in the Summary Report per Queue.</p> <p>Default value: 5 seconds</p>                                                                                                                                                                                                      |
| <b>Screen Pop Enabled</b>           | <p>When this flag is activated, a screen pop to display and enter customer data appears in myAgent for incoming calls.</p> <p>Screen pops are needed to accept and execute callbacks and to accept faxes and e-mails.</p> <p>Default value: Disabled</p> <hr/> <p><b>NOTICE:</b> Notifications option via <b>myAgent &gt; Setup &gt; Notifications &gt; Pop up application on inbound calls</b> are overridden by the activation of the screen pop via <b>WBM &gt; Expert Mode &gt; OpenScape Business UC Suite &gt; Contact Center &gt; Queue &gt; General Settings &gt; Screen Pop Enabled</b>.</p> <hr/> |
| <b>Wrapup Mode</b>                  | Definition of the wrapup mode                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Wrapup Mode: No Wrapup</b>       | No wrapup reasons can be defined for the queue.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Wrapup Mode: Simple Wrapup</b>   | One or more wrapup reasons can be defined for the queue.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Wrapup Mode: Multiple Wrapup</b> | One or more wrapup reasons can be defined for the queue and then classified into groups and subgroups.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Parameters                      | Description                                                                                                                                                                                                        |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Screenpop Time Out</b>       | Screenpop timeout in seconds .<br>If is set to 0 then myAgent will implicitly request 20s of screen pop time.<br>Default value: 20 seconds                                                                         |
| <b>Priorities</b>               | If an agent is assigned to multiple queues, the queue priority can be used to define whether calls for a queue with higher priority should be forwarded to this agent with precedence over calls for other queues. |
| <b>Queue depth mode</b>         | Definition of the queue depth mode                                                                                                                                                                                 |
| <b>Queue depth mode: Static</b> | In case that the Queue Depth mode is set to Static, WLS and Queue Depth Size can be configured.                                                                                                                    |
| <b>Queue depth mode: None</b>   | In case that Queue Depth is set to None the WLS Parameter can be configured and affects also the UCD configuration but parameter Queue Depth Size cannot be set                                                    |
| <b>Queue Pilots</b>             |                                                                                                                                                                                                                    |
| <b>Inbound Fax Pilots</b>       | Phone numbers (pilots) for incoming faxes<br>Faxes to these phone numbers will then be added to the queue and treated as incoming calls.                                                                           |
| <b>Inbound E-mail Service</b>   | E-mail addresses for incoming e-mails<br>E-mails sent to these addresses are placed in the queue and treated like incoming calls.                                                                                  |
| <b>Add</b>                      | Add a new Inbound Email Service                                                                                                                                                                                    |
| <b>Edit</b>                     | Edit a selected Inbound Email Service                                                                                                                                                                              |
| <b>Remove</b>                   | Remove the selected Inbound Email Service                                                                                                                                                                          |
| <b>Auth Method</b>              | Authentication method to use for accessing the inbound email service<br>You can choose between <b>Basic</b> and <b>OAuth 2.0</b> .                                                                                 |
| <b>Server</b>                   | DNS name or IP address of the inbound email service                                                                                                                                                                |
| <b>Port</b>                     | Port number of the inbound email service                                                                                                                                                                           |
| <b>Username</b>                 | Username for accessing the inbound email service                                                                                                                                                                   |
| <b>Password</b>                 | Password for accessing the inbound email service<br>Editable only if the selected authentication method is <b>Basic</b> .                                                                                          |
| <b>Uses SSL connections</b>     | Enable or disable the use of SSL connections according to the configuration of the Inbound Email Service                                                                                                           |

| Parameters                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Tenant ID, Application ID, Client Secret, Scope</b> | <p><b>Tenant ID, Application ID</b> and <b>Client Secret</b> corresponding to the application that has been registered in Azure AD for E-mail Queues. They can be obtained from your Azure AD administrator.</p> <p><b>Scope</b> the application requires (optional). Default value: https://outlook.office365.com/.default</p> <p>Visible only if the selected authentication method is <b>OAuth 2.0</b>.</p> |
| <b>Miscellaneous</b>                                   |                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Return Email Address</b>                            | <p>Sender E-mail address for sent emails</p> <p>The e-mail address specified here is displayed to the recipient when an e-mail is sent by an agent.</p>                                                                                                                                                                                                                                                        |
| <b>Intelligent Call Routing</b>                        | <p>When this flag is activated, incoming calls are automatically forwarded to the agent with whom the caller was last connected, As a prerequisite, no preferred agent must have been defined for the caller.</p> <p>Default value: Disabled</p>                                                                                                                                                               |

### Grade of Service

The Grade of Service can be used to assess the response rate of the queue. This is achieved by comparing the waiting time for callers in the queue with target values, which can be specified individually for each queue here.

For each call to an appropriate queue, the service level is determined after the call and committed to the database. The Grade of Service can be evaluated by agents with the authorization level of a Supervisor or Administrator by using the myAgent application.

For detailed information on defining target values for the Grade of Service, see [Configuration Procedure](#)

| Parameters              | Description                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Queue</b>            | Queue Name                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Queue Active</b>     | Indicates whether the queue is active or inactive.                                                                                                                                                                                                                                                                                                                                                            |
| <b>Hunt Group</b>       | Hunt group identifier of the UCD group, which was set up during the basic configuration of the Contact Center.                                                                                                                                                                                                                                                                                                |
| <b>Grade of Service</b> | <p>The horizontal axis shows the waiting time in the queue in intervals of 10 seconds, and the vertical axis shows the target value for the Grade Of Service as percentage values. The red dots specify the target values for the quality of switching in the queue.</p> <p>Quality assessments can then be made by comparing these target values with the actual waiting times for callers in the queue.</p> |

### VIP Caller Priorities

The VIP Caller Priority can be defined individually for each queue in order to specify whether callers included in the VIP Call List should be given preferential treatment.

The values for the VIP Caller Priority can be defined freely, depending on the waiting time for callers in a queue. This determines the level of preference for VIP callers as opposed to normal callers.

When a VIP caller activates an agent callback (by recording a voicemail with a callback request), the agent callback is retained in the queue instead of the VIP caller. The VIP caller priority is not applied here.

For detailed information on defining the VIP caller priority, see [Configuration Procedure](#)

| Parameters                 | Description                                                                                                                                                                                                                                                                         |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Queue</b>               | Queue Name                                                                                                                                                                                                                                                                          |
| <b>Queue Active</b>        | Indicates whether the queue is active or inactive.                                                                                                                                                                                                                                  |
| <b>Hunt Group</b>          | Hunt group identifier of the UCD group, which was set up during the basic configuration of the Contact Center.                                                                                                                                                                      |
| <b>VIP Caller Priority</b> | The horizontal axis shows the waiting time in the queue in intervals of 30 seconds, and the vertical axis shows the priority of normal callers who are not registered in the VIP call list directory. The red dots define the priority of normal callers as opposed to VIP callers. |

### VIP Call List

Callers who have already been registered in the communication system (external directory) can be added to the VIP call list. In addition, call number patterns can be entered. A call number pattern consists of a specific sequence of digits and a wildcard (placeholder). It can thus be used to transfer all employees of a company to the VIP call list, for example.

For detailed information on configuring the VIP call list, see [Configuration Procedure](#)

| Parameters           | Description                                                                                                                                                                                                                                                                                                                                                            |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Queue</b>         | Queue Name                                                                                                                                                                                                                                                                                                                                                             |
| <b>Queue Active</b>  | Indicates whether the queue is active or inactive.                                                                                                                                                                                                                                                                                                                     |
| <b>Hunt Group</b>    | Hunt group identifier of the UCD group, which was set up during the basic configuration of the Contact Center.                                                                                                                                                                                                                                                         |
| <b>VIP Call List</b> | <p>Displays the callers and call number patterns included in the VIP call list.</p> <p>You can Add, edit or remove callers and call number patterns from the VIP Call List.</p> <p>The further right the scroll bar is for a caller or call number pattern, the higher the priority over the other callers or call number patterns contained in the VIP call list.</p> |

### Preferred Agents

Every caller can be assigned one or more preferred agents of a queue. In such cases, the communication system first tries to switch

## Expert mode

the caller and his callback requests through to a preferred agent. If multiple preferred agents have been specified, a priority (sequence) can be defined to determine the order in which these agents are connected.

If no preferred agent is available, the call is forwarded to any available agent.

For details on defining preferred agents, see [Configuration Procedure](#)

| Parameters                                                | Description                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Queue</b>                                              | Queue Name                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Queue Active</b>                                       | Indicates whether the queue is active or inactive.                                                                                                                                                                                                                                                                                                                              |
| <b>Hunt Group</b>                                         | Hunt group identifier of the UCD group, which was set up during the basic configuration of the Contact Center.                                                                                                                                                                                                                                                                  |
| <b>Preferred Agents</b>                                   | <p>Displays the preferred agents for each caller indicated in the customer list.</p> <p>You can add, remove and change the priority of an agent.</p> <p>If multiple preferred agents were defined for a caller, the list position shows the priority over the other preferred agents. The higher an agent is positioned in the list, the higher the priority of that agent.</p> |
| <b>Display only customers who have agent associations</b> | <p>When this flag is activated, only the callers for whom at least one preferred agent was defined are displayed in the customer list</p> <p>Default value: Disabled</p>                                                                                                                                                                                                        |

### Contact Center Breaks

In order to allow every agent the chance to take a defined break, Contact Center breaks of different lengths can be defined. Contact Center breaks are available system-wide and can be selected by an agent via myAgent as required.

For details on defining Contact Center breaks, see [Configuration Procedure](#)

| Parameters      | Description                                                       |
|-----------------|-------------------------------------------------------------------|
| <b>Add</b>      | Add a new Contact Center Break                                    |
| <b>Edit</b>     | Edit a selected Contact Center Break                              |
| <b>Remove</b>   | Remove the selected Contact Center Break                          |
| <b>Name</b>     | Name of the Contact Center break                                  |
| <b>Duration</b> | Duration of the Contact Center break in minutes                   |
| <b>Active</b>   | Indicates whether the Contact Center break is active or inactive. |

### Simple Wrapup

One or more wrapup reasons can be defined here for queues with the wrapup mode "Simple Wrapup".

Wrapup reasons can be used to assign incoming calls to specific categories (orders, complaints, service, etc.). The assignment is made by an agent after completing the call (during the work time) by entering the appropriate wrapup reason using myAgent.

For details on defining wrap-up reasons, see [Configuration Procedure](#)

| Parameters         | Description                                               |
|--------------------|-----------------------------------------------------------|
| <b>Add</b>         | Add a new simple wrapup                                   |
| <b>Edit</b>        | Edit a selected simple wrapup                             |
| <b>Remove</b>      | Remove the selected simple wrapup                         |
| <b>Queue</b>       | Name of the queue for which simple wrapup was configured. |
| <b>Description</b> | Descriptive text for the wrapup reason.                   |

### Multiple Wrapup

For queues with the wrapup mode "Multiple Wrapup", one or more wrapup reasons can be defined here and then classified into groups and subgroups.

Wrapup reasons can be used to assign incoming calls to specific categories (orders, complaints, service, etc.). The assignment is made by an agent after completing the call (during the work time) by entering the appropriate wrapup reason using myAgent.

For details on defining wrap-up reasons, see [Configuration Procedure](#)

| Parameters         | Description                                                                                                                          |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <b>Queue</b>       | Name of the queue that was configured for multiple wrapup.<br>The groups and subgroups already defined for this queue are displayed. |
| <b>Description</b> | Descriptive text for the wrapup reason.                                                                                              |

### Queue Bindings

Queues bindings are used to assign agents to one or more queues.

For details on assigning agents to queues, see [Configuration Procedure](#)

| Parameters                        | Description                                                                                                    |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------|
| <b>Queue</b>                      | Queue Name                                                                                                     |
| <b>Queue Active</b>               | Indicates whether the queue is active or inactive.                                                             |
| <b>Hunt Group</b>                 | Hunt group identifier of the UCD group, which was set up during the basic configuration of the Contact Center. |
| <b>Agent Assignment (Binding)</b> |                                                                                                                |
| <b>Extension</b>                  | Display of the user's extension number                                                                         |
| <b>Name</b>                       | Display of the user's name.                                                                                    |

## Expert mode

| Parameters                             | Description                                                                                                                                                                                                                                                                                       |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Agent</b>                           | Agent assigned to the queue.                                                                                                                                                                                                                                                                      |
| <b>Type</b>                            | Agent Type<br>The following options are possible: <ul style="list-style-type: none"><li>• Primary Agent: The agent receives calls regardless of the load on the queue.</li><li>• Overflow Agent: The agent receives calls only when the queue overflows.</li></ul>                                |
| <b>Skill Level</b>                     | Displays the skill level in percent<br>The skill level controls the distribution of calls to agents in a queue. Agents with higher skill levels are given preference during the call distribution. In cases where all agents have the same skill level, the longest idle agent receives the call. |
| <b>Enable agent callback</b>           | When this flag is activated, the agent receives callback requests in the form of voice messages.                                                                                                                                                                                                  |
| <b>Work Time</b>                       | Automatic work time in seconds                                                                                                                                                                                                                                                                    |
| <b>Overflow after seconds in queue</b> | Only for Overflow Agent: Overflow time in seconds<br>When the overflow time has elapsed, a call is routed to an overflow agent.                                                                                                                                                                   |
| <b>Overflow after calls in queue</b>   | Only for Overflow Agent: Number of calls<br>Calls that exceed this maximum number are routed to an overflow agent.                                                                                                                                                                                |

### 28.4.4.9 OpenScape Business UC Suite > Schedules

Parameter Description of Tabs:

- **Edit/Add**

| Parameters                 | Description                                                                                                    |
|----------------------------|----------------------------------------------------------------------------------------------------------------|
| <b>Auto Attendant</b>      | Configure the AutoAttendant function for the UC Suite (Company AutoAttendant)                                  |
| <b>Schedule</b>            | Schedule Name                                                                                                  |
| <b>Queue</b>               | Name of the queue to which the schedule is assigned.                                                           |
| <b>Hunt Group</b>          | Hunt group identifier of the UCD group, which was set up during the basic configuration of the Contact Center. |
| <b>Edit / Add / Remove</b> | Edit or remove the selected rule or add a new rule (via the rule editor)                                       |
| <b>Schedule Name</b>       | The schedule can be saved under a user-defined name. It is recommended that you enter a meaningful name here.  |

| Parameters          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Default CCV</b>  | The schedule, in turn, must have at least one rule (called a Call Control Vector or CCV) assigned to it. Rules determine how incoming calls are to be handled during a specific time period. Rules apply only to calls and not to faxes and e-mails. Rules are created with the graphical rule editor (CCV Editor) by combining predefined CCV objects. Several predefined, standardized templates are available; these can be changed as desired and adapted to specific needs. |
| <b>Queues</b>       | It is recommended to activate only one queue per schedule (set only one check mark).                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Queue Name</b>   | The queue can be saved under a user-defined name. It is recommended that you enter a meaningful name here.                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Queue Active</b> | The queue can be enabled or disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Schedule</b>     | Select the associated schedule.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Pilot</b>        | Call number of the associated virtual port in the communication system.                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Exceptions</b>   | A schedule with an assigned default rule applies to a queue 24 hours a day, 365 days a year. If different rules are to be applied at certain times (breaks, weekends, holidays, vacations, etc.), these can be assigned to the schedule as exception rules (Exception CCV). This means that you can define how incoming calls are to be handled during the holiday schedule, for example. Holiday schedules have precedence over the other schedules and rules.                  |
| <b>CCV</b>          | Selection of the exception rule (exception CCV).                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>  | Enter a description for the exception schedule                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Type</b>         | Within the time range of one or more weekdays / Freely definable within the time date range / Holiday schedules for a specific date range                                                                                                                                                                                                                                                                                                                                        |
| <b>Start Date</b>   | Beginning of the exception (date)                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>End Date</b>     | End of the exception (date)                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Start Time</b>   | Beginning of the exception (time)                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>End Time</b>     | End of the exception (time)                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>(Weekday)</b>    | The exception will apply to one or more weekdays                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Occurs</b>       | The frequency the exception is scheduled                                                                                                                                                                                                                                                                                                                                                                                                                                         |

#### 28.4.4.10 OpenScape Business UC Suite > File Upload

Parameter Description of Tabs:

- **Audio File Manager**

## Expert mode

| Parameters                                    | Description                                                                                                                                                             |
|-----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Upload Destination</b>                     | Application for which the new announcement is used                                                                                                                      |
| <b>Upload Destination: Auto Attendant</b>     | Announcements for the Automatic Attendant                                                                                                                               |
| <b>Upload Destination: Profiles</b>           | Announcements for some or all users of UC Suite                                                                                                                         |
| <b>Upload Destination: Voicemail Greeting</b> | Voicemail announcements for all or individual users of UC Suite<br>The maximum recording length of Voicemail Greeting is limited to 1 minute.                           |
| <b>Upload Destination: VM Group Greeting</b>  | Greeting for a group voicemail box                                                                                                                                      |
| <b>no key for: uploader</b>                   | The announcement is available for upload as a PCM file with the following properties: 8 kHz, 16 bit, mono. The maximum length for the audio file name is 30 characters. |
| <b>Recorder</b>                               | The announcement is recorded via the telephone of an extension                                                                                                          |
| <b>Wave File</b>                              |                                                                                                                                                                         |

Parameter Description of Tabs:

- **Add / Edit**

| Parameters                  | Description                                                                                                                                                                                                                                                                    |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Profiles</b>             | User profiles store the settings of the UC Suite users. One or more users (members) can be assigned to a user profile. All members of this profile have the same settings (at first). Multiple profiles can be created to define different settings for different user groups. |
| <b>Name</b>                 | Name of the profile (free input)                                                                                                                                                                                                                                               |
| <b>Personal Details</b>     |                                                                                                                                                                                                                                                                                |
| <b>My Personal Details</b>  | Selected personal data for the assigned users. The lock symbol determines whether users can change these settings themselves.                                                                                                                                                  |
| <b>My Preferences</b>       |                                                                                                                                                                                                                                                                                |
| <b>Appearance</b>           | Skin and language of the UC client of the associated user. The lock symbol determines whether users can change these settings themselves.                                                                                                                                      |
| <b>Notification</b>         | Notifications for the assigned users. The lock symbol determines whether users can change these settings themselves.                                                                                                                                                           |
| <b>Outlook Connectivity</b> | Calendar integration for the assigned users. The lock symbol determines whether users can change these settings themselves.                                                                                                                                                    |

| Parameters                       | Description                                                                                                                                                                                                        |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Hot Keys</b>                  | Activation and set up of key combinations for access to various commonly used functions through the keyboard. The lock symbol determines whether users can change these settings themselves.                       |
| <b>Miscellaneous</b>             | Automatic return to the presence status "Office"; transfer method and retention period of the call journal for the assigned users. The lock symbol determines whether users can change these settings themselves.  |
| <b>Call Rules</b>                |                                                                                                                                                                                                                    |
| <b>Forwarding destinations</b>   | Forwarding destinations for incoming calls for the assigned users, depending on the presence status. The lock symbol determines whether users can change these settings themselves.                                |
| <b>Communications</b>            |                                                                                                                                                                                                                    |
| <b>Voicemail settings</b>        | Recording of voice messages for the assigned users, depending on the presence status. The lock symbol determines whether users can change these settings themselves.                                               |
| <b>VM Notification</b>           | Notification of new voice messages for the assigned users. The lock symbol determines whether users can change these settings themselves.                                                                          |
| <b>Fax Notification</b>          | Notification of new fax messages for the assigned users. The lock symbol determines whether users can change these settings themselves.                                                                            |
| <b>Missed Call Notifications</b> | Notification Service for Missed Calls.                                                                                                                                                                             |
| <b>VoiceMail Profiles</b>        |                                                                                                                                                                                                                    |
| <b>VoiceMail Profiles</b>        | Personal AutoAttendant for the assigned users. The respective users must record an announcement for the selection. The lock symbol determines whether users can change these settings themselves.                  |
| <b>Sensitivity</b>               |                                                                                                                                                                                                                    |
| <b>Security and Access</b>       | Allow listening to voicemail with myAttendant and checking the voicemail box from the own phone without a password. The lock symbol determines whether users can change these settings themselves.                 |
| <b>Presence Visibility</b>       | Internal subscribers who are allowed to see the presence status. The lock symbol determines whether users can change these settings themselves.                                                                    |
| <b>VoiceMail Presence</b>        | Internal or external callers who are to be informed about the presence status through automated announcements of the voicemail box. The lock symbol determines whether users can change these settings themselves. |
| <b>Favorites</b>                 |                                                                                                                                                                                                                    |
| <b>Favorites</b>                 | Favorite groups with a list of contacts that can be assigned to the user.                                                                                                                                          |

- **Add**
- **Remove**

| Parameters                  | Description                                                                                                                     |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <b>Template Name / Name</b> | Name of the header (must be unique).                                                                                            |
| <b>Text</b>                 | Placeholders for the date/time, company name, user name, company phone number, page number and number of pages can be inserted. |

#### **28.4.4.16 OpenScape Business UC Suite > Skin Settings**

Parameter Description of Tabs:

- **Skin Settings**

| Parameters                     | Description                                      |
|--------------------------------|--------------------------------------------------|
| <b>Skin</b>                    |                                                  |
| <b>Skin:<br/>Unify Default</b> | The default skin is applied to the WBM interface |
| <b>Skin:<br/>Unify Dark</b>    | The dark skin is applied to the WBM interface    |

## 28.4.5 Web Services

The functions for configuring of the web interfaces such as Web Collaboration, for example, are grouped under **Web Services**.

### 28.4.5.1 Web Services > Web Collaboration

For the integration of web collaboration via a public server (web collaboration server as a service on the Internet) or via a custom server (web collaboration server in the customer network or with a partner).

Parameter Description of Tabs:

- **Web Collaboration Server**

| Parameters                                                     | Description                                                                                                                                                                                                                                                                                                                                |
|----------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Server Type</b>                                             | Selection of the web collaboration server.                                                                                                                                                                                                                                                                                                 |
| <b>Server Type: Public Server</b>                              | The web collaboration server is a public server and is located on the Internet. A secure https connection is used for this. In addition, a license number and a password are required. By default, TCP port 5100 is used for this purpose.                                                                                                 |
| <b>Server Type: Public Server (Demo Mode/ Evaluation Mode)</b> | The web collaboration can be tested for 5 minutes. No input of an IP address, license number and password are required for this.                                                                                                                                                                                                           |
| <b>Server Type: Custom Server</b>                              | The web collaboration server is a custom server and is located in the customer network or with a partner. Either a secure https connection or an unsecured http connection can be used for this. When connecting via https, a license number and a password are additionally required. By default, TCP port 5004 is used for this purpose. |
| <b>Server Type: No Web Collaboration Server</b>                | No web collaboration server is being used. The option to start a web collaboration session is disabled in the UC clients.                                                                                                                                                                                                                  |
| <b>URL / IP address</b>                                        | Enter the URL or IP address of the appropriate web collaboration server. Public server via https and custom server via http or https.<br>Example:<br><code>http://&lt;web collaboration server IP address&gt;:5004/OscInterface</code><br><code>https://&lt;web collaboration server IP address&gt;:5100/XMLRPSecure</code>                |
| <b>License number</b>                                          | License number for the secure connection to the web collaboration server.                                                                                                                                                                                                                                                                  |
| <b>Password</b>                                                | Password for the secure connection to the web collaboration server.                                                                                                                                                                                                                                                                        |

## 28.4.6 Open Directory Service

The functions for configuring the Open Directory Service are grouped under **Open Directory Service**.

### 28.4.6.1 Open Directory Service > Basic Settings

| Parameters                                   | Description                                                                                                                                                                                                |
|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Enable/Disable Open Directory Service</b> | Default value: disabled                                                                                                                                                                                    |
| <b>LDAP server login credentials</b>         | Login data of the external database server. Open Directory Service must be authorized to access the external database; if necessary, a separate user account must be added on the server for this purpose. |

### 28.4.6.2 Open Directory Service > Data sources > OpenScape Business

Parameter Description of Tabs::

- **Overview of the configured data sources**

| Parameters                          | Description                                                                                                                           |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <b>OpenScape Office directories</b> | Internal directory of UC Suite. The directory is permanently assigned to the Open Directory Service and cannot be deleted or changed. |
| <b>Speed Dials</b>                  | Central speed-dial numbers. The directory is permanently assigned to the Open Directory Service and cannot be deleted or changed.     |
| <b>Add</b>                          | External data sources for contact information from databases with read access via ODBC                                                |

Parameter Description of Tabs::

- **Edit data source**

| Parameters             | Description                                                  |
|------------------------|--------------------------------------------------------------|
| <b>New data source</b> | The parameters of the added data sources can be changed here |

### 28.4.6.3 Open Directory Service > Data sources > LXV3

| Parameters         | Description                                                                                                                       |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <b>Speed Dials</b> | Central speed-dial numbers. The directory is permanently assigned to the Open Directory Service and cannot be deleted or changed. |

#### 28.4.6.4 Open Directory Service > Data sources > LXV3

| Parameters                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Overview of the configured data sources</b> | An LDAP data output mapping determines which of the fields in the data schema of the Open Directory Service are to be output via LDAP, e.g., for specific LDAP clients or for different groups of subscribers who do not want to see all the details, but only a defined subset. The LDAP data output mapping "web" is available by default and cannot be deleted or changed. All fields of the data schema in the Open Directory Service are permanently assigned to the LDAP output in it. You can also configure other LDAP data output mappings. |
| <b>Add</b>                                     | Add more data output mappings. LDAP clients can access a specific LDAP data output mapping via the dc parameter in the LDAP login, for example: dc=web.                                                                                                                                                                                                                                                                                                                                                                                              |

#### 28.4.6.5 Open Directory Service > Maintenance

Parameter Description of Tabs::

- **Maintenance**

| Parameters                                  | Description                                                                                                                                   |
|---------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Check/Restart Open Directory Service</b> | Status indicator of the Open Directory Service (grey = disabled, red = incorrect configuration or data source not available, green = enabled) |
| <b>Restart</b>                              | Restart the Open Directory Service                                                                                                            |

### 28.4.7 Application Launcher

The functions for configuring Application Launcher are grouped under **Application Launcher**.

#### 28.4.7.1 Application Launcher

| Parameters                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Upload Configuration File</b> | Profile with configuration data for Application Launcher to enable the easy and fast configuration of Application Launcher on all client PCs. As soon as Application Launcher has been fully configured for an initial user, as an administrator, you can make that profile with the Application Launcher configuration data available in the communication system. All other users can then perform the configuration of Application Launcher by importing this profile. |
| <b>Profile</b>                   | Allowed file type .xml                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## 28.5 Middleware

The functions for configuring the middleware are grouped under **Middleware**.

### 28.5.1 Announcement Player

Parameter Description of Tabs:

- **Announcement player settings**
- **Announcement Player Statistics**

| Parameters                                   | Description                                                                                                                                                   |
|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Activation</b>                            |                                                                                                                                                               |
| <b>Service will be started automatically</b> | Activation or deactivation of the playback device for announcements.                                                                                          |
| <b>Announcement Player Statistics</b>        | The status of the announcement device is displayed here. The data is automatically updated every 5 minutes. However, the page can also be refreshed manually. |

### 28.5.2 Csta Message Dispatcher (CMD)

Parameter Description of Tabs:

- **CSTA Message Dispatcher (CMD) settings**
- **CSTA Message Dispatcher (CMD) Statistics**

| Parameters                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Activation</b>                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Service will be started automatically</b> | Activation or deactivation of the CSTA Message Dispatcher (CMD). The CMD sets up the connection between the OpenScape Business TAPI 120 clients and the communication system and is required for the functionality.                                                                                                                                                                                                                                                      |
| <b>Auto Registration</b>                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Client auto registration enabled</b>      | Enable or disable the automatic registration of the clients.<br><br>Automatic registration means that new entries are possible in the list of CTI firewall, and the CTI firewall is thus configured automatically. When all authorized clients have registered, the check mark can be removed, and new entries in the CTI firewall can be prevented.<br><br>A PC can be authorized to control a specific extension. The TAPI/CTI licenses must be additionally assigned. |
| <b>CTI firewall</b>                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Delete</b>                                | Entries with a check mark in the Delete column are removed from the list of authorized clients on clicking the <b>Apply</b> button. An login will then be rejected, unless the automatic registration is enabled.                                                                                                                                                                                                                                                        |

| Parameters                                      | Description                                                                                                                                                                                                                                                                                          |
|-------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Application ID</b>                           | Name of the PC from which an extension can be controlled. By using the PC name, DHCP can also be used for the OpenScape Business TAPI 120 PCs.                                                                                                                                                       |
| <b>Call number</b>                              | Internal call number of the extension to be controlled.                                                                                                                                                                                                                                              |
| <b>CSTA Message Dispatcher (CMD) Statistics</b> | The status of the CMD is shown here. During the current operation, it is possible to verify for which of the OpenScape Business TAPI 120 connected to the CMD licenses may need to be assigned. The data is automatically updated every 5 minutes. However, the page can also be refreshed manually. |

### 28.5.3 Csta Service Provider (CSP)

Parameter Description of Tabs:

- **Csta Service Provider (CSP) settings**
- **CSTA Service Provider (CSP) Statistics**

| Parameters                                    | Description                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Activation</b>                             |                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Service will be started automatically</b>  | Activation or deactivation of the CSTA Service Provider (CSP). The CSP is required for the UC Suite, the DSS server (Presence Manager, only in networking), the OpenScape Business TAPI 170 and external CSTA applications.                                                                                                                                             |
| <b>CSTA Access</b>                            |                                                                                                                                                                                                                                                                                                                                                                         |
| <b>CSTA user ID / CSTA user password</b>      | OpenScape Business TAPI 170 and external CSTA applications can only log in at the CSP with the user account configured here. If no CSTA user is configured, it is not possible to use OpenScape Business TAPI 170 or external CSTA applications at the CSP.                                                                                                             |
| <b>CSTA Service Provider (CSP) Statistics</b> | The status of the CSP is shown here. You can see how many and which applications are connected with the CSP. Unknown applications are represented with 'Default'. The connection status to the individual nodes of the network or the local node can be displayed. The data is automatically updated every 5 minutes. However, the page can also be refreshed manually. |

### 28.5.4 DSS Server

Parameter Description of Tabs:

- **DSS Server settings**
- **DSS Server Statistics**

| Parameters        | Description |
|-------------------|-------------|
| <b>Activation</b> |             |

| Parameters                                   | Description                                                                                                                                          |
|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Service will be started automatically</b> | Enable or disable the DSS server.                                                                                                                    |
| <b>DSS Server Statistics</b>                 | The status of the DSS server is displayed here. The data is automatically updated every 5 minutes. However, the page can also be refreshed manually. |

## 28.5.5 Media Extension Bridge (MEB)

Parameter Description of Tabs:

- **Media Extension Bridge (MEB) settings**
- **Media Extension Bridge (MEB) Statistics**

| Parameters                                     | Description                                                                                                                                   |
|------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Activation</b>                              |                                                                                                                                               |
| <b>Service will be started automatically</b>   | Enable or disable the Media Extension Bridge.                                                                                                 |
| <b>Media Extension Bridge (MEB) Statistics</b> | The status of the MEB is displayed here. The data is automatically updated every 5 minutes. However, the page can also be refreshed manually. |

## 29 Appendix

This appendix contains reference information such as the supported languages, standards, configuration limits and capacities, Euro-ISDN features, codes for enabling and disabling features, feature codes using DTMF and the IP protocols and port numbers used.

### 29.1 Supported Standards

This section contains information on the supported standards.

#### **Ethernet**

- RFC 894 Ethernet II Encapsulation
- IEEE 802.1Q Virtual LANs
- IEEE 802.2 Logical Link Control
- IEEE 802.3u 100BASE-T
- IEEE 802.3ab Gigabit Ethernet
- IEEE 802.3X Full Duplex Operation

#### **IP Routing**

- RFC 768 UDP
- RFC 791 IP
- RFC 792 ICMP
- RFC 793 TCP
- RFC 2822 Internet Message Format
- RFC 826 ARP
- RFC 2131 DHCP
- RFC 1918 IP Addressing
- RFC 1332 The PPP Internet Protocol Control Protocol (IPCP)
- RFC 1334 PPP Authentication Protocols
- RFC 1618 PPP over ISDN
- RFC 1661 The Point-to-Point Protocol (PPP)
- RFC 1877 PPP Internet Protocol Control Protocol
- RFC 1990 The PPP Multilink Protocol (MP)
- RFC 1994 PPP Challenge Handshake Authentication Protocol (CHAP)
- RFC 2516 A Method for Transmitting PPP Over Ethernet (PPPoE)
- RFC 3544 IP Header Compression over PPP

#### **NAT**

- RFC 2663 NAT

#### **IPSec**

- RFC 2401 Security Architecture for IP
- RFC 2402 AH - IP Authentication Header
- RFC 2403 IPsec Authentication - MD5
- RFC 2404 IPsec Authentication - SHA-1
- RFC 2405 IPsec Encryption - DES
- RFC 2406 ESP - IPsec encryption

- RFC 2407 IPsec DOI
- RFC 2408 ISAKMP
- RFC 2409 IKE
- RFC 2410 IPsec encryption - NULL
- RFC 2411 IP Security Document Roadmap
- RFC 2412 OAKLEY

### **SNMP**

- RFC 1213 MIB-II

### **QoS**

- IEEE 802.1p Priority Tagging
- RFC 1349 Type of Service in the IP Suite
- RFC 2475 An Architecture for Differentiated Services
- RFC 2597 Assured Forwarding PHB Group
- RFC 3246 An Expedited Forwarding PHB (Per-Hop Behavior)

### **Services**

- RFC 2597 Assured Forwarding PHB Group
- RFC 3246 An Expedited Forwarding PHB (Per-Hop Behavior)

### **Codecs**

- G.711
- G.729

### **VoIP over SIP**

- RFC 2198 RTP Payload for Redundant Audio Data
- RFC 2327 SDP Session Description Protocol
- RFC 2617 HTTP Authentication: Basic and Digest Access Authentication
- RFC 2782 DNS RR for specifying the location of services (DNS SRV)
- RFC 2833 RTP Payload for DTMF Digits, Telephony Tones and Telephony Signals
- RFC 3261 SIP Session Initiation Protocol
- RFC 3262 Provisional Response Acknowledgement (PRACK) Early Media
- RFC 3263 SIP Locating Servers
- RFC 3264 An Offer/Answer Model with the Session Description Protocol
- RFC 3310 HTTP Digest Authentication
- RFC 3311 Session Initiation Protocol (SIP) UPDATE Method
- RFC 3323 A Privacy Mechanism for the Session Initiation Protocol (SIP)
- RFC 3325 Private Extensions to the Session Initiation Protocol (SIP) for Asserted Identity within Trusted Networks
- RFC 3326 The Reason Header Field for the Session Initiation Protocol (SIP)
- RFC 3489 STUN - Simple Traversal of User Datagram Protocol (UDP) Through Network Address Translators (NATs)

- RFC 3515 The Session Initiation Protocol (SIP) Refer Method
- RFC 3550 RTP: Transport Protocol for Real-Time Applications
- RFC 3551 RTP Profile for Audio and Video Conferences with Minimal Control
- RFC 3581 An Extension to the Session Initiation Protocol (SIP) for Symmetric Response Routing
- RFC 3891 The Session Initiation Protocol (SIP) Replaces Header

**Other**

- RFC 959 FTP
- RFC 1305 NTPv3
- RFC 1951 DEFLATE

## 29.2 Euro-ISDN Features

The Euro-ISDN features can be used at every Euro-ISDN port if the available hardware (phone or ISDN card, for instance) is appropriately configured. The features are either available permanently in the Central Office or activated/deactivated with codes.

The availability of features depends on the network provider. Some of the named features are subject to charges.

| Topic                                           | Explanation                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Multiple Subscriber Number (MSN)                | Every point-to-multipoint connection can be assigned several phone numbers. The user can assign these phone numbers to the individual terminals directly at the terminals.                                                                                                                                                                                              |
| Calling Line Identification Presentation (CLIP) | The actual phone number is transmitted to the called station and appears, for example, on the phone's display or in the caller list if the call is not answered. Incorrect phone numbers cannot be transmitted. Direct inward dialing from TC systems cannot be checked, however. Phone number transmission can be suppressed on a case-by-case basis or for all calls. |
| Calling Line Identification Restriction (CLIR)  | Phone number transmission can also be deactivated either permanently or on a case-by-case basis. If deactivated, phone numbers are only displayed at specially defined B stations (emergency help lines, police, fire department).                                                                                                                                      |
| Malicious Call Identification (MCID)            | The called party can have an anonymous caller traced by the attendant console, even if phone number transmission is deactivated. A charge is applied for this feature.                                                                                                                                                                                                  |

| Topic                                                                     | Explanation                                                                                                                                                                                                                               |
|---------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Terminal Portability (TP)                                                 | This feature lets you move the ISDN phone you are using and plug it into a different ISDN jack without interrupting an ongoing call. You must park the ongoing call before you move the ISDN phone.                                       |
| Subaddressing (SUB)                                                       | This function is subject to an additional charge and can be used in addition to the normal phone number. Subaddressing lets you operate a dialable phone (for example, a program on the PC) depending on the caller.                      |
| User to User Signaling (UUS)                                              | Information can be exchanged over the D channel during connection setup and clear-down. Transmission is possible in both directions.                                                                                                      |
| Closed User Group (CUG)                                                   | If you activate this feature, no calls are possible outside the user group (apart from the emergency numbers 110 and 112). External callers can also be blocked.                                                                          |
| Call Forwarding Busy (CFB)                                                | This call forwarding variant routes calls on busy to an arbitrary available phone. Call forwarding is performed in the attendant console. This leaves both B channels free.                                                               |
| Call Forwarding Unconditional (CFU)                                       | This call forwarding variant routes calls immediately to an arbitrary available phone. Call forwarding is performed in the attendant console. This leaves both B channels free.                                                           |
| Call Forwarding No Reply (CFNR)                                           | This call forwarding variant routes calls after 20 seconds (if the destination cannot be reached) to an arbitrary available telephone. Call forwarding is performed in the attendant console. This leaves both B channels free.           |
| Call waiting (CW)                                                         | A second caller is signaled during an ongoing connection. The caller meanwhile hears the ringback tone. The camp-on connection can be accepted, declined or simply ignored.                                                               |
| Toggle (Hold = Call Hold)                                                 | The Consultation feature lets you set up a second connection while another connection is already ongoing. Switching back and forth between two connections is known as toggling. The party on hold cannot overhear the other active call. |
| Three Party Service (3-PTY)                                               | Two existing connections can be joined together. A three-party conference can be conducted by three subscribers.                                                                                                                          |
| Completion of Calls to Busy Subscriber (CCBS; automatic callback on busy) | You can activate this feature if a station called is busy. You hear a signal as soon as this station's port is free. The connection is cleared down by replacing the handset.                                                             |

| Topic                            | Explanation                                                                                                                           |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| Advice of Charge (End) (AOCE)    | You can program the application to display call charges at the end of a call. This does not take account of any discounts or tariffs. |
| Advice of Charge (During) (AOCD) | You can program the application to display call charges during a call. This does not take account of any discounts or tariffs.        |

## 29.3 Used Ports

The OpenScape Business system components use different ports, which may need to be opened in the firewall as required. For the ports of the web-based clients (e.g., myPortal to go), port forwarding must be configured in the router.

An actual and complete list of all used ports of OpenScape Business is available in the "Interface Management Database" (IFMD) which can be accessed via the Partner Portal of Unify (<https://unify.com/en/partners/partner-portal>).

---

**NOTICE:** The ports identified with "O" in the list below are optional, i.e., are not permanently open in the firewall.

## 29.4 Project Planning of DSP Channels for the OpenScape Business X3/X5/X8 Communication Systems

Connections between IP and TDM phones/trunks are "gateway connections"; each gateway connection requires one DSP (Digital Signal Processor) channel. In addition, DSP channels are required on activating the Signaling And Payload Encryption (SPE) feature.

No DSP channels are required for pure TDM connections and IP-only connections.

The mainboards of the OpenScape Business X3/X5/X8 communication systems provide a maximum eight DSP channels.

If the DSP channels of a mainboard are not sufficient, additional channels can be provided by plugging in a Voice Channel Booster Card (OCCB1 or OCCB3 subboard):

- OCCB1 provides up to 40 additional DSP channels.
- OCCB3 provides a maximum of 120 additional DSP channels.

The number of DSP channels available for gateway connections is reduced by the use of the G.729 codec and when using Signaling and Payload Encryption (SPE).

Ultimately, the number of simultaneous gateway connections (simultaneous voice connections with IP-TDM transition) determines whether and which OCCB subboard should be used.

In the case of UC-Suite conferencing and IP Phones, an OpenScape Business X3/X5/X8 communications system can include up to eight DSP channels. By default three DSP channels are allocated for the 3 default codecs of Music on Hold. This number can be reduced if you use less codecs for Music on Hold. In addition, two DSP channels are reserved for the configuration of the Signaling and Payload Encryption (SPE). The rest of the DSP channels can be allocated for IP phones (one DSP channel per IP phone). When the available DSP channels are exhausted, the number of DSP channels can be increased with the use of the corresponding OCCB cards (OCCB1 or OCCB3 as stated previously).

---

**INFO:** For more details on the maximum DSP channels available on the mainboard and the OCCB subboards, see [System-Specific Capacity Limits](#).

---

The undersizing of DSP channels can result in DSP bottlenecks that typically manifest themselves through busy states when setting up connections (busy tone during call setup, display showing `Not currently possible`).

When a DSP bottleneck occurs, an entry is made in the event log file of the communication system.

The following measures should be taken if DSP bottlenecks occur frequently:

| If                                                                       | Then                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| The DSP channels on the mainboard are being used.                        | Insert the OCCB1 or OCCB3 subboard into the mainboard.                                                                                                                                                                                                                                                                                                                       |
| The DSP channels on the mainboard and the OCCB1 subboard are being used. | Insert the OCCB3 subboard into the mainboard.                                                                                                                                                                                                                                                                                                                                |
| The DSP channels on the mainboard and the OCCB3 subboard are being used. | <p>Check whether the communication system can be operated only with the G.711 codec. This increases the number of DSP channels to the maximum.</p> <p><b>INFO:</b> The <b>Use G.711 only</b> option can be activated by an administrator with the <b>Expert</b> profile in <b>Expert Mode</b> (<b>Telephony</b> &gt; <b>Voice Gateway</b> &gt; <b>Codec Parameters</b>).</p> |

The following table provides orientation values for which OCCB subboard, if any, should be used.

| Sum of the TDM channels:<br>CO trunks and network trunks (ISDN, T1, CAS, analog) | Sum of IP channels:<br>ITSP connection, SIP-Q and SIP networking, connection to the UC Suite (UC Booster Server or UC Booster Card (OCAB)) | Sum of TDM telephones and TDM devices (S <sub>0</sub> , U <sub>P0/Er</sub> , CMI, a/b) | Sum of IP phones and devices (HFA, SIP) | Which OCCB subboard? | Notes                                                                       |
|----------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------|-----------------------------------------|----------------------|-----------------------------------------------------------------------------|
| Any number                                                                       | Announcements (up to 16)<br>0                                                                                                              | Any number                                                                             | 0                                       | No OCCB subboard     | Smart VM and system conferences are processed through the switching matrix. |

|                                                                                  | > 0                                                                                                                                        | > 100                                                                                 |                                         | OCCB3                | Up to 120 simultaneously                                                                                                                                              |
| > 0                                                                              | up to 8                                                                                                                                    |                                                                                       |                                         | No OCCB subboard     | The combination is essentially relevant for SIP-Q and UC Suite.                                                                                                       |

| Sum of the TDM channels:                             | Sum of IP channels:                                                                                                 | Sum of TDM telephones and TDM devices (S <sub>0</sub> , U <sub>P0/E</sub> , CMI, a/b) | Sum of IP phones and devices (HFA, SIP) | Which OCCB subboard? | Notes                                                           |
|------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------|-----------------------------------------|----------------------|-----------------------------------------------------------------|
| CO trunks and network trunks (ISDN, T1, CAS, analog) | ITSP connection, SIP-Q and SIP networking, connection to the UC Suite (UC Booster Server or UC Booster Card (OCAB)) |                                                                                       |                                         |                      |                                                                 |
| > 0                                                  | up to 9                                                                                                             |                                                                                       |                                         | OCCB1                | The combination is essentially relevant for SIP-Q and UC Suite. |
| > 0                                                  | > 40                                                                                                                |                                                                                       |                                         | OCCB3                | The combination is essentially relevant for SIP-Q and UC Suite. |

The following examples provide orientation values for which OCCB subboard, if any, should be used.

#### Example 1: OpenScape Business with TDM Trunks and IP Phones and Devices

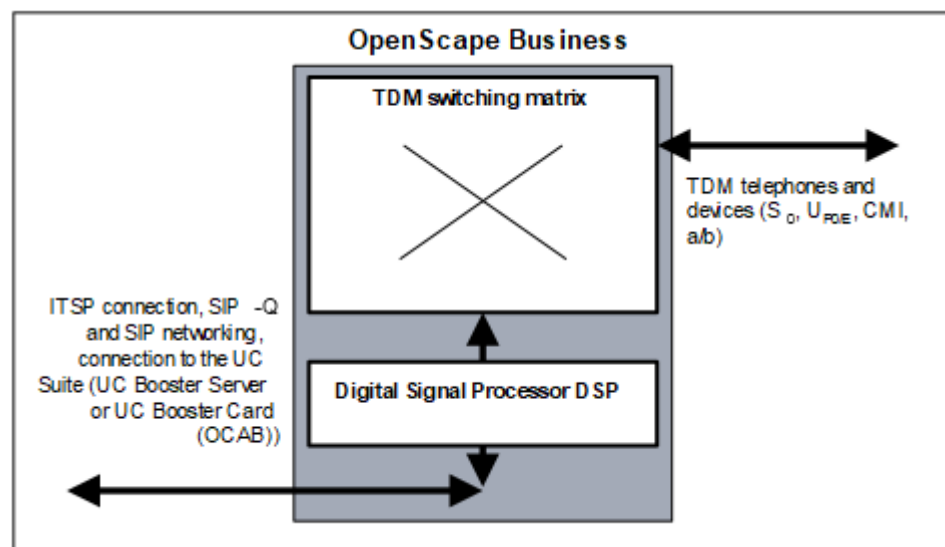

| If                                                                                                                                      | Then                                                                            |
|-----------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------|
| OpenScape Business with: <ul style="list-style-type: none"> <li>• 1 x TDM-CO (ISDN)</li> <li>• 20 x IP telephones (HFA, SIP)</li> </ul> | The DSP channels on the mainboard are sufficient. No OCCB subboard is required. |

| If                                                                                                                                       | Then                                                                                                                                                               |
|------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OpenScape Business with: <ul style="list-style-type: none"> <li>• 1 x TDM-CO (ISDN)</li> <li>• 100 x IP telephones (HFA, SIP)</li> </ul> | Subboard OCCB1 is required.<br>Alternatively, the OCCB3 subboard can be used.                                                                                      |
| OpenScape Business with: <ul style="list-style-type: none"> <li>• 2 x TDM-CO (ISDN)</li> <li>• 100 x IP telephones (HFA, SIP)</li> </ul> | Subboard OCCB3 is required.                                                                                                                                        |
| OpenScape Business with: <ul style="list-style-type: none"> <li>• 4 x TDM-CO (ISDN)</li> <li>• 500 x IP telephones (HFA, SIP)</li> </ul> | Subboard OCCB3 is required.<br><b>NOTE:</b> In order to achieve the maximum number of DSP channels, only the G.711 codec may be used in this system configuration. |

If the communication system is to be equipped with TDM phones and devices as well ( $S_0$ ,  $U_{P0/E}$ , CMI, a/b), additional DSP channels for this must be taken into account.

#### Example 2: OpenScape Business with ITSP Connections and TDM Phones and Devices

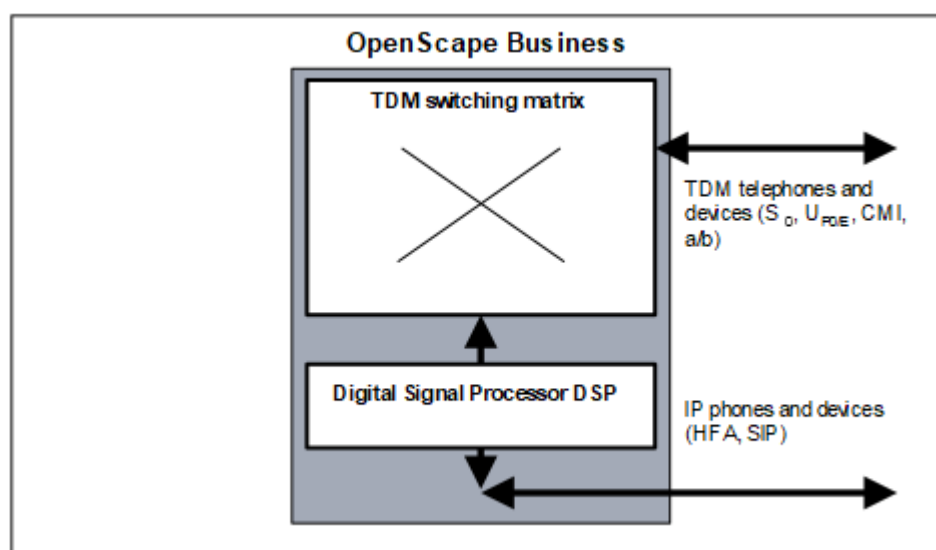

| If                                                                                                                                                                                                  | Then                                                                            |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------|
| OpenScape Business with: <ul style="list-style-type: none"> <li>• 6 x ITSP connections (6 B channels)</li> <li>• 20 x TDM telephones (<math>S_0</math>, <math>U_{P0/E}</math>, CMI, a/b)</li> </ul> | The DSP channels on the mainboard are sufficient. No OCCB subboard is required. |

| If                                                                                                                                                                                                     | Then                                                                              |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|
| OpenScape Business with: <ul style="list-style-type: none"> <li>• 30 x ITSP connections (30 B channels)</li> <li>• 100 x TDM telephones (<math>S_0</math>, <math>U_{P0/E}</math>, CMI, a/b)</li> </ul> | Subboard OCCB1 is required.<br><br>Alternatively, the OCCB3 subboard can be used. |

If the communication system is to be equipped with IP phones and devices as well (HFA, SIP), additional DSP channels for this must be taken into account.

### Example 3: OpenScape Business with TDM Phones and Devices and IP Phones and Devices

| If                                                                                                                                                                                              | Then                                                                            |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------|
| OpenScape Business with: <ul style="list-style-type: none"> <li>• 6 x TDM telephones (<math>S_0</math>, <math>U_{P0/E}</math>, CMI, a/b)</li> <li>• 6 x IP telephones (HFA, SIP)</li> </ul>     | The DSP channels on the mainboard are sufficient. No OCCB subboard is required. |
| OpenScape Business with: <ul style="list-style-type: none"> <li>• 100 x TDM telephones (<math>S_0</math>, <math>U_{P0/E}</math>, CMI, a/b)</li> <li>• 100 x IP telephones (HFA, SIP)</li> </ul> | Subboard OCCB3 is required.                                                     |

If the communication system is to be equipped with TDM trunks or IP trunks as well, additional DSP channels for this must be taken into account.

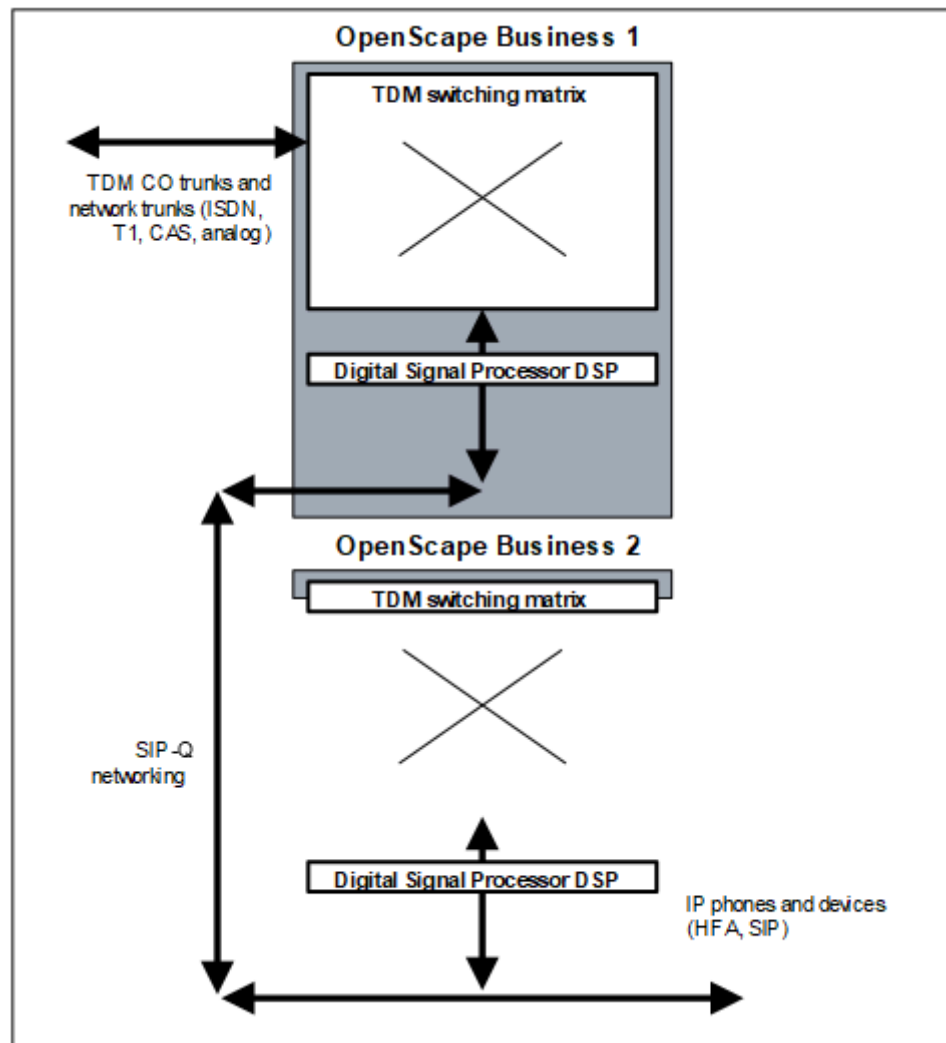

#### Example 4: SIP-Q Networking with OpenScape Business

**NOTICE:** This example presents requirements of a networked second OpenScape Business system. Connections in the first system are not depicted here for the sake of simplicity. However, the requirements of the first system, as stated in examples 1, 2, and 3 must be taken into consideration also.

The OpenScape Business 1 communication system acts as a gateway for TDM Central Office.

IP phones (HFA, SIP) are connected only to the OpenScape Business 2 communication system.

Depending on the number of IP phones at the OpenScape Business 2 communication system, the DSP channels for the OpenScape Business 1 communication system must be planned. DSP channels are required exclusively in the TDM gateway.

| If                                                                                                                                                                                                                   | Then                                                                                                                                                                                                                                                        |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OpenScape Business 1 with:<br><ul style="list-style-type: none"> <li>• 1 x TDM-CO (ISDN)</li> </ul> OpenScape Business 2 with:<br><ul style="list-style-type: none"> <li>• 100 x IP telephones (HFA, SIP)</li> </ul> | Subboard OCCB1 is required in OpenScape Business 1.<br><br>Alternatively, the OCCB3 subboard can be used.<br><br>No OCCB subboard is required in OpenScape Business 2.                                                                                      |
| OpenScape Business 1 with:<br><ul style="list-style-type: none"> <li>• 2 x TDM-CO (ISDN)</li> </ul> OpenScape Business 2 with:<br><ul style="list-style-type: none"> <li>• 100 x IP telephones (HFA, SIP)</li> </ul> | Subboard OCCB3 is required in OpenScape Business 1.<br><br>No OCCB subboard is required in OpenScape Business 2.                                                                                                                                            |
| OpenScape Business 1 with:<br><ul style="list-style-type: none"> <li>• 4 x TDM-CO (ISDN)</li> </ul> OpenScape Business 2 with:<br><ul style="list-style-type: none"> <li>• 500 x IP telephones (HFA, SIP)</li> </ul> | Subboard OCCB3 is required in OpenScape Business 1.<br><br><b>NOTE:</b> In order to achieve the maximum number of DSP channels, only the G.711 codec may be used in this system configuration.<br><br>No OCCB subboard is required in OpenScape Business 2. |

If the OpenScape Business 2 communication system is to be equipped with TDM trunks or TDM phones and devices ( $S_0$ ,  $U_{P0/E}$ , CMI, a/b) as well, additional DSP channels must be taken into account for this.

#### Example 5: SIP-Q Networking with OpenScape Business

---

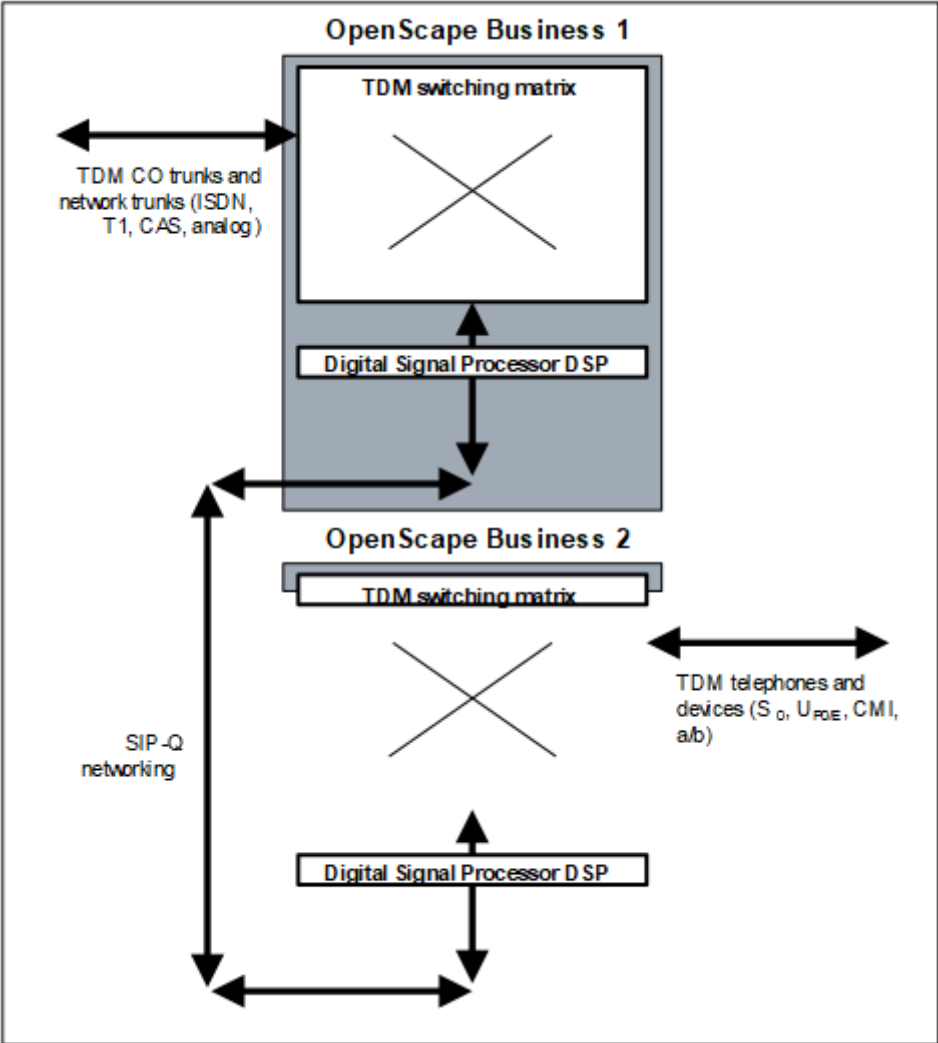

**NOTICE:** This example presents requirements of a networked second OpenScape Business system. Connections in the first system are not depicted here for the sake of simplicity. However, the requirements of the first system, as stated in examples 1, 2, and 3 must be taken into consideration also.

---

The OpenScape Business 1 communication system acts as a gateway for TDM Central Office.

TDM phones ( $S_0$ ,  $U_{P0/E}$ , CMI, a / b) are connected only at the OpenScape Business 2 communication system.

Since gateway connections are required in both communication systems (OpenScape Business 1: TDM CO <-> SIP-Q Networking, OpenScape Business 2: SIP-Q Networking <-> TDM phone), DSP channels are needed in both systems.

| If                                                                                                                                                                                                                                           | Then                                                                                                                                             |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| OpenScape Business 1 with: <ul style="list-style-type: none"><li>• 1 x TDM-CO (ISDN)</li></ul> OpenScape Business 2 with: <ul style="list-style-type: none"><li>• 100 x TDM telephones (S<sub>0</sub>, U<sub>P0/E</sub>, CMI, a/b)</li></ul> | Subboard OCCB1 is required in OpenScape Business 1 and OpenScape Business 2.<br><br>Alternatively, the OCCB3 subboard can be used in both cases. |
| OpenScape Business 1 with: <ul style="list-style-type: none"><li>• 2 x TDM-CO (ISDN)</li></ul> OpenScape Business 2 with: <ul style="list-style-type: none"><li>• 100 x TDM telephones (S<sub>0</sub>, U<sub>P0/E</sub>, CMI, a/b)</li></ul> | Subboard OCCB3 is required in OpenScape Business 1 and OpenScape Business 2.                                                                     |

If the OpenScape Business 1 communication system is to be equipped with TDM phones and devices ( $S_0$ ,  $U_{P0/E}$ , CMI, a/b) as well, additional DSP channels must be taken into account for this.

#### Example 6: OpenScape Business with IP Phones and Devices

**NOTICE:** This example presents requirements of a networked second OpenScape Business system. Connections in the first system are not depicted here for the sake of simplicity. However, the requirements of the first system, as stated in examples 1, 2, and 3 must be taken into consideration also.

| If                                                                                                                 | Then                                                                            |
|--------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------|
| OpenScape Business X3/X5/X8 with: <ul style="list-style-type: none"> <li>• 7 x IP telephones (HFA, SIP)</li> </ul> | The DSP channels on the mainboard are sufficient. No OCCB subboard is required. |
| OpenScape Business: <ul style="list-style-type: none"> <li>• 30 x IP telephones (HFA, SIP)</li> </ul>              | Subboard OCCB1 is required. Alternatively, the OCCB3 subboard can be used.      |
| OpenScape Business with: <ul style="list-style-type: none"> <li>• 100 x IP telephones (HFA, SIP)</li> </ul>        | Subboard OCCB3 is required.                                                     |

## 30 Glossary

The glossary provides short explanations of the terms used (for instance, protocols and standards).

### 30.1 Glossary

#### **10BaseT, 100BaseT, 1000BaseT**

This refers to a specification (IEEE. 802.3i)) for networks with 10 Mbps base band transmission over a symmetrical 100-Ohm four-wire cable. 100BaseT, on the other hand, is used for bandwidths of up to 100 Mbps and 1000BaseT for bandwidths of up to 1000 Mbps.

#### **AES (Advanced Encryption Standard)**

AES is a symmetric encryption system that was ratified by the National Institute of Standards and Technology as the successor to the earlier DES and 3DES Standards. It is used for VPN, for example.

#### **ADSL with dynamic IP address**

ADSL stands for Asymmetric Digital Subscriber Line and means that the bandwidths from the Internet (download, downstream) and to the Internet (upload, upstream) are different. The classic Internet telephony connection is ADSL. A dynamic IP address is sufficient if the web and mail services are provided by the Internet Service Provider.

#### **ADSL with fixed IP address**

ADSL stands for Asymmetric Digital Subscriber Line and means that the bandwidths from the Internet (download, downstream) and to the Internet (upload, upstream) are different. The classic Internet telephony connection is ADSL. ADSL with a fixed IP address is required if you want to run your own web and mail server on your site.

#### **AF-EF (Expedited Forwarding - Assured Forwarding)**

The codepoints AF and EF define the various priorities of IP packets for QOS (Quality of Service).

AF: guarantees minimum bandwidth for the data

EF: guarantees constant bandwidth for this data.

#### **ARP (Address Resolution Protocol)**

The Address Resolution Protocol (ARP) is a network protocol that facilitates the assignment of network addresses to hardware addresses. Although it is not limited to Ethernet and IP protocols, it is almost exclusively used in conjunction with IP addressing in Ethernet networks.

**Authentication**

Authentication is the verification of a person's or PC's identity. The check can be performed with a simple user name, for example, as well as with a fingerprint.

**Authorization**

Authorization is a mechanism for granting rights, e.g., access rights in a data network.

**B channel**

A B channel is the transmission path for the payload (voice, data) of an ISDN connection.

**Busy Lamp Field (BLF)**

myPortal provides a so-called Busy Lamp Field (BLF) to display the call status of the specified subscribers.

**Broadcast**

A broadcast is a message sent to everyone in a PC network. The message (i.e., a data packet) is transmitted from one point to all subscribers in the network. A broadcast is mainly used in a data network if the address of the message recipient is unknown.

**CA (Certification Authority)**

The CA is an organization that issues certificates with digital signatures. Digital signatures are required for a VPN (Virtual Private Network), for example.

**CAPI Interface (Common Application Programming Interface)**

CAPI is an ISDN-compliant standardized software interface. CAPI enables the development of ISDN software without requiring any knowledge about the manufacturer-specific ISDN hardware being used.

**Centrex**

Centrex (Central Office Exchange) provides the functions of a telephone system via a PSTN or ITSP. This is also known as virtual telephone system, hosted PBX (Private Branch Exchange) or NetPBX.

**CHAP (Challenge Handshake Authentication Protocol)**

CHAP is an authentication protocol used within the framework of the Point-to-Point protocol.

**COS (Classes Of Service)**

QoS is a procedure that ensures the transmission quality for data in IP networks.

**CLIP (Calling Line Identification Presentation)**

With station number transmission, the caller's phone number is displayed on the called party's station. The called party can therefore identify the caller before picking up the call.

**CLIR (Calling Line Identification Restriction)**

The caller suppresses the display of his or her call number on the called station. As a result, the called party cannot identify the caller before picking up the call.

**COLP (Connected Line Identification Presentation)**

With Connected Line Identification Presentation, the called party's number is displayed for the caller if the connection is successful.

**COLR (Connected Line Identification Restriction)**

With Connected Line Identification Restriction, the called party's number is not displayed for the caller, even if the caller activated COLP.

**Comfort User**

Comfort User is the standard user of the communication system.

**Comfort Plus User**

The Comfort Plus User is the Advanced User of the communication system. In contrast to the Comfort User, the Comfort Plus User can use more features (such as Fax, Mobility and Conferencing).

**CorNet**

CorNet is a proprietary protocol for networking the HiPath and OpenScape communications systems. In contrast to the generally supported QSIG, all manufacturer-specific features of the HiPath and OpenScape communication systems are integrated in CorNet.

**CorNet-IP**

CorNet-IP is a protocol variant of CorNet that enables the cross-networking of systems or the connection of system telephones (such as optiPoint) over IP.

**CorNet-NQ**

A proprietary QSIG-based signaling protocol for interconnecting communication systems to one or more QSIG PBX systems.

**CSTA (Computer Supported Telecommunications Applications)**

CSTA is a protocol interface for applications that support the European Computer Manufacturers' Association (ECMA) standard. Telecommunication tasks are controlled and monitored using SIP via CSTA.

**CSV (Character Separated Values)**

A CSV file is a text file for saving or exchanging simply structured data. CSV stands for Character Separated Values, Comma Separated Values or Colon Separated Values, since the individual values are delimited by a special separator character such as a comma or semicolon. CSV files must be available in ANSI/ASCII format.

**CRL (Certificate Revocation List)**

A CRL or Certificate Revocation List is a list of all revoked certificates. CRLs always have to be generated by the certification authority where the certificates originate.

**Delay**

A delay has two meanings in telecommunications:

- The delay by which an event is postponed.
- The time between the occurrence of an event and the appearance of a expected follow-on event.

**Dedicated (Permanently Assigned) Gateway**

If a dedicated gateway is entered in the LCR for a route, then routing via this gateway is enforced. All contradictory rules are then invalid for the routing.

**DHCP (Dynamic Host Configuration Protocol)**

DHCP is a procedure by which a PC is assigned a certain IP configuration (IP address, subnet mask, etc.) at startup.

**DS (DiffServ, Differentiated Services)**

DS is a procedure for managing packets in data networks. The routing method for a specific data packet is specified as is a particular service level in regard to bandwidth, queuing theory, and packet discard decisions.

**Diffie-Hellman algorithm**

The Diffie-Hellman algorithm is used for the exchange of keys in a VPN. The data produced by this algorithm is configured with a specific set of mathematical parameters. The key exchange only works properly if both subscribers use identical values for these parameters.

**DLI (Deployment License Service Integrated)**

DLI enables the unattended installation and upgrading of IP system telephones.

**DMZ (Demilitarized Zone)**

A demilitarized zone (DMZ) refers to a PC network that offers a number of security features for accessing connected network nodes (PCs, routers, etc.).

### **DNS (Domain Name Service)**

Name resolution on the Internet and in the LAN. DNS translates the names of PCs or web pages into the relevant IP addresses.

### **DSL (Digital Subscriber Line)**

DSL is a technological solution for providing high-bandwidth Internet access. Internet telephone bridges the gap between the provider's attendant and the customer's telephone jack.

### **DSS (Direct Station Selection)**

The function keys on a telephone or add-on device can be programmed as Direct Station Select (DSS) keys. These are programmed with the phone number of an internal subscriber or a group for this. Pressing a DSS key initiates an immediate call to the programmed destination.

### **DTMF (Dual Tone Multifrequency)**

See DTMF.

### **EIM (Enterprise Instant Messaging)**

EIM is an Instant Messaging Service that runs on private servers in a company on platforms such as the Live Communications Server.

### **Enterasys Switches**

Enterasys switches are produced by Enterasys Networks as secure network solutions. The stackable switches support QoS features and can classify and prioritize voice, video and data applications.

### **ESP (Encapsulating Security Payload)**

ESP is an IPsec protocol that guarantees packet encryption, packet integrity as well as packet authenticity. The integrity and authentication check does not extend to the IP header. It is only performed for the actual data (payload).

### **FoIP (Fax over IP)**

FoIP is a method for transmitting fax messages over an IP network.

### **FTP**

The File Transfer Protocol (FTP) is a network protocol specified in RFC 959 for the transmission of data via TCP/IP networks.

### **Functional Numbers**

Functional numbers (also called function codes) are MSN/DID numbers or pilot numbers, e.g., for parking, conferencing and the AutoAttendant. The functional numbers correspond to virtual stations. The functional numbers in an internetwork must be unique.

**G.711**

G.711 is a standard for digitizing analog audio signals. It is used in classic fixed-network telephony (PCM technology). G.711 can also be used for voice encoding in VoIP.

**G.729AB**

G.729 is a codec for voice compression in digital signals and is used in IP telephony. G.729 is very CPU-intensive. Though only marginally inferior in terms of quality, G.729AB is a somewhat simplified version and therefore less CPU-intensive.

**Gateway / Gateway Modules**

A gateway is the entrance and exit to a communications network, usually connecting two disparate traffic flows.

**GSM (Global System for Mobile Communications)**

GSM is a standard for digital mobile networks that is primarily used for telephony, but also for line- and packet-switched data transmissions as well as short messages (SMS).

**Handover**

The term handover designates the process in a mobile cellular communication network in which the mobile phone switches from one cell to another during a call or a data connection. The term is also used when switching between GSM and UMTS with a dual-mode mobile phone.

**Hash value**

Hash or dispersion range values are usually scalable values from a subset of natural numbers. A hash value is also referred to as a "fingerprint" because it is a virtually unique identification of a quantity in much the same way as a fingerprint is a virtually unique identification of a person.

**H.323**

H.323 designates a group of standards that define a variety of media types for packet networks. The standards cover voice, data, fax and video, and define how signals are to be converted from analog to digital and what signaling is to be used.

**OpenScape Business Assistant**

OpenScape Business Assistant is used to administer the communication system. It provides all wizards for the quick support of administration tasks.

**Hosted Services**

Hosted Services are traditional IT services such as e-mail, instant messaging (IM) and unified communications (UC), which are provided to a company by an Internet Provider from a remote site, thus eliminating the company's need to run and manage these services on their own servers on-site.

### **ICMP (Internet Control Message Protocol)**

ICMP is used in data networks for the exchange of information and error messages using the Internet Protocol IP.

### **IDS (Intrusion Detection System)**

IDS is a security system that monitors all incoming and outgoing network activities to identify possible security violations. These include both intrusion (attacks from outside the organization) and abuse (attacks from within the organization).

### **IEEE Standards**

IEEE Standards are a set of specifications defined by the Institute of Electrical and Electronic Engineers (IEEE) (such as Token Ring, Ethernet) to establish common networking standards among vendors.

### **IEEE. 802.1p**

IEEE. 802.1p is an IEEE standard for regulating the transport of data packets with different priorities in computer networks. The data packets are classified into priority classes from 1 to 7. The Standard only stipulates ascending priorities from 1 through 7, but does not deal with how the individual data packets should be handled.

### **IKE Protocol**

The IKE protocol has two different tasks. Start by creating an SA (Security Association) exclusively used by the IKE protocol (IKE-SA). The existing IKE-SA is then used for secure negotiation of all further SAs (payload SA) for the transmission of payload data.

### **IM (Instant Messaging)**

IM is a procedure for the real-time exchange of text messages over the Internet using computers, Pocket PCs and mobile phones. Modern IM services enable VoIP and video conferencing, file transfers and desktop application sharing.

### **IP PBX**

IP PBX is a communication system that supports both VoIP and normal voice connections over traditional phone lines.

### **IPSec**

IPSec is a framework of open standards for ensuring private, secure communications over Internet Protocol (IP) networks through the use of various security services and protocols.

### **ISP (Internet Service Provider)**

An ISP is a business that supplies Internet connectivity services to individuals, businesses, and other organizations. Some ISPs are large national or multinational corporations that offer access in many locations, while others are limited to a single city or region.

**ITSP (Internet Telephony Service Provider)**

An ITSP is a business that supplies Internet connectivity services to individuals, businesses, and other organizations.

**DP (Dial Pulsing)**

DP is the oldest signaling method used for automatic telephone switching. Today, DP has generally been superseded by DTMF.

**Jitter**

Jitter refers to packet delay variations in voice transmissions. An excessive delay between the sending of packets and their arrival at the receiving end results in irregular voice communications infectivity are difficult to understand.

**ISD (Individual Speed Dialing)**

Individual Speed Dialing (ISD) enables 10 external individual speed-dial numbers to be saved at every authorized phone in addition to the system speed dialing (SSD).

**SSD - System Speed Dialing**

Frequently required external phone numbers can be stored in the system memory of the communication system. Every number is represented by a speed-dial number, which can be used instead of the full phone number by all stations.

**Latency**

Latency is the time required to transport a data packet from one application to another, including the time for transmission over the network and for preparing and processing the data at the transmitting and receiving devices.

**LCR (Least Cost Routing)**

You can use the Least Cost Routing (LCR) function to specify the provider you want to use, e.g., for trunk calls, mobile phone calls or international calls. You use the communication system to define the least-cost provider and conduct all calls via this specific path.

**LIN (Location Identification Number)**

LIN is an unique, max. 16-digit number that corresponds to the 10-digit NANP (North American Numbering Plan).

**LWCA (Lightweight CA)**

LWCA is a restricted certification function.

**Media Stream Channel**

A media gateway can terminate circuit-switched ISDN B channels and use the voice data carried to generate media stream channels for an IP-based packet-switched network. Media stream channels feature a combination of audio, video, and T.120 media.

### **DTMF (Dual Tone Multifrequency)**

Dual Tone Multifrequency (DTMF) is the dialing method in analog telephony that is predominantly used in switching technology today for transmitting the phone number to the telephone network.

### **MIM (Mobile Instant Messaging)**

MIM is a Presence and Instant Messaging Service for mobile phones.

### **Mobility**

The term mobility designates the use of Pocket PCs and mobile phones and their integration in the communication system of a company.

### **MOH (Music on Hold)**

Music on Hold (MOH) can be played to callers who cannot be switched through immediately.

### **MSN (Multiple Subscriber Number)**

When connecting ISDN phones via an S0 bus (point-to-multipoint connections), every single ISDN phone (ISDN station) is assigned a unique Multiple Subscriber Number (MSN). The ISDN stations can be reached via their MSNs.

### **MULAP (Multiple Line Appearance)**

MULAPs are special groups in which multiple telephones are combined. A group member may be assigned multiple phones under a single call number (Basic MULAP) here. In addition, such a group can be used to implement special features required for communication between an Executive and Secretary, for example, or within teams (Executive MULAP, Team MULAP).

### **Multi-Gateway**

In the case of a multi-gateway network, calls are routed via several different gateways.

### **myAttendant**

myAttendant is the attendant console of the communication system.

### **myPortal**

myPortal is the Java-based user portal that enables subscribers to access the Unified Communications functions. Apart from information on the presence status, convenient dialing aid via favorites and directories, subscribers can also access voicemail messages and faxes.

### **myPortal for Outlook**

myPortal for Outlook is the user portal integrated in Microsoft Outlook that enables subscribers to access unified communications functions. It is analogous to myPortal. myPortal for Outlook also provides a convenient Desktop Dialer.

**NAC (Network Admission Control)**

NAC is a technology that supports defenses against viruses and worms from within the network. With NAC, terminal devices are checked for conformity with guidelines during the authentication. If the virus scanner is not up-to-date, for example, or if the client operating system does not have the latest security patch installed, the device involved is quarantined and provided with the current updates until it meets the applicable security guidelines.

**NAT (Network Address Translation)**

NAT is a procedure for replacing one IP address in a data packet with another. It is used to map private IP addresses to public IP addresses. Masking or PAT (Port Address Translation) is when the port numbers are also rewritten.

**NTBA (Network Termination for ISDN Basic Access )**

An NTBA (Network Termination for ISDN Basic Access), also known as NT (Network Termination), is the network termination device for the ISDN basic rate interface. It is the link between the network operator's digital network and the ISDN configurations on the subscriber side.

**NTPM (Network Termination for Primary Rate Multiplex Access)**

An NTPM (Network Termination for Primary Rate Multiplex Access) is the network termination device for the ISDN primary rate interface. It is the link between the network operator's digital network and the ISDN configurations on the subscriber side.

**OLSR - Optimized Link State Routing Protocol**

OLSR is special ad-hoc protocol that enables the missing routing capability on the OSI Layer 2 to be optimized on the OSI Layer 3.

**ONS (One Number Service)**

Call number directly assigned to a user One or more resources (telephones) may be assigned to a user. When a user is called via his or her ONS number, the call is forwarded to the phone that is currently being used by that user (e.g., a mobile phone).

**PAP (Password Authentication Protocol)**

PAP is an authentication procedure based on the point-to-point protocol. It is used for dialing into an ISP. PAP transmits the password for authentication as clear text together with a user ID.

**PBX (Public Branch Exchange)**

A PBX is a switching system that interconnects multiple terminals such as phones, fax and answering machines between themselves and also to the public phone network.

### **Peer**

A peer is the terminal device for communication in a peer-to-peer network. During communication, every peer makes its services available and uses the services of the other peer.

### **Peer-to-peer**

In a peer-to-peer network, all PCs have equal rights and may use and also provide services on the network.

### **Peer-entity authentication**

The corroboration that the peer entity in an association is the one claimed.

### **PKI (Public Key Infrastructure)**

In cryptology, a PKI (public key infrastructure) is a system for generating, distributing, and verifying digital certificates. The certificates issued within a PKI are used to protect computer-driven communication.

### **PPP (Point-to-Point Protocol)**

PPP is an IETF standard for transmitting IP packets over serial lines. PPP is mainly used for dialing into the Internet.

### **PPPoE (Point-to-Point Protocol over Ethernet)**

The PPPoE Protocol (PPP over Ethernet) enables the use of the Point-to-Point network protocol over an Ethernet connection.

### **Pre-shared Key**

The pre-shared key is a key that is defined for the tunnel configuration (for VPNs). In order for VPN peers communicating via the tunnel to authenticate themselves, the same password must be used for both of the tunnel endpoints.

### **PPTP (Point-to-Point Tunneling Protocol)**

PPTP is a technology used for configuring a virtual private network (VPN). Because the Internet is essentially an open network, PPTP is used to ensure that messages transmitted from one VPN node to another are secure. PPTP lets users dial into their corporate network via the Internet.

### **Presence**

The term Presence refers to the capability of a Unified Communications system to determine the location and status of a user at any time. This makes it easier to respond to the specific communication needs of a user by phone, e-mail, Instant Messaging or fax.

### **Proxy Server**

The proxy server is the connecting link between a client application and a Web server. It performs the task of filtering client application requests and thus relieves the load on the Web server.

**PSTN (Public Switched Telephone Network)**

As the name implies, PSTN refers to a public switched telephone network. Public networks may be owned by private or public entities.

**QoS (Quality of Service )**

You must guarantee a minimum bandwidth for Voice over IP for the entire transmission duration. If multiple applications with equal rights are operating via IP, then the available bandwidth for a transmission path is split. In this case, a voice connection may experience packet losses which can reduce voice quality. There are different ways to guarantee the highest possible quality for transmission; these methods are collectively referred to as Quality of Service (QoS).

**RAS (Remote Access Service)**

A RAS (Remote Access Service) user is an IP subscriber (e.g., a teleworker) who logs into the system remotely and behaves like an internal IP station. This subscriber can therefore use the complete functional scope of the communication system.

**RJ45 (Registered Jack 45)**

RJ45 is an eight-pin connector that is used for connecting a 10BaseT cable in network technology, for example.

**Roaming**

Roaming is the capability of a mobile network subscriber to automatically make calls or access other mobile network services in a foreign network, i.e., one that differs from the home network of the subscriber.

**RTCP (Real-Time Control Protocol)**

The real time control protocol (RTCP) is used for the negotiation and compliance of Quality of Service (QoS) parameters through the periodic exchange of control messages between senders and receivers.

**RTP (Real-Time Transport Protocol)**

RTP is an IETF Standard for streaming real-time multimedia data using the Internet Protocol. Typically, RTP runs on top of the UDP protocol, and uses dynamic UDP ports negotiated between the sender and receiver of specific media streams.

**RTT (Round Trip Time)**

RTT is the time interval required by a data packet to move from the source to the target and back.

**SA (Security Association)**

SA is a security association between two communicating units in computer networks. It describes how the two parties will use security services to communicate securely with each other.

### **SDSL (Symmetric Digital Subscriber Line)**

SDSL is particularly suited to Internet telephony, intranet applications in companies with local networks, for video conferencing and is, for example, designed for teleworkers who can use it to send and receive data with the same bandwidth. In contrast to ADSL, SDSL uses identical bandwidths from and to the Internet.

### **Secure CLI**

Secure CLI is a security feature that provides secure command line and data transfer interfaces with the help of the Secure File Transfer Protocol (SFTP).

### **SFTP (Secure File Transfer Protocol)**

SFTP is a security protocol for transporting connection data records.

### **ShrewSoft VPN Client**

The ShrewSoft VPN client is an open source and free VPN client with a graphical user interface. It includes, among other things, ISAKMP, Xauth and RSA support, and AES, Blowfish and 3DES encryption protocols.

### **Single Gateway**

In the case of a single-gateway network, calls are routed via a single gateway.

### **SIP (Session Initiation Protocol)**

SIP is a standard Internet protocol defined in RFC 3261 for setting up and managing voice connections and video conferences over an IP network.

### **SNMP (Simple Network Management Protocol)**

SNMP is a procedure for obtaining information on the status of network components and PCs.

### **SPE (Signaling and Payload Encryption)**

Signaling & Payload Encryption (SPE) serves to enhance security when transmitting voice data. The VoIP payload and signaling data streams from and to the gateway and between IP phones are encrypted.

### **SRTP (Secure Real-Time Transport Protocol)**

SRTP is an encrypted RTP protocol. It is particularly suitable for transmitting communication data over the Internet and is used in IP telephony.

### **SSH (Secure Shell)**

SSH is a protocol that provides support for secure remote login, secure file transfer, and secure TCP/IP forwarding. It can automatically encrypt, authenticate, and compress transmitted data.

**SSL (Secure Socket Layer)**

SSL is a protocol for transporting documents over the Internet. With SSL, data is provided with a private key before it is transmitted. By convention, URLs that require an SSL connection start with https: instead of http:.

**Status**

The status, together with the "Presence" concept, indicates whether a subscriber is available, busy, offline, etc., so that other subscribers in the communication system know if this subscriber can be reached.

**STUN (Simple Traversal of UDP through NAT)**

STUN is a network protocol for detecting, identifying, and bypassing firewalls and NAT routers.

**Survivability**

Survivability is the capability of an internetwork to maintain service continuity in the presence of faults within the network.

**TAE (Telekommunikations-Anschluss-Einheit) - German standard for telephone plugs and sockets**

A TAE is a type of connector for analog phone connections with the a/b interface and for ISDN connections to plug the NTBA into the main line. It is used to connect analog telephones, fax machines and ISDN phone systems.

**TCP (Transmission Control Protocol)**

TCP is a protocol that governs how data should be exchanged by PCs. All operating systems in modern PCs support TCP and use it for data exchange with other PCs.

**TFTP (Trivial File Transfer Protocol)**

TFTP is a trivial file transfer protocol that supports only the reading and writing of files. Many of the functions supported by the superordinate protocol are unavailable, for example, functions allocating rights, displaying existing files or user authentication.

**Telnet**

A protocol that links two PCs in order to provide a terminal connection to the remote PC. Instead of dialing into the PC, the user connects over the Internet via Telnet. The user initiates a Telnet session, connects to the Telnet host and logs in. The connection enables the user to work with the remote PC as though it were a terminal connected to it.

**TOS (Type of Service)**

TOS is a field in the header of IP data packets. It is used for the prioritization of these packets and evaluated for Quality of Service, for example.

### **UCD (Uniform Call Distribution)**

UCD enables incoming calls in the communication system to be uniformly distributed to a group of stations (UCD-group).

### **UDP (User Datagram Protocol)**

UDP is a network protocol that belongs to the Transport layer of the Internet protocol family. UDP is responsible for routing data transmitted over the Internet to the correct application.

### **UMTS (Universal Mobile Telecommunications System)**

UMTS is a third-generation mobile network standard with which significantly higher data transmission rates (384 kbps to 7.2 Mbit/sec.) can be achieved as compared to the mobile network standards of the second generation or the GSM standard.

### **Unified Communications**

Unified Communications is the integration of various communication systems, media, devices and applications within an environment (e.g., IP telephony, site-based and mobile telephony, e-mail, instant messaging, desktop applications, voicemail, fax, conferencing and unified messaging).

### **Unified Messaging**

Unified Messaging is the integration of different communication data such as e-mail, SMS, fax, telephony, etc., in a uniform message store. This message store can be accessed by several different devices.

### **VAD (Voice Activity Detection)**

VAD (Voice Activity Detection) is an algorithm in speech processing to detect the presence or absence of speech in the digital transmission of audio data.

### **VCAPI Interface**

VCAPI is a virtual CAPI interface that emulates the presence of a local ISDN card. If an ISDN card has been installed on a PC in the internal network, then this ISDN card can be made available to all stations on the network via the VCAPI interface.

### **VDSL (Very High Speed Digital Subscriber Line)**

VDSL is used to transfer symmetrical or asymmetrical data streams at high speed over short distances. VDSL is an alternative to ADSL and SDSL that additionally offers higher transmission speeds.

### **VoIP (Voice over IP)**

VoIP is the transmission of voice data over IP-based networks.

### **VPN (Virtual Private Network)**

A VPN uses the public infrastructure of the Internet to connect sites and provide teleworkers with access to internal networks. External partners are provided with secure access to the internal data network by using encryption and authentication mechanisms.

**WAN (Wide Area Network)**

WAN is the designation for wide area data networks such as the Internet, for example.

**WBM (Web-Based Management)**

WBM is a web-based user interface that is displayed in an Internet browser using HTML or JAVA pages (web pages) and a web protocol (HTTP or HTTPS).

**X.509 standard (VPN certificate)**

X.509 is an ITU-T standard for a public key infrastructure and currently the most important standard for digital certificates.

**XMPP (Extensible Messaging and Presence Protocol)**

Internet standard that is primarily used for Instant Messaging. XMPP supports the interaction with users of other networks such as AIM, ICQ or Windows Live Messenger (WLM), for example. Among other things, XMPP and its extensions support conferencing with multiple users (e.g., multi-user chats) and the display of the online status.

**Second Degree**

Second degree means that a station is calling and already has a second call waiting for that station.
